Within medieval society, perceptions of disability and able-bodiedness were largely based on the extent to which an individual was able to perform the socially-defined duties that they were expected to undertake. As such, many variables affected the social assignment of disability including; status, age and gender. The aim of this research is to explore how chronic physical impairment, both acquired and congenital in nature, impacted the lives of medieval Scottish women. Through a series of case studies, this paper reconstructs the lived experiences of three medieval women with acquired and congenital impairments including: severe scoliosis, bilateral hip dysplasia and an antemortem pelvic ring fracture. The human skeletal remains were macroscopically examined, and biomechanical data

was derived from micro-computed tomography. When historically contextualised and interpreted through the lenses of the 'bioarcheology of care' framework, the unique care requirements for each individual are discussed, as are the physical and social consequences of living with a physical impairment during the medieval period. This research highlights the heterogeneity in the lived experiences of women with physical impairments which contributes to the ongoing discussion about care provision and social constructions of disability within the rigidly constructed gender roles of medieval society.

#### **A. CHILDHOOD AND ADULT DIETS IN PLAGUE AND FAMINE VICTIMS FROM THE MEDIEVAL MINING COMMUNITY OF KUTNÁ HORA (CZECHIA, 13TH–16TH CENTURY)**

**Abstract author(s):** Dřítkolová Kaupová, Sylva (National Museum) - Frolík, Jan - Světlík, Ivo (Czech Academy of Sciences) - Velemínský, Petr (National Museum) - Brzobohatá, Hana (Czech Academy of Sciences)

**Abstract format:** Poster

Due to intensive copper and silver mining activity, Kutná Hora developed into one of the most important centres of the medieval Czech Kingdom. Through overall prosperity, its inhabitants, however, had to face all the negative aspects of intensive urbanisation related to overcrowding and poor sanitation.

This study presents the preliminary results of dietary reconstruction of the local population buried in a medieval cemetery uncovered during rescue excavations around Kutná Hora/Sedlec ossuary. A total of 1837 skeletons were unearthed, mostly from mass burial pits. A combination of archaeological finds and radiocarbon dating enabled these graves to be linked with two historically documented events. The first group can be linked to the famine that occurred after climate changes and crop failures at the beginning of the 14th century (1318). The second group can be linked with the deadly plague epidemic in Europe in 1348–1350.

This study presents the carbon and nitrogen isotopic values of bone collagen of 90 individuals, removed from mass graves and single inhumations in a regular cemetery. An intraindividual sampling strategy was applied, taking 1) a sample of bone tissue to reflect the long-time dietary average from adulthood and 2) a sample of tooth dentine (lower part of M1 root) to reflect the childhood diet.

Carbon and nitrogen isotopic values of the studied dataset are typical for a terrestrial, predominantly C3-based diet with variable proportions of animal products. The results are further analysed and discuss i) whether the dietary habits in earlier life predisposed the individual to higher mortality risk from both famine and plague, and ii) whether the socio-economic composition of the buried population changed during the mortality crises.

This study was supported by Czech Science Foundation (21-09637S), Ministry of Culture (DKRVO 2019-2023/7.II.d, 00023272) and Ministry of Education, Youth and Sports (OP RDE CZ.02.1.01/0.0/0.0/16\_019/0000728).

#### **B. INFECTIOUS DISEASES IN A MEDIEVAL URBAN ENVIRONMENT: SIGTUNA AS A CASE STUDY**

**Abstract author(s):** Pochon, Zoé - Krzewińska, Maja - Götherström, Anders (Centre for Palaeogenetics, Department of Archaeology and Classical Studies, Stockholm University)

**Abstract format:** Poster

Infectious diseases are not easy to detect in paleopathology. Long-lasting diseases such as tuberculosis, leprosy, syphilis and brucellosis can leave visible traces on the bones, but this is not the case for most infectious diseases. With the development of next-generation sequencing techniques, it is now possible to recover the genomes of ancient humans but also of the pathogens they were hosting at the time of their death such as *Yersinia pestis*, the agent of plague.

Here we focus on the impact of urbanization on infectious disease with the medieval town of Sigtuna as a case study. Over 40 individuals were subjected to shotgun sequencing and screening for potential pathogens. Preliminary results are promising with the detection of foodborne pathogens and sexually transmitted diseases, among others. This analysis is part of a larger project tracking the impact of early urbanization on infectious diseases from the late Iron Age to the medieval period in present-day Sweden.

#### **C. LIVING THROUGH TIMES OF POLITICAL UNREST: EXAMINING LIVING CONDITIONS IN LUXEMBOURG CITY THROUGH OSTEOLOGICAL AND BIOARCHEOLOGICAL ANALYSES**

**Abstract author(s):** Kremmer, Anne (AG Biogeology, University of Tübingen) - Bocherens, Hervé (Fachbereich Geowissenschaften, Forschungsbereich Paläobiologie, Universität Tübingen; Senckenberg Center for Human Evolution and Palaeoecology - HEP, Universität Tübingen)

**Abstract format:** Poster

Since its first mention in 963 AD the city and especially the fortress of Luxembourg had been growing steadily throughout the medieval times under the rule of the counts of Luxembourg. However, it is only in 1443, after the conquest by Philip the Good, duke of Burgundy, that the city of Luxembourg, which by then had become one of the strongest fortresses in central Europe, finally entered the geostrategic playing field opposing the interests of all the major political

forces of the time. From then on until the demolition of the fortress in the mid 19th century, life in Luxembourg City had been dominated by foreign occupations as well as several sieges and wars. This first comprehensive interdisciplinary study aims to shed light on the impact of these times of political unrest on the lives of the inhabitants of Luxembourg City through the analysis of 391 graves from a Franciscan cemetery in the city center, whose two occupancy phases have been dated to ~1445-1650 AD and ~1650-1798 AD through 14C-analysis as well as historical and archaeological sources. Data on dental status, metric analyses, stress indicators and pathological as well as traumatic lesions on bones were evaluated together with  $\delta^{15}N$  and  $\delta^{13}C$  stable isotope data to reveal differences but also similarities in living conditions in the city over time, between the sexes and between groups of different social status.

## 267 TOWARDS THE SEA: HUMAN ECOLOGY, SUBSISTENCE AND ADAPTATIONS ALONG THE EUROPEAN COASTS FROM THE LOWER PALAEOLITHIC TO THE NEOLITHIC [PAM]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** García-Escárgaza, Asier (Department of Human Science, University of La Rioja. Logroño; Department of Archaeology, Max Planck Institute for the Human Science. Jena) - Simões, Carlos (ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, University of Algarve) - Monteiro, Patrícia (ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, University of Algarve.; Direção-Geral do Património Cultural - DGPC – Laboratório de Arqueociências - LARC) - Dias, Rita (ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, University of Algarve. Faro, Portugal.; ERA Arqueologia S.A.) - Sierra Sainz-Aja, Alejandro (AASPE Archéozoologie, Archéobotanique: Sociétés, Pratiques et Environnements, Muséum National d'Histoire Naturelle, Dept. Homme et Environnement, Paris)

**Format:** Regular session

Coasts have long been hypothesised as key areas for human populations due to being very relevant areas for sourcing protein, essential for reproductive and cognitive success and, in turn, stimulating technological and cultural innovation. Also, they are seen as crucial areas for the rapid dispersal of our genus out of Africa, before becoming sites of increasingly sedentary societies around shell middens in the Mesolithic period of Europe, for example. Therefore, increasing our knowledge on the role of coastal environments for hominids throughout Prehistory is crucial for better understanding human-environment interactions, but also forager and first farmer subsistence strategies, among other very relevant aspects, such as the diffusion of the economic and technical innovations occurred during the Pleistocene and Early/Middle Holocene. In this session, we aim for studies focusing on human populations that inhabited littoral areas along Europe from the Lower Palaeolithic to the Neolithic. From a more specific point of view, we are very interested in littoral resource exploitation patterns and its management throughout time, human occupation, and mobility patterns along the coasts, and archaeological sites' formation processes. We also want to focus on paleoenvironmental reconstruction and climate change implications for human ecology across the Atlantic and Mediterranean Europe, as well as the role played by marine environments during climate anomalies. Nevertheless, all those papers that study of the modus vivendi of hominids in littoral areas are welcomed.

## ABSTRACTS

### 1 FIREWOOD EXPLOITATION DURING THE EARLY HOLOCENE IN ABRIGO DO POÇO ROCKSHELTER (LEIRIA, CENTRAL PORTUGAL)

**Abstract author(s):** Monteiro, Patrícia (Laboratório de Arqueociências - LARC - Direção-Geral do Património Cultural; ICArEHB – Interdisciplinary Center for Archaeology and Evolution of Human Behaviour – Universidad do Algarve) - Nora, David (Institute of Archaeology – Hebrew University of Jerusalem; ICArEHB – Interdisciplinary Center for Archaeology and Evolution of Human Behaviour – Universidad do Algarve) - Paixão, Eduardo (TraCER – Laboratory for Traceology and Controlled Experiments, MONREPOS – Archaeological Research Centre and Museum for Human Behavioural Evolution, RGZM; ICArEHB – Interdisciplinary Center for Archaeology and Evolution of Human Behaviour – Universidad do Algarve) - Évora, Marina (Centro de Estudos Globais - Departamento de Ciências Sociais e de Gestão – Universidade Aberta; ICArEHB – Interdisciplinary Center for Archaeology and Evolution of Human Behaviour – Universidad do Algarve) - Carvalho, Vânia (Museu de Leiria, Câmara Municipal de Leiria) - Holliday, Trenton (Tullane University, New Orleans, USA; Centre for the Exploration of the Deep Human Journey – University of Witwatersrand) - Pereira, Telmo (Departamento de Artes, História e Humanidades – Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar, Portugal; Centro de Geociências da Universidade de Coimbra; UNIARQ – Centro de Arqueologia da Universidade de Lisboa)

**Abstract format:** Oral

To address firewood exploitation modalities to understand coastal adaptations is important to characterize the local landscapes and also recognize the reliance on inland resources. Concerning hunter-gatherer communities' inherent mobility and their growing dependence on marine resources during the Holocene, it is important to comprehend the role of other inland resources on their mobility and occupation patterns. The case presented here is Abrigo Poço

rockshelter, specifically, the early Holocene occupation, dating from the cold Bond Event 6. The hunter-gatherers that occupied this site had access to both coastal and inland resources since Poço rockshelter is located in the narrow karstic canyon of Chitas stream, an affluent of the River Lis (central Portugal) that links the inland mountains and the Atlantic coast. This makes it a particularly rich and leafy ecotone. This occupation was identified in ash, scattered charcoal, and shellfish deposits in the rockshelter and testifies activities of gathering of both marine and woodland resources and use of fire. Charcoal analyses were carried out to characterize the firewood exploitation modalities of these hunter-gatherer populations. The results allow the identification of *Olea europaea*, *Quercus deciduous*, *Quercus* sp., *Pinus* sp., *Arbutus unedo*, Ericaceae, Monocotyledonous, and indeterminate angiosperm. The refuge areas such as the example of this valley might have contributed to the resilience of thermophilous species even in colder periods of the Holocene, also suggesting that Chitas valley, more than a corridor between the coast and the inland mountains, might also have provided important daily resources for hunter-gatherer communities such as firewood.

## 2 SEASONALITY AND SUBSISTENCE OF THE LAST MESOLITHIC HUNTER-GATHERERS – THE ICHTHYOLOGICAL REMAINS OF THE CABEÇO DA AMOREIRA SHELLMIDDEN (MUGE, PORTUGAL)

**Abstract author(s):** Dias, Rita (Era - Arqueologia, Conservação e Restauro; ICArEHB - Interdisciplinary Center for Archeology and Evolution of Human Behavior) - Bicho, Nuno (ICArEHB - Interdisciplinary Center for Archeology and Evolution of Human Behavior) - Detry, Cleia (Uniarq/FLUL)

**Abstract format:** Oral

The study of Subsistence patterns, occupation and mobility of Mesolithic human communities is a central theme in the context of evolution and changes in human behaviour and adaptation processes during the environmental alterations characteristic of the Holocene period. One of the phenomena associated to these alterations is the appearance of a particular kind of anthropic deposit known as shell midden, and characteristic of Mesolithic occupation in the Atlantic facade of the Iberian Peninsula.

Here, we present high-resolution data from fish remains recovered through the 2008-2014 excavations at Cabeço da Amoreira. A tentative reconstruction of the role of fish in subsistence e technological reality is made.

Taking into account the abovementioned issues, this work aims to contribute to the discussion about occupation models (e.g. seasonality), type of occupation, subsistence strategies and exploitation of locally and regionally available species and, to confirm the existing models that propose a sedentary or semi-sedentary occupation, throughout the year and, that do not exclude a relatively high individual mobility. Simultaneously, we seek to integrate the Cabeço da Amoreira shell midden on the Mesolithic geographical and paleoenvironmental setting, through the ichthyological remains.

We also seek to present data from sclerochronological analysis and  $\delta^{18}\text{O}$  stable isotopes, of 15 Meagre (*Argyrosomus regius*) otoliths from the last Mesolithic occupation of the Cabeço da Amoreira shell midden. The carbonate samples, collected on the several growth rings, were analysed to obtain the values of  $\delta^{18}\text{O}$  stable isotopes, to determine a predominant season of capture and, seasonally frame the site's occupation, paleoenvironmental setting and origin of resources (locally vs regionally). Potential diagenetic alterations were tested through  $\mu$ -Raman and LA-ICPMS.

The obtained results reveal clear seasonal values and a seasonal estimation consistent with periods of higher temperature (Spring-Summer-beginning of Autumn) for the last Mesolithic occupation of Cabeço da Amoreira.

## 3 INFLUENCE OF EARLY HOLOCENE KARSTIC SPRING REACTIVATION ON HUNTER-GATHERERS' SETTLEMENT STRATEGIES AND SHELL MIDDEN FORMATION IN ASTURIAS, SPAIN

**Abstract author(s):** Simões, Carlos (ICArEHB, Universidade do Algarve) - Iriarte, Eneko (Universidad de Burgos) - Arias, Pablo (Universidad de Cantabria)

**Abstract format:** Oral

The littoral platform of eastern Asturias (N. Spain) is a coastal karst heavily shaped by action of the sea. During the Early Holocene, this karstic landscape was exploited by a dense hunter-gatherer population with a successful coastal-adapted lifestyle, during five millennia until the consolidation of food-producing economies. The hunter-gatherer activity resulted in an elevated density of shell midden deposits in cave entrances. In the 1920's, the Count Vega del Sella established the post-Palaeolithic age of the Asturian shell middens, characterized by being carbonate-cemented and adhered and even hanging from the walls of karstic cavities. He argued that such remains were all that's left from past shelly accumulations completely obturating the cavities, which worked as trash disposal places, while the occupations occurred mostly outside.

Our geoarchaeological approach tested this long-lasting model, based on micromorphology and carbonate microfacies analysis of two sites: El Alloru and El Mazo. Novel outcomes are: 1) the carbonate cements correspond to calcareous tufa likely resulting from spring activity; 2) the deposits preserve internal stratigraphy, related to different human occupation phases; 3) tufa formation and accumulation of anthropogenic debris are syn-depositional; 4) the

deposits were cemented during higher water-table fluctuations that periodically submerged the deposits, cementing them under phreatic conditions, which contradicts a priori expectations from Vega del Sella's model.

These data suggest a hydrological regime marked by higher water-table base level than today, due to more intense rainfall that kept the karst saturated, despite today most caves show no signs of recent spring activity. Micromorphological observations suggest that occupation debris were likely produced inside the rockshelters, and thus these might have been used as occupation spaces as well. The Mesolithic foragers exploited the karstic network, alternating between many cavities, as their hydrological conditions fluctuated.

#### 4 SEASONALITY OF SHELLFISH COLLECTION IN THE CANTABRIAN MESOLITHIC DEDUCED FROM STABLE OXYGEN ISOTOPE RATIOS

**Abstract author(s):** Arniz Mateos, Rosa (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria, Gobierno de Cantabria, Grupo Santander) - García Escárzaga, Asier (Universidad de la Rioja, Departamento de Ciencias Humanas, Logroño; Max Planck Institute for the Science of Human History, Department of Archaeology, Jena) - González Morales, Manuel R. (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria, Gobierno de Cantabria, Grupo Santander) - Gutiérrez Zugasti, Igor (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria, Gobierno de Cantabria, Grupo Santander)

**Abstract format:** Oral

Oxygen isotope values ( $\delta^{18}O$ ) of shell calcium carbonates can be used to determine seawater temperatures and the seasonality of mollusc collection at archaeological sites. Previous studies using both modern and archaeological specimens have confirmed the potential of oxygen isotopes-based techniques to provide relevant information about subsistence strategies and coastal settlement patterns adopted by the last groups of hunter-fisher-gatherers after the arrival of the Holocene. In the present study, we used shells from the topshell *Phorcus lineatus* (Da Costa, 1778) and the limpet *Patella vulgata* (Linnaeus, 1758) from the Mesolithic site of El Toral III (Llanes, Asturias, Spain), dated between ca 10 and 7.3 ka, in order to find out seasonality of shell collection. Results showed two different patterns depending on the species: the topshells were collected during autumn/winter, while the limpets were collected during a longer period of the annual cycle. These results were compared with those from other sites in the region, such as El Mazo, La Chora, La Riera, Mazaculos II and El Penicil to have a wider overview of the seasonal use patterns.

#### 5 STRATEGIES FOR THE COLLECTION OF MARINE MOLLUSCS BETWEEN 12,000-5,000 CAL BC IN NERJA-MINA (MÁLAGA)

**Abstract author(s):** Aguirre, Amaia - Colonese, Andre Carlo (University Autonomous of Barcelona) - Jordá, Jesus (National University of Distance Education) - Aura, Emili (University of Valencia) - Valledor de Lozoya, Arturo (Expert) - Saña, María (University Autonomous of Barcelona) - Álvarez-Fernández, Esteban (University of Salamanca)

**Abstract format:** Oral

In the Nerja Cave, located on the coast of the Alboran Sea, one of the few stratigraphic sequences of the transition from the Upper Pleistocene to the Early Holocene of the Western Mediterranean has been documented. The archaeological interventions carried out by Professor Francisco Jordá Cerdá, between 1979 and 1987, in the Sala de la Mina, provided 16 levels with abundant malacological remains. The chronology correspond to the final Upper Magdalenian between 12,400 and 11,700 cal BC (levels XVI, XV and XIV), Epipaleolithic (Level XIII), the Geometric Mesolithic between 6300 and 6000 cal BC (Levels XII and XI), the Early Neolithic between 5300 and 5100 cal BC (Levels X, IX, VIII, VII and VI) and the Final Early Neolithic between 5100 and 4500 cal BC (level V). This communication presents, on one hand, the biometric study, through the geometric morphology, of *Patella caerulea* individuals and, on the other, the study of seasonality from the analysis of stable oxygen and carbon isotopes of the shells of the same species, documented in the different occupations of Nerja-Mina. The objective is to determine the management of marine molluscs by the last hunter-gatherer societies and the first Neolithic societies, and whether there was a change in the intertidal gathering areas and the annual or seasonal acquisition of this resource between ca. 12,000 and 5,000 cal BC in the Western Mediterranean.

## STABLE OXYGEN ISOTOPE APPROACHES TO STUDYING SHELLFISH EXPLOITATION AND ECONOMIC CHANGE ACROSS THE MESOLITHIC-NEOLITHIC TRANSITION IN N IBERIA

**Abstract author(s):** García-Escárzaga, Asier (Department of Human Sciences, University of La Rioja, Logroño; Department of Archaeology, Max Planck Institute for the Science of Human History, Jena) - Fano, Miguel (Department of Human Sciences, University of La Rioja, Logroño) - Ontañón-Peredo, Roberto (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria, Gobierno de Cantabria, Grupo Santander; Museo de Prehistoria y Arqueología de Cantabria - MUPAC) - Gutiérrez-Zugasti, Igor - Gonzalez-Morales, Manuel (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria, Gobierno de Cantabria, Grupo Santander) - Ilgner, Jana - Lucas, Mary (Department of Archaeology, Max Planck Institute for the Science of Human History, Jena) - Roberts, Patrick (Department of Archaeology, Max Planck Institute for the Science of Human History, Jena; School of Social Sciences, University of Queensland)

**Abstract format:** Oral

The Mesolithic-Neolithic transition involved high implications for past human groups, provoking deep changes in societies and economies around the world. During the last few decades, the N Iberian Peninsula has been revealed as a key area to better understand the neolithization process along the Atlantic Façade of Europe, where the previous Mesolithic populations generated an archaeological assemblage with characteristic features. Although multidisciplinary investigations recently carried out in N Iberia have allowed us to notably increase our knowledge on the Mesolithic-Neolithic transition, more studies are still required to better comprehend the complexity of this process in this region. To achieve this objective, the application of new methodological approaches to investigate hidden aspects of this transitional period is required, such as changes in littoral resource exploitation strategies by Early Neolithic human groups.

Marine resources had a very important role for the forager subsistence strategies during the Mesolithic. Stable oxygen isotope ratios analyses conducted on the topshell *Phorcus lineatus* (da Costa, 1778) have highlighted that seasonal shellfish collection patterns during the Mesolithic were probably driven by cost-benefit principles. However, there remains debate, in N Iberia and elsewhere, as to the degree to which marine resources continued to play a role following the dawn of the Neolithic. Here, we apply stable oxygen isotope analyses to *P. lineatus* shells recovered from two stratigraphic units (A4 and A3: ca. 5,200-4,000 BC) of Los Gitanos site (Cantabria, Spain) to determine how the role of mollusc and seasonal shellfish exploitation patterns changed across the Mesolithic-Neolithic transition. Preliminary results obtained so far have revealed that this topshell species was mainly collected from late autumn to early spring during the Early Neolithic. This seasonal pattern coincides with that previously deduced for the Mesolithic period, suggesting a continuity in human-littoral relationships through the Early and Middle Holocene.

## BETWEEN COAST AND INLAND: POTTERY USE IN THE ERTEBOELLE-CULTURE AND ITS IMPACT ON SETTLEMENT PATTERNS, RESOURCE EXPLOITATION AND SOCIAL COMPLEXITY

**Abstract author(s):** Meyer, Ann-Katrin (University of Hamburg)

**Abstract format:** Oral

The Erteboelle culture (ca. 5100-4000/3900 cal BC) belongs to the final Mesolithic of Northern Germany and Southern Scandinavia and is understood as a primarily coastal phenomenon. Furthermore, due to its aquatic subsistence preferences, a (seasonal) settlement permanence and other traits such as hierarchies, food storage and pottery use it is classified as a complex hunter-gatherer society.

Within this context, the (recently completed) PhD project "Early pottery in the Baltic" focusses on the origins of ceramic technology and its impact on Erteboelle lifestyle and settlement patterns as well as on the Neolithisation process.

Through the analysis of previously neglected inland find assemblages and an extensive comparison to the coastal materials the project developed a new perspective on settlement cycles and subsistence patterns, which identifies the Southern Erteboelle regions as a main corridor for the spread of innovations such as ceramic technology from 4700 BC onwards. A further analysis of the Erteboelle material culture centering around this new technology was able to show that ceramics played a central role in the final Mesolithic and significantly influenced various activities of daily life.

The use of ceramic vessels thus led to an intensification of existing subsistence and resource preferences which stabilised formerly established patterns and helped anchor the typical material signature and (coastal) settlement focus of the Erteboelle Culture. In this sense, ceramics are involved in forming complex social structures rather than resulting from them and facilitate the gradual establishment of Neolithic modes of subsistence by replacing more "traditional" Late Mesolithic structures.

- 8**      **ARCHAEOZOOLOGICAL APPROACHES TO MAMMAL HUNTING AND ECONOMIC CHANGE ACROSS THE MESOLITHIC-NEOLITHIC TRANSITION ON THE CANTABRIAN COAST (N IBERIA)**
- Abstract author(s):** Sierra, Alejandro (AASPE «Archéozoologie, Archéobotanique: Sociétés, Pratiques, Environnements» UMR 7209 CNRS MNHN) - Fano, Miguel Ángel (Department of Human Sciences, University of La Rioja, Logroño)
- Abstract format:** Oral
- The study of the neolithisation process in northern Iberia has been little studied until the last few decades. This lack of studies has prevented a good understanding of the dynamics of the adoption of farming practices in this area. Information obtained so far has shown that the Cantabrian region was occupied during the Mesolithic by forager groups whose subsistence relied heavily on marine resources. The ways of exploiting those resources have been extensively studied in recent years, while terrestrial resources have attracted less attention in research. Nevertheless, we know mammal hunting was a very important subsistence activity for the last hunter-gatherers. In fact, later hunting was also practiced by coastal Early Neolithic groups in N Iberia.
- The archaeological record corresponding to the Mesolithic-Neolithic transition (from ca. 5000 cal BC) in northern Iberia is heterogeneous in terms of the quantity and quality of the data available. A few archaeological sequences like El Mirón or Los Gitanos in Cantabria have provided detailed information while other sites have hardly been studied to date. The aim of this paper is to study hunting practices through the Mesolithic-Neolithic transition in Cantabrian Spain. Specifically, we study the fauna in the shell midden at Arenillas (Level 0) (Islares, Cantabria). This shell midden has provided dates corresponding to the Mesolithic and the beginning of the Neolithic, but further multidisciplinary research is needed to verify its cultural attribution. In this paper, we study the mammal fauna in this archaeological deposit and contextualize it with other Mesolithic and Early Neolithic sites in the region in order to identify dynamics in the forms of exploitation of these resources.
- 9**      **THE MESOLITHIC-NEOLITHIC TRANSITION IN THE MUGE SHELLMIDDENS (CENTRAL PORTUGAL): PRELIMINARY RESULTS**
- Abstract author(s):** Gonçalves, Célia - Cascalheira, João - Barbieri, Alvisé (ICArEHB, Universidade do Algarve) - García Rivero, Daniel (Universidad de Sevilla) - Umbelino, Cláudia (CIAS, Universidade de Coimbra; ICArEHB, Universidade do Algarve) - Godinho, Ricardo - Bicho, Nuno (ICArEHB, Universidade do Algarve)
- Abstract format:** Oral
- The transition from the Mesolithic to the Neolithic is a period of major economic, technological, and social change, marking the end of the last hunter-gatherers in Western Europe and the appearance of food-producing societies.
- The Muge shellmiddens, located in the Tagus Valley (Central Portugal), are among the most important sites to study this transition. Published genetic and archaeological data showed that the Neolithization of this region emerged from the admixture of the endemic Mesolithic foragers with immigrant Neolithic groups. The Mesolithic people that inhabited the Muge region were characterized by a different behavioral spectrum in comparison with previous forager communities of Portugal. Estuarine resources seem to have played a very important role for the subsistence of these Mesolithic humans, indicating their adaptation to the pulse(s) of cold freshwater from the North-West Atlantic towards the coast of Portugal, which characterized the 8.2 K cold event. This highly productive environment made possible the consolidation of a complex economic and social system of hunter-gatherers in the Muge area, as seen in the archaeological record uncovered by recent projects funded by Fundação para a Ciência e Tecnologia.
- With this contribution, we present our results from the last excavations at Cabeço da Amoreira and pilot investigations at Cabeço dos Ossos. At these sites, we discovered so far unreferenced "shell-free" archaeological loci, including Neolithic occupations, located in peripheral areas of the middens.
- 10**      **POPULATING THE COAST. THE RESILIENCE OF THE FIRST NEOLITHIC GROUPS IN THE IBERIAN PENINSULA**
- Abstract author(s):** Cortell-Nicolau, Alfredo (University of Cambridge)
- Abstract format:** Oral
- Currently, the maritime character of the Neolithic expansion through the Mediterranean is widely accepted. Nevertheless, while the debate is turning to questions relating to the mode of the spread, such as its uniform or arrhythmic character, there are still unresolved issues regarding to the expansion itself. More in particular the way how these groups of early farmers continued their way inland, and how this affected their relationship with previous hunter-gatherer populations.
- In this work, we will concentrate on the shores of the Eastern Mediterranean of the Iberian Peninsula, where the oldest radiocarbon dates attributed to the Early farmers so far are not in coastal sites, despite our knowledge that coastal expansion was the main route of arrival to this area. The focus will be on the analysis of one specific area, the mouth of the Serpis river (Valencian Country). This area constitutes one of the natural paths of entrance to the sites of Mas

d'Is and Cova d'en Pardo (inland sites with some of the oldest Neolithic dates for the Valencian region). In addition, it presents a particular concentration of sites, with at least 6 attested sites with cardial pottery in an area of ca 25 Km<sup>2</sup>. All of this provides a perfect ground for the study of the Neolithic pioneers in the coasts of the Western Mediterranean. Did these sites belong to the same, or similar groups? Where these groups related to the inland sites? How did they thrive? Did they have sea support from other groups? By studying the cultural transmission processes affecting this area, as well as the spatial relationships of these sites, this work will be a first approach to answer these questions.

## 11 **MARINE AND TERESTRIAL INVERTEBRATES AT ZACATÍN ROCKSHELTER (GRANADA, SOUTHEASTERN SPAIN): FIRST RESULTS**

**Abstract author(s):** Aguirre, Amaia (University Autonomous of Barcelona) - Álvarez-Fernández, Esteban (University of Salamanca) - Aparicio-Alonso, María Teresa (National Museum of Natural Sciences of Madrid) - Gutiérrez-Frías, Ismael (University of Granada) - Martínez-Sánchez, Rafael (University of Cordoba)

**Abstract format:** Oral

The Zacatín shelter, located on the Granada coast in the Alborán Sea, preserves one of the few stratigraphic sequences in the Andalusian Mediterranean, where the transition from the Mesolithic to the Neolithic is recorded. The proximity of the site to the coastline places it as a key settlement in the study of the management of marine resources by past societies. The interventions carried out in 2019, under the direction of Dr. Rafael Martínez-Sánchez, have provided abundant remains of marine and terrestrial molluscs, as well as crustaceans and echinoderms. This communication presents the taxonomic and quantitative analysis of the remains of marine and terrestrial invertebrates from the Mesolithic and Early Neolithic levels of the site. Likewise, the biometric study of the most abundant specimens of the *Patella* genus is exposed: *P. caerulea*, *P. ulyssiponensis* and *P. rustica*, as well as the terrestrial gastropod *Iberus alonensis*. The objective is to determine the exploitation strategies of invertebrates, both marine and terrestrial, and whether there was a change in the management of these resources during the transition from the Mesolithic to the Neolithic.

## 12 **THE EXPLOITATION OF MARINE RESOURCES DURING THE LATE NEOLITHIC IN THE ISLAND SETTLEMENT OF CARTAGENERAS (SAN FERNANDO, CÁDIZ, SPAIN)**

**Abstract author(s):** Vijande, Eduardo - Corona Borrego, José (Universidad de Cádiz) - Sánchez Aragón, María (Freelance archaeologist) - Cabrera Castro, Remedios (Universidad de Cádiz) - Carmona Gil, María (Freelance archaeologist) - Becerra Martín, Serafín - Cantillo Duarte, Juan - Ramos Muñoz, José (Universidad de Cádiz)

**Abstract format:** Oral

We present the preliminary results of the study of the exploitation of marine resources by a Neolithic community in the late 4th millennium BCE. This site, excavated in 2021, is situated in the former island of San Fernando (Bay of Gibraltar, Spain) barely 150 m from the ancient shoreline and approximately 15 m.a.s.l. A total of five silo-shaped structures were excavated, in which numerous marine remains were found: malacofauna, ichthyofauna, and corals. Terrestrial animal remains have also been found, but in much smaller numbers. The ceramic and lithic material is dated to the late 4th and early 3rd millennium BCE, when agricultural and stockbreeding practices intensified in the Iberian Peninsula, as reflected by the proliferation of silo-fields. We present a first set of radiocarbon dates, and the identification of malacological and ichthyological remains. These data allow us to argue that this community had a comprehensive understanding of the marine environment, and that they collected molluscs from different ecological niches (sandy, silty and rocky environments), and captured different fish species using a wide variety of fishing tackle. The presence of foreign materials (axes, necklace beads, etc.), also suggest that, at the very least, basic navigation techniques were known.

## 13 **THE DAR ES SOLTAN I CAVE IN IT'S GEOMORPHOLOGICAL AND PALEOECOLOGICAL CONTEXT**

**Abstract author(s):** Shaymae, Iken (UDC University) - Bouzouggar, Abdeljalil (INSAP) - Grandal D'Anglade, Aurora María (UDC University)

**Abstract format:** Oral

The coastal area of Rabat (between Oued Bouragrag and Oued Ikem) is one of the richest regions from a geological, geomorphological and archaeological point of view; as a result, it presents fertile ground to study the Quaternary as a whole.

The behavior of prehistoric humans towards animals, in a paleogeographic context, interest several researchers (Ouchaou 2000, Aouraghe 2001, Campmas 2012 and among others) which gives us general idea about the ecosystem of such population in a spatio-temporal structure.

The reconstruction of the paleoenvironments and lifestyles of prehistorical humans requires the use of paleontological and archaeozoological study, but in their natural context, which requires a geological and geomorphological study of the space concerned. All of these mechanisms make it possible to tie up the operating chain of a given popula-

tion and to have an idea of the vulnerability or invulnerability of their living environment, all within the framework of the paleo-ecosystem.

The documentation of the North African fossil faunas during the Upper Pleistocene and the Holocene, particularly in archaeological context, remains incomplete. This study aims to improve our knowledge of the subsistence behaviors of prehistoric, Aterian and Neolithic populations, and to have an updated vision of their lifestyles.

For this reason, our study consists in contributing on the knowledge of the subsistence of the Aterian and Neolithic populations, and the part of responsibility of the Humans and / or other accumulators (Carnivores, Rodents, natural accumulation) in the deposits and in the modifications of the surfaces bones as well as their adaptation to climate change at Dar Es Soltan I cave.

## 14 WHERE CITIZEN SCIENCE AND ARCHAEOLOGICAL SCIENCE MEET: AN INTERDISCIPLINARY APPROACH TO COASTAL SHELL MIDDENS IN COUNTY SLIGO (NW IRELAND)

**Abstract author(s):** Connolly, Rory (School of Archaeology, University College Dublin)

**Abstract format:** Oral

The role and significance of marine resource use has been the focus of much debate in European Neolithic studies. Although the precise nature, magnitude, and geographic extent of post-agricultural prehistoric marine exploitation in Europe is not well understood, the continued accumulation of shell middens in regions such as Sligo in the northwest of Ireland following the introduction of agriculture demonstrates noteworthy social and economic interest in littoral resources among coastal farming communities. Here, substantial oyster-dominated middens, up to 3-metres thick in places, are exposed in eroding section for hundreds of metres along the coast. In light of recent isotopic evidence which appears to show that these communities subsisted on a predominantly terrestrial diet, the deposition of these middens requires explanation. Unresolved questions remain as to whether the exploitation of coastal resources at this time represents a local and sporadic response to climate change, evidence of intermittent crop failure, or ought to be considered part of a long-term strategy to mitigate environmental constraints in remote Atlantic coastal settings.

Many of these shell midden sites are, however, vanishing due to both natural (sea-level rise, coastal erosion, increasingly frequent storm surges) and anthropogenic factors (visitor footfall, removal of shells, agricultural practices, and encroaching development). The NeoMarE project (Neolithic Marine Resource Exploitation in Atlantic Europe) aims to mitigate the loss of these valuable archives by developing a citizen science programme of participatory mapping to identify and record threatened sites. This is allowing us to isolate those sites most severely endangered and target them for radiocarbon dating, archaeological soil micromorphology, and lipid biomarker sampling for palaeoenvironmental reconstruction. The project is integrating new approaches to citizen participation in research with cutting-edge archaeological science to offer fresh evidence for critically re-evaluating competing hypotheses about Neolithic marine resource use.

## 15 PRESENTATION OF THE SURVEY PROTOCOL FOR THE COASTLINE PROJECT (COASTAL ANCIENT SICILY' LINE)

**Abstract author(s):** Forgia, Vincenza (Dipartimento Culture e Società, Università di Palermo) - Antonioli, Fabrizio (CNR, IGAG, Roma)

**Abstract format:** Oral

The peculiar paleo-geographic evolution of Sicily, the main Mediterranean island, makes it a perfect environment to study the relationship among early peopling, marine environment and coastal changes through the last millennia. One of the main issue debated from topographers and archaeologists dealing with human mobility, ancient viability and paleo environmental studies is the actual morphology of the coastline depending from relative sea level-change that deeply changed from 15 ka cal BP (-101 m), 11 ka cal BP (-56.6) and 7 ka cal BP (-10.3 m) (Lambeck et al., 2011) directly influencing palaeocostlines.

Our research aims at filling this gap, in some key sites in Sicily, offering valid variables to territorial models eventually combining archaeological survey with the actual ancient coastal morphology and the related distance from archaeological sites: all decisive factors for a precise palaeoenvironmental contextualization of the archaeological data and the reconstruction of littoral resource exploitation patterns, human occupation, and mobility patterns along the coasts.

In order to achieve our scope we have georeferenced some archeological sites along the modern coastline of Sicily with a chronology spanning from the documented early peopling of the island (~ 17 ka cal BP) to the Neolithic. Then we take into consideration morphobathymetric, lithological and sea level change (both isostatic and tectonic), in order to reconstruct the ancient coastal morphology, the distance and altitude of sites from and on the sea and, in some cases, the eventual existence of submerged archeological deposits or features at five specific case study: Grotta del Tuono and Cala del Genovese (Egadi, Trapani), Baia dell'Uzzo (San Vito Lo Capo, Trapani), Grotta dell'Arco di Capo Zafferano (Bagheria, Palermo) and Riparo del Castello (Termini Imerese, Palermo).

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Nilsson Stutz, Liv (Linnaeus University) - Mickleburgh, Hayley (Linnaeus University; Forensic Anthropology Center Texas State University) - Tarlow, Sarah (University of Leicester)

**Format:** Regular session

Research on human remains is a part of a long scientific tradition. Today museums are the custodians of extensive collections of both skeletal remains and soft tissues. In the Humanities and Social Sciences (archaeology, biological anthropology, history of medicine) research on human remains provide valuable information on the lived experience of people in the past. At the same time, reservations are made against research on the remains of people who were never able to consent. Laws and guidelines have been developed to regulate the issue, but these have for the most part been developed to handle the remains from indigenous peoples/minorities, and do not include provisions for all remains. Similarly, medical laws and regulations do not consider older remains. Researchers who work on these collections therefore find themselves in a relatively unregulated area, which risks undermining the legitimacy of the research.

With the rise of the Third Science Revolution in archaeology, museums are feeling the increased pressure to make biological specimens available for research which sometimes includes destructive analysis. At the same time, public and cultural debate about social inequality and racism has led to increased scrutiny of museums, archaeology and biological anthropology, in their handling of these remains.

This session seeks to go beyond presentations of best practices and recommendations and start to theorize the ethics of the research on human remains and their role in museums and archaeological research in a European context. Can we formulate a new ethics for the handling of human remains in archaeology that is informed by critical social theory? Can new ethical practices contribute to more sustainable collections, research and communities? We are looking for papers from across the EAA community and look forward to an intellectual discussion enriched by diverse perspectives.

## ABSTRACTS

### 1 HANDLE WITH CARE. THEORET(H)ICAL ISSUES ON HUMAN REMAINS

**Abstract author(s):** Nicolis, Franco (Archaeological Heritage Office Trento)

**Abstract format:** Oral

Human remains are polysemic objects and/or subjects, representing dead biological systems and/or parts of human complexity. Polysemic means that they spread different meanings, and therefore they also carry different interests. But they have just one value, or at least a prevailing one, their humanness, their human nature that goes beyond any other secondary interest or meaning. The legitimacy of research is out of discussion in ethical dilemmas: legitimacy is given by a law (latin *lex/legis*) or by a rule, while ethics is not driven by the law, it is the "domain of Obedience to the Unenforceable" which stands between the "domain of the Positive Law and the domain of the Absolute Freedom". On the other side ethics can only be scientific, and as such it can only be secular. Science is not faith but the continuous construction of truths: scientific truth is an act, not a fact, is a process, not a Code.

Usually the search for an ethical code for human remains is the search for behaviours to be adopted; actually what we need in the process of coding is to learn to critically choose between alternative attitudes; every ethical dilemma always ends with an ethical failure, which always implies the fall of a primary interest, but not of the primary value, that, in the case of human remains, is their humanness, a definitive ontological value which is not negotiable,

We need to move from behaviour, a simple conduct based on rules, to attitude, a style of conduct adopted by those who understand why it is right to apply those rules and share them. In this context we need to rethink basic concepts like respect and dignity of human remains: dignity is constitutive of life, and human remains are what remains of it.

### 2 CARING FOR THE DEAD: COULD ETHICAL CONSIDERATIONS FROM MEDICOLEGAL CONTEXTS HELP ELUCIDATE THE ETHICS OF RESEARCH ON ARCHAEOLOGICAL HUMAN REMAINS?

**Abstract author(s):** Nilsson Stutz, Liv (Linnaeus University) - Mickleburgh, Hayley (Department of Cultural Sciences, Linnaeus University; Forensic Anthropology Center, Texas State University)

**Abstract format:** Oral

Recent public and academic debate on the ethics of scientific research on human remains in research/teaching collections and museums provides new stimulus and important opportunities to re-examine the ethics of research on human remains and develop new ethical practices informed by diverse perspectives. In this presentation, we will explore the norms and practices of caring for the dead in case studies from the fields of forensic anthropology and

medical autopsy/thanatopraxy. We argue that the ethical considerations of forensic scientists and thanatopractors working closely with human remains are relevant to the study of archaeological human remains, and can provide valuable interdisciplinary perspectives on shared topics such as informed consent, postmortem privacy, and bodily dignity of human remains. We will explore how these concepts are defined, regulated, and handled in practice in these fields, and how the transfer of knowledge between disciplines can support the development of a strong research ethic regarding human remains.

We will also consider how the Ethics of Care theoretical framework (EoC) –which considers ethical practice to be context-bound, rather than informed by generalized and rationalist principles of what is moral– enables us to delve into the contextuality of what is considered an appropriate manner for treatment of human remains. EoC prioritizes caring over logic and reason, and centers moral action around individual relationships, thereby explicitly recognizing that ethical practice is relational and situational, and allowing distinct norms and frameworks regulating human remains in different contexts to be brought together

### 3 WHOSE ETHICS? ARCHAEOLOGISTS, THE DEAD AND THE DIFFERENT ARCHAEOLOGICAL MENTALITIES

**Abstract author(s):** Rajala, Ulla (Stockholm University)

**Abstract format:** Oral

In this paper I will return to the ethno-archaeological study I carried out in 2003 among central Italian archaeologists who were involved in funerary archaeology (Rajala 2016). In that study I interviewed 20 practitioners and used a pre-prepared set of questions to get comparable answers on questions related to different archaeological mentalities, the attitudes towards archaeological theory and method, ancestors and the dead. I compared my results to those achieved by Mary Leighton (2003; 2010) among a set of archaeologists and osteologists excavating funerary remains in Britain. One of my results was that there was a difference between the attitudes towards the dead among the British and the Italian practitioners.

Recent years have brought about sometimes heated discussions on the respectful handling of human remains in archaeology. In these discussions it is often taken as a given fact that there is a shared universal ethical code in relation to handling human remains, when it is clear that there have been and there are multiple different attitudes and beliefs. In this paper I will naturally not be questioning the need for ethical codes or respectful handling, but I am questioning the unresearched way the discussion often requires archaeologists to regard one ethical code over another.

Leighton, M. 2003. The meaning of death: the archaeologist's perspective. An unpublished BA dissertation. Department of Archaeology, University of Cambridge.

Leighton, M. 2010. Personifying Objects/Objectifying People: Handling Questions of Mortality and Materiality through the Archaeological Body. *Ethnos* 75(1): 78-101.

Rajala, U., 2016. Separating the Emotions: Archaeological Mentalities in Central Italian Funerary Archaeology. In H. Williams and M. Giles (eds.), *Archaeologists and the Dead: Mortuary Archaeology in Contemporary Society*, 68-96. Oxford.

### 4 THE NAMES OF THE DEAD: IDENTITY, INDIVIDUALISATION AND THE ETHICS OF ANONYMITY IN EXHIBITING THE DEAD BODY

**Abstract author(s):** Tarlow, Sarah (School of Archaeology and Ancient History)

**Abstract format:** Oral

One of the foundational principles of modern medical ethics is the maintenance of anonymity in the case of researching human material and in disseminating that research. This principle safeguards the privacy of living human subjects, and minimises the prejudicial effect that personal knowledge might have on the researcher. Many of the human remains displayed in museum or other institutional contexts are necessarily anonymous. However, some institutions display the remains of historically identified individuals, often famous (royalty, senior clerics, saints and celebrities) or infamous people (criminals). What are the ethical implications of exhibiting the remains of known individuals? This paper argues that human remains are situated on a continuum between person and thing. Anonymity is one of the strategies used to move the remains further towards the universal body as an object of enquiry (thing) and away from a biographied and personalised self (person). By decentering the post-colonial context in which much of the debate about the archaeological and museological treatment of human remains has taken place, I hope to tease apart some of the broader ethical issues around the power relations between the living and the dead.

### 5 CHALLENGES OF STUDYING POST-MEDIEVAL HUMAN REMAINS IN FINLAND

**Abstract author(s):** Moilanen, Ulla - Paasikivi, Sofia (University of Turku)

**Abstract format:** Oral

This paper discusses the challenges in research of Post-Medieval human remains in Finnish churches, namely in the church of Seili and the Cathedral of Turku. Both sites are located in South-Western Finland, but one is a small con-

gregational burial place, while the other includes prominent, stately graves and monuments. Due to the conflicting legislation, it is currently difficult to get permissions to study the human remains in the Turku Cathedral, and at the moment, it is unclear who can decide if and how these remains can be part of research. The questions are tied to several ethical issues as well as religious sensitivities. How does the known identity of buried individuals affect the research, and are anonymous burials and burials in prominent and less-prominent sites valued differently? Do archaeologists have a right to study these burials? On the other hand, why is there (and is there) a presumption among the non-archaeologists that research can be wrong and unethical?

## 6 ANCIENT DNA, ETHICAL PRACTICES, AND THE ROLES OF INSTITUTIONS THAT HOLD HUMAN REMAINS: SOME COMMENTS FROM A BRAZILIAN PERSPECTIVE

**Abstract author(s):** Martinez Okumura, Maria Mercedes - Raimundo, Gabriel (University of Sao Paulo)

**Abstract format:** Oral

In the last decades, studies on ancient DNA (aDNA) have been important to either propose new hypothesis or support previous models regarding human origins and dispersals. Most of the discussion regarding the ethical research made on aDNA and human remains have been on the (very important) relationship between researchers and the present-day indigenous groups and the usually observed power imbalance between them. However, we point to two relationships where such imbalance can also be observed and that have been disregarded so far. The first might involve aDNA researchers and staff in charge of the collections of human remains. Whereas in North America and Europe most museums and collections present policies on the use (including destruction) of human remains for scientific purposes, many institutions from Central and South America (including Brazil) lack personnel with such expertise. In such contexts, aDNA researchers that are striving for an ethical approach must also be involved in engaging employees of museums and collections and discuss future guidelines and ethical practices involving aDNA. The other relationship which might be unequal refers to researchers from the Global North who are interested in ancient DNA research involving human remains from developing countries. In the case of Brazil, such remains can be either curated in the country or in European museums and collections. Regardless of the location of such remains, Global North researchers should aim to establish a better dialogue with Brazilian colleagues, in order to benefit from their expertise, as well as to avoid perpetuating colonialist practices in science. Given that aDNA studies are increasing globally at an unprecedented rate, time is ripe for a discussion on how to deal with a diversity of realities and hopefully our view from the Brazilian context can contribute towards such debate.

## 7 "BUT, YOU WILL STILL SHOW THE GRAVE IN THE NEW EXHIBITION, RIGHT?"

**Abstract author(s):** Nilsson, Per (The County Museum of Östergötland)

**Abstract format:** Oral

In the 1950s, a well preserved grave from the Scandinavian Battle Axe Culture (BAC) was found in the small town of Linköping, in the southeastern part of Sweden. A man, a woman, a small child and a dog had been buried together with rich grave goods. Since then, the grave (known as Bergsgraven in Swedish) has been regarded as a prime example of a grave from the BAC. With the arrival of new scientific methods, especially DNA-analyses, the grave has also come to play an important role within the paradigm known as The Third Scientific Revolution. In recent years, new DNA-studies have shown that the individuals in the grave had genealogical connections to migrations associated with the Yamnaya-culture. The results were widely discussed by archaeologists and scientists alike, and they were also picked up by Swedish and international media.

But from a museum perspective, there is more to this story than the amazing results of new archaeological research. The grave has been exhibited in the county museum of Östergötland for almost 70 years and thousands of visitors, including several generations of school children, have been fascinated and quite often scared, by the skeletal remains. Thus, the grave has become both a symbol for the museum and a marker of local identity. The title of this paper is, in fact, one of the most common questions we've received during our work with the new permanent exhibition where the grave will once again be exhibited. In this paper, I will use the different roles and functions the grave has played since its excavation as a starting point for a discussion on research and ethics from a museological, archaeological and pedagogical perspective.

## 8 A MODERN-DAY „MEMENTO MORI” OR MANIFESTATIONS OF IGNORANCE – ARCHAEOLOGICAL HUMAN REMAINS ON DISPLAY

**Abstract author(s):** Jastrzebska, Emilia (University of Warsaw)

**Abstract format:** Oral

Excavation and research on human remains raise a considerable number of ethical questions, especially when destructive methods are employed in the analysis. My reflections on the topic, however, focus on making archaeological human remains public, which is sometimes found disrespectful and even more unethical. As a result of this perception, a lot of stress has been placed on how the display of human remains should be limited based on ethical

considerations and lack of consent of the deceased. Consequently, museums lean towards the withdrawal of human remains from exhibitions.

Curators, however, have obligations not only to museum objects, which human remains essentially are but also to the recipients of the museum's offer. Intuitively we think about not making visitors uncomfortable by the presence of a dead body in a showcase, but one should not forget about the positive impact such an encounter may have. Mortality salience (MS) is currently the main topic of terror management theory (TMT), which unfortunately more often than not proves negative effects of provoking death-related thoughts, such as aggression, derogation, or racism. However, MS has served many different purposes in the past, including, what can be compared to „anti-consumerism" in the middle ages or encouragement to live your life to the fullest in antiquity.

With death as a social event and the dead body as a social actor being practically removed from our lives, museums offer unique opportunities to look the Dead in the face. Perhaps archaeological museums then, instead of withdrawing authentic human remains from exhibitions, should change the way they interpret them to live up to the role of genuine mortality awareness agents and by applying a considerate manner of exposition take on the role of positive „memento mori" enforcers.

## 9 HUMAN REMAINS IN SWEDISH MUSEUMS. A STUDY OF PRACTICES, DECISION MAKING AND THE VALUES THAT UNDERLIE THEM

**Abstract author(s):** Nilsson Stutz, Liv (Linnaeus University)

**Abstract format:** Oral

This paper presents the preliminary results of a large-scale study of the practical handling of human remains in Swedish museums. The study maps and analyses the attitudes, rationales and arguments, implicit and explicit, informing choices made in Swedish museums curating human remains. The category "human remains" is defined broadly and includes all remains originating from the human body, including skeletal remains, cremains, mummified soft tissue, hair, nails, skin, wet specimens of bodies, body parts, organs and other human tissue, and body fluids. The study encompasses human remains from different types of collections including materials from archaeological, medical and ethnographic contexts, which results in an interdisciplinary approach to the topic. The purpose of the study is to identify conscious and unconscious value systems underlying the decision making in the care of these remains. The results are discussed drawing on a theoretical framework including a consideration of the dualistic life of the corpse, the symbolic and cultural roles of the body and its parts as both subject and object, ethics of care, and socially responsible scientific practice.

By recognizing the complexity of the challenge, the study seeks to lay a foundation for a more reflexive discussion of the ethics of handling human remains in museums, and to make an inventory of needs in museums as they face competing demands from different stakeholders.

## MORE THAN WALLS AND FENCES - THE IMPORTANCE OF SPACE AND BOUNDARIES IN SYSTEMS OF VIOLENCE AND OPPRESSION

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Theune, Claudia (University of Vienna) - Rass, Christoph - Wolff, Frank (University of Osnabrück) - Hintendorfer, Peter (University of Vienna) - Bobe, Christin (University of Osnabrück)

**Format:** Regular session

The intentional organization of physical and social space, which is also manifested in material forms, can be geared to contribute to practices of violence and oppression. This becomes clearly visible in various types of secluded spaces, from attempts to seal state borders against unwanted mobility to more confined versions of immobilization in camps, prisons, or other forms of internment.

These forms of containment include both a culture of restrictions to foster acceptance of these boundaries from legislature to public discourse, and stigmatization and defined spatial zones of material fortification. The latter contains architectures to combine maximized ability (up to impunity) for guards to act, secured confinement of persons, and limited access and visibility for outsiders. These normative, discursive and material elements are connected through sets of measures and practices to mutually secure each other. The result is a far-reaching and boundary-based stratification of both space and human agency. In other words, its exploration requires integrated interdisciplinary efforts.

This session brings together contributions on questions about how the structuring of space was (or is) used to enable and/or consolidate the exercise of physical, psychological, and symbolic violence and oppression and how it influences the social organization of space and the agency of different groups of people, for example regarding forced camps, prisons or, on a large scale, national and transnational borders. By inviting archaeological, historical, social science, remote sensing and geophysical expertise, we aim to inspire interdisciplinary exchange and to enhance the mutual understanding of different empirical and methodological approaches for the joint exploration of the meaning of space and boundaries in systems of oppression and violence.

**1 NEAR-SURFACE GEOPHYSICS FOR THE NON-INVASIVE LARGE-SCALE INVESTIGATION OF SITES OF VIOLENCE**

**Abstract author(s):** Bobe, Christin (Osnabrück University)

**Abstract format:** Oral

Excavating is an established method in archaeological investigations. However, excavations are usually time consuming and may destroy archaeological sites. For a few decades, near-surface geophysical methods have been successfully applied in archaeological investigations as an indirect, non-invasive alternative or complementary to excavations. Geophysical methods are relatively fast in execution, especially with the nowadays available simultaneous measurement of positioning using GNSS antennas with real-time kinematic correction, and motorized platforms for the measuring equipment.

Recently, geophysical methods were applied to archaeological sites of violence, for example battlefields, labour camps, and war cemeteries. Considering the size of such sites, the survey speed due to both real-time positioning and motorized surveying is particularly beneficial. In this contribution, we present applications focusing on electric, magnetic and electromagnetic geophysical methods. We will put a particular focus on setting up a field survey and we will compare efficiencies of different set-ups for surveying violence landscapes. Additionally, we will outline the usefulness of geophysical methods with respect to various targets and different geological contexts. We will show examples from literature as well as from our own work.

**2 LAYOUT AND CAMP STRUCTURE OF NATIONALSOCIALIST CAMPS**

**Abstract author(s):** Theune, Claudia (University of Vienna)

**Abstract format:** Oral

People imprisoned in camps are permanently exposed to physical, psychological and symbolic violence. This also happens through the structuring of the space; for example the structural arrangement and architectural construction. It can often be seen that camps located closer to central places have a different structural substance and appearance than camps located in more marginal regions. In the lecture I will focus on the camps of the National Socialist dictatorship.

So-called early concentration camps used already existing buildings. It was not until 1936 that new camps were built. It can be seen that most of the camps have a closed rectangular ground plan, while there are also a few panopticum-like camps (for example in the former concentration camp Sachsenhausen). The layout of other camps seems to be rather irregular. In addition, building materials vary. A massive stone architecture stands next to simpler wooden structures. Also different types of fencings occur.

The paper will compare the camp architecture of the National Socialist camps. Different aspects will be considered. These refer to the different types of camps (extermination sites/camps, concentration camps, forced labor camps, etc.), to the geographical location within central or more marginal areas, as well as to different time periods of the National Socialist dictatorship (1933 - 1936 / 1936/38 - 1942 / 1943-1945).

**3 VIEWSHEDS, BORDERS, ACCESSIBILITIES - THE SPATIAL STRUCTURING OF NATIONAL-SOCIALIST FORCED CAMPS ILLUSTRATED BY THE EXAMPLE OF THE CONCENTRATION CAMP MAUTHAUSEN**

**Abstract author(s):** Hinterndorfer, Peter (Universität Wien)

**Abstract format:** Oral

One of the primary functions of Nazi forced camps was to intern specific groups of people within an area surrounded by walls and fences and to isolate them from the outside world. These camps were subdivided by further fences, walls, ditches, ramparts, doors, and gates, forming a complex system of areas with different accessibilities, and serving different purposes. The spatial differentiation included the separated accommodation of the various categories of internees under hierarchically graded survival conditions as well as areas dedicated to administration, storage, or workshops. Furthermore, infrastructure associated with the camp extended beyond the perimeter, such as the sites of forced labour, buildings used for housing and entertainment of the SS or railway connections and access roads.

This complex spatial organisation, determining the possibilities for movement and visual perception for individual groups of people in and around the camp, will be illustrated using the example of the concentration camp Mauthausen. Mapping and digitally reconstructing the camps infrastructure, the terrain and selected elements of the surroundings form the basis of the detailed analysis of viewsheds, borders and accessibilities on both an architectural micro level and a topographical macro level.

#### 4 IDEOLOGY AND SPACE ON A SITE OF TERROR: THE NS-FORCED LABOUR CAMPS ON TEMPELHOF FIELD, BERLIN

**Abstract author(s):** Misterek, Kathrin (Freie Universität Berlin)

**Abstract format:** Oral

From 1939-1945, three large forced labour camps were located on the Tempelhof Field in Berlin. Here, several thousand people from all over Europe were held in order to work for the Nazi-German armaments industry. The day-to-day life of all forced labourers was subjected to the exploitative system employed by the Nazis; their region of origin, however, further determined the experiences of the people imprisoned on the Tempelhof Field.

This racist hierarchy was reflected in the treatment by the German overseers and workers the forced labourers interacted with. It also determined their access to resources and also the living conditions in the barracks and areas of the camps the imprisoned labourers were forced to inhabit. Thus, the material space was a direct representation of an inhumane, criminal ideology. The way this space was organized impacted not only the freedom of movement of the different groups but also their living conditions within the barracks and, most probably, even the time available to the individuals within the groups of forced labourers.

In my presentation I will touch on how the material space of the forced labour camps on Tempelhof Field in Berlin a) was a physical manifestation of the Nazi-ideology, b) structured the lives of those people forced to live in it beyond a purely spatial structuring and c) how the interdisciplinary approaches of a Historical Archaeology can help to unlock areas of knowledge hitherto unknown.

#### 5 THE BORDER AS A CONFLICT LANDSCAPE: HOME, MEMORY, AND COMPETING PASTS AT THE "GREEN BELT"

**Abstract author(s):** Wolff, Frank (Osnabrück University)

**Abstract format:** Oral

In a Bundestag-debate in 2020 about the recognition of the "Green Belt" as a "National Natural Monument", the AfD-delegate Andreas Bleck conjured stories of expulsion and violence at the intra-German border. Without mentioning history, he saw a question of "Heimatkunde", a home now threatened by the ecological project of the "Green Belt". His stance was radical but by no means exceptional. The "Green Belt" is a monumental ecological project which turned the 1393km-long former "death strip" at the intra-German border into a protected biotope. It is carried out and supported by local groups, various ecological organizations and foundations, and increasingly high-level politicians. Yet, the project is also heavily contested. Officially the Thuringian State Commissioner for the Examination of the SED-Dictatorship even spoke of a new "Green Wall".

While it stands uncontested that the former intra-German border constitutes "historical ground", both parties rely on history not as a discipline, but as perception, defined by a blurred terminology of memory and home. For one side it is a "memory landscape", for the other a "Green Wall". In their difference, both views remain strongly shaped by totalitarianism theory – either by evoking fear of a once "red" and now "green" totalitarianism or by overcoming the effects of totalitarianism by "healing" landscape and nation all the same.

This paper inquires the dynamics behind this debate. It examines how the intensified talk about home and memory is an evasion of grappling with the past everyone pretends to be talking about. It approaches the "Green Belt", in all its beauty, as a showcase of the effectual emptiness of a streamlined national narrative of the meaning of division and unification. By confusing history with memory and memory with politics, the debate displays how Germany keeps struggling with its history and the results of its former division.

#### 6 ISOLATION AND SEGREGATION LANDSCAPE. THE IMPORTANCE OF SPACE AND BOUNDARIES IN THE QUARANTINE INSTITUTIONS

**Abstract author(s):** Cianciosi, Alessandra (University of Amsterdam; Stanford University)

**Abstract format:** Oral

The practice of quarantine, traditionally seen as a simple mechanism to prevent epidemics, over the centuries spread across Europe and further into the colonial worlds, becoming a recurrent issue of political and economic debate, as well as a source of abuse, still observed in the present day.

During the colonial period, this practice of enforced isolation, conceptually and as a system, serves as a lens on changing views of the labor diaspora. Indeed, between the eighteenth and nineteenth centuries, human impact on the new lands and migrations, first of enslaved people and then of indentured laborers, led to large-scale debilitating epidemics. In response, European powers often resorted to the installation of new institutions, such as quarantine stations, in most of the colonies, adhering to their way of perceiving epidemic disease and its control.

This contribution aims to present the results of the research conducted in the quarantine system established by the British Empire in the Indian Ocean colonies during the nineteenth century. The exceptional preservation of most of the

structures at some of the sites in the Mascarene Islands made it possible to conduct an archaeological survey, outlining a systematic spatial organization and functional diversification of quarters and structures within the quarantine stations. In addition, archival and material documentation attested to how medical theory and the epidemic emergency of the time influenced the design of the built environment and the functional configuration of the quarantine landscape, legitimizing the segregation of certain social groups and the unbalanced sanitary measures applied towards them.

Finally, the comparison with earlier and contemporary sites triggers a reflection on how imperial quarantine became a discriminating mechanism of biopower against unhealthy immigrant ships rather than a universal system to prevent epidemics.

## THE SOCIAL ROLE OF POTTERY AND POTTERS IN NEOLITHIC AND COPPER AGE SOCIETIES OF THE BALKANS AND CENTRAL EUROPE

**Theme: 3. The Carpathian Basin: Integration, Mobility and Diversity**

**Organisers:** Marton, Tibor - Jakucs, János (Eötvös Loránd Research Network, Research Centre for the Humanities, Institute of Archaeology) - Spataro, Michela (Department of Scientific Research, The British Museum) - Gomart, Louise (French National Centre for Scientific Research) - Kreiter, Attila (Hungarian National Museum Laboratory of Applied Natural Sciences)

**Format:** Regular session

The study of ceramic inventory is traditionally one of the key fields in research on Neolithic and Copper Age communities. The ceramic repertoire of the Balkans and Central Europe includes a great diversity of styles, which are chronologically and geographically clustered usually based on the variety of shapes and decorations. To date, however, only a few examples of analyses could be listed from the region that identifies pottery chaîne opératoire and integrates experimental- and ethnoarchaeological observations into interpretations, aiming specifically to assess the social embeddedness of pottery and the craftspeople's social identity within the social web of their community network.

The session aims to integrate researchers who approach Neolithic and Copper Age societies through pottery, either through craft- or consumption analyses. Given that we may justifiably assume that technological behaviour, style, and function were influenced by partially differing social factors, a distinction between the potential range of meanings within the social context of production and consumption is particularly important. On one hand, presentations may certainly involve statistical analysis or mapping of morphology and decorations, possibly redrawing or reinterpret static boundaries anchored by the traditional typological method. On the other hand, the incorporation of complex technological analysis of pottery is essential to understand underlying patterns in material culture production. Such analyses 'operate independently' from the conventional archaeological categories such as „culture" or „phase" and provide a more fine-grained understanding on the social relationships of craftspeople and their social role within their local or cross-cultural social networks or even throughout generations. Questions regarding the functional evaluation of vessels, their secondary use, symbolic actions, fragmentation and deposition are also crucial both in terms of everyday practices and/or conveying messages on social status. Comprehensive presentation covering all of these aspects are also welcome.

### ABSTRACTS

#### 1 SCIENTIFIC APPROACHES TO THE ANALYSIS AND UNDERSTANDING OF PREHISTORIC POTTERY: OPPORTUNITIES AND LIMITATIONS

**Abstract author(s):** Spataro, Michela (British Museum)

**Abstract format:** Oral

Prehistoric ceramic assemblages have long been the object of stylistic and morphometric research, often in order to develop cultural and chronological taxonomies, rather than to understand the production or use of the pots themselves. In recent decades, however, archaeometric analyses of pots and their contents have become increasingly popular. Organic residue analyses, using microscopic, isotopic and biomolecular techniques, address pottery function. Techniques commonly used in earth sciences, such as petrography and geochemistry, instead support research on where and how pottery was made.

Recording the chaîne opératoire, and recognising the exchange of artefacts or ideas, help us to address a variety of deeper questions, from cultural identity, cultural transmission and hybridisation, innovation and change, and the role of the potters in prehistoric societies. Increasing technical complexity in pottery production, including raw material selection, implies increasing investment in training and equipment, which would generally coincide with increasing social differentiation and craft specialisation. More expedient technological choices, by contrast, would normally coincide with decreasing social and economic complexity.

In this paper, a variety of case-studies, e.g. early ceramics made in south-eastern Europe, early specialised pottery production in the Middle East, hunter-gatherers ceramics in the Baltic, imports of imitation vessels to Sudan, will be used to discuss the possibilities of an ideal approach, and the limits and the inherent limitations of working with archaeological ceramics.

## 2 **BLACK IS ALWAYS IN FASHION: EARLY PRODUCTION OF DARK BURNISHED WARE IN THE NEOLITHIC OF UPPER THRACE**

**Abstract author(s): Tsurev, Atanas (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences)**

**Abstract format: Oral**

This paper will re-evaluate the diagnostic significance of the Dark Burnished Ware (DBW) in the Thracian early Neolithic (first half of the 6th millennium BC). It focuses on the dark surface burnished ware produced in the southeast of Thrace and particularly in the Middle Maritsa Valley. There is a noticeable difference between the dark surface ware produced in the different parts of Upper Thrace. In the west and north parts of the region, it is characterized by dark brown and dark grayish surfaces respectively and by conservative non-painted decoration techniques. The assemblages in the Middle Maritsa Valley include mostly black burnished ware whereas the black-brown and dark brown burnished surfaces appear only occasionally. Multiple decoration techniques were used in the latter part of Thrace, some of which can only be associated with the DBW. It is important to note that the DBW production in the Middle Maritsa Valley in amounts close to or even greater than the red slipped ware has been attested since the very beginning of the Neolithic, which contradicts the currently accepted theory. The role of the Maritsa Valley as a communication route is of particular interest in regards to the origins and distribution of the DBW production, as it most probably facilitated the early contacts between Upper Thrace and the neighboring areas to the south.

## 3 **CHANGES IN THE TECHNOLOGICAL PROCESS OF POTTERY PRODUCTION. THE CASE OF STARČEVO-CRIȘ POTTERY FROM OARDA-LIMBA DE JOS (ROMANIA)**

**Abstract author(s): Tudorie, Anamaria - Ciută, Marius (Lucian Blaga University of Sibiu)**

**Abstract format: Oral**

During the archaeological rescue excavations occasioned by the construction of the Lot no. 1 of the Highway no. 10, Sebes-Turda (Romania), undertaken between 2017 and 2018, on the site of Limba-Oarda de Jos (Alba County), a dwelling belonging to Starčevo-Criș culture was discovered.

The ceramic materials identified here were macroscopically analysed, considering three aspects: the fabrication methods analysis (which included framings for category, identifying the exterior and interior colour, the temper used for producing the pottery, the analysis of surface treatment and firing), the typological analysis and ornamentation.

The results of our investigation, correlated with older discoveries, clearly indicated the fact that the technology of fabrication developed by the Starčevo-Criș, III B community from Limba-Oarda de Jos presented some noticeable changes, comparative with what it is known as being specific for this moment of evolution in the Early Neolithic period. Also, the technological and statistical analysis provided new information on the complex processes specific to the final phases of the Early Neolithic and the transition to the Middle Neolithic.

## 4 **A STARČEVO POTTING KOINE: INVESTIGATING POTTING CHOICES AND PRACTICES AT SVINJARIČKA ČUKA**

**Abstract author(s): Burke, Clare (Austrian Archaeological Institute)**

**Abstract format: Oral**

In the early years of Neolithic research, Starčevo pottery assemblages were traditionally used to denote cultural boundaries based on the striking degree of similarity between forms and decorative styles at different sites. Within the last 10-20 years increased investigation of raw materials and the technology used to produce a number Starčevo assemblages, has begun to uncover an interesting mix of shared and nuanced techniques used to make Starčevo pottery, suggestive of different technological trajectories and adaptations operating within an overarching Starčevo koine.

To add to this growing body of data this paper will present results of raw materials and technological analysis of Starčevo pottery from Svinjarička Čuka in Serbian with a brief comment on potential pottery use. Through the combination of macroscopic and lab-based methods, it has been possible to identify a narrow range of raw materials and different techniques used to make pottery at the site which suggest the presence of multiple practices and learnt ways of doing within particular elements of the chaîne opératoire, alongside evidence for a range of pottery uses. That said, it is clear that these choices lie within shared technological concepts around suitable base clays, and consumption choices related to what pottery should look like and potentially how it could be used, that fit well with other Starčevo assemblages.

## 5 POTTERY PRODUCTION AT VIROVITICA-BREKINJA AND THE DYNAMICS OF TRANSFORMATIONS IN THE 6TH MILLENNIUM CAL BC DRAVA REGION

**Abstract author(s):** Botić, Katarina (Institute of Archaeology, Zagreb) - Oross, Krisztián (Institute of Archaeology, Research Centre for the Humanities, ELRN, Budapest) - Balen, Jacqueline (Archaeological Museum in Zagreb)

**Abstract format:** Oral

Traditionally, the earliest Neolithic pottery production along the Drava river is classified as part of the great Early Neolithic realm of south-east Europe, namely the Starčevo culture. However, only a handful of sites were excavated to some extent, and very little data have been published. Recent research suggests profound changes in the material culture of settlements following this initial Neolithic development. Transformations are particularly spectacular in pottery production, both in style and morphology, as well as concerning technology.

Our beliefs on spatio-temporal patterns of canonized 6th millennium cal BC pottery styles (Starčevo, Vinča, Ražišće, LBK) became more fluid as a consequence of current achievements. Hence, a comprehensive analysis of the related cultural processes cannot be performed without an accurate regional-scale absolute chronology. Some Croatian sites have been dated with AMS measurements recently, and the results of extended dating programmes in neighbouring southern Transdanubia can also serve as a comparable chronological framework. Nonetheless, the number of available data sets is still very limited for decisive contributions to issues such as cultural dynamics and large-scale developments. Particular focus of the research is the period broadly between 5500 and 5300 cal BC, more precisely around 5400 cal BC and during the subsequent two to four human generations.

The paper provides a site-based analysis of the Virovitica-Brekinja assemblage and a regional survey of mid-6th millennium cal BC transformations in pottery production. Regarding absolute chronology, it aims to discuss the current state of research, weaknesses and perspectives in a larger area that encompasses continental Croatia and the western Carpathian basin. The proposed complex, multi-scale approach is essential for any future model building on the emergence and spread of new practices and their impacts towards and from central Europe.

## 6 TRANSFORMING TRADITIONS: AN INTEGRATED MULTIDISCIPLINARY RESEARCH PROJECT ON POTTERY PRACTICES OF 6TH MILLENNIUM CAL BC EASTERN TRANSDANUBIA

**Abstract author(s):** Marón, Tibor (Institute of Archeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Kreiter, Attila (Hungarian National Museum, Laboratory of Applied Natural Sciences) - Oross, Krisztián (Institute of Archeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Gomart, Louise (Centre National de la Recherche Scientifique) - M. Virág, Zsuzsanna (Budapest History Museum) - Füzesi, András (Hungarian National Museum) - Pető, Ákos (Szent István University, Department of Nature Conservation & Landscape Ecology) - Gorlva, Gergely (Hungarian National Museum) - Gucsi, László - Jakucs, János (Institute of Archeology, Research Centre for the Humanities, Eötvös Loránd Research Network)

**Abstract format:** Oral

Southern Transdanubia served as the westernmost distribution of Southeast European type Early Neolithic (Starčevo culture) during the early 6th millennium cal BC. Following the initial Neolithic development, diverse networks of various archaeological groups or "cultures" both with Southeast and Central European ties emerged from about 5350 cal BC. The Danube region in Eastern Transdanubia proved to be a particularly active zone of interactions. Our research in Southeast Transdanubia over the past decade has revealed a high degree of entanglement between these groups at least in terms of their pottery practice. Considering many further technological aspects of potting tradition, concepts on sharp boundaries between these "archaeological cultures" must be completely re-evaluated. Our research project focuses on key sites of the Danube region in Eastern Transdanubia between the Drava river and the Danube Bend, which have been intensively investigated during the last ten years. We addresses issues of pottery manufacture and consumption from three main aspects. The first involves the the classification of different combinations of ceramic forms and elements of decorations based on their spatial and chronological distribution. The second is a multidisciplinary study of the technology. The technology is assessed within the framework of a complex system, the "technological style", which includes aspects of raw material selection, tempering, the structure, surface treatment and firing methods. The third is the functional study of pottery, both in terms of practical usage and in terms of pottery as an expression of social roles. The integrated analysis of the main aspects of pottery production and consumption provides a potential for reconstructing the entire chaîne opératoire of pottery production and at the same time, offering new avenues in the interpretation of ceramic assemblages as a means of reconstructing social and cultural mechanisms.

7

## **(DON'T) LET IT FADE: PERSISTENT TRADITION AND CHANGING STRATEGIES OF CERAMIC PRODUCTION AMONG THE POST-STARČEVO COMMUNITIES IN SOUTH-EASTERN TRANSDANUBIA**

**Abstract author(s):** Jakucs, Janos - Marton, Tibor - Oross, Krisztián (Institute of Archeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Kreiter, Attila (Hungarian National Museum, Laboratory for Applied Research)

**Abstract format:** Oral

The earliest settlements of first pottery producing communities, attributed to the Starčevo culture, appeared in South-Eastern Transdanubia from the first half of the 6th millennium cal BC and persisted until about 5500 cal BC. In the subsequent stage of neolithization, a number of longhouse settlements characterized by early Vinča, Ražiste and early LBK-style pottery manufacture have been established around 5350 cal BC. The period between 5500 cal BC and 5350 cal BC remains enigmatic in most of western Hungary, leaving intriguing questions regarding the issues of cultural transmission and population continuity. Results published in recent years have provided a detailed picture on several aspects of ceramic technology as well as the practical use of pottery among the Starčevo communities from the wider area of its distribution. Nevertheless, research into the pottery technologies that unfolded later remained more sporadic. Our research project in South-Eastern Transdanubia, focusing on sites with well documented settlement structure and robust absolute chronological background, carried out integrated multidisciplinary analyses on the entire spectrum of the region's pottery traditions flourished during the second half of the 6th millennium cal BC. The main results of the project are to be highlighted through the pottery analysis conducted on the assemblages from the Alsónyék, Tolna-Mözs, Balatonszárszó and Szederkény sites. Our presentation seeks to show how tradition of pottery crafting and use linger on among the region's post-Starčevo communities, otherwise characterized by highly varied pottery styles. Furthermore, how new elements had been incorporated into the chaîne opératoire after the mid-54th century cal BC and what they are exactly? Moreover, looking at the increasing diversity of technological choices they made, we also put questions of how the social network of craftspeople reshaped at the time of formation the first longhouse settlements.

8

## **ANALYZING POTTERY USE-ALTERATION TRACES ON 6TH MILLENNIUM CAL BC CERAMIC ASSEMBLAGES FROM SOUTH-EASTERN TRANSDANUBIA**

**Abstract author(s):** Gucsi, László - Jakucs, János - Marton, Tibor (Institute of Archeology, Research Centre for the Humanities, Eötvös Loránd Research Network)

**Abstract format:** Oral

The last decades of large scale preventive excavations on account of motor-way constructions provided new opportunities to study many archeological subjects much deeper as previously was possible. As a result of this new boom of available information, the research of the Neolithic communities of South-Eastern Transdanubia also went through significant changes. Studies on settlement strategy, absolute chronology and more traditional classification of pottery styles set the basic framework for our understanding of the Neolithic societies in the region. Now we aim to focus on smaller details for inferring past human behavior and environmental conditions. 6th millennium cal BC ceramic assemblages of South-East Transdanubia have already been analyzed from a variety of aspects, however, traces of use-alteration are among the less studied. To move forward in this subject we analyzed large quantities of ceramics from key sites of the region, as part of the Transforming Traditions project. Our analysis aimed to answer questions such as: Is certain use-wear traces significantly occurring on certain vessel types? If yes, then what is the reason for it? Can special functions be identified in correlation to vessel types? What kind of recurring traces on the ceramics indicate repairs, intentional damage, secondary usage? What is the distribution of certain traces in the level of sites and on the region's pottery finds?

The aim of this presentation is an overview on our recent analysis of Neolithic pottery fragments with use traces, getting more insight into the complex nature of ceramic function and socioeconomic status.

9

## **TRACING THE PROVENANCE OF THE EARLIEST POTTERY WITH SR AND ND ISOTOPES**

**Abstract author(s):** Tóth, Péter (Masaryk University) - Pokutta, Dalia (Masaryk University; University of Stockholm) - Zack, Thomas (University of Gothenburg) - Belka, Zdzislaw (Adam Mickiewicz University) - Peřík, Jan (Masaryk University) - Bickle, Penny (University of York) - Slavíček, Karel - Adameková, Katarína - Petr, Libor (Masaryk University)

**Abstract format:** Oral

The essential components needed for creating a ceramic vessel are clay, water, and temper. Based on ethnographic studies, clay and temper sources are usually located no more than 20-100 minutes of walking distance from the site of creation, but was this the case in Prehistory? Our preliminary results within the NEOPOT project have shown that the first pottery in the northern parts of the Pannonian Basin appeared in the hunter-gatherers' context around 5600 cal BC followed by the pottery of the first farmers around 5500 cal BC. However, the pottery from both traditions sharply differs in terms of production technology. The origin of the pottery is usually studied through the traditional approach,

evaluating the vessel shape, decoration, or manufacturing process. This paper will demonstrate a different approach using stable isotope analysis to trace the provenance of the earliest pottery in Slovakia. Several studies have shown a successful application of  $^{87}\text{Sr}/^{86}\text{Sr}$  in solving problems of the provenance of various archaeological materials. Our approach is multiproxy, using radiogenic isotopes of strontium ( $^{87}\text{Sr}/^{86}\text{Sr}$ ) and neodymium ( $^{143}\text{Nd}/^{144}\text{Nd}$ ). The combination of two isotope systems enables us to pinpoint more precisely the origin of the earliest pottery and shed new light on the social networks during the process of Neolithisation. The work is supported by the Grant Agency of the Czech Republic under contract No. GA20-19542S (Tracing the Neolithic transition through the first pottery; NEOPOT project).

## 10 RICH OR POOR? THOUGHTS AND ANALYSES ON THE SOCIAL ROLE OF POTTERS IN NEOLITHIC AND CHALCOLITHIC SOCIETIES OF SOUTH-EASTERN EUROPE

**Abstract author(s):** Hofmann, Robert (Kiel University; CRC 1266: "Scales of Transformation - Human-Environmental Interaction in Prehistoric and Archaic Societies")

**Abstract format:** Oral

In medieval, early modern and recent local communities, pottery producers often (but not always) belonged to the poorer segments of the population, whose workshops were frequently peripherally located in settlements due to fire safety reasons, among other things. Based on case studies from South Eastern Europe, the paper aims to explore the question of the social role of potters in Neolithic and Chalcolithic societies. Sources of the study are pottery assemblages from Late Neolithic settlements in central Bosnia (Okolište) and Vojvodina (Borđoš) and a pottery workshops including pottery remains in Copper Age Tripolye settlements in central Ukraine (e. g. Maidanetske). Based on the quantification of the production remains and the contextual investigation (e.g. mapping) of stylistic and technological aspects in ceramic assemblages and workshops, the attempt is made to understand the organisation of pottery production, to estimate the intensity of production and the degree of professional specialisation and – deduced from this – the social role of potters in these communities.

## 11 CREATING TRADITIONS: THE EARLY TISZA POTTERY STYLE AND PRACTICE IN ÖCSÖD-KOVÁSHALOM (5200-4800 BC, EAST-HUNGARY)

**Abstract author(s):** Füzesi, András (Hungarian National Museum / Magyar Nemzeti Múzeum) - Bajnok, Katalin (Eötvös Loránd Research Network, Centre for Energy Research) - Raczky, Pál (Eötvös Loránd University, Institute of Archaeological Sciences)

**Abstract format:** Oral

The Late Neolithic settlement complex of Öcsöd-Kováshalom along the lower course of the Körös River is one of the most important sites of prehistoric research in Hungary. The excavations carried out between 1983-87 discovered a settlement structure characterised by remains of burnt houses and recovered a large quantity of ceramics. Recent fieldwork since 2018 has revealed a macro-structure in the 40-hectare settlement. The large triple ditch system confirmed the character of the settlement as a micro-regional centre and linked it to a series of settlements also characterised by burnt houses and large ditch systems, as well as by the ceramics of the Tisza culture.

The processing of the ceramic assemblage excavated in the 1980s has started in 2016. In addition to the formal and stylistic analysis of the ceramics, functional and technological evaluation of the pottery is also being carried out. Each of the observed steps in ceramic forming has been placed into a chaîne opératoire according to major technical and typological categories. Representative samples based on functional-stylistic groups have been selected and sampled for thin section ceramic petrographic analysis. Furthermore, local clayey raw materials from around the site have been collected and then thin-sectioned for comparative studies. The composition of the applied surface decoration has also been examined by spectroscopic methods.

The absolute chronological data available for the site date the chronological position of the assemblage to the Late Szakálhát – Early Tisza culture. Thus, our multi-proxy study of the pottery shows the emergence of the Tisza ceramic traditions. Based on our overview of the settlement, the results suggest that the community of Öcsöd-Kováshalom might have been an important catalyst in this socio-cultural process.

## 12 COMPLEX VESSELS IN SIMPLE HUTS: THE FOUR-LEGGED VESSELS FROM NEOLITHIC DISPILIO, NORTH GREECE

**Abstract author(s):** Voulgari, Evangelia (School of History and Archaeology, Aristotle University of Thessaloniki) - Sofronidou, Marina (Ephorate of Antiquities of Drama) - Kotsakis, Kostas (Prehistoric Archaeology, School of History and Archaeology, Aristotle University of Thessaloniki)

**Abstract format:** Oral

In this paper, we focus on polypod vessels from the neolithic lake settlement Dispilio in Lake Kastoria. Dispilio is the first wetland site excavated in Greece and has been systematically investigated since the 1990s' by the Aristotle University of Thessaloniki. In the last three years, the participation of Aristotle University in the ERC-funded EXPLOR Project

has given the opportunity to process the data collected in previous years. In neolithic northern Greece, polypod vessels became far more frequent in the second half of the 6th millennium and were out of use by the end of the 5th millennium. Archaeological literature usually presents these vessels either as having special or ritual functions or as intended for cooking food.

In the ceramic assemblage from Dispilio, we have restored a wide range of four-legged vessels, mainly with zoomorphic characteristics. The analysis of their morphological and technological characteristics, their use-wear, and secondary use indicates that the neolithic inhabitants used them in a variety of practices. Some types were numerous, while others were few; some types had a wide geographical dispersal from the Adriatic coast to southern Greece, while others occur only in southern Albania and northern Greece. The potters from Dispilio imitated things they saw, copying them with modifications to suit local practices and needs. Because of the multi-layered diachronic development of the settlement from the mid-6th to the early 5th mil BCE, we have noticed changes in their social role, while the large corpus of the about 1600 whole pots and profiles we have restored so far, provide us the necessary framework to compare these vessels with other types of cooking and consuming forms. It provides us with the indications to suppose that the simplicity of the neolithic dwellings contradicts the complex shades of the daily lives performed inside and outside the domestic sphere.

### 13 THE RISE AND FALL OF THE GROG-TEMPERED POTTERY IN THE SOUTHERN ROMANIA DURING THE CHALCOLITHIC PERIOD (5TH MILLENNIUM BCE)

**Abstract author(s):** Opris, Vasile (Bucharest Municipality Museum)

**Abstract format:** Oral

The technology of making fired clay vessels reached the South-western Romania area with the arrival of first Neolithic communities, about 8000 years ago. Organic-tempered pottery is considered characteristic for the early pottery assemblages in most parts of South-east Europe, including Southern Romania, and recent studies improved greatly the research of this tradition, showing its wide dispersion. Grog (crushed pottery) did not appear as an intentionally used temper in the Early Neolithic of the Middle and Lower Danube Basin, or in the contemporary and adjacent cultures in the eastern Adriatic. During the second half of the 6th millennium BCE, a buffer zone was created between Danube and the Carpathians, in which innovations spread through contact and exchange following multiple communication routes: South to North, West to East and North to South. Based on scarce published information, it appears that grog-tempered pottery began to be used in the region at the end of this period, around 5200/5000 BCE. However, little is known about the origin, dispersion and intensity of this technological practice.

The aim of this paper is to trace and explain the appearance and distribution of grog tempered pottery during the 5th millennium BCE in Southern Romania, following specific objectives, such as (i.) knowing the intensity of grog-tempered pottery employed by various Boian-Gumelnița communities; (ii.) detecting the spreading model in the selected time span and geographical area; (iii.) exploring the use of grog related to vessel characteristics and possible function; (iv.) observing and explaining variability. The information from literature will be merged with new results obtained from macroscopic and archaeometric analyses on pottery assemblages from Early and Middle Chalcolithic sites from Southern Romania.

### 14 TALES OF TECHNOLOGY: AN ARCHAEOMETRIC CHARACTERIZATION OF ENEOLITHIC POTTERY FROM THE EPONYMUS ARCHAEOLOGICAL SITE "GUMELNIȚA"

**Abstract author(s):** Manea, Bogdan (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB) - Opris, Vasile (Bucharest Municipality Museum) - Dimache, Mădălina (Gumelnița Civilization Museum, Oltenița, Călărași County) - Mirea, Dragoș - Ignat, Theodor (Bucharest Municipality Museum) - Dimoffe, Daniela - Roban, Relu (Faculty of Geology and Geophysics, Department of Mineralogy, University of Bucharest) - Lazăr, Cătălin (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB)

**Abstract format:** Oral

The eponymous site of the Eneolithic Gumelnița culture is located on the left bank of the Danube in South-East Romania, nearby Oltenița in Călărași County, and was part of a larger techno-cultural complex (known as Kodjadermen-Gumelnița-Karanovo VI) that inhabited the Balkans during the second half of the 5th millennium BC. Along with the archaeological sequences which belong to the Gumelnița community and fall within the Developed Eneolithic period (ca. 4600-3800 BC), excavations here also revealed the existence of an Early Eneolithic (ca. 5000-4500 BC) level which, based on the ceramic materials and radiocarbon data, was associated with a Boian (Vidra phase) occupation.

The current paper will present the results of an archaeometric investigation performed on the ceramic materials resulting from the 2017-2021 archaeological excavations carried out at Gumelnița. By involving research methods such as X-ray fluorescence (XRF), thin section petrography, microscopic and macroscopic analysis, we will discuss the general technological characteristics of both Gumelnița and Boian pottery found in this archaeological site. The in-

formation gathered will then be correlated with the archaeological record and interpreted within a broader context of the pottery belonging to the Eneolithic period from Southern Romania.

Ultimately, these new data sets will contribute to the already available ones on Eneolithic pottery from the Balkans, thus improving the overall understanding of technological changes and traditions in a well-defined spatial-temporal framework.

This work was supported by a grant from the Ministry of Research, Innovation, and Digitisation, contract number 41PFE/30.12.2021, within PNCDI III.

## 15 **CHALCOLITHIC POTTERY AND PIGMENTS: TECHNOLOGIES, TRADITIONS AND EXCHANGES. CASE STUDY: CUCUTENI POTTERY, EASTERN ROMANIA**

**Abstract author(s):** Drob, Ana ("Alexandru Ioan Cuza" University, Interdisciplinary Research Institute, Department of Exact Sciences and Natural Sciences, Arheinvest Center, Iași) - Bolohan, Neculai ("Alexandru Ioan Cuza" University, Faculty of History, Iași) - Vasilache, Viorica ("Alexandru Ioan Cuza" University, Interdisciplinary Research Institute, Department of Exact Sciences and Natural Sciences, Arheinvest Center, Iași)

**Abstract format:** Oral

In this study was used a model of interdisciplinary ceramic analysis that provides a series of data about Chalcolithic pottery and pigments. The analyzed ceramic fragments come from several newly discovered Chalcolithic settlements from Eastern Romania. For the vessels ceramic paste, interdisciplinary methods are used to obtain more information about raw materials and production technology, inclusions, finishes, firing temperatures and functionality. This research will also focus on the red, black and white pigments used while painting the pottery of these communities. Although there are a number of contributions that have focused on studying the pigments, at the regional level the topic needs to be improved in order to correlate the data with the eastern and western contemporary variants. Moreover, the results will provide a series of data about the pigment's nature, preparation methods and sources of raw materials.

The methods used in the analysis are macroscopy (shape, color, wall thickness, firing type and inclusions type, distribution, form and sorting), optical microscopy (texture of the paste, surfaces and inclusions details), SEM-EDX (elemental composition) and  $\mu$ FT-IR (chemical compounds).

Through this study we want to contribute to the expansion and completion of the existing database with new technological information about painted ceramics from Eastern Romania. Also, we are trying to highlight the role of interdisciplinary results, that led to the identification of technological features and specific ceramic traditions, as well as aspects related to the exchange of special goods.

## 16 **UNDERLYING PATTERNS: CERAMIC TECHNICAL TRADITIONS IN THE EARLY AND MIDDLE COPPER AGE ON THE GREAT HUNGARIAN PLAIN**

**Abstract author(s):** Solnay, Eszter (Eötvös Loránd University; Université Paris 1 Panthéon-Sorbonne; CNRS - UMR 8215 Trajectoires)

**Abstract format:** Oral

The Early and Middle Copper Age (4500/4450 – 4000 cal BC) on the Great Hungarian Plain is a largely debated period, when a new technological, social, and communication system emerged, which included the first appearance of the formal cemeteries, a network of small settlements, and a more mobile lifestyle. Until recently, the entire material culture of the period was defined by three distinct, consecutive cultures; the Tiszapolgár, Bodrogkeresztúr, and Hunyadhalom cultures. However, recent studies questioned their strict chronological separation which raises numerous new issues such as the real social mechanisms of the period and their relationship with the traditional typological and stylistic data.

The present study investigates this subject with the anthropological approach of ceramic assemblages which are capable to detect social networks through the analysis of pottery fashioning. Ceramic fashioning sequences appear to be resistant to change due to the learning process when the learner observes and copies the forming gestures of the tutor which become "motor habits" after the learning process is completed. In this mechanism, the tutor and a learner are always socially related, thus this methodological approach enables to identify communities of practice sharing sets of technical traditions that are transmitted over time.

Therefore, the analysis of several Early and Middle Copper Age sites can reveal the underlying patterns in the material culture of the period beyond the traditional typological and stylistic data. The similarities or differences in the ceramic production on the analyzed sites can detect the trajectories of technical traditions, thus socially based contact networks can also be identified on the Great Hungarian Plain. Furthermore, this aids to reinterpret the static typo-chronological boundaries by revealing the hidden patterns of the social embeddedness beyond the technological and stylistic data.

## 17 A STATISTICS-BASED APPROACH TO THE FUNCTIONAL RECONSTRUCTION OF MIDDLE COPPER AGE VESSELS IN EASTERN HUNGARY

**Abstract author(s):** Hegedus, Zsuzsa (Eötvös Loránd University, Institute of Archaeological Sciences)

**Abstract format:** Oral

Prehistoric settlement archaeology frequently faces the difficulties posed by the vast and highly fragmented pottery assemblages. The examination of such materials is not only resource-consuming, but also difficult from the traditional, typological perspective. A possible solution to this problem lies in the use of statistical tools that are able to handle large amounts of data and highlight the correlations between the characteristics of thousands of vessel sherds. As the result of such analyses, several different groups of pottery can be outlined, which then, with the use of ethnoarchaeological data, can be linked to primary functional categories. These categories, although have limitations in reconstructing the full complexity of pottery use, can provide a more detailed picture of vessel usage from a mainly practical viewpoint.

Through a case study of the analysis of fragmented pottery assemblages from the Great Hungarian Plain, dating to 3900–3700 cal BC, I present how this statistics-based approach can be used for functional reconstruction. Here, it proved to be possible to distinguish three main functional categories: cooking, serving and storage vessels. With further investigations based on the results, it is feasible to better understand the internal processes of Middle Copper Age Hunyadhalom settlements through the communities' pottery use and the behaviours linked to disposal.

## 18 DOMESTIC POTTERY AS A PART OF THE EVERYDAY ACTIVITY: EVALUATING SOME LATE COPPER AGE SETTLEMENTS

**Abstract author(s):** Fábíán, Szilvia - Berente, Zoltán - Klinga, Flóra (Hungarian National Museum) - Marton, Tibor (Institute of Archaeology, Research Centre for the Humanities of Eötvös Lorand Research Network)

**Abstract format:** Oral

"The changing horizons of material culture" research project supported by the National Research Fund was developed to provide a deeper understanding of the use of space and activity areas in Late Copper Age Baden settlements. The current project analyzes domestic pottery and other material remains that form an organic part of everyday life (ceramic sets, utensils, tools) according to qualitative, quantitative and semiotic aspects, prioritizing the distribution and mutual relationships of the given find materials.

During this investigation, we assume that the assessment of the vessel sets may shed light on the size, complexity, and wealth of a given household and the community. Questions regarding the functional evaluation of vessels, their secondary use, symbolic actions, fragmentation, and deposition are also crucial both in terms of everyday practices and/or conveying messages on social status.

We attempt to infer the function of the vessels from their shape, size, and technology through statistical analyses rather than from archaeometric analysis bearing in mind the formation of archaeological contexts and wider theoretical and methodological tools.

Manufacture consists of the fashioning of a vessel for some intended function from raw materials obtained from the environment; this is followed by the utilization of the vessel for either food storage, preparation, or consumption, in some cases followed by its use for some other purposes.

Based on integrated methods, such as multivariate statistical analysis on the spatial distribution of the individual ceramic types corresponding with its quality categories, it becomes possible to interpret the patterns within each settlement from a socio-archaeological point of view.

## 19 LATE COPPER AGE POTTERY FROM SOUTH-EASTERN ALPINE REGION: A MULTIDISCIPLINARY ARCHEOMETRICAL APPROACH IN THE STUDY OF LJUBLJANA CULTURE

**Abstract author(s):** Leghissa, Elena (ZRC SAZU, Institute of Archaeology, Ljubljana) - Bernardini, Federico (University Ca'Foscari Venezia; Multidisciplinary Laboratory, The "Abdus Salam" International Centre for Theoretical Physics) - Montagnari Kokelj, Manuela (Department of Humanities, University of Trieste) - De Min, Angelo (Department of Mathematics and Geosciences, University of Trieste) - Velicogna, Matteo (Department of Land, Environment, Agriculture and Forestry, University of Padova)

**Abstract format:** Oral

The material culture of the Late Copper Age in the south-eastern Alpine region is well known in archaeological typological studies. So far, the ceramic finds have been treated mainly from a typological-chronological point of view. However, in the last ten years an international team from Italy, Slovenia and Hungary has carried out several traditional and innovative scientific analyses of a large number of samples from various sites in the Ljubljansko barje (central Slovenia) and in the Trieste Karst (NE Italy), as well as of some samples from Hungary (about 100 samples). We have used various destructive and non-destructive methods: X-ray diffraction, optical microscopy, X-ray computed microtomography and PGAA.

Our recent research focuses mainly on pottery from the middle of the third millennium BC attributed to the Ljubljana culture, which was widespread in the Ljubljansko barje and in the Adriatic region (Leghissa 2021). According to the newly-defined Ljubljana culture, it includes mainly decorated fine ceramics, on the one hand, and common ware, coarser vessels that mainly reflects contact with the Somogyvár-Vinkovci culture, on the other. The redefinition has raised many new questions, especially concerning the relationship between the individual contemporaneous pile-dwellings in the Ljubljansko barje. Through archaeometric analysis, we have tried to determine whether we can detect similarities and/or differences in pottery between the contemporary sites, especially in the manufacture of vessels and the recipes used for their preparation. Are such similarities/differences a reflection of contact and exchange, and can they also reflect the status of individual sites in this small area?

At the EAA conference, we will present the preliminary results of optical microscopy analyses. We will also consider the results of analyses conducted in other neighbouring areas that will be used to identify possible imports.

## 20 IN SEARCH OF LOST SYMBOLISM. NEW DIRECTIONS IN THE INTERPRETATION OF PREHISTORIC ANTHROPOMORPHIC VESSELS

**Abstract author(s):** Turcanu, Senica ("Moldova" National Museum Complex of Iasi Romania)

**Abstract format:** Oral

For all historical periods and in all cultures, the metaphor of the vessel as a representation of the human body is recognized and documented by numerous ethnological and anthropological references. Taking this axiomatic statement into consideration, one can say about anthropomorphic vessels that they have a dual character, with a special value. On the one hand, these are containers, on the other hand, they have a human or partially human form.

Present as early as the Neolithic and well into the Bronze Age, and spread from the Orient to Central Europe, relatively rare in all cultural areas, the anthropomorphic vessels are regarded as an important category of sacred objects. Beyond their utilitarian function, the symbolic potential embodied by their particular form had multiple avenues of meaning.

There exist several classifications, some extremely elaborate, that systematize these pieces. Some of the symbols encoded in their shapes and decorations seem to indicate a complex, superregional coded communication system, most probably employed in religious and social contexts.

In this particular scope, I will focus the core of the presentation on a species of representation of the anthropomorphic vessels that is quite particular, little noticed or – more correctly – never analyzed or discussed per se. This peculiarity is connected, in my opinion, to the existence, since the 5th-4th millennia BC, of a double-faced deity in the imaginary universe of Neolithic and Chalcolithic communities in Central and Southeastern Europe, most likely possessing attributes similar to the god Janus Bifrons of classical Roman mythology.

The hermeneutic potential embedded in these special artifacts will be highlighted both by analyzing some containers that have long been circulating in the literature, as well as some pieces that are not published yet.

---

## 273 FAIRLY FRONT-LOADING THE ARCHIVE: MOVING BEYOND FINDABLE, ACCESSIBLE AND INTEROPERABLE TO REUSE OF ARCHAEOLOGICAL DATA

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Aspoeck, Edeltraud (Austrian Centre for Digital Humanities and Cultural Heritage, Austrian Academy of Sciences) - May, Keith (Historic England) - Wright, Holly (Archaeology Data Service, Department of Archaeology, University of York)

**Format:** Regular session

Archaeologists and digital practitioners have been working for over 20 years to make archaeological data Findable and Accessible, and in the last 10 years, much has been accomplished to also make more of this data Interoperable. The advent of the FAIR Principles (<https://www.go-fair.org/fair-principles/>) in 2016 set out that data must also be Reusable. Making archaeological data Findable, Accessible and Interoperable does not necessarily mean it will be Reusable however, or available in the most reusable form.

Initiatives such as the ARIADNE infrastructure, currently funded under the Horizon 2020 programme of the EC (<https://ariadne-infrastructure.eu/>) and the SEADDA COST Action, funded by the Horizon 2020 Framework Programme of the EU (<https://www.seadda.eu/>) are working to ensure Reuse is considered equally with the rest of the FAIR Principles.

This session addresses the reuse of data in archaeology from multiple perspectives including presentations of results from the aforementioned projects along with contributions from the wider archaeological community. We invite papers that explore key questions such as:

- How can we optimise archaeological data and research interfaces for re-use?
- How can we better understand qualitative re-use of archaeological data and what facilitates new knowledge creation?

- How do we reflect differences in records of scientific data and interpretive or deductive reasoning?
- How can access to archaeological data by the wider public gain greater benefits for society?

We also invite papers illustrating the above using specific case studies or projects. These may involve the reuse of archaeological fieldwork data from excavation or post-excavation analysis and synthesis work (e.g. reuse of stratigraphic data, or related finds, environmental, or scientific dating data, either from multiple interventions on a particular site, or re-using other peoples related data from multiple sites). We are particularly interested in case studies that can discuss challenges and opportunities encountered with the reuse of such data.

## ABSTRACTS

### 1 THE URGENT NEED FOR CONSENSUS FOR FAIRY ROCK ART DATA

**Abstract author(s):** **Bofica, Natalia (Lab2PT; Unidade de Arqueologia da Universidade do Minho) - Luís, Luís (Fundação Côa Parque) - Silva2, José (Lab2PT; Fundação para a Ciência e Tecnologia)**

**Abstract format:** Oral

The Côa Valley, considered "the most important site with open-air Paleolithic rock art", was inscribed by UNESCO as a World Heritage Site in 1998. Although the rock art of the Côa Valley has been intensively studied in the last 23 years by the Archaeological Park of the Côa Valley (PAVC), the Iron Age is a chronological period where there is a greater deficit of study and knowledge.

The work we will present was developed under the RARAA project, funded by the Fundação para a Ciência e Tecnologia (FCT) "COA / OVD / 0097 / 2019- Rock Art Open Access Repository", aiming to study the Iron Age rock art of the Côa Valley and the accessibility of data in an open access repository, describing the methodology used and seeking to implement best practices for organization, recording, storage and sharing of data.

In this presentation we will give particular emphasis to the FAIR principles adopted, seeking consensus, both in the structure and in the attributes and vocabularies used, serving not only the purpose of safeguarding the data, but also its management, study and sharing. The study and interpretation of archaeological sites and rock art depend heavily on access to existing data, namely to seek parallels and cross-reference data for more comprehensive studies. Thus, we will present the RARAA project as a case study, making available in an open-access online data repository, metadata and paradata, 3D models, photos, vector drawings and maps of Iron Age rock art in the Côa valley.

### 2 WHITHER GIS? – SOME CHALLENGES OF USING AND REUSING SPATIAL DATA FROM ARCHAEOLOGICAL FIELDWORK

**Abstract author(s):** **McKeague, Peter (Historic Environment Scotland)**

**Abstract format:** Oral

Spatial data is fundamental to documenting our past, underpinning research questions and informing the decision we – and others – take in the protection and stewardship of the historic environment.

Through the INSPIRE Directive, National Agencies are required to publish metadata, view and download services for Protected Sites datasets within a European framework. In contrast to these 'curated' datasets, there is neither the mandate, nor the mechanisms to coordinate, curate and share data created through archaeological fieldwork and research. The degree of standardisation in documenting fieldwork recording and archival deposition varies considerably across Europe posing considerable challenges to the reuse of data. Both are key factors in not realising the potential of 'collated data' from multiple sources. The challenges of stewardship of the data have been highlighted through SEADDA COST Action Work Group 1, but assuming the data has reached an archive, how easy is it to retrieve that data? Earlier this year, SEADDA Work Group IV ran an online survey to evaluate the quality and usefulness of online portals for information discovery and retrieval. For spatial data, the questionnaire explored three questions

- How easy is it to find GIS data in an archive?
- Can I view and download GIS data in a portal?
- Can I find and use a View or Download service in my own system?

Informed by the survey results and through the lens of a Scottish context, this presentation will discuss some of the challenges presented in reusing GIS data from primary sources.

### 3 PEPADB: PUTTING THE FAIR PRINCIPLES INTO PRACTICE

**Abstract author(s):** Romero García, Galo - Garrido-Cordero, José Angel (Department of Prehistory and Archaeology - Universidad de Sevilla) - Odriozola, Carlos P. (Department of Prehistory and Archaeology - Universidad de Sevilla; UNIARQ - University of Lisbon)

**Abstract format:** Oral

The main interest in the publication of spatial indexed archaeological data is to offer users the possibility of querying, downloading and/or accessing them in external applications. These apps are aimed to model, analyze, display or generate new geospatial data, information and value-added resources, both in the social and economic spheres.

Given the extremely high cost of generating geographic information, the reuse of this data by users is highly expected. As the result of not complying with the FAIR EU policy, the already existing spatial indexed archaeological data are not easily accessible and therefore reusable, neither to the public, nor to the academia (Sobotkova, 2018).

PEPAdb (Prehistoric Europe's Personal Adornment) is a multidisciplinary and open research project which has materialized in an SDI (Spatial Data Infrastructure) and a web-app for the online publication of georeferenced archaeological scientific data referring to personal adornment in European Recent Prehistory. It accounts for thousands of records on Prehistoric Personal Adornment from over 900 archaeological sites on the Iberian Peninsula, giving access not only to thematic cartographies, but also to raw data and empirical data sets through an online cartographic viewer, and a database query app.

This initiative aims to comply with the FAIR principles, placing special emphasis on data reusability. Data repositories (such as Dataverse, among others) can generate a formal citation for each piece of data according to specific standards, in addition to automatically assigning the DOI (Document Object Identifier) and the so-called persistent identifiers, providing a greater accessibility to (meta)data (Wilkinson, 2016).

Referenced cites:

### 4 FAIRLY DATA, FURTHER KNOWLEDGE: THE 2ARCHIS DATABASE AND POTTERY ANALYSIS

**Abstract author(s):** Machado, Diego (Unidade de Arqueologia da Universidade do Minho; Laboratório de Paisagens, Património e Território; Fundação para a Ciência e Tecnologia) - Bofica, Natália - Fernandes, Lara - Martins, Maria Manuela - Magalhães, Fernanda - Sousa, Rui (Unidade de Arqueologia da Universidade do Minho; Laboratório de Paisagens, Património e Território)

**Abstract format:** Oral

The Archaeology Unit of the University of Minho (UAUM) has carried out systematic archaeological activities in the northern region of Portugal since 1977, which has provided a significant set of data, where we highlight the enormous collections of spoils. Since the 1990s, however, it was decided to focus on more effective instruments for the storage and management of these data, whose accumulation in physical media was unviable both because of the space it occupied and the obstacles it offered to consultation. The database has evolved over the past two decades, both in the incorporation of new modules for recording archaeological data, but also in the standardization of attributes and the vocabulary used. Currently, the 2ArchIS information system, in addition to the objective of safeguarding and internally managing the data through the various ways of visualization and obtaining quantitative and qualitative analysis of an increasingly large set of data, also aims to make its data visible and shareable by the entire community through its publication in a repository.

Thus, we propose for this work to present the results of the application of FAIR principles to the registration of data and metadata of ceramic material from archaeological excavations conducted by UAUM in very diverse contexts and chronologies, a phenomenon that is at the same time challenging, due to the technological, formal and decorative variety of the materials, however, for the same reasons, enriching from the methodological point of view. We will also present some studies carried out, where the access and interoperability of data from different excavations is fundamental to enable their cross-referencing and visualization in more comprehensive studies.

## 5 MONITORING THE CONSERVATION OF OPEN-AIR MESOLITHIC SITES USING SPATIAL DATA INFRASTRUCTURES: IMPLICATIONS FOR CULTURAL HERITAGE STUDIES

**Abstract author(s):** Gómez-Puche, Magdalena - Fernández-López de Pablo, Javier (Research Institute of Archaeology and Historic Heritage - INAPH. University of Alicante)

**Abstract format:** Oral

The integration of SDI technologies and the reuse of archaeological fieldwork data allow to assess the impact of urbanistic and infrastructure development on open-air Mesolithic site's preservation and provide precise information needed to develop CRM policies at local, regional, and national action levels.

In this paper we present two case studies located in Eastern Spain: The Mesolithic open-air sites of Casa Corona (Vilena, Alicante province) and El Collado (Oliva, Valencia Province). Both sites, were excavated in rescue operations in 2008 and 1987-1989 respectively, providing Mesolithic burials and human remains of major cultural and bioanthropological scientific significance. However, unexcavated adjacent archaeological areas of both sites have been partially destroyed afterwards.

Here, we show how the combination of accurate imagery and LIDAR elevation data provided by public (free access) data repositories, primary archaeological spatial data acquired during excavations and published information digitized, can be effectively integrated using Geographic Information Systems to monitor the impact of urbanistic and infrastructure development on both sites and perform risk assessment for future planning.

We believe this case study exemplifies the benefits of applying the FAIR principles to Mesolithic archaeological data. We hope that this example will encourage similar actions from fellow professional archaeologists and will foster efficient conservation strategies from public and private stakeholders.

## 6 PLEASE RECYCLE: ARCHAEOLOGICAL LEGACY DATA AND REUSE IN SWEDEN

**Abstract author(s):** Kaiser, Jessica - Friberg, Zanna (Uppsala University)

**Abstract format:** Oral

Archaeology is a messy business. This messiness extends from the heterogeneity of the material uncovered and the often cross-disciplinary teams of specialists who employ diverse methods to analyze them, to the destructiveness of the excavation process itself and the often unruly nature of the archives generated to preserve data that can only be collected once. In only one generation, project archives have gone from being predominantly analog to mainly digital, and deposition of reports and datasets in repositories such as ADS (UK), tDAR (US), and Forn dok/HER (Sweden) has become increasingly common.

This growing reliance on digital storage and the increase of born-digital data has prompted concerns about sustainability, initially focused mainly on stability and forward compatibility. Recently, discussion has shifted to interoperability and reuse, concluding that legacy data require an additional layer of contextual data that describes the data itself (metadata) as well as the collection process (paradata).

But what, exactly, do we mean by "re-use"? Archaeological archives are themselves as heterogeneous as the discipline from which they derive, and the re-usability of a dataset may vary depending on who is reusing it and for what purpose. Further, previous studies suggest that legacy datasets are only infrequently accessed by scholars. It may serve us well to investigate whether this truly depends on the lack of contextual data.

To better understand how archaeological legacy data is reused in practice, data was harvested from three different repositories in Sweden: research applications registered with the Swedish History Museum, download-counts of archaeological datasets and reports through the Swedish National Heritage Boards' search interface (Forn dok/Arkivsök), and web search statistics from the Swedish National Data service. Initial results suggest that the relationship between contextual data, access, and reuse is more complicated than previously thought.

## 7 SHARING AND REUSE OF OPEN AND FAIR DATA: INSIGHTS FROM THE ARIADNE SURVEYS

**Abstract author(s):** Geser, Guntram (Salzburg Research Institute)

**Abstract format:** Oral

In recent years the principles of open and FAIR data have been adopted by ever more research funders with the goal that data collected or generated by projects become publicly accessible and reuseable. In this endeavour data reuse is seen as a key indicator for a return on investment in research projects, data repositories and networking infrastructure. The impact of this expectation is increasingly felt also in the archaeological research and data management community.

This contribution to the session will focus on what is known about the sharing, access to and reuse of archaeological data from the largest available surveys of the ARIADNE data infrastructure initiative. Surveys have been carried out in 2013 and 2019 with participation of researchers, directors of research organisations and project and repository data

managers. A survey in 2021 also specifically investigated how well archaeological repositories comply with the FAIR principles.

From this rich record of surveys results concerning requirements for open and FAIR archaeological data and emerging practices will be presented, for example, identified patterns in researchers' sharing and reuse of different data resources or what would help repositories most to support open data access and reuse (e.g., in terms of policies and standards). The presentation will provide insights into the landscape of archaeological data sharing and reuse as a background for examples of specific cases.

## 8 DATA DISCOVERY AND DATA RE-USE IN ARIADNE

**Abstract author(s):** Richards, Julian (Archaeology Data Service, University of York)

**Abstract format:** Oral

The ARIADNE European research e-infrastructure has created a portal that allows interoperable resource discovery across 20 countries and over 2m digital resources. However, the portal's value is not just in finding data, as it also a powerful research tool for data visualisation in its own right. Its timeline and map-based search permit the exploration of data trends, highlighting national and regional differences in the archaeological record. Some of these relate to differences in national archaeological recording traditions, whilst others reflect real differences in the past - both are valid areas for future research. The project has now created the ARIADNE Lab, a suite of tools that allow the more advanced user to directly interrogate the ARIADNE Knowledge Base – the triplestore that underpins the portal. This paper will demonstrate how the Portal and Lab can facilitate Big Data research and data-reuse. It will also show how they can be adapted for specific sub-domains, introducing their use in the study of marine heritage.

## 9 THE ROCEEH OUT OF AFRICA DATABASE: A CASE STUDY IN REUSING ARCHAEOLOGICAL DATA SENSIBLY

**Abstract author(s):** Kandel, Andrew - Kanaeva, Zara - Sommer, Christian - Haidle, Miriam (Heidelberg Academy of Sciences and Humanities)

**Abstract format:** Oral

In this talk, we discuss our experience in aggregating archaeological data from the past 150 years into the ROCEEH Out of Africa Database (ROAD). We offer ROAD as a case study for learning how to reuse previously published information and integrating its content into a robust digital framework. By assimilating data written in many languages from sites in Africa and Eurasia spanning from three million years until 20,000 years ago, we add value and also preserve information for future generations to use and reuse. By linking ROAD with ARIADNEplus, we made the data more findable. The data are digitally accessible to scholars and the public through an open license and user interface. The data can be linked and downloaded in several formats, making them interoperable with other systems. Finally, the data have been both reused through their integration into ROAD, and are now ready to be reused by others.

To reuse the data, we first developed a method to distill the elements that we thought would be most informative based on the collective experience of our team consisting of archaeologists, paleoanthropologists, paleontologists, paleobotanists and geographers, as well as data scientists. To overcome vast differences in research traditions, we had to decide upon a least common denominator that would be available regardless of when and where data were collected and published. We also needed to harmonize the data to ensure that their entry into the database would flow smoothly. We learned to standardize data formats, wrote detailed specifications, and developed vocabularies to ensure as much consistency as possible. In the end, we discovered the perils and pitfalls of data reuse and applied what we learned in real time to optimize their entry into ROAD. Through this process, we feel that we created a database that is robust, sustainable and multidisciplinary.

## 10 DEALING WITH DIGITALLY BORN LEGACY DATA AND LESSONS FOR THE FUTURE – PROJECT URDAR AND SWEDISH CONTRACT ARCHAEOLOGY

**Abstract author(s):** Larsson, Asa (Swedish National Heritage Board) - Löwenborg, Daniel (Department of Archaeology and Ancient History, Uppsala University) - Jonsson, Maria - Nordinge, Johan (Swedish National Heritage Board) - Páls-son, Gísli (3GIMBALS) - Smith, Marcus (Swedish National Heritage Board)

**Abstract format:** Oral

Project Urdar is a collaboration between Uppsala University and the Swedish National Heritage Board. It was initiated in 2020 with the aim of ensuring that thousands of georeferenced field documentation databases are transformed from proprietary formats into open and reusable ones. Preservation is only part of the goal, as the data also needs to be made accessible and interoperable, useful for further analysis and knowledge production. Dealing with legacy data which is still only 5-20 years old has brought the team a lot of insight into the challenges facing 21st C archaeology. The professionalisation and adoption of digital methods will paradoxically result in worse preservation of knowledge from excavations undertaken in the previous centuries, unless major changes are implemented. The

challenges are only partly technical, mostly it is a question of human practice and incentive, from field archaeologists to government agencies.

We will present the ongoing work FAIRifying digitally born field documentation from Swedish contract archaeology, and the technical and human issues that have to be dealt with, as well as some uses that are possible. The data should still be considered as raw field documentation and needs to be complemented with information available in the reports. Attempting to reuse the data, and to recreate the interpretive process of the excavation serves to illustrate some of the challenges of reuse of documentation out of context.

We will also present the steps taken by the project to engage stakeholders from both public and private sectors in the process, in order to bring about wider systematic changes. We will highlight how this work will become part of the new national research infrastructure for digital archaeology – SweDigArch – which was recently approved by the Swedish Research Council.

## 11 CREATING FAIR ARCHAEOLOGICAL DATA IN NORWAY

**Abstract author(s):** Uleberg, Espen (Museum of Cultural History University of Oslo) - Ore, Christian-Emil (Department of Linguistics and Scandinavian Studies, University of Oslo) - Dell'Unto, Nicolo (Museum of Cultural History, University of Oslo) - Callieri, Marco (Institute of Science and Technologies of Information - National Research Council) - Matsumoto, Mieko - Bonelli, Letizia - Kimball, Justin - Pantos, Alexis - Kristensen, Steinar - Samdal, Magne (Museum of Cultural History, University of Oslo)

**Abstract format:** Oral

This paper presents recent achievements in creating archaeological FAIR data in Norway and making it accessible nationally and internationally. The Norwegian university museums have cooperated since the 1990s to create infrastructures for the collections and photographic archives. The latest infrastructure project is ADED (Archaeological Digital Excavation Documentation).

The ADED project has created a national infrastructure for detailed archaeological excavation data. The Norwegian university museums have used 2D Intrasis for field documentation since 2011. ADED has converted these projects to Postgres and published them at [aded.unimus.no](http://aded.unimus.no) with artefacts and photo documentation from each site viewable through links to the artefact database and the digital photo archive. This repository is mapped to CIDOC-CRM to facilitate integration into ARIADNEplus.

Data can be queried, accessed and downloaded from any individual project, as well as across multiple projects.

The ADED website has links to [kulturminnesok.no](http://kulturminnesok.no) — the public version of the National Heritage and Environment Register, Askeladden — and will also have links to excavation reports archived at the university museums.

ADED has made years of archaeological results available for researchers and the general public, and the open publishing contributes to a democratisation of knowledge through a single website that gives access to measurements, photo documentation, and artefacts from all excavations undertaken in Norway over the last 10 years.

A future extension of ADED will be the integration of 3D data. KHM and the other Norwegian university museums will use more 3D documentation of excavations. KHM addresses this through BltFROST, where one of the goals is to refine methodology and encourage re-use. To achieve this, we have chosen to use 3DHOP to give online access to the 3D models. The BltFROST interface, built on 3DHOP, enables annotation and sharing of models, thus facilitating the active exchange of ideas in research, teaching and outreach.

## 12 DATA FRAGMENTATION, COMPLEXITY, AND THE CASE OF SWEDISH ARCHAEOLOGY IN THE MEDITERRANEAN. THE COMMON GROUNDS PROJECT

**Abstract author(s):** Nenova, Denitsa (Norwegian Institute at Athens; Takin.solutions) - Bruseker, George (Takin.solutions) - Wallenstein, Jenny (Swedish Institute at Athens) - Hansson, Ulf (Swedish Institute in Rome) - Frejman, Axel (Uppsala University)

**Abstract format:** Oral

In contemporary archaeological practice, archaeological data suffers from three main conditions: 1. the accumulation of vast amounts of data, 2. considerable fragmentation of data, and 3. the fast technological progress resulting in a constant need of new or upgraded data solutions to ensure sustainability and accessibility. Moreover, as data multiplies, so does data complexity. As a result, rather than a growing network of connected knowledge, researchers are faced with a growing set of disconnected data pools.

The 'Common Grounds' semantic data project aims to bring together tested work in semantic data representation of archaeological datasets for providing a consistent conceptual model and create an integrated semantic data management platform for the Swedish Research Institutes in Rome, Athens, and Istanbul. Given a number of base datasets the data will be transformed using CIDOC-CRM ontological framework and loaded into an instance of the open source platform 'Arches'. The datasets will thus be accessible and open for research to data owners and their collaborators from different locations in the world. Initially inter-institutional, this will allow the potential connection

with external data sources in the future. The semantic nature of the transformed data will ensure its sustainability and independence from a specific data platform for decades to come and will facilitate not only the integration of other relevant datasets but also the creation of semantically-born data.

### 13 ARGENTINIAN DIGITAL ARCHAEOLOGICAL DATA GOING FAIR. OPPORTUNITIES, STRENGTHS AND CHALLENGES FOR THE REUSE OF INFORMATION AVAILABLE IN OPEN ACCESS

**Abstract author(s):** Izeta, Andres - Cattáneo, Roxana (CONICET; Universidad Nacional de Córdoba)

**Abstract format:** Oral

Argentina's national archaeological data is public information. However, its access is unequal, as much information remains in analogue format. Considering this context, since 2010 we have been working on the digitization of various types of archaeological information to allow a more democratic access to the data such as published material to raw data. In this context, the FAIR, TRUST and CARE principles are of vital importance as a framework for an ethical and democratic management of information. The Suquía Repository and the IDACORDIG platform, dedicated to the custody of digital information of archaeological origin, as the oldest repository dedicated to archaeological data, have incorporated several tools that allow the use and re-use of the information deposited there. The principal products on the repository are the database of archaeological sites of the Province of Córdoba (BADACOR) and a virtual library that compiles over 6000 objects (published and grey literature) generated from the 1880s to the present (BIBARQARG). BADACOR is the most comprehensive curated tool since it has standardized its metadata and allows linking the information of each archaeological site to the publications and databases available in the Repository and with IDACORDIG. The BIBARQARG database provides not only links and full text files in open access format but also provides a set of metadata that allows better information retrieval. The latter has been carried out as an action by the Argentine Digital Archeology Network. In short, standardizing data and metadata, adding a greater number of descriptors to each digital object, attaching a set of para-data in each case, and monitoring the metrics of visits and use of the information becomes an important asset to guarantee a FAIR use of archaeological data on a national scale.

### 14 THE MATRIX: CONNECTING AND RE-USING DIGITAL RECORDS OF ARCHAEOLOGICAL INVESTIGATIONS

**Abstract author(s):** May, Keith (Historic England; University of South Wales) - Taylor, James (University of York) - Binding, Ceri (University of South Wales)

**Abstract format:** Oral

Stratigraphic laws, principles (Harris 1989), and data underpin the archaeological records from excavated sites and are essential for integrated analysis, wider synthesis and accessible digital archiving of the growing body of archaeological data and reports generated through the commercial archaeological sector in the UK and internationally. On most excavated sites, the stratigraphic record, commonly visualized and to a degree quantifiable, in the form of a stratigraphic matrix, acts as the primary piece of evidence for how, and in what order, the site was excavated. As such the stratigraphic record is the key mechanism that enables anyone less familiar with the site, to re-visit the excavation records, understand what data is most relevant and re-usable for any research questions, or problems encountered, and piece together the underlying details of how the interpretations by the excavator(s) were arrived at. However, such primary records are often only held on paper or scanned copies of matrix diagrams that cannot easily be re-used with associated data. Often the key phasing data needed for re-use in synthesis work and interpretive understanding, let alone Bayesian Chronological modelling of scientific dating evidence, is not consistently documented, if at all, in archives. This results in key records being unsearchable or remaining unconnected, unused, and lacking interoperability with other data (unFAIR).

The focus of digital archives and museums is switching from simply providing better access to digital archives, to how users in commercial units, curatorial organizations and academia, along with the wider public, can make best use of this growing body of digital information and data.

This paper will discuss the re-use issues and present latest work undertaken by The Matrix project [AH/T002093/1] to address some of the current problems caused by the lack of standardized approaches to analysis and digital archives of archaeological stratigraphic and phasing data.

- 15 IMPROVING THE REUSABILITY OF RELATIVE AND ABSOLUTE CHRONOLOGICAL INFORMATION BY AUTOMATING AND ARCHIVING THE BAYESIAN CHRONOLOGY CONSTRUCTION PROCESS**
- Abstract author(s):** Moody, Bryony - Buck, Caitlin (University of Sheffield) - Wright, Holly (Archaeology Data Service) - Dye, Thomas (University of Honolulu) - May, Keith (Historic England)
- Abstract format:** Oral
- Archaeological excavations produce a wealth of data. Due to the unrepeatable nature of this fieldwork, once the site is fully excavated, digital records must be archived in a manner that best facilitates reuse. However, in our experience, despite the best efforts of digital repositories such as ADS, archiving data does not ensure reusability. In this talk, we discuss attempts to reuse data for chronological modelling. We focus on three case studies where the user wished to reuse digital chronological data and ran into problems.
- Following this, we will outline a prototype software we are developing for handling the relative and absolute dating evidence. This software focuses on evidence obtained during single context excavations, as carried out in many European countries such as the UK. This software uses mathematical graph theory to manage stratigraphic and chronological information during Bayesian chronology construction.
- We provide an overview of the process that the software follows. Following this, we will focus on managing data during this process. Such management includes: at which points in the process we save data from the software; what format should our data be in; and which data to archive. Finally, we provide recommendations specific to chronological data that seek to improve the reusability of such data for future users.
- 16 BRINGING EXCAVATION DATA TOGETHER. ARE WE THERE YET AND WHERE IS THAT?**
- Abstract author(s):** Nenova, Denitsa (Takin.solutions Ltd.; Norwegian Institute at Athens) - Bruseker, George (Takin.solutions Ltd.) - Derudas, Paola (Lund University) - Hiebel, Gerald (University of Innsbruck) - Hivert, Florian (Centre national de la recherche scientifique - CNRS) - Katsianis, Markos (University of Patras) - Marlet, Olivier (Centre national de la recherche scientifique - CNRS) - Opitz, Rachel (University of Glasgow) - Ore, Christian-Emil - Uleberg, Espen (University of Oslo)
- Abstract format:** Oral
- Archaeological data repositories usually integrate excavation data archives as single data collections with restricted capacities to accommodate excavation data interoperability at the sub-collection level. This is largely due to the complexity of excavation data archives that are compiled with different tools and methodologies, use distinct conceptual descriptions at variable granularities, can often be unfinished or open-ended and may be linked to all sorts of digital data types, each with its own complicated production workflow. In the past decades, several attempts to adapt CIDOC-CRM in order to provide more explicit descriptions of the excavation domain have resulted in several model extensions (e.g. CRMarchaeo, CRMsc, CRMba). Each focuses on corresponding aspects of the excavation research process, while their combined usage holds an already demonstrated potential to support expressive data mappings at the sub-collection level. As part of the ongoing ARIADNEplus project, several CIDOC-CRM developers and domain experts have been working as a group and engaging in conceptual mapping exercises to address the practicalities of bringing excavation data descriptions together. In this presentation we will consider several issues that may be affecting the applicability of existing solutions and link these to our overall expectations/aspirations in terms of excavation data discoverability and reusability.
- 17 REUSE OF RESEARCH DATA FOR GIS-ANALYSES. USE CASE OF BRONZE AGE MINING IN THE LOWER INN VALLEY AND PINZGAU (AUSTRIA)**
- Abstract author(s):** Danthine, Brigit - Hiebel, Gerald - Scherer-Windisch, Manuel (University of Innsbruck)
- Abstract format:** Oral
- Within the Research Center HiMAT (History of Mining Activities in Tyrol and Adjacent Areas) different projects were conducted aiming to investigate mining activities in Tyrol and Salzburg from Prehistory to Middle Ages. Within them not only existing research data, freely available information or material from previous publications were reused, but the research data of the projects in return flowed e.g. into the ongoing project "Information Integration for Prehistoric Mining Archaeology".
- One goal of this project is to investigate more closely the regions Brixental (Tyrol) and Mitterpinzgau (Salzburg), located between the well-studied mining areas of Unterinntal and Mitterberg. One method used for this purpose are GIS-analyses, with which potential regions for unknown sites are determined based on known sites. This analysis included processed research data from previous projects, as well as various freely available geodata, such as availability of water or geographic features extracted from surface models, e.g. slope or exposure.
- The data from previous research projects come e.g. from "Open Research Data for Mining Archaeology", which objective was to process the generated research data from surveys and excavations conducted in the project "Prehistoric copper production in the Eastern and Central Alps" as FAIR [<https://www.go-fair.org/fair-principles/>] data and

integrate them into the ARIADNEplus-portal [<https://ariadne-infrastructure.eu/portal/>]. Other projects like "Text Mining Medieval Mining Texts" aimed to transcribe medieval manuscripts, annotate them and extract and model their information. The historical sites were localized by reusing old map data [e.g. <https://hik.tirol.gv.at/>], gazetteers from previous projects [<http://onomastik.at/content/flurnamendokumentation-im-bundesland-tirol>] or published works [like Pirkl (1961): *Geologie des Trias-Streifens und des Schwazer Dolomits südlich des Inn zwischen Schwaz und Wörgl* (Tirol), in: *Jahrbuch der Geologischen Bundesanstalt* 104.].

All data were interoperably processed using the event-based CIDOC CRM [<https://www.cidoc-crm.org/Version/version-7.2>] and uploaded to the LOD-cloud. Through interfaces like the Sparqling-Unicorn-plugin for QGIS [<https://github.com/sparqlunicorn/sparqlunicornGoesGIS>], this data can be specifically queried for the analyses.

## 18 MAKING OLD DATA NEW – OBSTACLES AND OPPORTUNITIES IN THE RE-USE OF DATA FOR CONSTRUCTING A BOG BUTTER DATABASE

**Abstract author(s):** O'Toole, Karen (University College Dublin)

**Abstract format:** Oral

The FAIR Principles are the foundation of data management for present-day researchers in any discipline. However, the application of these principles is relatively new and as archaeologists we often rely on data created prior to their implementation. Reusing such data poses a number of obstacles that can be time-consuming and difficult to tackle. However, particularly in the light of the COVID-19 pandemic, the reuse of data has come to the forefront as an approach researchers can use to mitigate or substitute for data that is inaccessible either temporarily or permanently. While challenges such as the interoperability, standardisation and original purpose of such data continue to exist, the opportunities presented to us by the reuse of data are becoming increasingly clear.

Using the construction of an Irish bog butter database as a case study, this presentation will explore why I chose to reuse data; the challenges associated with this; and the opportunities this has presented. It will also look at how applying modern techniques to old data can create new knowledge and revolutionise our understanding of previously poorly understood phenomena – how we can make old data new again.

## 19 WORK DIGITAL, THINK ARCHIVE, CREATE ACCESS - CREATING RESOURCES TO SUPPORT DIGITAL DATA MANAGEMENT AND ARCHIVES

**Abstract author(s):** Parker Wooding, Jen (Chartered Institute for Archaeologists) - Forster, Manda (DigVentures)

**Abstract format:** Oral

The question of how to manage digital archives has been a hot topic for archaeology for years. Digital technologies have transformed the way archaeologists work, providing innovative research tools, improving how we investigate sites and giving new life to knowledge about the past. As with all parts of an archaeological archive, digital data contributes to the long-term preservation of sites by providing key information which can be accessed by researchers and the public alike. How that information can be used in the future is an important consideration and, as innovative technologies become the norm, we must be sure that our archive processes adapt to incorporate new methods, tools, and data. FAIR Principles are central to the resource and the creation of archives which are designed with reuse in mind has been an important consideration of the project - but the development of Standards, guidance and resources only responds to part of the problem. Through a combined effort involving training and regulation, our aim at the Chartered Institute for Archaeologists (CIfA) is to support consistent implementation of good practice guidance across the archaeological sector within the UK and further afield. The Dig Digital project is an Archaeological Archives Forum (AAF) initiative which has focused on these issues for the past two years. Managed and delivered by DigVentures, in partnership with CIfA and funded by Historic England, the project concluded in February 2022 and the online resource is now available and hosted by CIfA as part of their digital Toolkit series ([www.archaeologists.net/digdigital](http://www.archaeologists.net/digdigital)).

## 20 RETAINING ROOTS WHILE HARD PRUNING DATA: CONTEXT AND COLLABORATION IN DIGITISATION AND DATA MODELLING IN SOUTH ASIA

**Abstract author(s):** Vafadari, Azadeh - Abdul Jabbar, Junaid - Khan, Afifa - C. Roberts, Rebecca - Campbell, Rosie - Gerrits, Petrus (McDonald Institute for Archaeological Research, University of Cambridge) - Gregorio, Jonas (Universitat Pompeu Fabra) - Suarez Moreno, Maria - Tomaney, Jack - A. Petrie, Cameron (McDonald Institute for Archaeological Research, University of Cambridge)

**Abstract format:** Oral

There are large numbers of published (and unpublished) archaeological sites and monuments in South Asia, but much of the available documentation is not available in a digital format, and paper publication remains the default. Information about archaeological heritage varies in detail, and there is considerable variation in how archaeological sites are documented. This paper explores the work and challenges of the Mapping Archaeological Heritage in South

Asia (MAHSA) project in digitising, modelling, re-interpreting, linking, and re-using non-digital archaeological data into a structured and standardised digital format using a common and unique controlled vocabulary, so that it may become findable, accessible, interoperable, and reusable data.

Working with partners in South Asia, the MAHSA project is compiling existing and published data (from published documents, reports, and surveys) to be published in an Open Access database (Arches platform), which can be used for research and preservation. New and previously undocumented sites identified through the analysis of historic maps, remote sensing, automated site detection methods, and field documentation will also follow the same data standards and recording methodology.

Retaining context while delivering 'cleaned' usable data is a key challenge to this type of data modelling, and the meanings of the original source and context are inevitably subject to re-interpretation during this process. The project is working collaboratively between South Asian and international stakeholders, each bringing their own expectations of data use, management, and accessibility, in addition to navigating the post-colonial space in which the project operates. To ensure usability, different use cases scenarios have been identified and are being developed with collaborators and database end-users. We argue that through linking archaeological data to their original sources and following best practices in modelling techniques, we can remain faithful to the original context while incorporating any change and enhancements where data needs to be verified and updated.

## 21 WHAT DOES USABILITY MEAN AND HOW CAN IT BE ACHIEVED? ONLINE CELTIC COINAGE (OCC) AS A CASE STUDY

**Abstract author(s):** Wigg-Wolf, David - Brand, Mirko (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts - RGK) - Deligio, Chrisowalandis (Goethe-University Frankfurt, Big Data Lab) - Hofmann, Kerstin - Möller, Markus - von Nicolai, Caroline - Tietz, Julia (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts - RGK) - Tolle, Karsten (Goethe-University Frankfurt, Big Data Lab)

**Abstract format:** Oral

The transformation from analogue to digital data is the core principle of the digital turn in the sciences and humanities. Within numismatics, this is visible in projects to digitise coin collections and publish them in online catalogues (e. g. IKMK and KENOM), or in coin find databases (e. g. AFE-RGK).

The project nomisma.org was founded to promote and support the application of LOD within numismatics, and is now firmly established internationally as the primary resource for the domain. Drawing on the vocabulary and ontology of nomisma.org, a range of web-based resources, such as OCRE for the Roman Imperial coinage, now translate individual coins from instances in collection or find databases to exemplars of standard typologies or classifications,.

However, in contrast to the coinages of much of the Graeco-Roman world, for which well established classifications exist, the lack of a single, universal classification for Celtic coinages presents a range of challenges. Instead there are a number of classifications for individual coinages and regions, many of which cannot be mutually reconciled.

To address this, the BMBF cooperative project ClaReNet is developing a nomisma-conform virtual union catalogue, Online Celtic Coinage (OCC) to provide both a human-user friendly resource and machine-readable, re-usable data for the semantic web (LOUD and FAIR). This presents not only a unique opportunity to attain interconnectivity between the disparate classifications of analogue publications, but also to incorporate contextual, in particular the archaeological information (distribution, findspot) that is essential for establishing the chronology of Celtic coinages and understanding their use.

Taking OCC as an example, this paper aims to explain how we would define LOD usability for Celtic coins and how data from different contexts of collection can be brought together in a virtual union catalogue.

## 22 A MULTIDISCIPLINARY RESEARCH PROJECT USING DIGITAL HUMANITIES FOR STUDYING ARCHAEOLOGICAL ARCHIVES: FIRST RESULTS IN PROGRESS AND OUTLOOKS

**Abstract author(s):** Tuffery, Christophe (INRAP - National Institute for Preventive Archaeological Research)

**Abstract format:** Oral

As part of an ongoing PhD since 2019 on the study of the effects of digital devices on archaeology and archaeologists' practices, particularly for field recording, we digitized field notebooks from the 1970s and 1980s from an excavation in which we participated between 1980 and 1988.

For the digital transcription of the contents of the digitized field notebooks, we have developed an application that makes it possible to place each of the contents of the notebooks in their archaeological context: excavation squares, stratigraphic units, archaeological structures, etc. But these notebooks also make it possible to reconstitute other contexts than just archaeological ones. This can be the sociological context of the excavation team, the scientific context of other archaeological sites of the same chronological period and/or geographically close by, the context of other researchers specializing in a subject and working on the site from time to time, the context of the period during which the site was carried out, etc. During the twenty years or so that this work site lasted, important upheavals

in the historical and epistemological context of archaeology occurred, notably with the appearance of personal micro-computing from the middle of the 1980s onwards and the place of preventive archaeology especially from the 1990s in France. On this site, we developed in 1985 a computer program which allowed us to record the field data from which we were able to recover the data and exploit them with recent software (GIS). The treatments that we carried out on these data make it possible to reconstitute precise illustrations of a part of the structures carried out on this building site, in particular in the form of plans of the archaeological structures found and the archaeological findings. From this example, a return of experience and perspectives are proposed.

#### **A. USING SEMANTIC MODELING TO CREATE FAIR OPEN DATA FOR ARCHAEOLOGICAL FIELD SURVEY: A SHOWCASE AND TOOLKIT (SEMAFORA)**

**Abstract author(s):** van Leusen, Martijn (Groningen Institute of Archaeology) - Bruseker, George - Nenova, Denitsa (takin.solutions) - de Haas, Tymon (Groningen Institute of Archaeology) - Siebinga, Sjoerd (Delving.eu)

**Abstract format:** Poster

This poster will present the background, aims, goals, deliverables, potential for wider applicability, and partners of the SEMAFORA project. This is a Netherlands Foundation for Scientific Research (NWO) funded Open Science project running from March 2022 to March 2023, in which survey specialists from the Groningen Institute of Archaeology will collaborate with two SME's with expertise in semantic modeling. Field surveys have, since about 1970, been the main method by which archaeologists discover and record findspots and individual finds at the earth's surface. Whilst for the Mediterranean area alone the documented finds already run in the millions, the lack of documentation standards effectively prevents researchers and heritage managers from conducting large-scale analyses. The SEMAFORA project seeks to build and showcase a software toolkit that will allow them to share and query this fundamental and irreplaceable resource in a distributed, online form, taking advantage of existing work in semantic data modelling in the cultural heritage sector.

#### **B. REUSING FIELD SURVEY DATA FOR NEW QUESTIONS: A CASE STUDY FROM THE SIBARITIDE REGION (CALABRIA, ITALY)**

**Abstract author(s):** Parini, Martina (University of Groningen)

**Abstract format:** Poster

This contribution presents a case study about the reuse of archaeological field survey data from my ongoing PhD research, focused on the analysis of Southern Italy's rural landscapes during the Hellenistic and Roman periods. The primary goal of the project is to identify and explain large-scale diachronic patterns in the organisation of the countryside by comparing regional variations and similarities, based on pedestrian survey data.

In this poster, I look at the characteristics and significance of low-density pottery scatters, which are classified as 'off-site': these surface distributions are generally interpreted as important traces of long-term agricultural practices, temporal activities, or post-depositional actions. Therefore, they can contribute to reconstructing land-use strategies and contextualising the sites.

The two datasets analysed were collected between 2000 and 2014 in the Sibaritide region (northern Calabria, Italy) within the framework of different projects, one by the University of Groningen (Raganello Archaeological Project) and one by the University of Calabria (Castrovillari municipality). Each project used different methodologies, regarding for example sampling strategies and the definition of survey units. Having the possibility to access and query the primary databases of the projects, data selection and different approaches are utilised to answer the research questions. In addition, this project plans to merge the datasets by applying the mapping tools and standards developed by the Roman Hinterland Database Project, which created an integrated database for the suburbium of Rome.

---

### **274 APPROACHES TO COMMUNITIES IN THE PAST AND THE PRESENT**

**Theme:** 2. [Re]integration

**Organisers:** Borake, Trine (Museum Vestsjælland) - Beck, Anna (Museum Sydøstdanmark) - Heitz, Caroline (University of Oxford) - Austvoll, Knut (University of Oslo)

**Format:** Regular session

Community studies rooted in sociology are traditionally defined as a dichotomy between *Gemeinschaft* and *Gesellschaft* (Tönnies 1964). *Gemeinschaft* refers to community defined by personal relations such as family, ethnicity, religion or rank, whilst *Gesellschaft* refer to society characterised by rationality, formalised conventions, and contractual relationships mediated by money, benefit or advantages. An evolutionistic development from an immature *Gemeinschaft* to a mature *Gesellschaft* is often presupposed (Brint 2001). These definitions, however, have proven inadequate in recent studies, and new concepts introduced, viewing communities as a set of variable properties of interactions at multiple scales (Harris 2014). These interactions, it is suggested, can evolve around specific locations such as a village or town; grow from individual identities such as ethnicity or religion; or they can be based on struc-

tures such as family, clans or profession. They can be morally or imaginably described, multi-scalar and emotional, and defined by things, landscapes, animals and plants.

The aim of the session is to explore the concept of communities as a dynamic phenomenon. We wish to target discussions on the processes that form, maintain and dissolve communities in the past and how we investigate these archaeologically. We are specifically interested in the discussion of how these processes can be defined and identified in the archaeological record. Based on these discussions, we would like to explore how studies of past communities can give new perspectives on - maybe even pose critical questions to - how communities form, are maintained and dissolve today.

On that note, we invite contributions that discuss the dynamic processes of communities with a starting point in either case studies from the archaeological record of any period; more general theoretical reflections; or studies that reflect on how theories of past communities can inform present day sense of community.

## ABSTRACTS

### 1 SHARING SLAVES- RURAL COMMUNITIES SEEN THROUGH SLAVE DISPERSAL IN HIGH MEDIEVAL SWEDEN

**Abstract author(s): Roslund, Mats (Institute of Archaeology and Ancient History)**

**Abstract format: Oral**

One aspect of approaches to past communities lies in marrying the study of households to that of a wider rural region. The extent of such provinces can be pursued to better understand social organisation, economic integration and shared mental landscapes.

Communities organised into "provision provinces" (Sw. "bygd") are difficult to delimit. Just as rural villages depend on close everyday cooperation, wider circles of interaction are upheld by social content, created by close contacts among people in and between nearby farms. Since these communities carry both geographic and emotional connotations, mere distribution patterns of artefacts will not suffice for an interpretation. Theories and methods addressing shared stylistic traditions are vital.

This contribution focus on provision provinces distinguished by the exchange of slaves in High Medieval Sweden. Shared ceramic traditions are assumed to be transferred between groups of multi-generational female *ambátts*. By using stylistic traits in household pottery, communities where un-free individuals were shared and settled emerge. The distribution of pottery producing slaves can be interpreted as a social geography of interacting communities. The emerging pattern show smaller "provision provinces" where similar styles on pots were shared among the un-free. They could indicate spheres of political interest or kinship relations expressing community affiliations among the free population. Another outcome is an interpretation of how intensely slavery was used in the region, as well as the cultural identities of the thralls. A slow hybridisation process took place among local potters, with low acceptance of foreign styles and stable use of local Viking Age ware, indicating that the slaves were few and born within the households.

### 2 BUILDING COMMUNITY

**Abstract author(s): Villumsen, Sune (Museum Sydøstdanmark)**

**Abstract format: Oral**

A sense of belonging, group identity and shared values, in other words a community can be expressed in many forms in the material culture, including architecture and building traditions. As an example, I will present a case study from the Roman Iron Age on Zealand, Denmark.

The presentation will focus on a specific house type: the Ragnesminde-type, which is endemic to the eastern and southern parts of Zealand. The Ragnesminde-type, although limited in its geographical distribution, has great significance for our understanding of the development of Iron Age societies in the Roman Period in South Scandinavia. Traditionally dated to the Late Roman and Migration Period, the introduction of the Ragnesminde-type is linked to the first dynastic lineage controlling the import and distribution of Roman luxury goods in the region and as such, they are interpreted as elite residences. However, in recent years a systematic approach to radiocarbon dating has forced us to revise the chronology of the Ragnesminde-type. On that basis, it is suggested that it is a very short-lived phenomenon.

However brief, easy distinguishable architectural traits make the house stand out from both prior and later building traditions, which in turn share many similarities. This raises the question of the role of the house as a symbol of coherency and identification as a community or as an expression of a specific social stratum in Roman Iron Age society.

### 3 **SETTLING WITH THE NORM? USING NORM AND VARIATION IN MATERIAL CULTURE TO STUDY (ROMAN) IRON AGE COMMUNITIES IN THE NETHERLANDS**

**Abstract author(s):** de Vries, Karen (ADC ArcheoProjecten)

**Abstract format:** Oral

When studying later prehistoric societies in the Netherlands, it becomes evident that shared practices, as well as variations, exist in the settlement record. Traditionally, the shared elements on large scales are stressed, what we consider to be shared norms. Variations in material culture have received considerable less attention. This is regrettable, because through the study of both norm and variation in material culture, it is possible to understand how people synchronously can be part of larger communities and express their affiliation to smaller social groups.

In this contribution, the results of the author's PhD research on this topic are presented, through the analysis of house-building practices, general deposition practices and special deposition practices from (Roman) Iron Age (800 BC-AD 300) settlement sites in the northern Netherlands. Based on the analyses, that were performed on different spatial and social scales, normativity and variation in material can be understood in different ways. First of all, practices are best studied and understood as nested practices, in which some aspects of the practices were always shared and other aspects less frequently. The studied spatial and social scales played different roles in this throughout the period under study. Secondly, it has become evident that the degree of normativity, and thus of variation, varied not just between the subperiods but also between the practices within one subperiod. This means that the (Roman) Iron Age inhabitants of the northern Netherlands had different means at their disposal to stress both large-scale and small-scale affiliations. This contribution therefore stresses the importance of a multi-scalar and multi-practice approach.

More than just searching for a better understanding of the (Roman) Iron Age societies of the northern Netherlands, this contribution also aims to understand how the use of typochronologies in archaeology and the choices researchers make influence our understanding to the past.

### 4 **FROM ARCHAEOLOGICAL RECORD TO SOCIAL DYNAMICS: A NEW APPROACH TO INVESTIGATE SOCIAL ORGANISATION OF NURAGIC COMMUNITIES OVER THE BRONZE AGE**

**Abstract author(s):** Pisanu, Laura (University of Melbourne)

**Abstract format:** Oral

Human groups settled in Sardinia over the Bronze and Iron Age (1650 – 900 BC) are known as being part of the Nuragic civilization (Lilliu 1988) due to the stone-towers, which are called nuraghi. These monuments are supposed to have been built as power manifestations of rank-layered communities, whose leading or secondary role might have affected the management of supplies and social relations in terms of hierarchical organisation. In this light, earlier scholarship supposed that the most monumental buildings might have been on the top of Nuragic pyramidal-structured civilization. However, archaeological data may suggest more complex relationships among Nuragic societies including leadership-sharing, mutual and complementary interactions to achieve common goals. In this paper, critical questions on Nuragic social organisation will be raised through the analysis of archaeological record at Montiferru and Campidano regions (western Sardinia) which are part of a still in progress PhD project. Indeed, studies on landscape, architectural and artefacts of these areas may contribute to define different theoretical approaches for the better understanding of social dynamics that form and transform Nuragic communities and their multi-scalar interactions across Sardinia and the Mediterranean Sea.

### 5 **BUILDING EARLY VILLAGER COMMUNITIES: SOME REFLECTIONS FROM A NORTHWEST ARGENTINA FORMATIVE LANDSCAPE**

**Abstract author(s):** López Lillo, Jordi A. (Institute of Heritage Sciences, National Research Council - Incipit-CSIC) - Franco Salvi, Valeria (National University of Córdoba - UNC); National Scientific and Technical Research Council - CONICET) - Salazar, Julián (National University of Córdoba - UNC; National Scientific and Technical Research Council - CONICET)

**Abstract format:** Oral

The traditional narratives about the Neolithic or Formative way of life assume the existence of a monolithic community pooling labour to carry out the tasks required by newly developed agriculture and herding. Rooted indeed in a merely (but not always explicit) economic comprehension of the social bond, this idea tends to overlook the political dynamics and inner tensions of assemblages whose scale and historical novelty necessarily inform of some degree of experimentality; of expectable processes of formation, growth, and dissolution. In the present communication, we analyse the case of La Ciénega, a closed ravine in South Andes with an extraordinarily well preserved and surface-visible formative landscape made of clustered and scattered house compounds, an earthen mound, and multiple productive structures. This enabled a multiscalar approach that combines open area excavations with extensive surveys, UAV mapping, and high-resolution satellite imagery processed in a GIS model in order to discuss in greater detail the trends characterizing this early villager experience. Considering the articulation of inhabited

spaces, the monumentality and duration of house compounds as well as the detection of an earth mound interpreted as some kind of ritual space located in an "empty center", we will argue that such a community operated as a fragmented and heterogeneous assemblage of equals. From our point of view, this scenario stresses at once the potential autonomy of households, which could nevertheless share some degree of resources and work, and their willingness to live together in the always provisional equilibrium of a dynamic, non-authoritarian framework of relations.

## 6 WOMEN'S GRAVE COSTUMES FROM THE CRYPTS OF THE BIAŁOWĄS POST-EVANGELICAL CHURCH

**Abstract author(s):** Dobek, Mikołaj (Nicolaus Copernicus University in Toruń) - Majewski, Marcin (University of Szczecin)

**Abstract format:** Oral

Białowąs is a village located in north-western Poland, a couple of kilometres away from Barwice, a country town located in West Pomerania, Szczecinek district. The church and the vault were built in 1689-1693 by Otto Casimir von Glasenapp and his successive wives: Agnes de domo von Carnitz and Sophia Elisabeth de domo von Galbrecht. The tomb, the area of which is 75 sq.m., currently houses the remains of 32 wooden sarcophagi. The oldest one dates back to c. 1665 while the youngest ones go back to the first half of the 19th century. Buried there are members of the Pomeranian nobility of the von Glasenapp family. Necessary maintenance works and inventory carried out in autumn 2020 enabled a partial verification of people buried in the tomb, recording sarcophagi, coffins and tomb's objects.

During the archaeological work, a number of interesting objects, evidence of funeral behavior functioning among the aristocratic families of Western Pomerania were obtained. Among them, two grave dresses are distinguished significantly, which after the completion of field research were subjected to detailed analysis, conservation and reconstruction. They are made of silk fabrics. They are a perfect reflection of the 18th-century costume design and the functioning of aristocratic families in the areas under the influences characteristic of Western European court fashion. This is due to the fact that the analyzed costumes were not only clothes sewn to the grave, but also served as their owner during their lives. Such a state of affairs may contribute to the discussion on the importance of differences in clothing in the context of the social stratification, and also cultural influences flowing from neighboring areas.

## 7 COMMUNITIES OF THE LIVING AND THE DEAD

**Abstract author(s):** Sloth, Pernille (Museum Southeast Denmark)

**Abstract format:** Oral

This paper presents a case study, which highlights the link between the living and dead in the creation of a community. Excavations surrounding Ølsemagle Village on eastern Zealand, Denmark has uncovered extensive traces of settlements from the Bronze and Iron Age. Over time, these settlements go through several profound changes, both in size and in structure, reflecting changes in the organisation of society. The world of the dead play a significant role in this process, and gives insight to the dynamics of formation and renegotiation of communities.

Surrounding Ølsemagle, a linear formation of Bronze Age barrows stand as significant monuments in the otherwise flat and uniform terrain. The placement of the barrows forms a line, both through the landscape, and through time. Along the axis of the barrows, multiple burials have been excavated, indicating that the barrows stand as a focal point through many centuries. They act as links to past generations forming a bond with the land and additionally strengthening the community among the living.

However, in the Roman Iron Age a new burial practice emerges which no longer centres on the barrows. Instead, the burials, often wealthy, are now found within the confines of the settlement itself in close linkage with the largest farmsteads. The question is why this explicit break with old traditions and past communities? Are the changes in practice perhaps a reflection of the establishment of a new genesis for the community in the area?

## 8 TO BE FED IN THE AFTERLIFE: AN ANALYSIS OF MATERIAL CULTURE OF CHILDREN IN PREDYNASTIC EGYPT AT BADARI AND MOSTAGEDDA

**Abstract author(s):** Crawford, Courtney (American University in Cairo)

**Abstract format:** Oral

The funerary cult was an important aspect in ancient Egyptian society because it highlights the death of community members in this life and their rebirth in the afterlife. In these cults, the deceased's family would make food offerings to the dead in order for them to eat and flourish after their rebirth. Although early ideas of feeding and caring for family members in the afterlife have been noted from prior periods, the concept of the funerary cult began to take shape in the Old Kingdom. However, most of the research focusing on funerary cults is not directing interest in burials involving children. Two Predynastic sites in Upper Egypt yielded not only numerous child burials, but also children who were buried with bowls, cups, or spoons placed directly in front of their faces. A few of these vessels even contained organic

material, such as burnt calf bones and bread. The concept of burying a child with a food vessel implies early community beliefs of eternal feeding and the desire to ensure one's child will be cared for in the afterlife. This research attempts to not only understand early ancient Egyptian culture through funerary archaeology, but also in relation to childhood studies and community relationships. I will examine the context of child burials from Badari and Mostagedda through their archeological site reports and compare these burials with ones containing feeding vessels to better understand early funerary practices. I will also illustrate the cultural significance of children in Predynastic Egypt and the community's relationships to the dead using the archaeological theory of childhood and funerary studies.

## 9 **MEDIEVAL CHURCHYARDS AS COMMUNITIES – A SOCIAL PERSPECTIVE ON URBAN CHURCHYARDS FROM COPENHAGEN, DENMARK**

**Abstract author(s): Dahlström, Hanna (Museum of Copenhagen)**

**Abstract format: Oral**

The people buried at a specific churchyard are often seen as a group which is somehow connected – socially or geographically. After 1200CE, the parish system linking people together in congregations was fully established in Scandinavia, but before that, it is more uncertain what tied people buried at a churchyard together. Sometimes it is said that social ties to a nobleman's family were decisive to which church, and churchyard one belonged to, but due to a lack of written sources little is known for certain.

In this paper the burial practices from two medieval churchyards in Copenhagen, Denmark, will be explored as material traces of the communities they once were parts of. Initial studies of the two churchyards have yielded information about cultural and ritual practices embraced by the people using the churchyards. Even though they were located only 150 meters from each other, substantial differences in practices between them raise questions about the social structure of early medieval Copenhagen.

By using the concept of communities in the analysis of the two churchyards, focus is placed on social dimensions of the urban environment. This opens for new perspectives of understanding life in the early town and adds to the contextualisation of medieval graves as source material. Questions to discuss relate to social heterogeneity, social stratification and gender inequality as seen in burials, social topography of the churchyard as well as in the osteological evidence. By seeing how these aspects change over time, social changes of the urban community – or communities - may be studied.

## 10 **ARCHAEOLOGY OF A RURAL COMMUNITY IN THE NORTH OF THE IBERIAN PENINSULA**

**Abstract author(s): Rebolgar Flecha, Luis (University of Oviedo) - López Gómez, Pablo (University of Leon) - Carballido González, Elías - Fernández Mier, Margarita - Fernández Fernández, Jesús (University of Oviedo)**

**Abstract format: Oral**

In the last decade the group "LLABOR" (Laboratorio rural de historia y patrimonio; Laboratory of Rural History and Heritage) has carried out complex research on the formation of rural communities in the Northwestern Iberian Peninsula. We chose the mountain village of Vigaña as an example and converted it into a laboratory to apply a methodology that combines historical, anthropological, and archaeological sources.

The large amount of information obtained allows to approach the changes and continuities in the models of territorial organization from a diachronic perspective. We focus on the processes that began in the Early Middle Ages and reach the present, a period where can be seen how the community is defined and redefined through the constant relations of vicinity/conflict with other communities or diverse multiscalar agents. We have recently started a new research line concerning gender issues and the construction of difference to analyze these rural settlements.

The forms of collective governance and the management of its own territory are two of the possible clues to understand the sense of identity and belonging to the community, represented through the processes of defense. The prevalence of the collective forms of management in the community derives in a stronger identity sense in the present.

This communities have developed their own ways to codify their landscape and heritage. The celebration of festivities on places with relevant Prehistoric remains and the construction of small chapels and necropolis over former settlements are an example of this. Our own research and public archaeology activities have produced a new codification of the past by this community. In 2019, during the celebration of Carnival, one of the most representative findings was used as its central motif: a 7th century burial with grave goods and clothing remains.

## PAST AND PRESENT OF A MOBILE INDIGENOUS COMMUNITY IN THE MOUNTAINS OF SOUTH CHILE

**Abstract author(s):** Toro, Oscar (University College London; Universidad Alberto Hurtado)

**Abstract format:** Oral

This research focuses on the changing role of mobility within a current Pehuenche community in southern Chile, from a historical perspective. A defining characteristic of the Pehuenche, an indigenous people of Andean South America, is that some families divide their annual residence between lower valleys in colder seasons, and highland pastures in summer, where they take their livestock and collect pinenuts from the Araucaria trees. This research aims to reveal how socio-political organisation, economy, state policies and people's perception of the landscape and their own past influence the material culture arrangements and their functions within and between settlements, considering the multi-temporality of those material characteristics. This generates a landscape in which present and past material culture co-exist and can be explained from and through their mobility cycle and the sense of identity embedded in this aspect of Pehuenche culture. Under an interdisciplinary perspective including archaeological, ethnographic, and historical sources, this work adopts a diachronic view which allows reflecting on the process of this particular social group to becoming a current indigenous community validated by the Chilean state, as a neo-colonial way of controlling the descendant population. However, these social groups still maintain some practices, although with some differences with ancient expressions, such as rituals, seasonal movements, and all the material expressions which are part of these activities, connecting present to the past way of life of historic Pehuenches. Overall, this approach not only gives importance to the historical processes of how indigenous groups interacted with colonial societies and responded to changes through time but also current concerns over land rights and the use of material culture by these mountainous groups. It also serves to reflect on how and why these communities maintain a sense of collective belonging in a context of devaluation of community feeling in the neoliberal wider society

## BRONZE AGE MINING AND THE CONSTRUCTION OF COMMUNITY

**Abstract author(s):** Wager, Emma (Independent Researcher)

**Abstract format:** Oral

This paper investigates the practical and ideational construct of community at a distinctive site type: the prehistoric copper mine. The study of past 'mining communities' has long been a focus of attention for sociologists and social historians. Over the previous 20 years, they have been joined by archaeologists interested in understanding the role played by prehistoric mining in shaping European society during the second millennium BC (e.g., O'Brien 2015; Knapp et al. 1998). Mines were clearly significant as the starting point for the Bronze Age 'metal supply'. I argue here, however, that they were also places where people's shared participation in the mining enterprise created a 'community of labour'. This dynamic construct reproduced and reworked ideas about contemporary self and society in ways which would have been entangled with and no less significant to the transformations arising from other fields of community interaction.

These ideas are explored using the material evidence for copper ore mining in the second millennium BC at one of Europe's larger and most accessible prehistoric mines, on the Great Orme, north Wales, UK. It considers ways to overcome some of the methodological challenges involved in investigating the multi-scalar processes underlying the formation of community at this mine. It shows through examples why studying this phenomenon is relevant to mainstream narratives of Bronze Age social life.

## COMMUNITIES AS DECENTRALISATION

**Abstract author(s):** Borake, Trine (Museum Vestsjælland)

**Abstract format:** Oral

Communities are traditionally recognised to assume a number of forms: they can evolve around specific locations such as a village or town; around individual identities e.g. ethnicity or religion; or they can be based on structures like family, clan or profession. They are contextually defined and not exclusive, meaning that people can participate in multiple communities.

This presentation will explore how a common desire to decentralise unwanted power form and shape communities. It is argued that people seek independence and self-government, but that this objective depends on a community tied together through common ambitions. No man is an island.

Multidisciplinary examples of decentralisation of power through prestige objects, defence constructions, legislation and migration will be presented. Organisations, actions, and interactions behind these examples would only succeed if a unified community joint forces and consented. It follows, that communities make meaning and create a sense of belonging valuable to the individual, accordingly, generating solidarity, commitment, mutuality, and trust (Cohen 1985; Crow and Allan 1994; Frazer 2000).

However, are we merely able to detect the indicia of unified communities behind certain actions and structures, or can we through these examples understand the characters, functions, and powers of communities?

## 14 PEER POLITY INTERACTION AND CREATION OF COMMUNITY IN THE URBANIZATION OF HELLENISTIC WESTERN ANATOLIA

**Abstract author(s):** DiFabio, Christina (University of Michigan)

**Abstract format:** Oral

How do people decide to come together to urbanize, and how do the members of once disparate settlements form a sense of community among their new urban structure? This paper addresses these questions with a case study of urbanization in western Anatolia during the Hellenistic period (circa late 4th to 1st centuries BCE). The environment created during the successor kingdoms of Alexander the Great encouraged great urban formation in the region. Some development can be attributed to the political agendas of the kingdoms, but other development was instigated by the local communities themselves, particularly by the male, elite groups which existed before Alexander's conquest. I use the peer polity interaction model, which posits that comparable, independent groups encourage socio-political change among one another, to consider how these local elite groups formed a network prior to urbanization through war, trade, religion, monument building, and resource extraction. The groups then relied upon this network during major political change to urbanize so they could simultaneously gain greater recognition from the Hellenistic kings and demonstrate their self-sufficiency. In my approach, I build upon other scholars' adaptation of the peer polity interaction model for the Hellenistic period, namely John Ma, Hannelore Vanhaverbeke, and Marc Waelkens. Overall, I argue that this interaction allowed these local elite groups to form a sense of community before formal urban development, and they built upon this community when urbanizing. I explore this model with examples from the ancient regions of Karia, Pisidia, and Kabalia. I also consider the limitations of such a model that focuses on a small segment of the population. The paper closes with a critical discussion of defining community within a city and how decisions made by a certain elite community affected a broader, non-elite community that also became part of these cities.

## 15 MOVEMENT IS COMMUNITY: MOBILITY, VALUE AND CHANGE IN MORE-THAN-HUMAN PLACES.

**Abstract author(s):** Kay, Kevin (University of Leicester)

**Abstract format:** Oral

Dominant ideas of community set high price upon the local and the stable—in a word, upon place. This creates a ready-made frame for many kinds of movement: movement undermines or unsettles communities. Many archaeological narratives (top-down and bottom-up alike) reinforce this understanding, situating migration, abandonment etc. as external and often traumatic drivers of change in communities.

I want to invert this narrative. Drawing on anarchist and posthumanist approaches to change (Graeber 2001; Crellin 2020), I argue that the very thing that defines a community is the way it engages bodies and things in collaborative, transformative (and sometimes conflict-saturated) motion. Taking late Neolithic architecture in Turkey as a brief case study, I show how the structure of community at the beginning of the global Neolithic expansion derived, not from the establishment or disruption of place but the more-than-human negotiation of ways forward. The paper concludes with broader reflection on what it means to define community as a form of motion, and the ripples this may send through archaeological narratives at many scales.

## 16 DEFINING COMMUNITIES ACROSS TIME AND SPACE

**Abstract author(s):** Madsen, Mette (Museum of Southeast Denmark)

**Abstract format:** Oral

Viewing modern day communities in an archaeological perspective can arguably help understand its mechanisms and dynamics. The concept of community is the common denominator in a recently initiated archaeological research project in Køge, Denmark. Here, the results of large-scale archaeological excavations performed over the past 20 years are to help create a sense of community and identity as new industrial areas and neighborhoods are developing by mirroring present communities in the past.

However, studying past communities in archaeology proposes several challenges. One is their dynamic nature, and especially how they manifest themselves in material culture. Another is that our understanding of community is strongly influenced by modern culture, geography, language and history. Both challenges underline the necessity of clearly defining how we understand each community we choose to study. By presenting how our perception of community changes over time and across archaeological traditions, I will argue that there is not one all-encompassing definition or understanding of community but—in theory—an infinite variety. In the paper, I will discuss the challenges in identifying and comparing communities across time and space but also suggest that looking at the role each community plays in society may help defining it, not just in archaeology but also in the new neighborhood that brought about this project.

17

## NEGOTIATING TAZ SELKUP IDENTITY: ETHNO-ARCHAEOLOGICAL INSIGHTS FROM A HUNTER-FISHER-REINDEER HERDER COMMUNITY IN THE SIBERIAN TAIGA

**Abstract author(s):** Piezonka, Henny (Christian Albrechts University Kiel)

**Abstract format:** Oral

Contrasting roles of material and immaterial culture in the maintenance and expression of identity are demonstrated by the Samoyed-speaking group of the Taz Selkup in Western Siberia. As a mobile hunter-fisher-reindeer herder community, the Selkup migrated from the southern to the northern taiga in the 17th and 18th centuries. This relocation history enables us to trace socio-economic adaptations to the new region and their recursive effects on the further development of the Selkup ethnic identity within the framework of material culture, language and toponyms, and self-perception. It is especially the inter-group relations practiced e.g. through exogamy with other communities (Evenks, Kets, Khanty, Russians) that led to a distinctive multiculturalism.

In this talk, I will present new research by our team of German, Russian and Selkup partners in order to shed light onto this conundrum from an ethno-archaeological perspective. I will show that with regards to the materials and methods available to archaeologists, the territorially distinct and strongly developed ethnic self-identification of the Taz Selkup community, which is expressed, e.g., by the conscious maintenance of the language, would probably be more or less invisible archaeologically. The material culture has evolved further in the new northern homeland, adapting to the new environmental and economic conditions by adopting suitable styles and types from other northern groups. Due to the archaeological invisibility of the main field of Taz Selkup identity enactment – the language – it is questionable whether the Selkup migration and the persistence and further development of a distinct Taz Selkup ethnic identity could be recognised on the basis of archaeological evidence alone (with the possible exception of a certain persisting dwelling type). Instead, the existence of this community would most probably be largely diluted in a material continuum of regional styles, hybrid items, and adaptive solutions.

18

## TEMPORALITY AND COMMUNITY. TIMESCALES FOR SOCIAL AGGREGATION, DIFFERENTIATION AND CHANGE IN EARLY IRON AGE SETTLEMENTS OF EASTERN DENMARK

**Abstract author(s):** Søndergaard, Mathias (Museum Sydøstdanmark)

**Abstract format:** Oral

A dominating perspective in the established regional model for the Early Iron Age settlement of eastern Denmark (c. 500 BC – 150 AD) is of small village communities, generally only comprising a few households. The chronological frameworks of the model are traditional typologies of material culture, especially house types that however have a low chronological sensitivity, since the sequenced types span blocks of time several centuries long. In this default model, establishment and evolution of the village communities is frequently described as a unilinear process, characterized by social inertia, continuity and a slow pace of change. Other perspectives have received less attention. These include specific delineation and correlation of variable temporal and social scales within and across the village communities of the period.

The presentation builds on a large radiocarbon dataset from recent, development-led excavations in Eastern Denmark. Chronological modelling constrains the timings and durations of separate villages with much increased precision. The refined chronological resolution provides a framework for alternative site biographies, consistently defined by rapid processes of social coalescence and village formation, varying but generally short durations and sometimes abrupt endings. The result is more precise and detailed estimates of individual developments in the size, composition and spatial layout of village communities. This allows for the identification of dynamic social differentiation and change at varying timescales. From this position, we can consider the continual balancing of the necessities, benefits and possible strains of daily community life in Early Iron Age villages, also incorporating differing capabilities, needs and choices at a household or group level. As a result, we may gain a better understanding of the complexities of Iron Age communities.

## THE ROLE OF ARCHAEOLOGY (AND ARCHAEOLOGISTS) IN THE COVID-19 RECOVERY PLANS ACROSS EUROPE AND BEYOND [EAA EXB]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Taloni, Maria (Ministry of Culture) - Chadburn, Amanda (Historic England) - Byrnes, Emmet (Forest Service Inspectorate)

**Format:** Regular session

"It is now time to get to work, to make Europe greener, more digital and more resilient": that is the key message taken from the Statement by the EU Commission President on the finalisation of national recovery plans under Next Generation EU.

The wide-ranging impacts of the pandemic crisis has affected all aspects of life, including the heritage world and archaeology: from research to conservation and protection, from outreach to training and education.

This session aims to be a moment of reflection about the role of archaeology - and archaeologists - within the national plans for recovery and resilience, looking not only at the European Union, but also other European countries, and outside Europe.

It will also be an opportunity to highlight the cases where archaeology has been forgotten, discussing possible reasons for this absence.

In addition, it will explore the expected impacts on the archaeological world from the implementation of these exceptional funding programs, and how archaeology can widen its horizons to help contribute to making our societies fairer, more sustainable and more resilient.

As underlined in the "EAA 2021 Kiel Statement on Archaeology and Climate Change", archaeologists should explore ways to translate fundamental archaeological research into actionable science to inform decision-making, as well as monitor the implementation of recovery plans: it means new challenges, but also new opportunities.

A follow-up aim will be the drafting of a Statement on Archaeology and Post-Pandemic Recovery Plans, as well as the suggested establishment of an internal EAA task force for monitoring their implementation.

Papers for this session may include but are not limited to:

- Description and discussion of "Response" and "Recovery" plans at both national and more local levels.
- Impact of Covid-19 pandemic on archaeology and archaeologists
- Challenges and opportunities in recovery plans for archaeologists and archaeological heritage.

## ABSTRACTS

### 1 RESPONDING TO THE IMPACT OF COVID-19 ON THE HERITAGE SECTOR IN ENGLAND

**Abstract author(s):** Olivier, Adrian - Francesca Benetti, Francesca - Heyworth, Mike (Historic Environment Forum) - Gale, Tess - Chadburn, Amanda (Historic England)

**Abstract format:** Oral

Within weeks of the outbreak of the Covid-19 pandemic in England, significant parts of the heritage sector in England were closed and at risk, although much pre-development archaeological work was able to continue. Weekly coordination meetings were rapidly established between sector representatives and Government officials, chaired by the Heritage Minister, to monitor the impact of the pandemic. Historic England (the Government's lead advisor for the historic environment) worked with members of the Historic Environment Forum (which brings together national organisations to work collaboratively on strategic matters) to develop a Heritage Recovery Plan (published in early 2021). The Plan set out short- and medium-term actions for the sector and for Government to ensure that the sector would survive the impact of the pandemic. Crucial to this survival was the Government's Culture Recovery Fund which supported organisations at risk of imminent failure. This paper will describe the Plan, the Government's response, and the current health of the heritage sector in England. It will also discuss the Heritage Resilience Plan (to be published in April 2022), which builds on the Recovery Plan and sets out how the heritage sector, with support from Government, can become more resilient and maximise the opportunities for the sector to play a full part in helping the country to deal with the major challenges of our times.

### 2 ARCHAEOLOGY AND COVID-19 IN SCOTLAND – RESILIENCE AND RECOVERY

**Abstract author(s):** Aitchison, Kenneth (Landward Research Ltd) - Heald, Andy (Scottish Strategic Archaeology Committee; AOC Archaeology)

**Abstract format:** Oral

In Scottish politics, Health and Culture are both devolved matters, which means that policies in these areas are the responsibility of the Scottish Government, not the United Kingdom's. Accordingly, the Scottish archaeological sector has developed a distinctive, strategic approach to archaeology, as presented in Scotland's Archaeology Strategy (2015). This paper reviews how this policy nexus and strategic approach have been tested by the Covid-19 pandemic, firstly by exploring how the commercial archaeology sector in Scotland responded from the earliest days of the pandemic in order to protect lives and livelihoods, in an environment where lockdowns and furlough had to be balanced against the needs of clients to continue to deliver crucial construction projects.

The paper will then examine the political impact and consequences of the ways that commercial archaeology has continued to work hand-in-hand with the public sector to ensure recovery through delivering Scotland's Archaeology Strategy, looking at how this model approach is matched against Scotland's National Performance Framework (which in turn is linked to the UN's Sustainable Development Goals).

### 3 RECOVERING FROM COVID-19 IN IRELAND: ARCHAEOLOGICAL HERITAGE MANAGEMENT

**Abstract author(s): Doyle, Ian (The Heritage Council of Ireland)**

**Abstract format: Oral**

Ireland experienced a relatively strict and prolonged "lockdown" compared to other countries in Europe.

In the early stages of the pandemic, in order to understand the impact of Covid-19 on the heritage sector the Heritage Council conducted a survey in April-May 2020.

The survey showed a 20% reduction in employment due to Covid-19 with traders and incorporated private sector organisations the hardest hit. At that point in 2020 the impact of Covid-19 was mainly temporary closure 51.6%; loss or postponement of work 66.4%; postponement/cancellation of planned income-generating or marketing events 50.8%, lack of revenue streams 45.6%, and staff well-being issues 20.2%. In the case of heritage visitor attractions, unsurprisingly 33% reported decreased numbers. 16.8% reported being affected by the unavailability of volunteers.

When asked 'How can the government (departments, agencies and local government) best support the heritage sector right now?', the top answers were:

- Promoting the value of heritage 79.7%
- New funding programmes for the heritage sector 79%
- Supporting heritage organisations to honour existing commitments 72.3%
- By providing flexibility around existing offers to grantees 62.3%

While this survey represented the heritage sector at a point in time early in 2020 it also included thirty-two archaeological organisations mainly in private sector practices. Notably 79% of all responders cited the need for new funding programmes. As such, the Heritage Council's #KnowYour5k, Community Grants Programme and its Heritage Capacity Fund as well as the National Monuments Service's Community Monuments Fund and the Irish National Strategic Archaeological (INSTAR+) programme have provided a direct response to this need.

This paper will describe the range of heritage responses to the pandemic in Ireland, what has changed but with a key question being whether the increased spend on heritage can be maintained?

### 4 NEXT GENERATION ITALIA: INNOVATIVE DOCTORATES FOR PUBLIC ADMINISTRATION AND CULTURAL HERITAGE

**Abstract author(s): Borgia, Elisabetta - Taloni, Maria (Ministry of Culture, Directorate-General for Education, research and cultural institutes)**

**Abstract format: Oral**

In the framework of Italian National Recovery and Resilience Plan (NRRP) an important boost to research in the cultural heritage sectors will come from the activation of cycles of national innovative doctorates for public administration and for cultural heritage, starting in the academic year 2022-2023 and continuing in 2023-2024 and 2024-2025. They are envisaged as part of reforms of doctoral programmes, where a new regulation has also been recently published, encouraging the establishment of new research courses, simplifying procedures and opening up public-private partnerships to promote the establishment of doctorates of national interest and benefiting from a budget of € 43 million.

The text of the NRRP, within the investment 4.1 'Extension of the number of research doctorates and innovative doctorates for the Public Administration and cultural heritage', states that: "The measure also envisages, in collaboration with the Ministry of Culture, the financing of PhD cycles aimed at the efficient management and development of the country's enormous cultural heritage, seizing the new opportunities offered by the digital transition. To help achieve this goal, 600 doctoral scholarships for cultural heritage are planned (200 for each academic year)."

The Directorate-General Education Research and Cultural Institutes (Ministry of Culture), which is responsible for the coordination of university and research programmes relating to the Ministry's fields of activity, in collaboration with the Ministry of University and Research and the National Council of Research, will work on the drafting of the new curricula for cultural heritage doctorates. New curricula will be a unique opportunity to balance the interests of protection and enhancement at the level of heritage management with those of research and innovation, to create a system that is able not only to feed on the results, but also to empower the skills required to meet the new challenges of and for cultural heritage.

### 5 THE PROJECTS OF THE PARCO ARCHEOLOGICO DELL'APPIA ANTICA (MINISTRY OF CULTURE, ITALY) FOR THE COMPLEMENTARY NATIONAL PLAN: CHALLENGES FOR ARCHEOLOGY

**Abstract author(s): Paolillo, Francesca Romana - Pontisso, Mara - Roascio, Stefano - Quilici, Simone - Cugno, Santino Alessandro - Reginaldi, Michele (Ministero della Cultura, Parco Archeologico dell'Appia Antica)**

**Abstract format: Oral**

The Parco Archeologico dell'Appia Antica is an autonomous institute of the Italian Ministry of Culture, providing protection and enhancement of a vast territory that extends from the city center to the Roman countryside, in which

archeology and landscape come together in an outstanding context. Following the COVID-19 pandemic, which caused a long period of difficulty, a new season of opportunities for scientific knowledge, conservation, and enhancement of the Parco Archeologico archaeological

sites begins today. In the following years, the Parco will undertake a complex series of interventions that will include acquiring new archeological sites, scientific research,

restoration as part of a general project called "Urbs. From the city to the Roman countryside".

The works will be implemented with funding from the National Plan for Complementary Investments to the National Recovery and Resilience Plan (NRRP) between 2022 and 2026, as part of the Strategic Investment Plan on cultural heritage sites, buildings, and natural areas. The NRRP includes a reform package and investments of up to € 222.1 billion: € 191.5 billion in resources being allocated through the Recovery and Resilience Facility and € 30.6 billion being funded through the Complementary Fund. The interventions will cover all the archaeological and monumental areas owned by the State in the Parco territory, located along the two main ancient roads of the region: the Via Appia and the Via Latina.

This presentation aims to emphasize the contribution of archaeological sciences to a complex system of interventions and projects aimed at increasing the public's enjoyment of an archaeological context that is unique in the world.

## 6 CARE FOR THE FUTURE – THE IMPACT OF PUBLIC ARCHAEOLOGICAL PARTICIPATION IN FOUR COUNTRIES BEFORE AND SINCE COVID-19

**Abstract author(s):** Lewis, Carenza (University of Lincoln) - van Londen, Heleen (University of Amsterdam) - Marciniak, Arkadiusz (Mickiewicz University in Poznań) - Vařeka, Pavel (University of West Bohemia) - Verspay, Johan (University of Amsterdam)

**Abstract format:** Oral

This paper will explore how archaeology can enhance people's lives and make our communities more resilient, using data, insights and reflections from the CARE project (Community Archaeology in Rural Environments Meeting Societal Challenges) before and since Covid-19.

CARE began in February 2019, aiming to explore the impact of involving rural residents in archaeological excavations investigating the long-term development of the places where they live. In the first year more than 200 people of all ages and backgrounds took part in the Netherlands, Czech Republic, Poland and UK. Participants uncovered features and recovered finds ranging in date from the Neolithic to the 20th century AD and learned with the professional archaeologists who set up and supervised the excavations what the finds could reveal about the long-term development of the places where they live.

In the second year of the project Covid-19 struck, upending expectations, attitudes and wellbeing while simultaneously confining most of those who expected to take part in the very places they were to have been excavating. Inevitably seriously affected by pandemic restrictions, the project has managed to continue, navigating numerous halts, starts, restarts and pragmatic twists and turns. Consequently, data showing the impact of participation in local community-focussed archaeological excavations on people and places in four different countries now cover the period before and since the pandemic.

This paper will distil emerging insights from CARE impact data, comparing different countries to identify key essential inputs and reflect on challenges in order to offer 'ways to translate fundamental archaeological research into actionable science to inform decision-making' which can help archaeology benefit society as we move forward since Covid-19.

## 7 IMPACT OF COVID-19 CRISIS ON ARCHAEOLOGY. CHALLENGES FOR THE FUTURE

**Abstract author(s):** Pyrgaki, Marie (Université Paris I, Panthéon-Sorbonne; Hellenic Open University)

**Abstract format:** Oral

This paper focuses on the global coronavirus (COVID-19) pandemic crisis that has had profound impacts on archaeological research activities and cultural heritage communication. We describe impacts on academic as well as contract archaeology, professionals and cultural heritage institutions.

We discuss current practices during the pandemic period and we explore challenges for the post COVID-19 era, particularly in academic archaeology.

Although universities were quick to replace face-to-face lectures with online learning, the closures affected learning and examinations on the sector of archaeology. The pandemic crisis raises questions about the value offered by a university education which includes networking opportunities as well as educational content. To remain relevant, universities will need to reinvent their learning environments so that digitalization expands and complements student-teacher and other relationships.

During the pandemic, organizations and projects provided fundings for online teaching and learning, activities such as webinars and online readings groups and other ways to stay active until a return to the normality is possible.

Many archaeologists explored new tools for improving the digital documentation and related skills to be best prepared for future field seasons. In coming years archaeologists will face many challenges. We explain why the community could adopt Open Science practices, not entirely new in archaeology, to overcome all these challenges and why creativity and openness to new ways, to new opportunities of working are needed, rather than trying to go back to business as usual.

## 8 THE CONFEDERAZIONE ITALIANA ARCHEOLOGI SOCIAL MEDIA PROJECTS DURING THE COVID-19 PANDEMIC: CHANGING THE DIGITAL COMMUNICATION APPROACH TO THE ONLINE COMMUNITY

**Abstract author(s):** Riva, Alessandra - Gusberti, Elisa - Donati, Nicoló - Magliaro, Tommaso (Confederazione Italiana Archeologi)

**Abstract format:** Oral

With the onset of the COVID-19 pandemic, social media has rapidly become a crucial communication tool for sharing information with the public. We are going to present two media projects: #CIAndremo and Una Domenica al Museo launched on the social media pages of the Confederazione Italiana Archeologi (CIA) following the lockdown stages in Italy in 2020. #CIAndremo is the first original project that our association released on Facebook, Instagram IGTV and YouTube during the pandemic, responding to the social campaign #iorestoacasa (I stay at home) as a measure to contain the epidemic outbreak. The second project was the enhancement of Una Domenica al Museo (Sunday at the Museum), a weekly column born on the CIA Instagram profile, which is advertised with the hashtag #unadomenicamuseo. We are presenting the adaptation of the format that followed the Italian government lockdown restrictions and how it also changed the interaction with the public. From a Public Archaeology perspective, these projects were an important means of communication for the CIA to contact new users and reconnect with old ones, while also conveying to the public the importance of heritage and informing them of cultural events and archaeology news. The COVID-19 pandemic showed the importance of the digital approach in the heritage sector, in line with the technological innovation defined in the National Recovery and Resilience Plan (NRRP). The usage of digital tools in archaeology should be extended and enhanced even further concurrently with the already existing practice of cultural promotion. The CIA started to open up several new possibilities for publicity and engagement with people and this new vision, where archaeology embraces technology, offers endless opportunities for highly personal interaction with the past in a future perspective.

## 9 NEW SOLUTIONS TO AGE OLD ISSUES? EXPLORING THE POTENTIAL FOR INNOVATION WITH SKILLS AND PROFESSIONAL DEVELOPMENT IN ARCHAEOLOGY

**Abstract author(s):** Jones, Cara (Chartered Institute for Archaeologists)

**Abstract format:** Oral

Within the UK, the past 18 months have seen unprecedented pressure to meet the demand for archaeological services – through the combined factors of Covid, Brexit and pressures felt by some higher education departments delivering archaeology. These

factors have also served to highlight and exacerbate existing skills issues and question how we develop and retain archaeologists within sector. Alongside this, we have also seen rapid adaptation to new ways of working within the sector. All this hints at the resilience of the archaeology sector, and the potential for innovative responses to existing ways of practice. It is likely that some Covid adaptations are here to stay. We ask, is this a unique time to start considering new solutions to age old issues regarding skills in archaeology?

This paper will seek to explore these factors in detail and highlight the observed issues and potential long term impacts these issues may have if no action is taken. Presenting case studies, the paper will look at how some organisations have started to adapt and change how they train, develop and retain archaeologists. The paper will also tentatively suggest how some of these innovations could be adopted within other areas of the profession.

**Abstract author(s):** Polymeropoulou, Panagiota (DAISSy research group - Hellenic Open University; Department of Management Science and Technology, University of Patras) - Kameas, Achilles (Hellenic Open University; DAISSy research group - Hellenic Open University) - Papadatos, Ioannis - Kalara, Antigoni (Department of History and Archaeology, National and Kapodistrian University of Athens) - Sogliani, Francesca (University of Basilicata; Post-graduate School of Archaeological Heritage, Department of European and Mediterranean Cultures. Architecture, Environment and Cultural Heritage, Matera) - Roubis, Dimitris (University of Basilicata, Department of European and Mediterranean Cultures. Architecture, Environment and Cultural Heritage; ISPC CNR, Matera) - Tóth, Peter - Malíšková, Johana - Hons, David (Department of Archaeology and Museology, Masaryk University, Brno)

**Abstract format:** Oral

The COVID-19 pandemic disrupted education provision at an unprecedented scale. The impact of limited use of digital educational tools and skills became more apparent during the pandemic, which created serious problems in conducting face-to-face excavation training in both the classroom and on excavation sites. Within this context, the integration of these two physical spaces through the digital "space" of online training is the main objective of project DELTA (Digital Excavation through Learning and Training in Archaeology), a transnational project funded in the context of Erasmus+/KA2 EU programme (2019-2022) with the coordination of the Hellenic Open University (DAISSy research group) and participants the relevant departments of archaeology of National and Kapodistrian University of Athens (Greece), University of Basilicata (Matera, Italy), and Masaryk University (Brno, Czech Republic).

The results of the first phase of the project included desk research aiming at recording the existing situation in the three countries concerning: the use of digital applications in archaeological excavations, courses on excavation practices, methods/techniques, and the use of digital educational tools.

The survey recorded the most recent trends in the university curricula, existing digital skills and level of expertise of students - professionals, their needs and desires concerning the use of digital applications in excavation and archaeological education. The results proved to be particularly revealing, especially when comparing the situation between the three countries. DELTA project aimed to design and develop a course through which, students of Archaeology were able to improve their knowledge and develop digital and 21st century skills. The online piloting allowed participating Universities to discuss the level of integration of digital applications, tools and methods in teaching and learning in Archaeology online, necessary digital skills and make suggestions for the future. Particularly within the context of the recent pandemic and the problems it created in students' excavation training.

## POTTERY AND IDENTITY IN THE EUROPEAN NEOLITHIC: THE INTERPRETATIVE PATH BETWEEN ARCHAEOLOGICAL FEATURES AND (PRE)HISTORICAL NARRATIVES

**Theme:** 2. [Re]integration

**Organisers:** García-Martínez De Lagrán, Íñigo (UNED - National Distance Education University) - Molina Balaguer, Lluís (Universidad de Valencia) - Manen, Claire (CNRS) - Carvalho, Antonio F. (Universidade do Algarve) - Gomart, Louise (CNRS)

**Format:** Regular session

During the Neolithic, the most numerous archaeological remains and one of those of greatest interpretative value is pottery. Not for nothing, the main archaeological entities of the Old continent are defined on the basis of some characteristics of their ceramics: Cardial, LBK, TRBK, SBK, Chasséen, etc. In this session we want to explore the ways that lead us from the recovery and recording of a pot to the interpretation we make of the Style of the pottery collections. This process, that usually implies the description of pottery manufacture, morphology, decoration layout and techniques, results in the identification of "ceramic traditions" classically used as the basis on which human group identities are constructed in Archaeology. Mainly, we want to focus on the underlying principles to the characterisation of these identities, that is, on the definition of differentiated human groups or communities based on the attributes of their pottery assemblages and beyond: what theoretical foundations do we use for the identification of these identities? What analytical procedures do we use to make these interpretations? Are "ceramic traditions" always superimposed with the traditionally defined "cultural groups"? If not, what exactly do these traditions encompass? What taphonomic data do we choose or highlight for defining past identities? What other archaeological criteria are essential to define those groups: chronology, geography, "Neolithic package", ...? What is the place of systemic studies in the definition of human group identities? And finally, how do we articulate our (pre)historical narratives from the study of pottery? To discuss these challenges, presentations in the realm of Neolithic ceramic studies (e.g. morphology, decoration, raw materials, forming/finishing, uses) carried out in an anthropological perspective, as well as papers integrating pottery analyses with other material, taphonomic or environmental data are welcome.

## 1 POTTERY IN THE CONTEXT: RAKUSHECHNY YAR EARLY NEOLITHIC CERAMIC ASSEMBLAGE (LOWER DON BASIN)

**Abstract author(s):** Dolbunova, Ekaterina (-) - Mazurkevich, Andrey (-) - Kulkova, Marianna (-) - Bondetti, Manon (BioArCh, Department of Archaeology, University of York) - Meadows, John (Centre for Baltic and Scandinavian Archaeology - ZBSA, Schleswig-Holstein State Museums Foundation) - Lucquin, Alexandre (BioArCh, Department of Archaeology, University of York) - Craig, Oliver E. (BioArCh, Department of Archaeology, University of York) - Heron, Carl P. (Department of Scientific Research, The British Museum)

**Abstract format:** Oral

The existence of Early Neolithic pottery at Rakushechny Yar settlement, judging by a series of recent dates, refers to an interval spanning no more than a few decades, centered around c.5600 cal BC. The highly specialized nature of the site, focused around the exploitation of seasonal aquatic resources, produced a range of functionally and typologically limited categories of bone and flint artifacts, a particular set of faunal remains, and the remains of constructions. The ceramic complex is distinct - the vessels were made on the site from shore sediments; several 'chaînes opératoires', the presence of a certain recurrent set of ceramic forms of varying volumes were highlighted. The pottery was used mainly to process aquatic products, and in keeping with the site's specialized context. The uniqueness of the site, which is the only known settlement with an Early Neolithic ceramic complex in this region so far, raises questions about the origin of the human groups that settled here. The marked similarity of certain features of the ceramic assemblage with other regions raises the question regarding the cultural mechanisms of ceramic acquisition: whether the tradition is transmitted as a whole 'package' with human groups or only as individual components in the context of skills transfer or copying. Local technological choices, or even functional choices determined by the specificity of the site could have played a role in this process. The study of this complex raises the question of the extent to which different synchronous regional ceramic traditions for the Early Neolithic of Eastern Europe mark distinct human groups with their own identities, and to what extent this world was open or closed - through the prism of ceramic production.

## 2 SURFACE TREATMENT: A REVIEW OF THE CONCEPT AND ITS IMPLICATIONS FOR THE PRODUCTION PROCESS OF PREHISTORIC POTTERY

**Abstract author(s):** Díaz-Bonilla, Sara (Universitat Autònoma de Barcelona) - Clemente-Conte, Ignacio (IMF-CSIC) - Gassiot-Ballbè, Ermengol (Universitat Autònoma de Barcelona) - Rey-Lanaspa, Javier (Gobierno de Aragón) - Clop-García, Xavier (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The surface treatment of handmade is often described in ceramological studies of archaeological assemblages as a residual, unremarkable question; it has rarely been approached from a global, theoretical, and conceptual perspective. The different types of surface treatment are explained in different ways, but without using uniform terminology regarding their production and purpose. However, the finishing actions of a ceramic vessel or the surface treatment provide crucial information when reconstructing the operational chain of ceramic production: it allows identifying the state of the clay in which a vessel is worked, how much labour is invested, and the pottery toolkit involved. Moreover, the characterisation of surface treatment opens up the possibility of characterising different craft traditions and the evaluation of whether specific production practices can be associated with the knowledge and know-how of specific groups.

In this contribution, we summarise the different theoretical and analytical contributions that have been made about the final phases of the pottery manufacturing process. This will allow us to reflect on the different aspects related to surface treatment and the "ways of making". Subsequently, we will suggest a traceological methodology of analysis applicable to any archaeological site as well as a theoretical proposal on concepts. All this will be described by applying the theoretical and methodological proposal to the study of a high mountain archaeological context: Coro Trasito, located in the Aragonesse Pyrenees.

## 3 MODELLING THE CLAY: POTTERY TECHNOLOGY DURING THE NEOLITHIC AT ELS TROCS CAVE (HUESCA, SPANISH PYRENEES)

**Abstract author(s):** Quevedo-Semperena, Izaro - Tejedor-Rodríguez, Cristina (Universidad de Valladolid) - Cubas Morera, Miriam (Universidad de Alcalá; Sociedad de Ciencias Aranzadi) - García Martínez de Lagrán, Íñigo (UNED, Universidad Nacional de Educación a Distancia) - Royo-Guillén, José Ignacio (Gobierno de Aragón) - Garrido Pena, Rafael (Universidad Autónoma de Madrid) - Arcusa Magallón, Héctor (Independent researcher) - Rojo-Guerra, Manuel Ángel (Universidad de Valladolid)

**Abstract format:** Oral

Pottery is traditionally linked to the spread of the Neolithic in South Europe, although different scenarios for the emergence and consolidation of this technology have been observed. Identification of raw materials, technological

choices, morphological and decorative approaches and determination of use of pottery are relevant aspects to address a complete study of these assemblages and, thus, to establish their role for Neolithic communities.

In this contribution, we present the exceptional case study of the pottery assemblage from Els Trocs Cave (Bisaurri, Huesca, Spanish Pyrenees) dated from ca. 5315 to 2915 cal BCE. Located in a mountain landscape, the site has revealed particular characteristics of exploitation of the environment. Pottery analysis has implemented an approach combining macroscopic and technological analyses in order to explore social organization of pottery production and its role for these farming communities, within a diachronic perspective linked to different uses of the cave during this time period. The choice of pottery manufacture has a social meaning, as it is transmitted between and within groups. This may indicate that the type of manufacture, the choice of raw materials etc. has a social meaning, and therefore allows us to define certain social groups.

Technological choices have been explored through mineralogical analysis of 50 thin sections obtained from the same number of vessels. A systematic petrographic description focused on the clay matrix, mineralogical fraction and textural features is able to propose different groups of manufacture. The data suggest that the raw materials used were available in the surroundings, which allows us to propose a local technology. Different sources and ways to prepare the clay were used in the manufacturing of the vessels. Exploring the correlation between technology and morpho-decorative features will allow us to test with previous work whether or not morphological features can be used to define these groups.

#### 4 TECHNOLOGICAL INNOVATIONS IN THE MOUNTAINS: NEOLITHIC POTTERY IN THE WESTERN PYRENEES

**Abstract author(s):** Santamaria, Urko (University of the Basque Country) - Gehres, Benjamin (UMR 6566 CReAAH - CNRS - Université de Rennes 1) - Cava, Ana - Barandiaran, Ignacio - Mujika-Alustiza, José Antonio (University of the Basque Country) - Cubas, Miriam (Universidad de Alcalá. Sociedad de Ciencias Aranzadi)

**Abstract format:** Oral

The spread of technological innovations is clearly related to the environment, which can influence local responses by prehistoric communities. In this sense, mountain environments are interesting scenarios to explore the local response and dynamics of adoption. The expansion of the Neolithic in Iberia has been linked to the introduction and consolidation of some technological innovations, i.e. pottery and polished lithic tools. However, its introduction in these mountainous environments is far from being well-understood.

The main aim has been to explore the processes of technological transmission that accompanied the introduction of ceramics in the Western Pyrenees. In order to do so, we present the main pottery assemblages recorded in the Western Pyrenees, focused on their technological, morphological and decorative characteristics. Aizpea, Berroberria and Zatoya have yielded the earliest pottery assemblages recorded in the area. Macroscopic and mineralogical analyses (thin section analysis) offer an integrative and systematic approach to these assemblages, so that they can be compared with those recorded in the surrounding areas. Our research shows some similarities in pottery manufacture with the Cantabrian region and the Ebro valley, but also some differences. A high variability is observed in the procurement of raw materials and the election of temper.

Technological choices offer the possibility to explore the contacts with other geographical regions, proposing some hypothesis focused on mobility patterns or contact with other groups.

#### 5 TECHNOLOGICAL RECIPES DURING THE NEOLITHIC: THE POTTERY ASSEMBLAGE FROM EL PORTALÓN DE CUEVA MAYOR (ATAPUERCA, SPAIN)

**Abstract author(s):** Francés, Marta (Laboratorio Evolución Humana, Universidad de Burgos; Área de Prehistoria, Universidad de Alcalá) - Iriarte, Eneko - Pérez-Romero, Amalia (Laboratorio Evolución Humana, Universidad de Burgos) - Cubas, Miriam (Área de Prehistoria, Universidad de Alcalá) - Carrancho, Ángel (Área de Prehistoria, Universidad de Burgos) - Arsuaga, Juan Luis (Centro Mixto UCM-ISCI) - Universidad Complutense de Madrid) - Carretero, José Miguel (Laboratorio Evolución Humana, Universidad de Burgos)

**Abstract format:** Oral

El Portalón de Cueva Mayor (Atapuerca, Spain) is an interesting archaeological site with a Holocene stratigraphic sequence attributed from the Neolithic (ca. 5320-3670 cal. BCE) to the Roman period. During the Neolithic, this site was used for habitational purposes given the high density of archaeological remains: pottery, lithics and faunal remains. Archaeological assemblage shows a mixed economy with similar roles of farming, hunting and gathering strategies.

In this contribution, we present new data about raw material procurement and technological choices observed in the pottery assemblage. To address this research question, 736 Neolithic pottery sherds were studied. Macroscopic characterization was the main criteria for the selection of 23 samples for further analyses. Thin section and geochemical analyses (XRF) were performed to identify clay composition and coarse mineralogical fraction. Our results pointed out the presence of three different manufacturing groups: i) MG1 (n=20) characterized by crystalline calcite

clasts tempers; ii) MG2 (n=2) characterized by siliceous clasts tempers, and, iii) MG3 (n=1) characterized by limestone clasts tempers.

To test the potential sources of raw material, an experimental work was performed trying to emulate the Neolithic pottery production. Experimental vessels (n=10) were recreated with local raw material recovered from surrounding areas from the site (ca. 7 km) using the same technological recipes. By applying the same analytical protocol, we obtained identical results for those MG2 and 3, although the origin of crystalline calcite is still under analysis. Comparison of archaeological and experimental data allows us to propose a local raw material procurement for the Neolithic pottery recorded at El Portalón site with further implications for pottery production by these farming communities.

Different technological choices, such as the use specific tempers or similar clay preparation, allow proposing interesting interpretations focused on the emergence of specialised crafts or technological influences from other geographical areas.

## 6 "CHOOSING MY TEMPER": NEOLITHIC POTTERY TECHNOLOGY IN THE SOUTHEAST OF THE CENTRAL PLATEAU (SPAIN)

**Abstract author(s):** Lozano-López, Néstor (Universidad Nacional de Educación a Distancia - UNED) - Sánchez Carro, Miguel Ángel (Universidad de Cantabria - IIPC) - Mingo, Alberto (Universidad Nacional de Educación a Distancia - UNED) - Cubas, Miriam (Universidad de Alcalá; Sociedad de Ciencias Aranzadi)

**Abstract format:** Oral

The southeast of the Central Plateau (Spain) is a strategic region to explore the connections between the Mediterranean coast and the inland Iberian Peninsula. Neolithic archaeological sites on the east coast of Iberia are well-known, mainly in Valencia and Alicante; however, the spread of domesticated plants and animals to the interior is still a highly debated question. In this contribution, we present a summary of the archaeological sites available to address this research topic, focused on one of the emblematic technologies linked to this phenomenon: pottery.

In this context, Pico Tienda III (Hellín, Albacete), dated in the Early Neolithic, is crucial for understanding this process. Macroscopic and mineralogical analysis of the pottery assemblage allowed it to be compared with other well-known ceramics in the surrounding area. Technological choices have been explored through mineralogical and textural analysis of twenty-one thin sections. Different technological choices have been identified regarding the selection of the temper. Grog was used as temper in most of the manufactures while, in a smaller number of samples, quartz sand and other rock fragments were also detected and had probably been added as temper. We explore a quantitative method for distinguishing natural non-plastic inclusions from temper based on the statistical analysis of the distributions of the grain size. The abundance and different types of grog are evidence of a technological tradition consisting in the systematic recycling of pottery for the manufacture of new vessels. Coiling as a building technique has been identified in at least one sherd. Few sherds are decorated with Cardial impressions. Technological choices, such as the use of a specific temper, might be related to influences from different regions, showing a relationship between different farming communities.

## 7 THE DEMISE OF THE LBK AS A TRANSFORMATION. A LOOK FROM THE PERSPECTIVE OF POTTERY. THE EXAMPLE OF LESSER POLAND

**Abstract author(s):** Czerniak, Lech - Michalak, Katarzyna - Połczyński, Łukasz (University of Gdańsk) - Zastawny, Albert (Archaeological Museum in Kraków)

**Abstract format:** Oral

The demise of LBK can be described as a phenomenon of abandoning a specific pattern of pottery production, which (through knowledge, skills and habits) shaped the sizes, forms as well as the manner of usage, manufacture and decoration of vessels. However, recognizing this pattern is not obvious. Firstly, due to the numerous modifications and differentiation that occurred during the 500 years of LBK's history. Secondly, due to the influence of the research tradition with its arbitrary prejudices regarding the criteria for distinguishing LBK. Lastly, ceramics has the ability to express ethnicity, which affects research results differently depending on whether we want to study local distinctiveness, the formation of interregional networks, or the inheritance of specific traditions.

We will compare the LBK and Malice culture pottery production patterns. The aim is to answer the question of whether – despite the far-reaching changes in the form of houses, funeral rites and discontinuation in the style of pottery – the descendant communities followed the older patterns of pottery making and what the changes consisted of. We will focus on the pottery coiling and forming processes with particular attention to the method of rims finishing. We assume that these features (as opposed to the ethnically affected style and the symbolically marked technology of grog temper) were transmitted between generations in the form of habits that were repeated unconsciously. Contextualization will be provided by the analysis of ceramics from one settlement complex located in the Tusznicza river valley consisting of six LBK villages. Later, on four of them, villages of Malice culture were founded. We assume that the complex of villages can better illustrate the intricate and dynamic history of settlement development of the

same local community. This paper is an output from the NSC Poland, project OPUS20 (2020/39/B/HS3/02529), hosted by the University of Gdańsk.

## 8 FIRST INSIGHTS INTO POTTERY FORMING DURING THE EARLY NEOLITHIC IN THE IBERIAN PENINSULA: NEW DATA FROM EL TORO AND FRARE CAVES

**Abstract author(s):** Cámara Manzaneda, Javier - Clop García, Xavier (ARCHAEOM, Department of Prehistory, Universitat Autònoma de Barcelona) - García Rosselló, Jaume (ArqueoUIB, Department of Historical Sciences and Art Theory, Universitat de les Illes Balears) - Camalich Massieu, María Dolores (Department of Geography and History, Universidad de La Laguna) - Marín Cóllica, Araceli (Servei d'Arqueologia i Paleontologia, Generalitat de Catalunya) - Marín-Socas, Dimas (Department of Geography and History, Universidad de La Laguna)

**Abstract format:** Oral

Ceramic productions represent one of the most characteristic elements of the Early Neolithic sites in the Western Mediterranean since their introduction with the spread of the Neolithisation process (6th millennium BCE). The production of such artifacts required the development of different manufacturing phases and work processes before obtaining the desired products. One of these phases that reflects in detail how the first farmers produced their ceramic wares concerns the forming techniques, which are strongly associated with the ways of doing and technical know-how of their producers.

Forming processes have recently emerged as a proxy in the context of the Early Neolithic to explore which were the technical practices used by the first communities of farmers. Indeed, current technological studies focused on the first ceramic productions revealed two completely different technical traditions (the patchwork technology and the coiling techniques) in separate areas of the Western Mediterranean (Gomart et al., 2017). However, other areas such as the coast of the Iberian Peninsula have not been yet integrated into the discussions on the distribution of these technical practices and traditions.

This paper presents new insights into the pot-forming processes from the Early Neolithic occupations of Frare (NE Iberia, 5200-4800 BCE) and El Toro (S Iberia, 5280-4780 BCE, Cámara et al., 2021) caves. The systematic analysis of technological traces allowed us to recognise the use of circular juxtaposed patches and coiling techniques in both sites, but also some differences between them on the use of moulding processes or discs. These results present clear parallels with the technical traditions from other Mediterranean areas and illustrate how these technical practices were possibly maintained over time and transmitted to NE and S Iberia. Furthermore, the identification of some differences might also reflect that these techniques were possibly combined or varied with the advance of the Neolithisation process.

## 9 POTTERY AND ROCK ART IN NORTHERN PORTUGAL AND THE LOWER DOURO BASIN. CONSIDERATIONS ON COMMUNITARIAN IDENTITIES DURING THE NEOLITHIC

**Abstract author(s):** Sanches, Maria (FLUP- CITCEM)

**Abstract format:** Oral

According to the program of session 280, this contribution will approach the issue of 'identities' in the Early and the Middle Neolithic of Northern Portugal and of the lower Douro basin. It is focused on the mutual articulation of different evidence where ceramic technology (in the broad sense) and rock art play an important role. This approach aims to combine that data from technology(s) and identities' traditions with their geographical distribution, highlighting the similarities and differences between coastal and inland regions. This geographic division is partly supported by the field of Biogeography which recognizes both the Atlantic (Galician-Asturian) and Iberian-Mediterranean regions. Our argument will support the idea that the Mesolithic-Neolithic «frontier», as a socio-economic and ideological transformation, can only be understood over a reasonably long period of time in both regions, in the approximate time interval of 5200/5100 -4800/4600 BC. Data from the Epipaleolithic/ Mesolithic will be also considered in comparison to the Early Neolithic data. This will emphasize the importance of both rock art (painted or engraved) and ceramic decoration in the constitution, transformation, and maintenance of prehistoric identities. Those 'technologies' should then also be approached as continuity or change indicators during the considered long period of time.

## 10 THE NEW CLASSIFICATION OF THE NEOLITHIC CERAMICS FOR TRACING THE CROSS-CULTURAL INFLUENCE IN THE MIDDLE AND LOW DNIEPER REGION

**Abstract author(s):** Andriiovych, Marta (Institut für Archäologische Wissenschaften)

**Abstract format:** Oral

Since the middle of the XX century, the ceramics complexes from 6th-4th Millennial BC of the Neolithic – Chalcolithic periods in the Middle and Low Dnieper region in Ukraine, were under discussion and took a major role in the definition of the local cultural styles. The special interest has pottery from the cemeteries of the Mariupil type, which are a unique reflection of the changes in the funeral ritual among the other Neolithic - Chalcolithic cemeteries of the same type, which had no ceramic among the accomplished goods.

The pottery assemblage from the Lysa Hora, Mykilske, Yasynuvate, Deriivka cemeteries contains especial evidence of the cross-cultural interaction between the Azov-Dnieper, Surska, Bug-Dniester, Kyiv-Cherkasy styles in the region. The pottery presented mainly with pots, jar-pots, and bowls fully decorated with impressions, scratched lines, and imprints external surface. The burials were separated from the settlement area. The ceramics from the cemeteries, trace the links between cemeteries and settlements to which they might be related to. At the same time, the settlements have a richer variety of ceramics.

Focusing on the ceramics from Lysa Hora cemetery were created a new classification of the Neolithic ceramics which unite the morphological characteristics and ornamental properties. The previous classification models were concentrated only on morphological characteristics. But the ornamentation scheme and ornament often were a defining characteristic for known Neolithic Chalcolithic cultural styles (like Cardium pottery or Comb ceramics style). The new classification combines the most important features of Neolithic ceramics.

The new model would help to expand the understanding of the cross-influence of the 'ceramics tradition' between the Neolithic groups with different styles of ceramics in the Middle and Lower Dnieper and the Eastern European region.

## 11 GEOMETRY IN POTTERY DECORATIONS AS A CULTURAL BOUNDARY PROXY

**Abstract author(s):** **Escribá Ruiz, M<sup>a</sup> Pilar - Jiménez-Puerto, Joaquín (Universitat de València, Facultat de Geografia i Història)**

**Abstract format:** Oral

In this work a new method of analysis of prehistoric ceramic has been tested as a result of PhD research using neolithic pottery. Classical studies in ceramics are developed taking data from typology, technology and decoration of vessels, in order to understand the different societies, cultural traditions, and evolutionary processes. In our PhD research, the geometrical component in decoration has been added, in order to test its ability as a cultural boundary proxy, and its informative capacity in Evolutionary Archaeology.

This type of symmetry analysis has been previously applied in Archaeology and it has been observed that in different contexts they used symmetry differently in elements as their architecture, fabrics, rock art or pottery.

In this work, examples of the usefulness and versatility of the study of symmetry will be shown, together with other classic proxies, which has been used to: a) Improve the definition of Bayesian chronological results. When the chronological forecasts provided by Bayesian studies are bimodal, symmetry has shown a greater resolution capacity rather than other proxies. b) Testing its capacity as a cultural boundary proxy. The patterns found in the record are always the product of a predefined plan. Therefore, symmetry used in the designs is affected by different types of transmission of information, and it provides us useful information to establish differences between groups and ways of making. Through its study, it is possible to analyze closer contacts between groups, where information is fluid, or cultural borders, which allows its use as a cultural boundary proxy.

To sum up, our results show that the combination in the use of several archaeological markers (including symmetry) seem to reveal complementary dynamics in the study of these societies and improve the definition of different processes, such as cultural boundaries and other data in the Evolutionary Prehistory field.

## 12 ICONOGRAPHY, TECHNIQUES AND TOOLS OF POTTERY AS DISTINGUISHING FACTORS OF IDENTITY IN THE WESTERN MEDITERRANEAN EARLY NEOLITHIC

**Abstract author(s):** **García-Martínez De Lagrán, Íñigo (UNED) - Molina Balaguer, Lluís (Universidad de Valencia) - Arcusa Magallón, Héctor (Independent researcher; Arcadia-FUNGE - UVa) - Bernabeu Aubán, Joan (Universidad de Valencia) - Laborda Lorente, Rafael (Independent researcher) - Manen, Claire (CNRS) - Quevedo Semperena, Izaro - Rojo Guerra, Manuel A. (Universidad de Valladolid)**

**Abstract format:** Oral

In the European Neolithic, pottery has played a fundamental role in the definition of human groups and archaeological entities. In the specific case of the western Mediterranean, this reality is extended by establishing the Cardial and Epicardial groups with different style elements in their pottery, but some of them are also shared. Defining these differentiating elements within these assemblages is the main objective of this paper. The analysis of a wide range of archaeological contexts in different territories of the western Mediterranean has allowed us to determine the existence of particular elements in certain geographical areas. These particularities are defined by different elements. In some cases, they are particular iconographic themes or representations, in others the use of specific techniques, and even in others the use of unique tools. The presence of specific vessel morphologies and possible combinations of themes with specific morphologies is also noted. All this in a general framework with certain shared characteristics in this vast territory that gives rise to an interesting dichotomy, especially from the interpretative point of view, even more so if we focus on identity issues.

## POTTERY AND IDENTITY IN THE MIDDLE NEOLITHIC: PRODUCTION AND DISTRIBUTION IN SOUTHWEST IBERIA

**Abstract author(s):** Neves, César (UNIARQ – Centre for Archaeology at the University of Lisbon; AAP - Association of Portuguese Archaeologists)

**Abstract format:** Oral

The transition from the Evolved Early Neolithic to the Middle Neolithic in southwest Iberia starts in the second half of the 5th millennium and ends in the first half of the 4th millennium cal BC, with the beginning of the first funerary megalithic monuments.

In contrast with the dynamics of the early stages of the Neolithisation process – where distinct cultural identities are well established – the Middle Neolithic in Southwest Iberia (~4500-3300 cal BC), seems to be characterized by a period of a large "sociocultural cohesion", shown by the homogeneity of domestic and funerary material culture, over a very broad territory.

It could correspond to a moment of stabilization and uniformity, with a collective knowledge, culturally recognized by human groups who occupy a large territory, sharing an increasingly common identity.

In pottery production, the Middle Neolithic represents a decrease of the decoration, until the presence of an archaeological record completely devoid of decorated vessels, in a complete opposition to the Early Neolithic, where pottery assemblages evidence the strong social meaning of decorative grammars, marked by a variety of techniques and decorative patterns.

It is between this dynamic that the first known megalithic funerary monuments emerged, in a phenomenon that belongs to the 2nd phase of the Middle Neolithic (~3700-3300 cal BC), and which also defines the beginning, in chronological terms, of this moment.

From the available empirical data, we will analyze the pottery role in the definition of the Middle Neolithic in southwest Iberia. During the Neolithisation process, this chronocultural phase developed in the moment that took place a set of human behaviors, with deep changes on social systems and symbolic complexity. These were, mainly, visible in the anthropic transformation of the landscape and the creation of social memories.

## DWELLING WITH THE IMAGES FROM THE ANCESTORS. THE DECORATED POTTERY OF REGADAS – TUA VALLEY, NORTHERN PORTUGAL

**Abstract author(s):** Teixeira, Joana (CITCEM-Transdisciplinary Research Centre «Culture, Space and Memory»/ Faculty of Arts and Humanities, University of Porto)

**Abstract format:** Oral

Regadas is a settlement located in the lower part of river Tua valley (Trás-Os-Montes, northern Portugal) that was excavated in the rescue context of the construction of Foz-Tua dam. There we found an occupation sequence from the Late prehistory where the best preserved contexts are dated from the regional Chalcolithic (2876-2503 AC) even if we believe it could have had an earlier foundation. In fact, Regadas' decorated pottery is generally characterized by its conservative aesthetics interpreted as deeply rooted in Neolithic traditions. Some features of this set of decorated pottery are also disruptive when compared to its regional parallels from the Neolithic and Chalcolithic and its interpretation is then complex and challenging. Our first aim is to present and discuss this data and how it seems to suggest a long-term intricate network of 'movements' of people/objects/ideas that somehow connected the Tua valley with interior and southern regions of Iberia.

Then, thinking about identity as a process, and not so much as a bounded entity, we will also discuss, through Regadas' case study, the role that the expression of different identities through behavior and 'archaeological objects' aesthetics, like in decorated pottery, could have had in groups' interaction during time. We will also discuss the extent to what we can, or not, directly correlate certain ceramics' characteristics to defined cultural entities strictly ascribed to a well defined chronology.

## THE CONTRIBUTION OF CERAMIC DECORATED TO UNDERSTANDING THE DYNAMICS OF CHALCOLITHIC COMMUNITIES: BETWEEN ESTREMADURA AND ALENTEJO (PORTUGAL)

**Abstract author(s):** Pereira Rocha, Leonor Maria (Universidade de Évora; CEAACP/UAlg) - Branco, Gertrudes (CHAIA/ Universidade de Évora)

**Abstract format:** Poster

Ceramic vessels are part of the visual environment of human behavior. One of the characteristics of the European culture of the Neolithic or later Copper Age is the appearance of special types of pottery indicating a particular concern with the presentation of food and drink, presumably for consumption in special social contexts.

In fact, the piece functionality is associated to it because of its shape, its decoration, applied onto pieces and in places that allow its visualization, carry a communicative intention, conditioned by the social and symbolic environment of the potter, intended to be understood in contexts of specific consumption.

It is in this context that the ceramic decorated with "acacia leaf" appears in the archaeological record. This is a decorative style, which results from the impression of a matrix - spatula on fresh clay - producing the effect of small leaflets that are arranged in a «spine» form or disposed in a cruciform way. Its presence, in an archaeological context, is conceived as one of the «directors fossils» of the communities that have inhabited the Portuguese Estremadura, during the Full Chalcolithic.

This type of ceramic decoration, a minority among the ceramics collected in the villages of Estremadura, can be found in a large number of villages (about 20), witnessing the existence of an extended community that shares an expressed message in a restricted set of ceramic recipients, which makes them eminently symbolic.

Recent archaeological works, carried out in the village of Santa Cruz 13, in Central Alentejo, allowed the collection of some ceramic fragments with "acacia leaf" decoration. These fragments are another element that testifies the intensification of the interregional interaction in the Chalcolithic. Its true dimension will be apprehended, always in a very small way, through the study and continuity of the archaeological works.

## **(RE)INTEGRATION OF THE CARPATHIAN BASIN INTO THE EUROPEAN MIDDLE PALAEOLITHIC: CULTURAL CONTACTS, INTERREGIONAL MOBILITIES, VARIABILITY IN SUBSISTENCE AND SETTLEMENT STRATEGIES [PAM]**

**Theme: 3. The Carpathian Basin: Integration, Mobility and Diversity**

**Organisers: Mester, Zsolt (Institute of Archaeological Sciences, Eötvös Loránd University; UMR 7194 HNHP CNRS/MNHN/UPVD, Institut de Paléontologie humaine) - Lamotte, Agnès (UMR 8164 du CNRS, HALMA, University of Lille, Bâtiment de Géographie)**

**Format: Regular session**

In 1976, Miklós Gábori published a great synthesis of the Middle Palaeolithic (MP) industries between the Alps and the Ural. As a main conclusion, he outlined a spreading process of the MP cultures from west to east, based on the actual typological and chronological dataset. He integrated the archaeological record of the Carpathian basin (CB) into this European scale palaeohistory of Neanderthals. Since the publication of his monograph, our understanding about the European Middle Palaeolithic have been changed considerably, due to new discoveries, new datations, new methodologies and new ideas. Cultural complexes have been recognized from the Eemian to the Interpleniglacial (MIS 5e-3, ca. 140-30 ka BP), like the microlithic tool industries, the Mousterian technocomplexes, the Keilmesserguppen, the Blattspitzengruppen and the laminar phenomenon. But little attention was paid to the archaeological materials of the CB.

Our aim is to (re)integrate the CB record into the European discours about MP. We are looking for cultural connections manifesting by similar patterns in technical behaviour, tool production, land use, settlement and subsistence strategies. Being connected to Central and Eastern Europe and the Balkans, the CB provides migration routes for animals and humans on a seasonal level or linked to the changing environment during the climatic oscillations of the last glacial cycle. In the light of the increasing chronological dataset, Gábori's model of the inhabitation process by Neanderthals should be revised.

For studying these different aspects, general synthesis, analysis on a regional or an interregional scale, and case studies are welcome.

### **ABSTRACTS**

#### **1 OVERVIEW OF THE MIDDLE PALAEOLITHIC OF HUNGARY IN EUROPEAN CONTEXT 45 YEARS LATER: ADVANCES AND NEW PROBLEMS**

**Abstract author(s): Mester, Zsolt (Eötvös Loránd University Institute of Archaeological Sciences; UMR 7194 HNHP CNRS/MNHN/UPVD)**

**Abstract format: Oral**

Forty-five years ago, in 1976, Miklós Gábori published his great synthesis of the Middle Palaeolithic (MP) industries between the Alps and the Ural. In this book, he placed the MP sites of Hungary and their lithic assemblages into European context. Taxonomically, he distinguished the Tata type industry (or Mousterian on pebbles), the Charentian of southeastern Europe, the Typical Mousterian of Central Europe, the Jankovichian and a Late Middle Palaeolithic industry with leaf points. He highlighted the existence of two groups, a western (Transdanubia) and an eastern (Bükk Mountains), without any relation between them. From 1980 onward, this picture changed considerably due to new discoveries and revisions by new approaches. Paralelly, the European context has been changed too. This pres-

entation aims at giving an overview of these changes in the interpretation of main MP sites in Hungary, like Subalyuk and Jankovich caves, Érd and Tata. The basic arguments of the new interpretations will be presented, as well as the related problems which have been raised or remained unsolved. The new discoveries allowed to identify new cultural units, like the Bábonyian in the region of the Bükk Mountains and the Micoquian in the Cserhát Mountains. Taking into account several similarities in typology, raw material economy and settlement strategy, the relation of these MP industries with bifacial tool production needs to be clarified. Although absolute datings are almost lacking for MP sites in Hungary, the chronology of the MP industries could be revisited regarding the European context.

## 2 GEOCHRONOLOGICAL FRAMEWORK OF THE MIDDLE PALAEOLITHIC IN HUNGARY

**Abstract author(s):** Ágnes, Novothny - Fonai, Milán (ELTE TTK)

**Abstract format:** Oral

The Middle Palaeolithic spans between 250 and 40 ka. This time interval corresponds with a part of Middle and Late Pleistocene, from Marine Isotope Stage (MIS) 7 to 3. The climate had drastically changed several times, warm and wet interglacial or interstadial conditions were altered by cold, dry glacials and stadials. The most widespread sediment on the surface of the Carpathian Basin is loess which has a considerable thickness of a few meter to maximum 80-90 m. It is among the most important and detailed terrestrial records of local climate and environmental changes during the Pleistocene. The 'young loess series', deposited from MIS 11 to 2, can be found widespread in Hungary and the most important key sections are located in the Gödöllő Hills and along the Danube-valley. The young loess series are subdivided into two parts. The lower part has a thickness of 15-20 m, intercalated by several thick, brown, well-developed forest steppe-like soils. The upper part has a thickness of 10 m and consists of sandy loess, intercalated by at least two very poorly developed soils. Two tephra layers are described from the young loess series. The lower one is termed Bag Tephra, locates above the lowermost pedocomplex. The high K-content suggests the correlation with the Villa Senni Tuff in Italy (around 351 ka BP). The other tephra layer is called Paks Tephra and it has similar composition like the Bag Tephra, therefore the same source area can be assumed. It deposited during MIS 3, as estimated from luminescence ages of the bracketing loess. In this study we are trying to present the state of the art (chrono-) stratigraphy of the Middle to Late Pleistocene in Hungary, as an essential geological framework for Middle Palaeolithic archaeological studies.

## 3 NEANDERTHAL SUBSISTENCE STRATEGIES IN HUNGARY FROM MIS 5 TO MIS 3

**Abstract author(s):** Seguedy, Marie (Institute of Archaeological Sciences, Eötvös Loránd University; UMR 7194 - HNHP, MNHN/CNRS/UPVD, Alliance Sorbonne Université, Institut de Paléontologie Humaine) - Patou-Mathis, Marylène (UMR 7194 - HNHP, MNHN/CNRS/UPVD, Alliance Sorbonne Université, Institut de Paléontologie Humaine)

**Abstract format:** Oral

Hungary is an important region to study Neanderthal behaviours since numerous Middle Paleolithic (Quina and Typical Mousterian, Taubachian, Bábonyian, Jankovichian) and transitional (Szeletian) technocomplexes are reported. So far, these different techno-cultural traditions are mainly known from lithic records. To provide further insights into Neanderthal behaviours, we present the preliminary results from the archaeozoological and taphonomic analysis of the Büdöspeszt and Szeleta caves. These analyses are accompanied by a synthesis of subsistence strategies from MIS 5 to 3 in Hungary. This study shows that Neanderthals exploited mainly large migratory herbivores such as woolly rhinoceros, bison, and horse but also smaller-sized herbivores in certain contexts and carnivores, notably as source of fur. This diversity suggests adaptation and anticipation skills and/or cultural choices. At all periods, Neanderthal occupations in Hungary consist of brief stopping-places and short-term camps mostly related to hunting, alternating with occupations by carnivores. As faunal remains are almost only preserved in caves and rock-shelters, this pattern could reflect a particular type of occupations. Neanderthal bone industries recovered at sites in Hungary are scarce but shed light on some possible behavioural changes through time.

## 4 RECENT DATA FROM SAJÓBÁBONY-MÉHÉSZ-TETŐ OPEN-AIR SITE : CHRONOSTRATIGRAPHY AND PALAEOENVIRONMENTAL RECORDS OF THE EPONYMOUS BÁBONYIAN (HUNGARY)

**Abstract author(s):** Salvador, Pierre (University of Lille) - Novothny, Agnes - Fonai, Milán (University of Budapest) - Marcoux, Nancy (University of Rennes 1) - Bout-Roumazeilles, Viviane (University of Lille) - Berger, Jean-François (University of Lyon 2) - Ventalon, Sandra - Lamotte, Agnes (University of Lille) - Mester, Zsolt (University of Budapest)

**Abstract format:** Oral

The Sajóbáony site of Méhész-tető is situated at about 207 m above sea level on the highest point of a small hill which forms the north-eastern end of the foothills of the Bükk mountains. The Sajó is the main river in the area. Several previous excavations have taken place at Méhész-tető, none of which provided any clear description of the stratigraphy or linking the site to the environment of the hill. A new field campaign, which started in 2019 still in progress, has made the reinvestigation of many studies possible, like the composition of clays, the characterisation of charcoal, the magnetism of the sediments and their composition elemental variations (XRF) and datings. A medium scale geomor-

phological study was carried out with the aim of integrating the archaeological site and its immediate environment. The study consisted of 5 manually dug holes (3 m deep) situated across the slope of the hill. Our objective was to check the conservation of the first pedostratigraphic observations. Next to the main excavation (12 m<sup>2</sup>), a manual open-hole-survey was also conducted. This revealed stratigraphy (2 m long by 1.80 m deep) from which a sedimentary column of 36 samples and 6 OSL dates were collected. The principal outcomes of our investigation demonstrated the development of a silty sequence older than 243 ka and also identified the last glacial/interglacial cycle (Eemian/Weichselian) in which the archaeological occupation levels were located. Using a multidisciplinary approach and original data, the purpose of this communication is to review the environmental evolution of the site in order to clarify the chronology of environmental and human events.

## 5 RE-READING THE LITHIC INDUSTRY OF THE EPONYMOUS BÁBONYIAN SITE AT SAJÓBÁBONY (BÜKK MOUNTAIN, HUNGARY)

**Abstract author(s):** Lamotte, Agnes (University of Lille) - Mester, Zsolt (University of Budapest)

**Abstract format:** Oral

Méhész-tető in Sajóbáony (northeastern Hungary), is an open-air site attributed to last glacial cycle. It yielded a lithic industry whose unique typo-technological composition gave rise to the classification of Bábonyian by Á. Ringer in 1983 and later in 2001. This Middle Palaeolithic cultural facies is characterised by leafpoints, Micoquian bifacial tools, Bábonyian knives and discoidal debitage resulting from flake production. The raw material used for both shaped tools and flake production is mainly quartz-porphyre.

Méhész-tető has been excavated several times by different prehistorians between 1975 and 1997 but unfortunately nothing has been published since 2000 so consequently, we were unfamiliar with the lithic composition, techno-economy datas of the industry, spatial distribution of the artefacts, and thereby did not possess any hypotheses regarding site function.

In 2019, however, this began to change. Firstly, we re-analysed all past collections from Toth Lajos and Arpád Ringer and, secondly was born a new international programme of excavations led by A. Lamotte and Zs. Mester, started at the site with a planned duration of 4 years (2019-2022) with many aims. Among them, this new programme permitted us to provide a better typo-technological characterisation of the industry and allowed us to compare all previous and current excavations (1986, 1997 and 2019-2022), using the same methods like metric, geometric morphometric, raw materials and chaine operatoire.

Each excavation yielded considerable numbers of artefacts scattered over 12 m<sup>2</sup>. Significantly, with this information, we were able to discuss the spatial distribution of each lithic category, the raw materials, make hypotheses regarding the daily activities carried out at the site and finally discuss about the Culture.

## 6 WEAR ANALYSIS OF THE LITHIC MATERIAL FROM SAJÓBÁBONY-MÉHÉSZ-TETŐ, HUNGARY

**Abstract author(s):** Borel, Antony (Histoire Naturelle de l'Homme Préhistorique - HHNP, Muséum national d'histoire naturelle, CNRS, UPVD, Paris; Institute of Archeological Sciences, Eötvös Loránd University, Budapest) - Mester, Zsolt (Institute of Archeological Sciences, Eötvös Loránd University, Budapest; Histoire Naturelle de l'Homme Préhistorique - HHNP, Muséum national d'histoire naturelle, CNRS, UPVD, Paris) - Lamotte, Agnès (University of Lille, HALMA Research Centre)

**Abstract format:** Oral

New excavations of the site of Sajóbáony-Méhész-tető (Hungary, Bükk Mountains), the eponymous site of the Bábonyian culture, have been carried out since 2019 in the frame of the French-Hungarian program of the French Ministry for Europe and Foreign Affairs. The revaluation of the site, aiming at characterizing the subsistence behaviours of its occupants, implies a thorough understanding of the function(s) of the stone artefacts. We propose here to present an extensive wear analysis carried out on the collections provided by the 2019 and 2021 excavations. The lithic material of Hungarian Palaeolithic archaeological sites has been the subject of only very few wear analyses. Moreover, no reference collection was so far accessible for the raw materials specific to the region, quartz-porphyre and limnosilicite in particular. Therefore, we will first present the ongoing experimental program which will later allow more detailed, qualitative and quantitative, examination of the surfaces of the artefacts. Through the microscopic screening of the stone pieces, we already classified them in four categories depending on the presence and clarity of the use traces. This first level of observation provides an insight of the spatial distribution and stratigraphical repartition of the use and about the relationship between tool raw material and use. The current results show clear discrepancies in terms of use micropolish development depending on the raw material of the tool. This raises questions concerning the proper function of the artifacts (more intensive use of the tools made of limnosilicite?) but can also be the result of a different development of the traces on the different raw materials or even of the technologies used for the observations. This will be discussed taking into account the new experimental data.

The experimental program is supported by the NRD Fund (K 132857), Hungary.

## 7 THREE CLASSICAL OPEN-AIR SITES OF THE BÁBONYIAN ON THE EASTERN MARGIN OF THE BÜKK MOUNTAINS (NORTHEAST HUNGARY): NEW INSIGHTS

**Abstract author(s):** Gábrriel, Sára (Eötvös Loránd University) - Béres, Sándor (independent researcher)

**Abstract format:** Oral

Due to the field researches conducted in the 1960's and 1970's in the Eastern margin area of the Bükk Mountains, a significant cluster of archaeological sites became known. These sites could be identified with the Middle Paleolithic era. Árpád Ringer presented the surface collections of five sites from this cluster in his dissertation, which was published in 1983. In his publication, the bifacial featured stone tools were compared to the collection of finds of the Central European Micoquian, which has been described by Gerhard Bosinski. However, Á. Ringer defined the Hungarian finds by the typological and technological characteristics as an individual cultural entity, by the name Bábonyian.

Since then, the term of the Bábonyian has been used in the international literature. Although during the last decades some field researches have been carried out, the traits and characteristics of the stone industry have not been described. On the eponymous site of the Bábonyian, since the year of 2019, in the framework of a French-Hungarian collaboration, new excavations have been carried out on Sajóbáony-Méhész-tető. Due to the new results of the research, it is worth to re-examine the finds of the classical Bábonyian sites.

During our presentation, we will present the surface collection of three of the five sites, which were published in 1983. The sites of Miskolc-Kánás-tető, Miskolc-Szabadka-tető and Sajókeresztúr-Szakáll-tető (Kövesoldal) are both located on the hilltops of the Eastern margin of the Bükk Mountains, 200-250 meters above sea level, north of the city of Miskolc. All the three sites' dominant raw material is the local quartz-porphry. The examined finds techno- and typology's characteristics will be compared to the informations published in 1983 to create a more complete image of the stone industry of the Bábonyian culture.

## 8 THE VARIABILITY OF THE MIDDLE PALAEOOLITHIC LEAF POINT INDUSTRIES IN THE CSERHÁT REGION AND THE IPOLY/IPEL' VALLEY

**Abstract author(s):** Markó, András (Hungarian National Museum - Budapest; University of Szeged) - Zandler, Krisztián (Ferenczy Museum Centre, Szentendre; University of Szeged) - Péntek, Attila (Independent researcher)

**Abstract format:** Oral

During the two last decades several open-air localities yielding leaf point industries were successfully excavated in Northern Hungary. At Vanyarc, Szécsénke and Galgagyörk, lying close to each other in the Cserhát region several hundreds or thousands of lithics were excavated in discrete artefact-bearing levels sealed by loam layers sterile in archaeological point of view.

The excavated assemblage from Szécsénke shows similarities with the 'Szeletian' industry from Moravia. The presence of the characteristic metarhyolite raw material the Galgagyörk and, especially, the Vanyarc site is strongly linked to one of the classical territories lying in the eastern part of the Bükk mountains and to the Tokaj-Hegyalja region. Lithic collections comparable to the Cserhát assemblages, however, have not been published from these territories until now.

Finally, in the Ipoly/Ipel' river valley the site of Hont first excavated by M. Gábori was (re)identified and tested by excavations too. The raw material types and the typological character of both the surface collected and excavated assemblages from this site is compared to the radiolarite tools known from poorly documented cave sites from the Transdanubia (formerly classified as belonging to the 'Jankovichian civilisation' or industry, as suggested by V. Gábori and M. Gábori) and probably to the 'Szeletian' known from Western Slovakia.

In the presentation we review the variability of certain tool classes like the side scrapers and end scrapers, as well as the assemblages from the four sites.

## 9 MIDDLE PALEOLITHIC OF THE PETROVARADIN FORTRESS IN A REGIONAL CONTEXT

**Abstract author(s):** Mihailovic, Dusan - Dragosavac, Sofija (University of Belgrade - Faculty of Philosophy) - Marković, Jelena - Mihailović, Bojana (National Museum in Belgrade) - Plavšić, Senka (University of Belgrade - Faculty of Philosophy)

**Abstract format:** Oral

The 2003 and 2004 rescue excavations of the Petrovaradin Fortress site near Novi Sad (Serbia) yielded a large number of Middle Paleolithic artifacts. Massive backed bifacially flaked sidescrapers, previously unknown from the southern part of the Pannonian Basin, were found in the lower layer of the site (Layer 2b), while the upper layer (2a) document an assemblage with a pronounced Charentian component (Mihailović, 2009). According to the OSL dating results, Layer 2b could be as old as  $86.0 \pm 9$  ka, while the obtained dates for Layer 2a vary between  $42.8 \pm 4.2$  ka and  $39.8 \pm 3.8$  ka (Marković et al., 2020). The unexpectedly late dates for Layer 2a raise the question of the stratigraphic integrity of the artifact-bearing strata, but also of the duration of Charentian in the region. Special attention will be paid

to these issues as well as the question of regional differentiation of Charentian industries in the southern part of the Pannonian Basin.

## 10 NEANDERTHAL DISPERSALS NORTHWARDS: TECHNOLOGICAL CONNECTIONS BETWEEN THE CARPATHIAN BASIN AND THE CENTRAL EUROPEAN MICOQUIAN

**Abstract author(s):** Picin, Andrea (Friedrich Schiller Universität Jena) - Keneder-Gubała, Katarzyna (Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Stefański, Damian (Archaeological Museum in Kraków)

**Abstract format:** Oral

During the Weichselian, climatic deteriorations and the expansion of the Scandinavian ice cup caused demographic contractions and decline of the Neanderthals populations across the mid-latitude territories of Europe. During these events, the Carpathian Basin were likely the sink area that contributed to the repopulation of Central Europe during the climatic amelioration (Picin et al., 2020). During these dispersals, Neanderthals from this glacial refugia may have brought with them local cultural traditions that could have been useful in the open environments of the Central European plains and in highly mobile contexts. In his seminal book, Gábori (1976) interpreted the richness of scrapers in several Eastern European sites to a new facies – the Central European Charentian. Further technological analyses of those lithic assemblages from the Pannonian basin revealed the recurrence of Quina and demi-Quina scrapers and the use of Quina technology (e.g. Mester and Moncel, 2006; Mester and Patou-Mathis, 2016). In this paper, we explore the possible cultural connection between the Carpathian Basin and the northern territories investigating the role of the Quina scrapers in the Micoquian techno-complex. We compare the presence of Quina retouch in several sites from Germany and Poland from a chronological perspective showing the presence of these type of tools since the beginning of the Micoquian.

## 11 THE LEVALLOIS TECHNIQUE AS A FACTOR DEFINING MIDDLE PALAEOLITHIC TAXONOMIC UNITS IN SOUTHERN POLAND

**Abstract author(s):** Stefanski, Damian (Archaeological Museum in Kraków) - Picin, Andrea (Bereich für Ur- und Frühgeschichtliche Archäologie, Friedrich Schiller Universität Jena) - Valde-Nowak, Paweł (Institute of Archaeology, Jagiellonian University)

**Abstract format:** Oral

The Levallois technique is an essential element defining the taxonomic diversity of Middle Paleolithic in Europe. The presence of this technique in many of its varieties has been recognized at numerous sites located north of the Carpathian Mountains, and particularly in the area of Krakow. One of the most interesting assemblages was discovered at the site of Kraków-Zwierzyniec I. The collection of Albin Jura from the 1930s, as well as assemblages acquired in the course of systematic research conducted by Ludwik Sawicki (the 1930s) and Waldemar Chmielewski (1973-74) allowed to define a local unit defined as Levallois-Mousterian culture. Using the stratigraphic position and thermoluminescent dates, the chronology of this unit was determined for the Eemu period. Apart from the issues outlined above, the Levallois technique is reported from other chronological and cultural contexts. The aim of this presentation will be to summarize the available information, as well as to outline this phenomenon based on old and new discoveries.

## 12 RESULTS OF USE-WEAR ANALYSIS OF TOOLS FROM LATE MIDDLE PALAEOLITHIC SITES LOCATED IN THE Odra VALLEY, POLAND

**Abstract author(s):** Chlon, Marcin (Institute of Archaeology University of Wrocław) - Pyżewicz, Katarzyna (Faculty of Archaeology University of Warsaw) - Kufel-Diakowska, Bernadett - Wiśniewski, Andrzej (Institute of Archaeology University of Wrocław)

**Abstract format:** Oral

Despite the increase in the number of sites and the number of finds from the Middle Palaeolithic, our knowledge of stone tool use is still very poorly understood. In this presentation we would like to present the results of traceological analyses for three Late Middle Palaeolithic sites. The research was financially supported by the National Science Centre (grant no. 2017/25/B/HS3/00925).

The first of the sites, Haller Avenue in Wrocław, contains artefacts forming two cultural horizons: an older one (MIS 5a-MIS 5d) and a younger one (MIS 3). The older one contains traces of several episodes connected with the acquisition of animal carcasses. Traces of contact with hide, soft tissue, and bone, are present. In the younger horizon no impressive traces were found, which is probably related to the function of bifacial tools aimed at reproduction. The

next site, Pietraszyn 49a, yielded traces dated to the beginning of MIS 3. The site represents a kind of workshop, where bifacial tools were prepared. Surprisingly, use-wear analysis shows that some of the tools brought in from outside and those made at the site contained traces of use during butchering activities or food preparation. There were traces of contact with soft tissue, hide, and bone. Another site, Dzierżyszlaw 1, has until recently been associated with transitional industries. It is now known that the artefacts this site are a mixture of Middle and Upper Palaeolithic, and possibly also industries from the border of these periods. Only single traces evidencing their use as elements of weapons have been identified.

In conclusion, we can say that use-wear traces are repetitive in terms of materials. However, their quantity is a result of many components, including the length of work, quality and quantity of raw material, length of stay, as well as dynamics of post-sedimentation processes.

### 13 UNREMARKABLE TRANSITIONS IN THE EASTERN CARPATHIANS: THE MIDDLE TO UPPER PALEOLITHIC TRANSITION IN ROMANIA

**Abstract author(s):** Chu, Wei (Leiden University) - Doboş, Adrian (Romanian Academy of Sciences)

**Abstract format:** Oral

The Late Pleistocene European record shows emerging patterns of demic turnover frequently associated with technological change between c. 50–40 thousand years ago. Across the continent, this is thought to be related to indigenous population replacement and the diffusion of developing technologies by *Homo sapiens* resulting in a spatio-temporal patchwork of hybridized transitional and Initial Upper Paleolithic industries. The Late Pleistocene record of Romania forms an anomalous situation in these scenarios. On the one hand, it has important Pleistocene archives that preserve direct evidence of Neandertal and *Homo sapiens* genetic admixture. On the other, Romania heretofore shows little evidence of technological assimilation across the Middle to Upper Paleolithic transition despite being astride where evidence is posited. Here, we critically review the Late Middle Paleolithic archeological record of Romania with new radiocarbon ages and artifacts to clarify the validity of the current archeological interpretation. We conclude that previous characterizations of the Late Middle Paleolithic of Romania are largely biased on misunderstandings of site taphonomy, the specifics of lithic raw materials and their typo technological classifications. Superimposing external frameworks simply do not work.

### A. MIDDLE PALAEOLITHIC OF THE MÁTRA REGION (NORTHERN HUNGARY): NEW INVESTIGATIONS AT GYÖNGYÖSTARJÁN 10 SITE

**Abstract author(s):** Gutay, Mónika (Hungary - Dobó István Castle Museum)

**Abstract format:** Poster

The Mátra Mountains constitute a part of the North Hungarian Range where the majority of the Palaeolithic sites in Hungary is located. Many researches have been investigated on the territories of the neighbouring Bükk and Cserhát mountains of the range, but little attention was paid to the region of Mátra. In the last fifteen years intensive field surveys were carried out in this region by the Dobó István Castle Museum (Eger, Heves County). During these surveys, eleven localities were recorded, mainly in the southern and southwestern part of the region, with sporadic finds or artefact concentrations of Middle Palaeolithic bifacial industries. Gyöngyöstarján 10 site was found in 2006, and together with Gyula Kerékgyártó independent researcher, we performed field surveys on several occasions until now. The extension of the site is about 300 m x 180 m where we collected knapped stone artefacts and raw material fragments. The collection is characterized by Middle Palaeolithic bifacial tools, mainly scrapers and points. Most of them can be attributed to Micoquian-Bábonyan cultures. In 2021, we conducted systematic field work and test excavation at the site. In the most intensive area of the site, a surface of 6 m x 30 m was carefully documented by a 1 m x 1 m grid system. In total 2710 knapped stones and raw material fragments were recorded. The richest square yielded 64 pieces. For stratigraphic control two test pits were dug next to the surveyed area. In these pits, respectively 27 and 257 artefacts were unearthed in stratigraphic context. The raw material is almost exclusively the local limnosilicite. Samples were taken for sedimentological analysis and OSL dating.

---

## 284 VISUALIZING, INTERPRETING, AND PRESENTING ARCHAEOLOGICAL SITES TO THE PUBLIC

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Thomas, Ben (Archaeological Institute of America) - Fonseca, Sofia (Teiduma, Consultancy on Heritage and Culture; German Archaeological Institute; ICArEHB-UAIG)

**Format:** Regular session

The number of visitors to archaeological sites around the world increases every year. Visitation has an impact on archaeological sites and several groups, including ICOMOS, and multiple publications have addressed the many issues, positive and negative, of increased archaeotourism. In this session, rather than discussing the impact of tourists on archaeological sites, we would like to consider the site's impact on the visitor. How are archaeological sites pre-

sented to the public? What does a visitor see and experience and how does that compare to what they expect to see and experience? Does the visitor leave with a clear understanding of the site and its interpretation?

Furthermore, what a visitor sees is the result of decisions made by site planners and managers. How are sites interpreted and presented to the public? Who makes the decisions about what should be shown and not shown? How do we decide what point or period in the site's history is to be represented? What are the influences (historical accuracy, tourism, nationalism, among others) that affect decision-making? What is the archaeologists' responsibility in terms of assisting and aiding with interpretations? What do we want the visitors to take away from their visit?

Finally, how are new technologies affecting interpretation and presentation? What is the role of digital technology, such as virtual reality and 3D, in presenting sites? Does virtual presentation take precedence over physical reconstructions? Are physical site visits even necessary anymore?

In this session, we want to discuss how archaeological sites are visualized, interpreted, and presented to the public. We invite papers from archaeologists, site managers, tourism experts, preservationists, and others involved with archaeological site presentation for the public.

## ABSTRACTS

### 1 CONTEXTUALIZING ARCHAEO TOURISM AND THE VISITOR'S EXPERIENCE

**Abstract author(s):** Thomas, Ben (Archaeological Institute of America; Berklee College of Music)

**Abstract format:** Oral

Visiting archaeological and historical sites is one of the most popular activities undertaken by tourists—ranking third after eating out at restaurants and shopping. As global tourism grows, the volume of visitors to archaeological sites is increasing rapidly. Site managers and the people in charge of preparing and presenting sites for the public employ a variety of methods and technologies to help visitors understand and interpret what they are seeing. But what do the visitors take away from the site? How do they understand and interpret what they see and experience? Additionally, how do visitors prepare for a visit to an archaeological site? If they prepare for the visit by learning about the sites, where and how do they get their information? Do site interpreters, tour operators, and others involved with presenting sites to the public make resources available for potential visitors so that they can do some pre-visit preparation? Is the experience of visiting a site enhanced by pre-visit preparation? In this presentation, I discuss the results of conversations and surveys that were conducted with a variety of people and organizations involved in Archaeotourism including tour operators, site managers, and, of course, the visitors themselves. The primary objective of this effort is to understand how people prepare for a visit to an archaeological site, what they learn before and during the visit, and what they take away with them after the visit. My hope is that this study highlights effective methods of enhancing visitors' experiences and understanding of a site by providing context for what they are seeing.

### 2 TURNING THE ARCHAEOLOGICAL SITE OF ELEUSIS INTO MYELEUSIS: VIRTUAL AND AUGMENTED REALITY AGAINST OR PRO PHYSICAL SITE VISITS?

**Abstract author(s):** Tsiafaki, Despoina (Culture & Creative Industries Dpt, Athena Research Center, Xanthi Branch) - Papangeli, Kalliopi (Ephorate of Antiquities of West Attica) - Mourthos, Ioannis - Motsiou, Paraskevi - Michailidou, Natasa (Culture & Creative Industries Dpt, Athena Research Center, Xanthi Branch) - Tzavali, Chrysanthi - Kazazaki, Christina (Ephorate of Antiquities of West Attica) - Koutsoudis, Anestis - Kiourf, Chairi - Ioannakis, George (Culture & Creative Industries Dpt, Athena Research Center, Xanthi Branch)

**Abstract format:** Oral

The COVID-19 pandemic caused, among other issues, the periodic closure of archaeological sites and museums and a big decrease in their visitor numbers, when they reopened. Moreover, during the lockdown the diverse digital access to archaeological and in general cultural heritage was promoted, where possible, as a means for the relevant institutions to keep their relationship with a digitally overwhelmed audience, but also for contributing to the people's wellbeing, during an unforeseen situation, through contact with engaging yet remote sites, peoples and times.

However, this increase in the use of Information and Communication Technologies within archaeological tourism and public outreach in general, dates back of course to pre-COVID-19 times. Especially 3D digitisation, along with virtual and augmented reality are among the advanced digital technologies used in the latest decades for studying, restoring and communicating archaeological sites and objects, with the ultimate goal to enable visitors to gain a complete picture of a site and its interpretation, as far as this is possible.

The present paper will describe the relevant technologies employed within the myELEusis project, in order to provide visitors with pertinent information before, during and after their actual time in Eleusis. It will discuss how and why 3D digitisation, virtual museums and augmented reality are engaged within the project, with the aim to enhance the visiting experience. The sanctuary of Demeter and Kore and the archaeological museum of Eleusis, listed among the most prominent and world-renowned Greek classical sites, will be a principal attraction of Eleusis, as the European

Capital of Culture in 2023. Will or can the pioneering digital systems, that will be created, replace the experience of the actual visit to the physical site of the ancient Eleusinian Mysteries, especially during or after the pandemic crisis?

### 3 THE PAST RECONSTRUCTED AND RELIVED: BETWEEN VISUALISATION, EXPERIENCES, EDUCATION AND COMMERCIALISATION

**Abstract author(s): Pawleta, Michal (Adam Mickiewicz University)**

**Abstract format: Oral**

The aim of my presentation is to determine the role archaeological reconstruction and historical reenactment may play in the interpretation of archaeological heritage assets for the general public currently conducted in Poland. These issues will be discussed in the context of the changes which have ensued in contemporary attitudes to the past caused by a series of economic, cultural and social factors.

It will be argued that archaeological reserves and reconstructions can serve as tourist attractions, enchanting visitors and offering them contact with the past compatible with the new historical culture. The same can be claimed about historical reenactment presentations which proliferation has been observable during the last decade. There are a lot of potential archaeology has to offer to heritage tourism, by bridging the gap between the past and present with a level of immersion, emotional engagement and realism.

Archaeological reconstruction and historical re-enactment will be then discussed from this point of view, with special consideration of the potential they have to offer for the visualization of the past, its interpretation and the ways of experiencing it. The aim of the discussion of these phenomena will be to identify their constitutive elements but also the pitfalls that arise in connection with them.

### 4 TRACES OF EXISTENCE – CAPTURING AND DISPLAYING A BRIEF MOMENT IN TIME

**Abstract author(s): Toreld, Christina - Johansson, Eirik (Bohusläns museum)**

**Abstract format: Oral**

In the late 18th century, a small community of Jews made themselves a home on the island of Marstrand, situated on the Swedish west coast. Today, their stories are embedded in the multiple layers of archaeology and history on the island. The project Traces of Existence aims to reveal this short but important part of history and make it visible in the public space, using innovative techniques.

The idyllic seaside resort you meet in July in the 21st century is quite different from what you would have experienced arriving at Marstrand in November in the 18th century. Then, the island was both a transit port for shipping as well as a military base, with the mighty Carlsten's fortress. In 1775, the town of Marstrand came to be classified as a Porto-franco (free port in the legal sense), and soon, a small group of Jews from Germany, the Netherlands and Denmark arrived. Now, religious freedom prevailed, allowing settlement without conversion. They were not many who came, nor was their community long-lived. Soon they moved on to the larger town of Gothenburg. But their traces still remain on Marstrand. Most obvious is the synagogue that was established in a casemate to Carlsten's fortress. We can discern their residences and occupations through historical documents, we can trace their whereabouts in historical maps and by studying the archaeological record maybe we can find shards of their everyday life.

By lifting the evidence of Jewish heritage that dwells in archives, places, and archaeological records the project Traces of Existence seeks to make this historical episode tangible again in the streets of Marstrand, creating a walk in time, an experience with sounds, images and stories.

### 5 FROM THE ARCHAEOLOGICAL REMAINS TO THE CO-CREATION OF MEMORIES

**Abstract author(s): Vieira, Alexandra (CITCEM - Transdisciplinary Research Centre «Culture, Space and Memory»; Instituto Politécnico de Bragança) - Pires, Raquel (Instituto Politécnico de Bragança; ID+, Instituto de Investigação em Design, Media e Cultura)**

**Abstract format: Oral**

The region of Trás-os-Montes and Alto Douro (Northern Portugal) has an exceptionally abundant heritage, namely in terms of archaeological heritage. This condition gives this inland region, with a low population density, a unique landscape that holds a significant touristic potential. Additionally, there are already numerous approved walking routes and trails to explore. However, despite this combination of favorable factors to the practice of sustainable archaeological tourism, there are still no archaeological routes in the region capable of engaging visitors and local communities.

The interpretation and the recognition of the past as an activator of co-creative experiences (UX) in the present, will support the design and implementation of a more sustainable cultural-tourism product/service, and fostering the economic development of the region.

This communication follows from two converging ideas. On the one hand, the creation of an archaeological route, which articulates cultural heritage elements located in the municipalities of Alfândega da Fé, Carrazeda de Ansiães,

Vila Flor and Torre de Moncorvo, to stimulate debate and networking, but also to include the local community and visitors in cultural participation. On the other hand, what if Service Design Thinking helps to reorganize the sphere of Archaeotourism, elevating it as an activator of the dynamics of valorization and interpretation of the heritage (in situ and digital) for public enjoyment?

Methodologically, we propose the combination of archaeological research, leading to tourism promotion, using the methods of Service Design Thinking, such as scenario design, user journey maps, blueprints, among others. We believe that such methodologies can encourage setting up or improvement of experiences, as well as decision-making on: which archaeological sites will be integrated into the Route; what are the preservation conditions that must be ensured; what are the most appropriate heritage interpretation strategies in each case; among other aspects.

## 6 THE CONSERVATION AND EXHIBITION PROGRAM OF VÉSZTŐ-MÁGOR, HUNGARY

**Abstract author(s):** Seifert, Jerrod - Lingle, Ashley (Cardiff University) - Gyucha, Attila (University of Georgia) - Parkinson, William (Field Museum; University of Illinois - Chicago) - Duffy, Paul (University of Kiel)

**Abstract format:** Oral

This multi-year conservation and mitigation program focuses on the Vésztő-Mágor tell in southeastern Hungary. The site is the largest prehistoric tell on the Great Hungarian Plain with ~7 m of stratified cultural layers dating to the Neolithic, Copper, and Bronze Ages, and is part of the Vésztő-Mágor National Historical Park. The Park features a unique, in-situ exhibition of a stratigraphic snapshot of Hungarian pre-history. The trench was opened in 1986 in the central part of the tell and was later covered with a permanent, closed structure to facilitate public access. Due to the fragile nature of the earthen heritage, a new program is underway to rejuvenate the site and increase visitor engagement.

With generous support from the Foundation for the Study and Preservation of Tells in the Prehistoric Old World, the first phase of the program began in 2022, focusing on the stabilization of the stratigraphic profiles and the conservation of the exposed features and artefacts. All conservation works implemented under the project will serve three main purposes, including capacity building, preservation, and engagement. Following this initial phase, we will model the newly regenerated site and begin developing digital experiences for site visitors. This program recognises the value in both the in-situ archaeology as well as the benefits of digital heritage.

This paper will examine the first phase of the project, focusing on the conservation of the in-situ archaeology and the development of a novel approach to environmental monitoring, interpretation, and data validation. We will demonstrate that by having a more nuanced understanding of the mechanisms of environmental decay of the site, a more sustainable preservation program can be developed. Ultimately this method will allow for the improvement of the physical and virtual experience of the site itself.

## 7 ANCIENT FINDS FOR MODERN TIMES. DEVELOPING A VR EXHIBITION FOR ARCHAEOLOGICAL SITES ON THE LOWER DANUBE: CIRNA AND NUFARU (ROMANIA)

**Abstract author(s):** Bors, Corina Ioana (National History Museum of Romania - MNIR) - Suteu, Calin (Gigapixel Art) - Cocis, Horatiu (County Museum of History and Art - Zalau - Salaj) - Florea, Mihai - Damian, Paul - Vasile, Mihai (National History Museum of Romania - MNIR) - Damian, Oana ("Vasile Parvan" Institute of Archaeology)

**Abstract format:** Oral

The Danube's Archaeological e-Landscapes project (DAeL) represents an opportunity to valorize the archaeological heritage by new technologies. In such a framework was possible to study museum collections and related documentary archives in order to create digital content for a state-of-the art exhibition focused on two archaeological sites: Cirna – Bronze Age cremation necropolis and Nufaru – Byzantine fortress. The rich and culturally diverse archaeological heritage of the Danube region is the only remnant of the millennia of our society's development and a carrier of important information about our past. Its huge potential for the development of tourism in the region is facing a major challenge, as it is not visible enough to be sustainably managed and used. By "visibility", not only sheer physical presence of archaeological artefacts or reconstructions of sites is meant, but also the visibility of archaeology for the general public. New technologies enable us not only to visualize archaeological knowledge in completely new ways, but also to transfer it promptly and in attractive ways to the broader public. The site from Cirna was completely excavated in the 40's and 50's of the 20th c. and published very accurately (for the scientific standards of those times), yet the original landscape heavily impacted by extensive agricultural and fish farming developments in the 70's followed by the total destruction due to the major floods of the Danube about 15 years ago. The site from Nufaru had part of the vestiges still visible in mid-19th c., yet today large portions of the fortification overlapped by a modern village. As a result, the exhibition offers an interesting curatorial dialogue, comprising a classical manner for displaying relevant artefacts, as well as providing a new VR milieu for a better contextualization, giving to the public new possibilities to understand and explore the past.

## 8 OTHER EYES: USING AVATARS AND IMMERSIVE REALITY FOR EMBODIED ARCHAEOLOGICAL INTERPRETATION

**Abstract author(s):** Morgan, Colleen (University of York) - Eve, Stuart (L-P Archaeology) - Alexander, Michelle (University of York)

**Abstract format:** Oral

The UKRI AHRC funded OTHER EYES project seeks to create avatars using bioarchaeological data to understand the experiences of past people using virtual embodiment and immersive technologies and to communicate this understanding to others. We are in the process of creating a mixed reality experience based on human remains excavated from Roman-era cemeteries in York, UK to test research questions regarding the construction and use of avatars to understand the past. These avatars include the 'Ivory Bangle Lady,' a Roman-era woman of North African descent and a man of Middle-Eastern descent. The ethics of resurrection are necessarily fraught, therefore an integral part of OTHER EYES is the formation of a rigorous, transparent, ethical framework for the digital reconstruction, visualisation and transmission of past people using bioarchaeological evidence. There are also considerable technical and interpretive challenges for this work that are informative for those seeking to access immersive technologies for archaeological investigation and dissemination. In this talk we discuss the formation, implementation and reception of this project.

## 9 PRESENTATION OF ARCHAEOLOGICAL SITES AND SUSTAINABLE CULTURAL TOURISM – HOW IT WORKS IN REAL LIFE EXAMPLES

**Abstract author(s):** Lukacevic, Marijana (Private company)

**Abstract format:** Oral

In Croatia, country rich in historical and cultural heritage, fortunately cultural tourism is a concept that is increasingly present in the language of tourists. Consequently, archeology, as a very mystical and interesting science to the general public, has found its place in the concept of cultural tourism. The main question of this presentation is how to attract tourists to archeological sites? How and who will properly present to them archeological sites such as prehistoric ones where after the research there is little left to see on the site itself? Are digital technology and VR the future of the presentation of archeological sites and educational boards with QR codes just an introduction to what the visitor should experience? Presentation of cultural heritage, archeological and historical sites is financially very expensive, local and state government units cannot allocate sufficient funds for all phases of reconstruction and presentation of one or several archeological and historical sites. Consequently, because of insufficient financial funds, we are losing the definition of complete and sustainable cultural tourism in one region. But, today, thanks to financial resources of various EU funds, it is possible to think about several parallel projects of reconstruction, presentation and digitalization of cultural heritage; and after a financial period of 7 to 10 years to have sustainable cultural tourism in one region. On the example of Požega-Slavonia County, the county in the heart of the Slavonia-Continental Croatia region, this presentation will show how the implementation of several parallel EU-funded projects of reconstruction and presentation of archeological sites, prehistoric and medieval, creates an infrastructure of sustainable cultural tourism and connecting archeological sites with activities of local people. And, finally, what benefits and recognizability we already have because one part of the Iron Age Danube Route with the Council of Europe certificate passes through our county.

## 10 MUGEPORTAL: A DIGITAL PLATFORM FOR THE LAST HUNTER-GATHERERS OF THE TAGUS VALLEY, PORTUGAL

**Abstract author(s):** Gonçalves, Célia (ICArEHB, Universidade do Algarve) - Umbelino, Cláudia (CIAS, Universidade de Coimbra; ICArEHB, Universidade do Algarve) - Figueiredo, Mauro (Universidade do Algarve) - Cascalheira, João - Godinho, Ricardo - Belmiro, Joana - André, Lino - Martins, Daniel - Matias, Roxane - Bicho, Nuno (ICArEHB, Universidade do Algarve)

**Abstract format:** Oral

The Muge Shellmiddens Project: a new portal for the last hunter-gatherers of the Tagus Valley, Portugal focuses on the requalification and valorization of the archaeological and paleoanthropological heritage of the Mesolithic complex of Muge (Tagus Valley, Portugal), classified as a Portuguese National Monument since 2011. It is a new multidisciplinary and innovative approach that involves the development of cybernetic infrastructures and e-science initiatives, that in turn will allow: (1) a systematization of the archaeological data collected over the last 150 years in Muge, implementing an online database that offers the possibility of storing, consulting and performing analytical-interpretative and spatial queries of archaeological, paleoanthropological, paleoenvironmental and historiographic data and, (2) the creation of interactive didactic and dissemination contents based on augmented and virtual reality technologies showing the daily lives of these communities. With these approaches, the project intends to promote a new path of scientific and cultural access to the Muge shellmiddens, transporting the Mesolithic to the present in a vibrant and informative way.

11

## LASTING IMPRESSIONS: PRESENTING ARCHAEOLOGICAL SITES OF THE XEROS RIVER VALLEY (CYPRUS) THROUGH 3D MODELS AND AUGMENTED REALITY

**Abstract author(s):** Ripanti, Francesco (Independent researcher) - Papantoniou, Giorgos (Trinity College Dublin, The University of Dublin) - Vionis, Athanasios (University of Cyprus) - Lanitis, Andreas (Cyprus University of Technology) - Ioannou, Eleftherios (The University of Sheffield)

**Abstract format:** Oral

During the COVID-19 pandemic, the role of digital technologies in facilitating the access to cultural heritage sites from home has been under the spotlight. Now that the social distancing measures are starting to be lifted and tourists can safely travel again, further reflection is needed on how to blend in-situ experiences with the opportunities offered by digital experiences - as they are not mutually exclusive. What do visitors expect from using technology while visiting heritage sites? Can digital experiences support the fruition of heritage in the long-term? What are the main challenges for the archaeologists? This paper will address these and other questions through a case-study research from Cyprus.

Developed within the framework of the "Unlocking the Sacred Landscapes of Cyprus" research project, the UnSa-La-CY app narrates the evolution of the surrounding landscape and the fate of pre-modern monuments and archaeological sites in the Xeros River valley (Larnaca District), serving as a guided tour for visitors of the area. Through QR codes, the users get access to historical information about the corresponding monument and, in selected cases, to a 3D reconstruction of monumental features part of the sacred landscape - partially browsable with augmented reality.

Over 2021, an evaluation process investigated the functionality, the user experience, and the educational impact of the app through mixed methods research - such as participant observation and surveys. Building on these newly collected data, this paper will discuss the outcomes of the evaluation process. The visitors' remarks, requests and priorities will be presented, to inform a reflection on the archaeologists' responsibility in the decision-making process behind the app design and implementation.

12

## UIST UNEARTHED: VISUALISING ARCHAEOLOGICAL SITES THROUGH AUGMENTED REALITY

**Abstract author(s):** Gal, Emily - Rennell, Rebecca (University of the Highlands and Islands)

**Abstract format:** Oral

Uist, in the Western Isles of Scotland boasts internationally-significant archaeological sites, exceptional preservation of remains, and diverse archaeological landscapes. Nevertheless, there are few impressive upstanding remains, fewer still with any form of on-site interpretation and limited material in local museums. This is challenging for communities and visitors wishing to engage more meaningfully in Uist's heritage. To date, this rich archaeological resource has been under-exploited in terms of visitor experiences.

Created and led by Lews Castle College UHI Archaeology staff supported by Comhairle nan Eilean Siar, the Uist Unearthed app reimagines important archaeological sites along the Hebridean Way in stunning Augmented Reality (AR), offering an exciting trail-based experience for visitors. It is the first of its kind in Scotland – presenting location-based AR experiences of archaeological sites. The mixed-media app contains detailed AR reconstructions of sites alongside bilingual information from excavations, animations, audio, and 3D artefact models. The creation and testing process highlighted the importance of balancing 'authenticity' with user experience at visitor sites. This presentation will reflect on priorities, challenges and opportunities for presenting and interpreting archaeological sites through Augmented Reality.

13

## HOW IDEALISED VIRTUAL REALITY MEDIATES ARCHAEOLOGICAL SCIENTIFICITY TO THE PUBLIC

**Abstract author(s):** Lengyel, Dominik - Toulouse, Catherine (BTU Brandenburg University of Technology Cottbus-Senftenberg)

**Abstract format:** Oral

In the 2020 session 'Sensitizing and Engaging the Public', we presented our method of visualising uncertainty in archaeological knowledge to show how abstraction and idealisation can help to engage the public in archaeology in a way that maintains scientificity by design for the visual translation of archaeological hypotheses.

In this paper we intend to present an ongoing research project which should provide direct answers to the questions posed in the session. It is about an amphitheatre on the coast of the Adriatic Sea that is marked by the impression of decay, while the task of the adjacent museum will be not only to show the magnificent architecture that preceded the ruin, but also to convey its social and cultural implications, since ancient amphitheatres were veritable visual reflections of society with their direct, structured representation of the social classes organised by the ranks. A largely destroyed building, which is at the same time a representative of an extensively researched building type, oscillates between individuality and commonalities, and therefore turns out to be particularly suitable for a visualisation method that focuses on idealisation and standardisation. The decision as to what is to be shown and conveyed is

made jointly between the disciplines of archaeology and architecture, both however committed to science with a commitment to a minimum of fictional addition and a maximum of scientific foundation. The find is responsible for the concrete location, the genius loci, the virtual digital visualisation is responsible for the scientific information, the spatial mediation in 3D, with or without virtual reality, as well as the emotional impact. Walking through even an abstracted spatial hypothesis with the help of digital technologies leaves behind a clear understanding of the site, a complementary addition through new technologies to the direct tactile experience of walking through the physical site locally.

## 14 VISUALIZING VIKING AGE AND MEDIEVAL TOWNS AND CENTRAL PLACES IN NORWAY. DIGITAL DISSEMINATION

**Abstract author(s):** Nytnun, Arve (Møre og Romsdal county)

**Abstract format:** Oral

By visualizing, interpreting, and presenting archaeological sites to the public, we are trying to get the visitors to understand how the sites may have looked like. But in what other ways does this type of dissemination affect the visitor?

Since 2018 we have been working close with historians, craftsmen and data engineers to find the right way to rebuild important historical sites in 3D graphics. The historical places are all important viking age and medieval sites, that represent important periods in the urbanization and development of towns and central places at different times. In Edøya we have chosen to focus on the mid viking age, while in Veøya in Romsdalsfjord we are presenting the early town, in the breaking time between the old Norse religion and Christianity. Some of the places are not easily accessible, and the 3D visualizing will make it possible to bring the sites to the tourist/visitor/school children etc.

In this paper I will take a look at the benefits with in making 3D models, but also present some of the challenges with doing so, not only relating to the technical and scientific challenges, but also in how we portray the presentation, and how we choose to present it.

How are sites interpreted and presented to the public? Who makes the decisions about what should be shown and not shown? The archaeologists, historian or 3D designer? How do we decide what point or period in the site's history is to be represented? What are the influences (historical accuracy, tourism, nationalism, among others) that affect decision-making?

## 15 GUIDELINES, RIGHT-HOLDERS, AND STAKEHOLDERS: HOW ARE WE COMMUNICATING AND EDUCATING IN ARCHAEOLOGICAL TOURISM?

**Abstract author(s):** Fonseca, Sofia (Teiduma, Consultancy on Heritage and Culture; German Archaeological Institute)

**Abstract format:** Oral

The ICOMOS International Cultural Tourism Committee (ICTC), is responsible for the ICOMOS Cultural Tourism Charter, considered the first international document dedicated to bringing awareness to the necessity for a responsible tourist approach to cultural heritage. The first version of the Charter dates to 1976, the second to 1999, and since 2021 the ICTC has been working on a revision version made to the charter due to the profound changes global tourism has suffered in the last decades. The draft charter, that has yet to be adopted at the ICOMOS GA 2022, in Thailand, is entitled "ICOMOS International Charter for Cultural Heritage Tourism (2021): Reinforcing cultural heritage protection and community resilience through responsible and sustainable tourism management", and focus on the importance of collaboration among stakeholders, participatory governance, people-centered and rights-based approaches, endorsing access, education, and enjoyment, to everyone visiting heritage places. In principle 3, it emphasizes "the importance of increasing public awareness and visitor experience through sensitive interpretation and presentation of cultural heritage". But how are we presenting and communicating archaeological sites to the public? And what are the guidelines to how we should convey the knowledge of right-holders and stakeholders regarding the sites? We will be using the 2021 Charter to understand what we should be bringing forward regarding communication and education at our Heritage sites to create more sustainable and responsible tourism.

## 16 PUIG CIUTAT, A LOW BUDGET ARCHAEOLOGICAL PARK

**Abstract author(s):** Tamba, Robert - Pujol, Angels (GIRA Association) - Sala, Roger (SOT Archaeological Prospection) - Ble, Eduard (DIDPATRI - University of Barcelona)

**Abstract format:** Oral

In small villages, with less than a thousand inhabitants, few resources can be dedicated to the maintenance of infrastructures dedicated to archaeology. In the case of Puig Ciutat, the solution that emerged was to create a free access and open-air archaeological park.

The archaeologists in charge of the excavation elaborated and presented a proposal having full liberty on the contents and the historical discourse. The strategy included involving learning theory specialists and the creation

of a webpage with complementary information. A virtual museum was also designed to compensate the lack of a physical one and to be able to present to the public the most singular elements of the archaeological collection.

After a few year of punctual contributions to the contents of the park and basic maintenance, an annual funding is allocated since 2019. As the excavation works are very slow and no new remains can be consolidated, it was decided to cover the remains at the end of each campaign and to represent the walls delimiting the spaces under excavation and additional features of interest with wood elements.

The main facilities of the park include panels that enable a self-guided visit with QR codes that give complementary information, reproductions of objects of interest that the public can touch and feel and a multi-point geocaching game.

Finally, starting form 2022, the park will host a recreational history event open to the public with theatricalised visits and access to the experimental activities that the recreational history members will be organising.

The main goal of the project of Puig Ciutat is that the public feel the site as their, as it is part of the history of humanity.

## 17 **VISUALIZING, RECONSTRUCTING, AND „VISITING” THE PAST: A CHALLENGE FOR THE MODERN ARCHAEOLOGIST?**

**Abstract author(s):** Dimopoulou, Sofira (Classical Archaeology, University of Münster)

**Abstract format:** Oral

This paper aims to present how the modern digital technology can be a medium to a direct connection between the past and the future for visitors of archaeological sites. The presentation is based on my PhD dissertation about the cult group in Lycosura in Arcadia of Peloponnese and the upcoming 3D reconstruction project of the colossal statues in the dark cella of the temple of Despoina. Pausanias was an archaeologist of the 2nd century AD., who visited the sanctuary of Despoina at Lycosura and his description about the temple, the statues, and the secret cult of the goddess is the only literary source about this archaeological site. The preserved fragments of the depicted figures in the National Archaeological Museum of Athens and of Lycosura Museum and the digital reconstruction of the group give the opportunity to the modern scholar and viewer to visualize and see them completed. A 3D visualization and tour inside the temple, where the visitor can experience and interpret the colossal group could be a real challenge. What is the purpose of this reconstruction and how far can the virtual reality affect the interest of interpreting ancient traditions? How can the visitor- in the case of Lycosura- experience the secret and forbidden and be a part of them?

## 18 **TRANSLATING GEOARCHAEOLOGY INTO GEO-EDUCATIONAL ITINERARIES IN THE MOLINA AND ALTO TAJO UNESCO GLOBAL GEOPARK, GUADALAJARA, SPAIN**

**Abstract author(s):** Banerjea, Rowena (University of Reading) - García-Contreras Ruiz, Guillermo (Universidad de Granada) - Monasterio, Manolo (Geoparque de la Comarca de Molina de Aragón-Alto Tajo and Museos de Molina) - Mattei, Luca (Universidad de Granada) - Pluskowski, Aleks (University of Reading)

**Abstract format:** Oral

UNESCO Global Geoparks and National Parks provide ideal settings to use geoarchaeology to synergise the presentation of cultural and natural heritage in their past landscapes. This paper explores ways to translate the important role that geoarchaeology plays in understanding past landscapes into heritage and tourist trails in relation to frontier landscapes in the Middle Ages with reference to 'castlescapes'—the cultural landscape associated with the biography of the castle. Geoarchaeology—the application of earth science techniques to archaeological research questions —creates synergies between the monument and its landscape and between cultural and geo-heritage. Soils and sediments are the backbone of the archaeological record and provide information about the changing form and function of spaces within castles and concerning the links between these spaces and activities in their hinterlands.

Cultural trails are increasingly commonplace tourism products and important aspects of tourism in Geoparks, National Parks, the Council of Europe's Cultural Routes programme and regional branding such as "Le Pays Cathare" in France. Trails are multi-faceted constructs, and this paper proposes to enhance them by using geoarchaeological and other environmental data to educate visitors as to how the historical landscape looked at a specific time. We provide ways to translate the role that geoarchaeology plays in understanding past landscapes into heritage and tourist trails using the case study of the Castle of Molina de Aragón, and its medieval frontier landscape, located in the Molina and Alto Tajo UNESCO Global Geopark. Geo-educational itineraries within the Molina 'castlescape' will be created with a GIS platform by drawing ideas from eno-tourism, where soil profiles are regularly presented in vineyards and museums, information boards with QR codes, and an app to view visualisations such as augmented reality informed by 3D photogrammetry and landscapes reconstructions based on geoscientific data, but also to showcase the entire scientific process.

A.

## ECHOES-DIGITAL RECONSTRUCTION OF ANCIENT HUMAN BIOGRAPHIES THROUGH THE STUDY OF ARCHAEO-ANTHROPOLOGICAL MATERIAL FROM THESSALONIKI, GREECE

**Abstract author(s):** Aidonis, Asterios (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Georgiou, Georgia - Kompatsiaris, Ioannis (Centre for Research and Technology Hellas - CERTH/ITI) - Protosalti, Soultana - Tzeveni, Stavroula (Ephorate of Antiquities of Thessaloniki City, Hellenic Ministry of Culture and Sports) - Alagiologlou, Cleopatra - Mavrokostidou, Maria (TETRAGON) - Kartsiakli, Vasiliki - Vra-ka, Christina (dot2dot) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

**Abstract format:** Poster

Urban areas are places where architecture, material culture, and the organization of space, reflect their history. The reconstruction of the historical past of cities brings to light specific features of past societies. We propose a methodology for highlighting the human past of a city, through a key factor of social expression, the biographies of its inhabitants. We study the human remains and the associated findings of material culture from the excavations during the construction of Thessaloniki's metropolitan subway. By integrating scientific innovations and cutting-edge technologies, such as isotopic analysis, virtual (VR) and augmented (AR) reality, we reconstruct the health, diet, and demography of the ancient population as well as the biographies of everyday and exceptional individuals. Through the cooperation of cultural institutions and companies of the sector of the creative industries, we develop alternative narrations and experiential tours. Our research project aims to preserve the historical memory of the transformed urban landscape of Thessaloniki, point out the significance of ancient humans as social agents in archaeological narratives and attract interest in the city's multicultural and diachronic character.

Acknowledgment: This research has been co-financed by the European Regional Development Fund of the European Union and Greek national funds through the Operational Program Competitiveness, Entrepreneurship and Innovation, under the call RESEARCH – CREATE – INNOVATE (project title: ECHOES-Development of a methodology for the digital reconstruction of ancient human biographies through the study of archaeo-anthropological material, project code: T2EDK-00152).

## GENDER DYNAMICS AT THE DAWN OF THE CLASSICAL WORLD: AN INDIGENOUS PERSPECTIVE [AGE]

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Saltini Semerari, Giulia (University of Michigan) - Ferrer, Merixtell (Universitat Pompeu Fabra) - López-Bertran, Mireia (Universitat de València)

**Format:** Regular session

The Iron Age brought lasting changes to the organization of Mediterranean societies, including increasing social complexity, the creation of city-states and other distinct territorial polities, the emergence of Mediterranean-wide exchange networks, and the widespread adoption of new technologies. These interconnected changes likely had a considerable impact on the economic and political organization and everyday lives of local communities, yet gender – one of the main axes around which people lives is structured – has yet to be fully integrated into this narrative. This is problematic, because traditional norms and behaviors regarding gender likely contributed to shaping local responses to these widespread changes, while also having to shift and adjust, in the long-term, to the changing economic and political context.

In this session, we would like to explore this issue from a comparative, Mediterranean perspective, highlighting the diversity of local responses to broad global shifts. In particular, we are calling for contributors to focus on the ways in which the allocation of power changed as more resources became available through Mediterranean-wide exchanges and migrations, as the social organization based largely on kinship became more stratified and as the distinction between the public and the private sphere became sharper. We would like to anchor our discussion around three main points: (1) a focus on all genders in their intersection with other axes of social organization (e.g. age, status); (2) a diachronic perspective; (3) gender in its relation with culture contact: how was gender renegotiated in light of the opportunities/threats/changes that occurred with the renewal and intensification in connectivity that took place in this period?

**1      **MERCHANTS AND WIFES. STORIES OF ROMANISATION IN PANNONIA****

**Abstract author(s): Szabó, Melinda (MTA - ELTE Research Group for Interdisciplinary Archaeology)**

**Abstract format: Oral**

In the context of the Mediterranean, the 1st century CE is not the dawn of the classical world. But in the Carpathian Basin the Roman conquest was the beginning of something new. The Roman province of Pannonia geographically was not part of the Mediterranean, but in the cultural aspect it had the same main characteristics as any other province of the Mediterranean. The indigenous Celtic and Illyric tribes of the region had their local habits, but as the Romans arrived, they had to find a way of living together.

In my presentation I would like to heighten two different aspects of the relation between the Romans and indigenous population. First, I deal with the difference or at some point the similarities between the Roman and indigenous merchants, who worked sometimes together. The second aspect is the practice of marriage of the new inhabitants. In the first decades of Roman presence, Roman residents usually married their own libertae. The change in this habit testifies the change in contact between Roman and Celtic inhabitants.

**2      **GENDER AND INTERCULTURAL DYNAMICS IN IRON AGE CAMPANIA****

**Abstract author(s): Cuozzo, Mariassunta (Università del Molise Italy)**

**Abstract format: Oral**

The paper deals with gender dynamics in Campania (Southern Italy) during the Iron Age. This is the period when the Greek "colonies" of Pithekoussai and Cumae were established profoundly changing the societal dynamics of the region. The present focus on gender adds another element to the multiple and often contradictory strands that pervade funerary studies such as the dialectics and/or the tensions between the collective and individual strategies. This has important gender implications, directly involving the highest-ranking female figures in the communities, the emergence of a Campanian aristocracy and also its growing monopoly over the exchange networks linking the Tyrrhenian to the rest of Mediterranean.

The paper discusses also some theoretical issues related to the definition of culture, ethnic identity, intercultural dialectics, cross-breeding and hybridization. From an archaeological viewpoint, a knotty question concerns the possibility that the material culture can convey ethnic and social meanings "Icons of power" and group dynamics are going to be analysed.

**3      **TRACKING VARIATIONS IN GENDER-ROLE PATTERNS. WOMEN AND SOCIO-ECONOMIC DEVELOPMENTS IN CENTRAL AND SOUTHERN ITALY****

**Abstract author(s): Desiderio, Anna Maria (Université Paris Nanterre; Università degli studi di Salerno) - Esposito, Arianna (Université Bourgogne Franche-Comté)**

**Abstract format: Oral**

This contribution aims to address the complex political and social dynamics characterizing the early Iron Age communities of ancient Italy, from the ninth to the seventh centuries BC. During this period, the system of exchange relationships and mobility in the central-western Mediterranean becomes considerably more complex and intensified. This leads to important changes in the socio-political organization of the Italic communities actively involved in the circuits of exchanges. In this context, they can hold, in various forms and degrees, groups and individuals from outside, who contribute to inter-cultural exchanges and technological innovations with native societies.

Our analysis aims to examine these socio-economic and political changes through the gender lens. What is the women's contribution to the construction of ideological models in increasingly hierarchical societies? Researchers have observed, for example, the concentration of imported ceremonial artefacts in the graves of prominent women. Examples come from southern Italy, Campania, and Etruria. They highlight the role played by small elite groups, who manage relations with the non-native components within the Italic communities. We would like to focus on the mediating function of the women and their participation in the local re-elaboration of external techniques and cultural models. It is precisely the diachronic and comparative perspective that is at the heart of our approach. This allows us to reveal a complex and interconnected system of identities, affected by a set of variables, expressed in an intersectional manner and funeral contexts dependent. This very dense system of relations and exchanges between the different societies involved (Greeks, Etruscans, Italics) plays a role in the balance of connectivity in the central-western Mediterranean.

## 4 GENDER DYNAMICS AND THE ORIGIN OF THE POLIS IN BASILICATA

**Abstract author(s):** Salfini Semerari, Giulia (University of Michigan)

**Abstract format:** Oral

The transition from the Early Iron Age to the Archaic period in Basilicata saw a confluence of large-scale social shifts which dramatically changed the economic, political and territorial organization of the region. Long-term processes of social competition and hierarchisation had created large indigenous communities plugged into wide-ranging exchange networks. To these communities settlers from the Aegean brought new resources, ideas and skills, giving rise to complex processes of culture contact. Ultimately, these processes also resulted in a reconfiguration of settlements in the region with the abandonment of Early Iron Age sites situated on the first inland plateaus in favor of new 'urban' foundations closer to the coast. This contribution discusses how gender dynamics may have intersected these changes and contributed to shaping them, from continuities in Early Iron Age gender traditions, to negotiations of gender roles in ritual contexts, to intermarriage, to the question of whether the transition to more institutionalized settlement forms based on (male) citizenship drastically diminished women's involvement in public political life.

## 5 FROM THE COLLECTIVE TO THE INDIVIDUAL: POWER AND GENDER DYNAMICS IN WESTERN SICILY, 9TH-6TH CENTURIES BC

**Abstract author(s):** Ferrer-Martín, Meritxell (Universitat Pompeu Fabra)

**Abstract format:** Oral

At the end of the 2nd Millennium BC the Sicilian population began a process of global transformation that, from the mid-8th century, was stressed by the gradual installation of groups of Aegean and Levantine immigrants in the coast of the island, and the subsequent establishment of regular relationships among these three communities. These changes are evidenced in settlement patterns, funerary practices, and domestic contexts.

These transformations point to the development of new social and political dynamics, but also to the emergence of new gender constructions, representations and relationships that can be analyzed clearer through the study of their ritual politics. Specially, I refer to the analysis of their main communal ritual places located in the settlement, the so-called acropolis.

The aim of this communication is to examine through the acropolis the construction of new power configurations and, mostly, the emergence of new hegemonic masculinities and femininities. To do this, I'm going to focus on two acropolis -Monte Polizzo and Polizzello- where, through their use of space and the different practices carried out there periodically, can be analyzed the gender and political transformations of these communities between the 9th and the 6th centuries BC.

## 6 THE SACRED WELL OF SANTA CRISTINA: CULT AND SYMBOLS

**Abstract author(s):** Carta, Arianna (Università del Litorale di Capodistria)

**Abstract format:** Oral

In Sardinia, the second biggest island of the Mediterranean sea, there are approximately 60 sacred wells, built during the final Bronze and first Iron Age, which represent a unique phenomenon in the entire Mediterranean area. In this paper I will specifically discuss Santa Cristina's isodomonic water temple (ca. XI sec. B.C.), the cultic use of which seems to be mostly related to the feminine sphere and its symbols: water, moon, (re)birth, death, while its cults survived centuries up to medieval times.

The discussion will proceed around three main axes. The first will be the analysis of Santa Cristina's sanctuary symbols: double staircase, vulva-shape perimeter, the up-side-down shadow phenomenon, the moon and the sun symbology.

The other axis will be the analyses of the archaeological context and the related remains (votive offerings such as bronze figurines, female-head thymiaterion, fibulae), astronomical hypothesis concerning the temple orientation according to the moon and the sun, the Phoenician influence and its possible role in the construction of the well and its cultic use (Tanit Goddess). The paper will also address continuity issues: patterns and changes occurred between Iron Age and Classical period, i.e. the subsequent worship of the Greek Goddess Demeter in this area and water temples named after female saints within catholic religion.

The third axis will provide some hints on Sardinia's folklore and traditions: tales about female characters and wells and their connection to archaeological sites and even connections to the traditional medicine (the "eye-medicine" transmitted through female lineage which implied the curative use of water) that can show the continuity of symbols and patterns within traditional culture.

## 7 HAVE YOU MET MY WIFE? GENDER AND LATE NURAGIC SARDINIANS

**Abstract author(s):** Hayne, Jeremy (Università Cattolica del Sacre Cuore)

**Abstract format:** Oral

Judging from iconographic and archaeological evidence, gender was one fundamental aspect of individual and group identity in the Sardinian Late Bronze and Iron Ages, and was critical in shaping how communities were navigated in a period that comprised deep societal changes (increasing contact with foreign communities at home and abroad). Yet discussions of gender roles are often ignored by scholars. There are various reasons for this: lack of burial data for this period of Sardinian protohistory; a focus on the problems of Sardinian chronology at the expense of a more comprehensive understanding of society. This paper engages with the discussion of Iron Age changes from a gender archaeology perspective, in two potentially informative areas: firstly iconography of the Sardinian bronzes. Studies of these have concentrated on stylistic elements of the male warrior or attempted a chronology based on style, but an exploration through gender perspective has been relatively untouched. The presence of female figurines implies gendered autonomy but how is this related to the wider social changes of the period? Does this reflect an increase in importance of the family, as seems to be intimated by changes to settlements or was there an increased role for women as lead figures at Iron Age sanctuaries? Secondly, contact between later Nuragic Sardinians and foreigners. Covering a period between the 9th-7th centuries BC Sardinians were in contact with both Etrurians on mainland Italy and Phoenician settlers Sardinia. Burials in Villanovan cemeteries seem to show that women played an important role in shaping contact, and intermarriage was likely to have been a factor in both contact situations. How did this contact affect gender dynamics of the islanders? This paper looks at the importance of gender diachronically and from an indigenous perspective, highlighting how the role of women and men has been moulded.

## 8 ENGENDERING THE "ORIENTALIZING" KOINE: GENDER DYNAMICS AND BODILY CAPITAL IN THE EARLY IRON AGE OF SOUTHERN PORTUGAL (7TH–5TH CENTURIES BCE)

**Abstract author(s):** Gomes, Francisco (University of Lisbon)

**Abstract format:** Oral

Recent research has highlighted the key role of gender dynamics in contexts of intercultural contact arising from the fixation of Levantine groups throughout the Mediterranean. Conversely, the impact of such contacts on the gender norms and their expression within local communities has also begun to be explored in greater detail.

However, significant blind spots still remain which need to be explored in further detail. The so-called "Orientalizing" koine of Southwestern Iberia is a case in point: while a great deal of research has been conducted on the impact of the Phoenician presence and on the social and political development of the communities which became embedded in the "Orientalizing" network mediated by that presence, very little attention has been afforded to the role of gendered social relationships in the structuration of that network.

New data from Southern Portugal does however afford new insights into that role. The information gleaned from newly excavated funerary sites is particularly interesting, as it highlights a shift in the ways gendered identities were conceived or, at least, expressed. One particularly significant aspect of that shift concerns practices related to bodily care, which in the Late Bronze Age were the province of male individuals and closely embedded in a "warrior ideology", but now become a prerogative of women, highlighting a new focus on female bodies which extends to other aspects, such as adornment and dress.

It will be argued that this shift, far from incidental, is a key component in the restructuring of local communities, especially in rural areas, and that it reflects a change in the strategies of accumulation of what might be called "bodily capital" (sensu Bourdieu) that was instrumental in the development of new sociopolitical structures which allowed those communities to adapt to their new position in the wider "Orientalizing" network.

## 9 ENGENDERING BODIES AND OBJECTS IN PLACES OF INTERACTION IN THE EARLY IRON AGE IBERIAN PENINSULA

**Abstract author(s):** López-Bertran, Mireia (Universitat de València) - Vives-Ferrándiz, Jaime (Museu de Prehistòria de València)

**Abstract format:** Oral

Over the last years archaeological research in the Mediterranean has emphasized the active role of material culture and objects for a better understanding of phenomena of culture contact. The far western Mediterranean during the Iron Age is no exception and diverse situations of interaction between indigenous people and groups of Phoenician and Greek origins, have been identified in which things played a key role.

In this paper we will focus on the cultural construction of gender in these episodes of contact situations. In tune with the tenets of a social and engendered archaeology we will address the material visibility of gender difference throughout the first half of the first millennium BC in the Iberian Peninsula. We will do so focusing on the mouth of the Segura and Vinalopó rivers; The reason for the selection of this area is that it shows very different degrees of involve-

ment and interaction between indigenous and Mediterranean groups, not least regarding the consequences of this contact. More specifically, we will examine the rich and varied evidence from ritual and funerary contexts.

The fundamental questions that we will raise are what gender-specific practices operated and how material culture was mobilised to construct, maintain or alter gender conceptions. Our theoretically informed approach places ideas of the social body at the forefront of the analysis by asking how things might have materialised gendered values and individuals in this area. This methodology allows us to get an in-depth understanding of social significances of gender differences and power relations and to what extent they differed and changed through time.

## 10 **CONNECTING GENDER BETWEEN ISLANDS: SOCIAL, ECONOMIC AND GENDER RELATIONS BETWEEN THE PUNIC ORBIT AND THE INDIGENOUS BALEARIC SOCIETIES (550-123 B.C.E.)**

**Abstract author(s):** Torres Gomariz, Octavio (Universitat d'Alacant; Universitat de Barcelona)

**Abstract format:** Oral

The colonial relations between the Phoenician-Punic communities of Ibiza and the indigenous groups of Mallorca and Menorca have been discussed in the protohistoric research of the Balearic archipelago (Spain). While for Ibiza there is a certain consensus in understanding them as state and patriarchal, the social structure of the indigenous groups of the eastern islands has been more debated. There has been talk of a progressive social stratification visible in necropolises and sanctuaries, something that contrasts with a defended continuity in the essential socio-economic forms. In short, this is a debate in which archaeology has focused above all on the great architectural manifestations of these island communities and the power relations that they materialise. However, the articulation of gender systems has not generally been integrated into these discourses, something that this work aims to advance. The study of everyday life reveals itself as an exceptional scenario for exploring the progressive construction of gender in this space and time, which has its roots in earlier periods and is at this moment when it reaches greater clarity. Through the integral analysis of domestic spaces, together with the information obtained from other areas of material culture, we propose an approach to the daily life of these populations in order to answer the following questions: was gender a real axis of social organisation at this time for both societies? Did the contact between the two structures have any kind of repercussion? The proposed answer is yes, but with its diversities and adaptations, and this work will propose the materials and hypotheses to understand this process.

## 11 **JEWELLERY AND ORNAMENTATION IN ANCIENT SOUTH-EAST ITALY: AN INSIGHT INTO GENDER AND CULTURAL ENGAGEMENT FROM THE 6TH-4TH CENTURIES BC**

**Abstract author(s):** Newland, Tayla (University of Sydney)

**Abstract format:** Oral

As an artefact type, jewellery has been systematically undervalued. While countless scholars have investigated prestige goods found in male burials, jewellery and ornaments have been decontextualised and relegated to museum catalogues, largely due to their association with 'feminine' enterprise. However, the study of jewellery can offer fundamental insights into the identities of its owners, and provides a useful lens through which cultural interaction can be viewed. This is particularly relevant in the context of ancient south-east Italy, where cross-cultural engagement between indigenous Italians and Greeks has long been debated. Despite this, past studies of jewellery from the region have proven Hellenocentric and superficial, with a notable absence of research on ornaments from indigenous sites.

This paper addresses the lacuna through a new typological analysis of jewellery from 6th-4th century BC south-east Italy. It considers the ways in which gender was actively embodied by ornamentation, and situates gender at the nexus of other facets of social identity such as age, social status and ethnicity. It also foregrounds indigenous women as agents of cultural mediation, and demonstrates that Italian communities used body modification to distinguish themselves from neighbouring groups. These analyses offer new insights into the lived experience of identity, changing social roles, and the nature of cultural contact on a local scale. But above all, they reframe gender within the dynamic socio-cultural context of this period, and provide a new perspective on the shifting social landscapes of the ancient Mediterranean world.

## 12 **EROTIC IMAGERY IN THE EASTERN ALPS AND ADRIATIC DURING THE 6TH/5TH CENTURY AS MANIFESTATIONS OF ELITE WOMEN'S AUTHORITY AND AGENCY**

**Abstract author(s):** Nebelsick, Louis D. (Unwersytet Kardynala Stefana Wyszynskiego w Warszawie)

**Abstract format:** Oral

Whereas most scholars dealing with fascinating East Alpine late sixth/early 5th century Situla Art concentrate on the "Situla Feast" as a reflection of Eastern Alpine social and ritual realities, I would like to explore more sophisticated aspects of this pioneering narrative imagery.

In this paper, I would like to examine the remarkable Situla from Pieve d'Alpago grave 1, an elite female sepulchre that has fascinated not only the scholarly community with its drastic and lusty depictions of courtship, sex and birth.

Scholarship has tended to see the imagery of this vessel reflecting drastically sexualized rustic narratives focussed on re-enactments of the Hieros Gamos and strategies of legitimizing inherited authority.

In this reevaluation of the situla's lusty imagery, I posit that, on the one hand, the imagery of this situla can be embedded in contemporary East Alpine iconographic formulae emphasizing women's sexual agency and familial authority. On the other hand, it surprisingly clearly reflects very specific Mediterranean mythologies involving transgressive sexuality. There are remarkable similarities between the Pieve d'Álpage situla's imagery and motifs in archaic Etruscan and Umbrian art, and particularly on Apulian stelae and Campanian subgeometric vase painting. Even more significantly, there are both iconographic and syntactic parallels between the Piave frieze and Pausanias' (5,17,5-19,10) description of the Kypselus Chest, which he saw in the Temple of Hera in Olympia.

In particular, the conceptual and iconographic interpretations of resolute Dike as the aggressive persecutor of Adikia /personified transgression of familial social and sexual norms and mythological women's attempts to transcend these strictures lie at the heart of the remarkable iconography of the Pieve d'Alpago situla. Clearly, interwoven mythologies were being invented, shared and interpreted in particular by elite women throughout the Adriatic.

## 13 A STUDY OF GOLD AND SILVER APPLIQUES OF SCYTHIAN GARMENTS

**Abstract author(s):** Lifantii, Oksana (National Museum of History of Ukraine)

**Abstract format:** Oral

My proposal examines gold and silver garment appliques of Scythian elite representatives that were buried in barrows of East European Steppe. The base of the study contains the appliques of clothes from more than 130 barrows of the 7th – 3rd c. BCE.

The character of images presented on these jewellery does not seem random. The symbolism brightly appears on long plaques of headdresses, where some integral "rows" and "order of code" could be seen, which is harder with small appliques.

Over 99% of items under analysis belong to the so-called small appliques (items with simple depiction and which length/height is twice as width) of garments that were used as the decor of all parts of the costume, from headdresses to shoes. The long appliques contain complex image schemes and the length of the item greater than the width three and more times.

The vast majority of long appliques decorated women's headdresses. I manage to allocated credible remains of 81 elite headdresses. Among them, nine are related to male "başlık" (hood) and forehead bands; 70 – with female "calathus", conic hats, blankets, hats, forehead bands and tiaras (type of Scythian hat). The remains of only two headdresses were found in children's graves, in the form of a conic cap with side beads owned by a girl 6-7 years old and a forehead band worn by a girl 10-12 years old. Furthermore, eight cases of decoration with gold appliques of men's and probably women's clothing (coats), seventeen women's dresses and one child shoulder clothes were traced. From nine remains of belts with appliques found in graves, in one case belt was belonged to the armed women, the so-called Amazon.

---

## 286 PUBLIC ARCHAEOLOGY AND SITES OF CONFLICT [PUBLIC ARCHAEOLOGY COMMUNITY]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Benetti, Francesca (Historic Environment Forum) - Westmont, Camille (The University of the South)

**Format:** Regular session

The past is contentious, and archaeologists and heritage practitioners are often at the forefront of interpreting these sites for and with modern audiences. These professionals also have a critical role to play in mediating disagreements over perspectives of the past, or in understanding and negotiating personal and visitors' emotions when dealing with signs of past conflicts. Working in sites of conflicts (or in sites that create tensions today) may require sensitivity (e.g. when dealing with human remains), clear aims, stakeholder collaborations, and a range of additional measures that may not be necessary in other contexts. How can archaeologists engage with difficult stories? What if stories of the past instigate conflicts/tensions today? What risks must archaeologists consider when working on these types of sites? Are there any opportunities to be harnessed? In this session we welcome papers aimed at exploring these topics, as well as others linked to sites of conflicts, from past battlefields to more recent conflicts and to social tensions stemming from different perspectives of the past.

## 1 FINDING FAMILY AT FROMELLES: KINSHIP, PRIVATE MOURNING AND NATIONAL COMMEMORATION AT A WORLD WAR I BATTLE SITE

**Abstract author(s):** Renshaw, Layla (Kingston University London)

**Abstract format:** Oral

The Battle of Fromelles took place in July 1916 in Northern France. Intended as a diversionary attack during the Somme offensive, it was a military disaster resulting in massive loss of life. One of the first major deployments of ANZAC forces on the Western Front, it has been described as the 'worst 24 hours in Australian history', and the 5th Australian Division suffered over 5,500 casualties.

In the wake of the battle, German burial parties gathered up the dead and buried them in mass graves. Due to the tenacious investigations and campaigning of amateur historian Lambis Englezos, and a network of relatives and supporters, the mass graves were eventually re-discovered and excavated in 2009. The exhumations were accompanied by intensive forensic analysis of the human remains and accompanying artefacts, as well as a large-scale DNA identification program. Of the 250 soldiers recovered, 166 have been successfully identified. The remains have now been reburied in a newly built cemetery close by to both the battle and mass grave sites. A new museum at Fromelles has become an important site of heritage and commemoration within the landscape of the Western Front.

This paper is based on a series of interviews with Australian relatives of the dead during the identification process. It examines tensions between different identities of Fromelles as the resting place of individual soldiers and as a heritage site for collective remembrance and education. Relatives value their profound, intimate and authentic connection to Fromelles, its landscape and residents. However, they also aspire to raise public consciousness of the battle, elevate the status of the site, and ensure state resources are committed to both investigating and honouring the dead. The impact of memorial diplomacy, the Great War centenary, and the universalizing effect of contemporary heritage practices will be explored.

## 2 REWRITING THE STORY OF SECOND WORLD WAR IN SKANDERBORG

**Abstract author(s):** Host-Madsen, Lene - Paulsen, Charlotte - de Vos, Julie (Museum Skanderborg)

**Abstract format:** Oral

During World War II, Denmark was occupied by Nazi Germany and during the last year of the occupation, the headquarters of the German Luftwaffe was placed in Skanderborg Dyrehave in the central part of eastern Jutland. After the war, the camp was reused to intern German refugees; civilians who had to flee their homes in the northeastern part of Germany, due to the Soviet offensive.

The relationship between Danes and Germans was tense both during and after the occupation and all contact with the interned civilians in the refugee camps was prohibited.

Based on archaeological fieldwork done in Dyrehaven, Skanderborg during the spring 2022, partially including a community dig, in this paper, the possible pitfalls and opportunities of doing archaeology at a contested site, as well as of including the local community in this doing, will be discussed.

The shaping of the narrative of the site is mainly in the hands of Danish researchers from Museum Skanderborg, integrating Danish locals in the research through a community dig. We are lucky to be in possession of original sources, as for instance diaries, and hopefully the archaeological digs will reveal untold stories that will add nuances to the narrative of the Germans in Dyrehaven. But how will the fact that the Germans themselves are absent from shaping their own narrative affect the knowledge that we produce? Or how do we balance with sensibility between both sides, without compromising our critical sense or undermining the drama lived on both sides of the barbed wire? The bringing together of this narrative, raises multiple questions that we would like to share at this session.

## 3 SOURCES OF CONFLICT: THE CASE STUDY OF THE AGITPROP SITE IN DREŽNICA, CROATIA

**Abstract author(s):** Iva, Stojevic (Institute of East Asian Studies, École Normale Supérieure de Lyon) - Gligora, Valerija (Valdir - obrt za istraživanje i usluge, Zagreb) - Grgurinović, Ivona (Department of Ethnology and Cultural Anthropology, Faculty of Humanities and Social Sciences, University of Zagreb) - Parežanin, Lujo (Department of Comparative Literature, Faculty of Humanities and Social Sciences, University of Zagreb) - Gomes Coelho, Rui (Department of Archaeology, Durham University; UNIARQ - Centre for Archaeology, University of Lisbon) - Horvatinić, Sanja (Institute of Art History, Zagreb) - Teixeira Simões, Sara (UNIARQ - Center for Archaeology, University of Lisbon)

**Abstract format:** Oral

The "Agitprop" site was located in 2020 during a landscape survey done within the project Heritage from Below | Drežnica: Traces and Memories 1941-1945. Between 1943 and 1944 the camp of the Central Technique of the Agitation and Propaganda Department of the Central Committee of the Communist Party of Croatia was located at Mt. Javornica, near Drežnica in central Croatia. The "Agitprop" was an important apparatus of the Yugoslav antifascist

resistance logistics, a kind of guerilla news agency service. Its Central Technique was a movable unit, printing newspapers, magazines, leaflets, as well as poetry and other literary works in the isolated mountain area.

Despite "Agitprop's" clandestine status during WW2, surviving local members of the resistance still have memories of it, and the local population still calls the forest glade "Agitprop". Agitprop's archives were lost, however, cooperation with local communities, along with testimonies of partisans working in the "Agitprop" published after the war, documentation efforts in the late 1960s, as well as archives and secondary sources were all used in the effort of locating the printing house.

In this paper we will present the results of the 2021 archaeological excavation on the "Agitprop" site in relation to ongoing archival and literary investigations about partisan cultural production. The aim of this paper is to reflect on the complex relationship between archaeological and archival sources in contemporary archaeology. We will focus on the circumstances surrounding work and history of the "Agitprop", and discuss how archaeological and historical evidence can be related in the production of an archaeological narrative. Even though the paper focuses on this one site, the issues raised by this excavation can be observed in similar sites, especially those that appear to be in conflict with official memory politics, or are in any way not in line with mainstream narratives.

#### **4 CULTURAL HERITAGE OF THE ITALIAN PARTICIPATION IN THE SPANISH CIVIL WAR: ARCHAEOLOGY, MEMORY AND RESIGNIFICATION OF A CONFLICT ARCHAEOLOGY SITE**

**Abstract author(s):** Perez-Juez, Amalia (Boston University) - Garcia Ruiz, Jose Luis (Independent Researcher) - Rodriguez Simon, Pedro (Independent Researcher) - Torija, Alicia (Tufts University) - Aramberri, Josu (Universidad del País Vasco -UPV)

**Abstract format:** Oral

Between July 1936 and August 1937, the northern region of Burgos, Spain, was a territory divided between those who remained faithful to the Spanish Republic and those who followed the fascist coup d'état. In the spring of 1937, the population of these communities witnessed the arrival of international troops, primarily the Italian soldiers from the Corpo Truppe Volontaire. This presence modified the landscape with the construction of trenches, dugouts, machine gun nests, and other structures for warlike attack and defence. The Italian troops also made dozens of engravings and graffiti on surrounding buildings and rocks. After the war, the landscape was changed again, this time, with propagandistic architecture such as the "Ossuary Pyramid of the Italian Fallen" or the monument to rebel soldiers.

This contribution presents the results of the project MD-209-2021, which deals with the protection of Spanish Civil War remains left by the Italian troops in northern Burgos. The work entails the cataloging of engravings and graffiti, but it also encompasses larger goals, which include the preservation and resignification of Civil War remains -clearly anti-democratic-. We are living a moment with an ongoing debate concerning the preservation of this kind of heritage. Citizens and researchers don't agree on the way it should be preserved or even if it should be. On the other hand, archaeological heritage offers a perfect opportunity to put things in context, and educate about present democratic values.

The remains we have located are rapidly decaying. Their preservation is urgent. The construction of roads, the demolition of old buildings, and ignorance or contempt are endangering the conservation of an irreplaceable, limited, undocumented and non-renewable heritage. The project also presents an international cooperation derived by the study of these remains and proposes how we can investigate, share, and engage in narratives that are still alive today.

#### **5 PUBLIC MEMORY AND ARCHAEOLOGY OF THE TENNESSEE CONVICT LEASE WAR, 1891-1892**

**Abstract author(s):** Westmont, V. Camille (University of the South)

**Abstract format:** Oral

Following the end of the US Civil War, white elites in the American South became re-enslaving African American men through the prison system. Prisoners were sold by the state penitentiaries to private businesses where they were forced to labor without pay for the duration of their prison sentences. Many businesses used prison labor as a means of preventing free labor from unionizing or striking for better working conditions. After 20 years of labor and racial oppression, free white working class communities across the state of Tennessee began using guerrilla tactics to bring about an end to the prison labor system. Repeated incidents of arson, attacks on prison wardens and guards, and public protests led by coal miners between 1891 and 1892 eventually led Tennessee to end their forced prison labor system. This series of events has collectively been called the Tennessee Convict Lease War. While the history of forced prison labor is gaining more attention across the American South, acts of rebellion such as the Tennessee Convict Lease War continue to be under-interpreted or entirely uninterpreted for public audiences. This paper explores efforts currently underway to expand interpretation of the Convict Lease War at the Lone Rock Stockade, where free coal miners repeatedly attacked a convict labor prison and successfully liberated the prisoners on one occasion.

## 6 FINDING COMMON GROUND IN THE SEARCH FOR THE UNITED STATES' LOST SERVICE MEMBERS

**Abstract author(s):** Peixotto, Becca - Toney, Joshua - Dalton, Kevin - Freudenstein, Nicolle - Grant, William (Henry M Jackson Foundation)

**Abstract format:** Oral

Through its Partnerships and Innovation (PI) program, the Defense POW/MIA Accounting Agency (DPAA) works with universities and organizations in the United States and around the world to fulfill its mission to provide the fullest possible accounting of the 70,000+ US service members missing from past conflicts. These collaborations often bring to light differing relationships that stakeholders have with the aircraft crash sites, battlefield landscapes, and sea loss locations. Archaeological excavations of World War II US aircraft crash sites in Europe by DPAA Partners allow an examination of the points of conflict and opportunity as the DPAA mandate, host nation heritage agency policy, local understandings of historical and present landscapes, and the interests of professional, trainee, and avocational archaeologists meet. In this paper, we discuss trends in the successes and challenges at the policy, institutional, and community levels encountered by DPAA and our Partners. Our experience suggests we can find common ground by respecting local memory and fostering new shared history at sites of past conflict.

## 7 CONFLICT ARCHAEOLOGY IN SCHOOLS: DISCUSSING DARK HERITAGE THROUGH MATERIAL CULTURE

**Abstract author(s):** Väisänen, Teemu (University of Turku)

**Abstract format:** Oral

The concept of dark heritage has recently gained traction in Finnish archaeology. While the definition of the concept remains debated, it generally refers to places of death, suffering, and disaster, whether battlefields, concentration camps or notorious sites of disasters. Such sites have not only been studied archaeologically in the recent decades, but they have also seen involvement of public and schools.

While there has been discussion on dark heritage as a source for history teaching in the form of school visits, little has been written on how students can address the difficult past of WWII through material culture, eg. taking part in archaeological excavations and discussing the difficult history through finds. In this paper, we discuss the possibilities of conflict archaeology in education.

As a case study, we focus on the Luftgau Finland research project organized by the University of Turku. The project researching the use of Finnish airfields by the Luftwaffe has seen public participation through public excavations, field schools and - most recently - an archaeological summer camp. These projects have not only educated a new generation of students into conflict archaeology and wartime history, but also sought to discuss difficult heritage with the local communities.

---

## 287 MACROARCHAEOLOGY - DEFINITION, OBJECTIVES AND APPLICATIONS OF A NEW ARCHAEOLOGICAL PARADIGM

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Schmid, Clemens (Max Planck Institute for Evolutionary Anthropology) - Matzig, David (Aarhus University)

**Format:** Regular session

Three years ago Charles Perreault published the "The Quality of the Archaeological Record", where he systematically deconstructs archaeology as a field frequently operating outside what it can verify "beyond reasonable doubt": "If juries were allowed to use the same test of consistency that archaeologists use, jails would be filled with innocent individuals and people would have no trust in the justice system." (Perreault 2019, p.21)

He justifies his withering critique with the following argument: In the last decades archaeology has fully internalized originally sociological or ethnological microscale research questions, focussing on individual-level agency, social organisation or even religion. That is ineffective, because the archaeological record is not sufficient for that in sampling interval, resolution and dimensionality. The mismatch of research questions and data – the "underdetermination problem" – causes archaeologists to publish narratives that can neither be verified nor falsified.

Founded on Perreault's analysis, this session seeks to explore the value in, barriers to, and arguments against a paradigm-shift towards what he introduces as "macroarchaeology": a data-focussed search for long-term, large-scale patterns of human behaviour, which emerge through extrinsic environmental drivers as well as intrinsic cultural evolutionary dynamics. It entails setting aside microscale processes in favour of evaluating the archaeological record itself — just like palaeontology did with the fossil record — and a focus on a small number of universal research questions surrounding measurable population parameters (e.g. rates of change in artefact categories or correlations among group structure properties).

To engage a diverse set of speakers who scrutinize theoretical and technical challenges of macroarchaeology, we invite contributions that...

- propose definitions and objectives for this field of research
- critically engage with its theoretical foundations
- argue for or against the paradigm
- discuss how it could complement previous work
- present research and datasets that fit a macroarchaeological frame of reference.

## ABSTRACTS

### 1 MACROARCHAEOLOGY: HOW CAN ARCHAEOLOGY MAKE NOVEL AND USEFUL CONTRIBUTIONS TO EVOLUTIONARY THEORY?

**Abstract author(s):** Perreault, Charles (Arizona State University)

**Abstract format:** Oral

Paleolithic archaeologist Geoff Bailey once observed that “archaeology . . . is reduced to an appendix, at best entertaining, at worst dispensable, of ecology, sociology, or whichever study of contemporary behaviour happens to be in current fashion.”. Although harsh, his comment is still accurate more than 35 years later. Archaeologists certainly aspire to make useful contributions to evolutionary theory and to our general understanding of human behavior. Archaeologists, for various historical reasons, have come to view themselves as prehistoric ethnographers, whose goal is to interpret the macroscale archaeological record in terms of microscale processes borrowed from other disciplines. In doing so they have produced a flow of information about the past that is impressive in its quantity but that is for the most part unverifiable. If archaeologists are to contribute to our understanding of human behavior and culture in a meaningful way, they need to do like paleontologists and recalibrate their research program to the quality of the archaeological record. This recalibrated agenda entails a different set of research questions than the ones archaeologists are trained to ask. Here I outline the kinds of research questions and the research strategies the macroarchaeology program entails.

### 2 CULTURAL MACROEVOLUTION

**Abstract author(s):** Prentiss, Anna (University of Montana) - Walsh, Matthew (National Museum of Denmark)

**Abstract format:** Oral

Charles Perreault's macroarchaeology offers an agenda focused on causes for variation in the pace and direction of cultural change. It joins a wider discussion of cultural macroevolution that includes several major themes. First, cultural macroevolution emphasizes the long term pattern of evolution. Such research offers opportunities for identification of a variety of underlying phenomena structuring variation in macroevolutionary trends. Second, cultural macroevolution provides insights into transitions on multiple scales. Technological transitions are common, while so-called great transitions are rare and the latter cannot exist without the former. Thus, cultural macroevolutionary explanations of transitions requires understanding of evolutionary hierarchies and reticulate causation. Third, cultural macroevolution contributes to scholarship concerning the wider bio-cultural evolutionary process. Culture provides one of several forms of inheritance (others include social learning, genetic, and ecological) and evolutionary causality is a reciprocal process incorporating effects of selection, phenotypic change, and acquired variation. Thus, cultural macroevolution enhances our understanding of critical processes such as animal and plant domestication. We review the wider scope of cultural macroevolution with respect to its potential to contribute to our understanding of human evolution across multiple scales. We provide illustrations of evolutionary process drawing in part from our own research in Arctic and Pacific Northwest North America.

### 3 WOULD A DINOSAUR VET CLINIC BE A DANGEROUS PLACE? SOME THOUGHTS ON THE ONTOLOGY AND EPISTEMOLOGY OF ARCHAEOLOGY

**Abstract author(s):** Araujo, Astolfo (Museum of Archaeology and Ethnology - University of São Paulo) - Okumura, Mercedes (Institute of Biosciences - University of São Paulo)

**Abstract format:** Oral

Processual archaeology was mistaken in many ways; however, we believe that one of the most damaging ideas that is still popular among some archaeologists is the belief that we study a fragmentary and imperfect cultural record and, therefore, that we do a poor, incomplete, and handicapped anthropology or ethnography of the past. Of course, processualists were not alone in this view. The idea of Archaeology as being interested in revealing an instant portrait of the past and human individual idiosyncrasies is one that has been permeating in the discipline in the last 60 years, trespassing even seemingly opposing theoretical stances, such as the “ecological”, “paleoethnographic”, or “agency” paradigms. In a sense, that prevents many archaeologists to realize that our discipline is in charge of studying the only long-term record of human culture, which can be regarded as a pivotal element to better understand cultural changes through time. We propose that archaeologists should engage in projects that can be properly developed considering the nature of the archaeological record. Such projects can include long term changes of

archaeological cultures, including changes in artifacts, subsistence, settlement, or burial patterns, among others, contributing towards the discussion regarding which factors are involved in cultural innovation or stasis through time. We consider that a theoretical framework that includes Evolutionary Archaeology and Cultural Transmission Theory would be fit to this endeavor, although other theoretical approaches could be considered. In this communication we will point some ontological issues and stress the importance of addressing Archaeology from a standpoint that is rooted in Philosophy of Science. We believe that once the mismatches between ontology, epistemology, and practice are detected and overtly stated, archaeologists can be more critic about their reasoning, discourse, and practices.

#### **4 MECHANISMS IN ARCHAEOLOGICAL EXPLANATION: MUCH NEEDED FOR MACROARCHAEOLOGY, BUT MAINLY MISSING FROM THE POST-MODERN MAINSTREAM**

**Abstract author(s): Marwick, Ben (University of Washington)**

**Abstract format: Oral**

In the last decade there has been burst of discussion in the social sciences, in biology, and in philosophy of science on how scientific explanations should be structured. Early unproductive engagements by archaeologists with philosophy of science work on explanation has led to a general neglect of these important developments in scientific explanations. Rather than advocate a specific explanatory style, these recent discussions in other fields indicate that one of the most important and useful structural elements in social science explanations are mechanisms. For archaeologists, working at the intersection of human and natural sciences, it has not been clear if the approach to mechanisms of biologists or sociologists will be more useful and generative. I argue that with some modifications, sociologists' concepts of mechanisms are most natural for archaeological explanation, and hold the most potential to improve reasoning about challenging situations, such as a unique case study. I describe the modifications necessary to satisfy most archaeological situations, and define "mechanismic" thinking as a way to deal with three important objections likely to come from archaeologists. I explore the dynamics of underdetermination determined by the temporal scale of an archaeological inquiry, and evaluate how this limits the kinds of mechanisms that can be included in explanatory narratives in archaeology.

#### **5 MACROARCHAEOLOGY, EPISTOMOLOGY, AND THE QUALITY OF THE ARCHAEOLOGICAL RECORD**

**Abstract author(s): Allison, James (Brigham Young University)**

**Abstract format: Oral**

Perrault (2019) combines a critique of current archaeological practice with a call to re-center research on questions of culture history as well as "macroarchaeology", or the search for large-scale patterns of human behavior and cultural development. His arguments for what archaeologists should do (and stop doing) are driven by the way the quality of the archaeological record underdetermines the answers to questions that archaeologists often seek to answer. There is much to like in Perrault's arguments, but there also are some problematic aspects. I agree that something like Perrault's macroarchaeology should receive greater focus within the discipline, and that archaeologists should carefully consider the quality of their data, but I cannot agree with his call for a radical pruning of archaeology's research agenda.

Perrault argues that archaeologists should search for "smoking guns" that allow hypotheses to be proven "beyond a reasonable doubt". This is a simplistic and unrealistic description of the research process. He does better when he introduces the idea of using likelihood ratios to evaluate the support given to multiple hypotheses but does not fully develop the idea.

I argue for a Bayesian epistemology, which uses the prior probabilities as well as the likelihood ratios of multiple hypotheses (given available data) to reduce uncertainty about the hypotheses, without strictly confirming or rejecting any particular hypothesis. A Bayesian research model provides a different perspective on the underdetermination problem – if smoking guns aren't necessary for research to progress, then the quality of the archaeological record is not as debilitating as Perrault suggests. Archaeological research can (and should) proceed at a variety of scales and work with data of varying quality. Macroarchaeology should become an important part of the discipline, but its impact will require successful macroscale studies, not radical pruning of other parts of archaeology's research agenda.

#### **6 ARE WE WHAT WE EAT? THE SOUTHWEST ASIAN "NEOLITHIC REVOLUTION" AS MACROARCHAEOLOGICAL THEORY**

**Abstract author(s): Roe, Joe (Institute of Archaeological Sciences, University of Bern)**

**Abstract format: Oral**

V. Gordon Childe's theory of a 'Neolithic Revolution' cemented the Neolithic of Southwest Asia as one of the key episodes in the cultural evolution of our species – ground zero for a new socioeconomic system that went on to transform prehistoric societies across Eurasia. Nearly a century of subsequent research has greatly expanded our knowledge of

the sequence and nature of the Southwest Asian Neolithic, yet in many ways we seem no closer to a definitive model of the causes and consequences of this new economy than we were in Childe's day. Indeed, the very concept of a Neolithic Revolution has accumulated such a weight of critique and modification that it seems all but buried: we now know that that, far from being a sudden spark of genius, the advent of agriculture was highly dispersed and protracted; alternative explanatory narratives have de-centered the development of agriculture as the primary driver of social change; and there is increasing scepticism that there was anything special or 'revolutionary' about the Neolithic at all, compared to periods before and after.

In this paper, I attempt to resuscitate the Neolithic Revolution within Perreault's (2019) macroarchaeology framework. I argue that, due to its roots in historical materialism, Childe's original formulation is a model of prehistoric social change that is still plausible—and plausibly tested—against the archaeological record. It can be seen as a set of interlinked hypotheses regarding a) the reconfiguration of Neolithic people's relations to economic production in response to external and/or internal drivers; and b) long-term economic and social changes this set in motion. And crucially, while many contemporary approaches to the Southwest Asian Neolithic suffer from, to use Perrault's terminology, 'underdetermination', we can derive from these hypotheses a set of 'smoking guns' that we could reasonably expect to see in the regional archaeological record.

## 7 CYCLES IN A LONG-TERM PERSPECTIVE

**Abstract author(s): Gronenborn, Detlef (Leibniz Reserach Institute for Archaeology - RGZM)**

**Abstract format: Oral**

Archaeology and other historical sciences have a long history of searching – and finding – long-term processes and dynamics in their respective records. These approaches go back to Classical Antiquity but have continued in the scholarly debates throughout the millennia, and continue to be evoked today.

Some of these theoretical models circle around a concept of history encompassing cycles, which entail the succession of integrative and disintegrative phases as inherent and essential components of these dynamics.

These approaches have been accused of being deterministic, and they are. But they are also based on empirical observations beginning with early farming societies (and likely much earlier but less well investigated societies), indicating that these do follow cyclical patterns in which integrative and disintegrative phases succeed each other. These phases not only form much of the archaeological data, but actually may constitute one major forcing factor in historical processes. If so, these cyclical successions of stages required and require humans in the past and in the present to cope with their inevitability.

Despite the ancestry of the concept, it is still valid and one component of these cycles, namely the concepts of (social) cohesion/cooperation are currently being discussed vividly, albeit more often as static stages, rather than as dynamic factors. Nevertheless, may cohesion be one major factor in resilience mechanisms.

Relating to the combined efforts of a wider group, I will summarize the current state of research on early to complex farming societies and their implications for modern state-level societies, including our own presence and possible future.

## 8 RECOVERY & RESILIENCE OF PREHISTORIC SOCIETIES AFTER DISTURBANCE AS SEEN THROUGH PALAEODEMOGRAPHY

**Abstract author(s): Riris, Philip (Institute for Modelling Socio-Environmental Transitions)**

**Abstract format: Oral**

The time taken by human societies to recover after disturbances is of widespread interest to archaeologists and anthropologists. To date, there has been no consistent, comparative study carried out a large (macroarchaeological) scale across prehistoric cultures to determine rates of recovery, their spatiotemporal variability, and the factors that affect outcomes. This talk will present a meta-analysis of palaeodemographic records that use archaeological radiocarbon dates as a proxy for prehistoric population history. It will draw on well-known case studies, with a view towards quantifying the geographical/biotic/cultural influences on societal recovery, as well as how different types of disturbances may shape adaptive responses. In summary, the paper aims to advocate for rigorous and robust approaches towards past patterns of resilience, ideally ones that 1) focus on measurable, comparable properties of cultural dynamics, and 2) are linked more closely with interdisciplinary definitions of resilience, in order to enable large-scale syntheses of archaeological and anthropological data. Arguably, achieving these two goals stands the greatest odds of success from a macroarchaeological perspective.

## 9 ZOOM AND ENHANCE: HIGH RESOLUTION RECONSTRUCTION OF MACRO-SCALE PROCESSES WITH BAYESIAN HIERARCHICAL MODELS

**Abstract author(s):** Hinz, Marfin - Roe, Joe (Institut für Archäologische Wissenschaften, University of Bern)

**Abstract format:** Oral

The usefulness of macro-level studies has been increasingly appreciated in archaeology over the last 10 years, not only since the publication of the book that is the reference point of this session, but also thanks to the greater accessibility of the data needed for such research. From this point of view, the call for a macroarchaeology is a culmination of a broader endeavour.

As exciting as the macroarchaeological research programme is, its aim of linking macro-scale processes to external drivers is a difficult task. In general, the prediction for recent prehistory is that only processes that take place over centuries can be identified. However, many relevant triggers have a much shorter duration, e.g. short-term climate fluctuations or epidemics.

One proven approach to increasing temporal sampling data is to combine data over large geographic areas. Another is data assimilation, which combines a modelled representation with data. Hierarchical Bayesian models are able to do both and can be used to link different qualities of data and supplement missing data, e.g. from one region with data from another.

In this talk, we embed a hierarchical Bayesian approach to reconstructing population density within the framework of macroarchaeology. With this methodology it is possible to reconstruct macro-scale processes with higher resolution than with a single indicator, potentially exceeding the empirical limits proposed by Perreault. In this way, relevant causal relationships between different population-level triggers and responses can be more accurately and credibly demonstrated, offering many more opportunities to address issues of macroarchaeological relevance.

## 10 A MACROEVOLUTIONARY ANALYSIS OF EUROPEAN LATE UPPER PALAEOLITHIC STONE TOOLS USING A BAYESIAN PHYLOGENETIC FRAMEWORK

**Abstract author(s):** Matzig, David (Aarhus University)

**Abstract format:** Oral

The identification of material culture variability remains an important goal in archaeology, as such variability is commonly coupled with interpretations of cultural transmission and adaptation. While most archaeological cultures are defined on the basis of typology and research tradition, cultural evolutionary reasoning combined with computer-aided methods such as geometric morphometrics (GMM) and Bayesian phylogenetic inference allow us to achieve a deep-time perspective, where the processes that were involved in shaping the evolutionary history of these artefact groups can be tested statistically.

In this paper, I present a macroevolutionary analysis of cultural change in the European Final Palaeolithic and earliest Mesolithic. Using a time scaled Bayesian phylogeny based on the outline shape of lithic tools obtained from a large set of legacy data via 2D geometric morphometrics, I estimate the rates of diversification, and trait evolution in artefact shape for the period between 15,000 and 11,000 BP. I test whether the recovered patterns correlate with the climatic and environmental changes occurring within this time frame.

This approach fits a macroarchaeological research program and serves as an example for potential future applications of this paradigm to the European Stone Age archaeological record.

## 11 MACROARCHEOLOGICAL BY DEFAULT: THE RESEARCH CENTER "THE ROLE OF CULTURE IN EARLY EXPANSIONS OF HUMANS" (ROCEEH)

**Abstract author(s):** Haidle, Miriam - Bolus, Michael - Bruch, Angela - Conard, Nicholas - Hertler, Christine - Kanaeva, Zara - Kandel, Andrew - Sommer, Christian (Heidelberg Academy of Sciences and Humanities, Research Center ROCEEH)

**Abstract format:** Oral

The research center "The Role of Culture in Early Expansions of Humans" (ROCEEH) is a long-term project studying expansions of cultural capacities, resource space and range during the period between 3 million and 20,000 years ago in Africa and Eurasia. Its goal is a systematic understanding of the interactions and dynamics of these fields in the process of "becoming human". At the core of the project stands the ROCEEH Out-of-Africa Database (ROAD) which unifies geographical and stratigraphical data of about 2,200 localities with information of about 16,500 assemblages of archaeological finds, hominin fossils, faunal and botanical remains. The multidisciplinary, relational structure of ROAD with GIS functionality allows for multi-variable queries and the visualization of the results on different maps. Thus, large-scale comparisons of different time-slices, archaeological periods, and find categories are facilitated.

The macroarchaeological approach of ROCEEH has become manifest in various forms. A theoretical avenue was taken with the Model of Evolution and Expansion of Cultural Capacities (EECC). The model integrates interactions

of evolutionary-biological, historical-social, ontogenetic-individual, and ecological factors and processes and delineates the broadening of cultural capacities from social information use to abstract notional capacities. Macroarchaeological case studies include, among others, a multidisciplinary examination of behavioural flexibility in the Middle Stone Age of Southern Africa, the increase of ochre use in the African MSA, the development of hunting technologies, large scale cultural network analysis, and the expansion of potential food resources due to the use of different tools and fire. ABM modelling of the potential of crossing sea straits with different water movement skills, for example, represents a third track taken by the research centre. Although the central research questions of ROCEEH are macroarchaeological by default, other studies on a small or even micro-scale represent important facets of our interpretation of deep human history.

## 12 MACROARCHAEOLOGY AND THE SOCIAL REACTORS PROJECT

**Abstract author(s):** Ortman, Scott (University of Colorado)

**Abstract format:** Oral

Since 2014, the social reactors project has been working to establish a theoretical and empirical basis for the study of human settlements through history. The project's primary goal is to identify common properties of human settlements, and general processes of growth and decline, in a framework that accommodates both regularity and contingency. We refer to human settlements as social reactors due to their role in concentrating and accelerating social interactions and their outcomes in space and time. This view derives from urban scaling research and the discovery that allometries of contemporary urban systems are also apparent in pre-modern and even non-urban systems. To date, project researchers have completed more than two dozen studies of urban allometries in past societies known through ethnography, history, and archaeology, and ranging from hunter-gatherer camps to Neolithic farming villages to urban centers of classical antiquity and Precolumbian Latin America. In this presentation, we summarize this work to show just how general scaling effects are, and to argue that the emerging field of macroarchaeology needs to include patterns like these within its scope of research.

## 13 A MACROARCHAEOLOGICAL PERSPECTIVE ON THE ARCHAEOGENETIC RECORD

**Abstract author(s):** Schmid, Clemens (Max Planck Institute for Evolutionary Anthropology)

**Abstract format:** Oral

Charles Perreault's analysis in and of "The Quality of the Archaeological Record" (2019) operates on a high level of abstraction: Macroarchaeology is well laid out as an idea, but still lacks concrete examples. In this paper I want to explore how a macroarchaeological research program could interface with the relatively new field of archaeogenetics.

Although it has only gained momentum in the last ten years, archaeogenetics has already demonstrated high disruptive potential. It allows remarkable new insights into human population history, the domestication of plants and animals, human subsistence strategies, or the evolution and impact of pathogens. Ancient DNA offers new pathways to reconstruct past human behaviour on very different scales, from biological kinship-structure at individual sites, to regional mobility and migration, to long term patterns of genetic adaptation [1].

Perreault's macroarchaeology was conceived with a focus on material culture, but could ultimately extend to arbitrary observations in space and time. I argue that the high-dimensional, well standardised and increasingly spatio-temporally dense aDNA data is a treasure trove for macroarchaeological meta analysis. Archaeogeneticists are only beginning to understand "macroscale patterns" in – for example – (effective) population size, mobility, or kinship systems. Genetics-derived proxies emerge as a whole new domain of promising correlates in "macroscale processes".

So far few aDNA papers have adopted a quantitative meta-perspective, or conceptualised diachronic summary statistics that could be compared with archaeological or biogeographical trends. Here I will give an overview of the state of this research, explain how my own work on large-scale mobility estimation integrates with macroarchaeology and outline potential ways into a future, where archaeologists and geneticists cooperate less through narratives, and more via code and data.

---

## 289 THE MATERIALITY OF LIVED RELIGION UNDER AND AFTER ROME

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Fleming, Robin (Boston College) - Effros, Bonnie (University of British Columbia)

**Format:** Regular session

Roman and medieval archaeologists and historians are invited to present papers that focus on the material culture of lived religion both under and after Rome. Presentations can focus on either traditional religious practices or those

associated with Christianity, Judaism, or Islam. Papers, beside introducing the audience to particular materials of religion rooted in a particular time and place, should also think through the interpretive challenges and uses of material culture for those interested in understanding past lifeworlds. The session provides space for historians, archaeologists, Romanists, and medievalists to have a serious discussion about the different ways our disciplines and chronological fields think about and use material evidence to reconstruct lived religion, the interpretive challenges it presents, and how, in the future, those of us working in different disciplines and in different periods might better combine our efforts. The goal of this session is to open a productive dialogue between Classicist and medievalists, historians and archaeologists.

## ABSTRACTS

### 1 **DECAPITATED DOGS AS A MATERIAL OF RELIGION IN IN ROMAN BRITAIN**

**Abstract author(s): Fleming, Robin (Boston College)**

**Abstract format: Oral**

Of the 1,500 dog ABGs found in structured deposits at Romano-British sites, almost two hundred are the remains of animals that had been decapitated. These dogs are found in the company of a fairly standard repertoire of odd accompaniments (everything from whole pots, to gaming pieces, to hares, human skulls, baby animals, and shoes), lending these deposits an air of what Bronisław Malinowski called "a high quotient of weirdness." This paper lays out the evidence for the deployment of decapitated canines in the practice of everyday religion in Roman Britain. It discusses the different contexts, periods, and social milieux in which the killing of these animals took place. It also thinks through the lived experience of events at which dogs lost their heads. Finally, it discusses the use of canines as a material of religion and meditates on what dogs can tell us about who, in Roman Britain, felt entitled to engage in ritual.

### 2 **NEPTUNE AND OCEANUS IN ROMAN BRITAIN: EVIDENCE FOR THEIR CULT AND THE BUILDING OF PROVINCIAL CULTURE**

**Abstract author(s): Goldstein, Avner (Boston College)**

**Abstract format: Oral**

The cults of Neptune and Oceanus were never widespread in Roman Britain but are nonetheless witnessed for the whole of the Roman period across military sites, at villas, and at local shrines patronised by ordinary people. This paper describes Neptune and Oceanus' evocations in these three very different contexts and argues that rather than simply functioning as gods of the sea, they were culted first for the help they gave travellers- especially soldiers; second as a symbol of imperial power and Roman identity; and third as more generalised water deities, something that had resonance in Britain, where water cults had been important long before the coming of Rome. Through this, we see the role religion and ritual played in the construction of a particular provincial culture, requiring us to question what it meant to 'become Roman' on one's own terms and rethink traditional theories of 'Romanisation' for cultural life in the provinces.

### 3 **THE SACRED STONES WORSHIP CONCEPTS FROM GREEK & ROMAN MYTHOLOGY TO ISLAM RELIGIOUS PRACTICE**

**Abstract author(s): Zear, Asem (Pázmány Péter Catholic University)**

**Abstract format: Oral**

In this paper, I would present the ancient story of sacred stones "omphalos" or "baetylus" which were found in Greek mythology in the story of Gaea goddess when she gave to her husband Cronus a stone to eat instead of her son Zeus the new-born. Zeus himself could defeat his father Cronus and got the stone and put it in the centre of the earth, Delphi temple and covered with a row of wool.

In Rome, Emperor Elagabalus 218/222 AC who came to Rome from Syria was already the hereditary high priest of the cult of the god Elagabalus there. Once made emperor he brought the god's baetylus stone to Rome with great ceremony and built the Elagabalium to house it.

After the death of this Emperor, this cult of religion has moved back to Syria with the stone itself. According to the archaeological evidence found in Palmyra city in Syria, there was a similar baetylus worship in the temple of Ba'al but because of the roman conquest the queen Zenobia asked to send the baetylus to a safe place which probably was al-Batra in Jordan temple of al-Lāt. Which later on in the early Islam time this stone moved to al-Kabba in Macca nowadays.

I will mention also the Jews and Christianity's concepts about the sacred stone in the Jerusalem city and the story of Abraham when he saw the god in his dream telling him about the holy land and the sacred stone which he used to sacrifice his son in the name of god.

## 4 THE LIVING, THE DEAD, AND WHAT TO BELIEVE

**Abstract author(s): Wenn, Camilla Cecilie (Museum of Cultural History, University of Oslo)**

**Abstract format: Oral**

The paper will focus on the religion displayed in burial settings. A case study, excavations in a necropolis in Hierapolis of Phrygia, Turkey, is the point of departure. The originally Roman necropolis was used and reused for a period of c. 1200 years. The period saw a significant religious shift through which the religious affiliation of the population changed from predominantly traditional Roman beliefs to Christianity, something that can be observed in the associated grave goods and customs, as well as in the townscape. The backdrop is the major changes in the town itself, where pagan temples are destroyed and places of Christian cult and worship take their place. The paper explores the meeting between old and new, the dialogue between conservatism and new religious expressions in the grave material as a means of understanding the effect of change on the populace. The way the living treated their dead shows how the ideas of life and afterlife changed, how religion was expressed in the moment where the known life ended, but also how old expressions had new interpretations.

## 5 ALIGNING THE DEAD: RETHINKING BURIAL ORIENTATION AND CHRISTIAN CONVERSION

**Abstract author(s): Mason, Austin (Carleton College) - Hosek, Lauren (University of Colorado, Boulder)**

**Abstract format: Oral**

In this paper, we argue for a closer and more comprehensive examination of burial orientation in European mortuary archaeology, particularly in the context of Christian conversion. The efficacy of using mortuary contexts to determine religious identity has long been questioned, but burial practices, including orientation, can reflect shared community rituals and group affiliation, while deviations from regional and local norms can offer clues as to social and religious identities at both community and individual scales. While archaeologists note the directional orientation of the body in a grave as standard practice when documenting cemeteries, little consideration is often paid to this characteristic in subsequent analysis. We propose that approaching burial orientation at multiple scales offers important insight into the interplay of mortuary practices, life histories, and physical and symbolic features of the landscape. At the scale of an individual burial, orientation is one expression of normative or deviant mortuary treatment and can help signify transgression, piety, outsider status, elite status, or unusual life or death circumstances when compared to the local community. On a larger scale, cemetery orientation patterns may reveal relationships to the landscape, the built environment, and (more controversially) celestial bodies in ways that may be of religious significance. To illustrate the potential value of a more thorough, multi-scale analysis of burial orientation, we offer examples from early medieval European Christianization contexts in both England and Bohemia. By visualizing burial orientation data in a novel way that combines circular diagrams plotted on a compass rose in R with aspect-slope maps developed in ArcGIS, we examine the topography of cemeteries and consider the religious and social factors that may have influenced orientation at multiple scales. Re-emplacing burial orientation in the context of landscapes, religious practices, and local customs enriches our understanding of Christian conversion in early medieval Europe.

## 6 LIVING AND DYING UNDERGROUND: LIVED RELIGION IN THE CAVES OF ROMAN AND POST-ROMAN BRITAIN

**Abstract author(s): D'Alisera, Alexander (Boston College)**

**Abstract format: Oral**

From the coasts of Wales to the scars of the Yorkshire Dales, caves in Britain contain an impressive array of evidence for myriad prehistoric and historic human activity. The human use of caves in the Romano-British period is particularly well-attested in the material record, revealing varied modes of quotidian life in economic, mortuary, and ritual-religious spheres. Importantly, the c. 410 withdrawal of the Roman state did not put an end to such underground encounters, and a number of British cave sites contain evidence for continued activity well into the middle ages. Early medieval encounters with the underground in Britain, however, are often overlooked in favor of the larger corpus of Romano-British evidence. In this paper, I take a long view of the British underground across the traditional dividing line of the early fifth century, by focusing on two cave sites that contain material evidence of both Romano-British and early medieval human activity: Dog Hole, in Cumbria, and Lesser Garth Cave, near Cardiff. In both locations, the geomorphological form of the cave proved to be an enduring and attractive locus for ritualized human behavior. Through this study, I suggest ways in which the environmental reality of the caves themselves (their darkness, their soundscapes, their flora and fauna) might have complemented and provoked varying modes of Insular religious practice, both before and after the Roman withdrawal. By historicizing the material record left behind in these caves, I ultimately argue that further analysis of the underground can grant scholars fresh access to the lived religious practices of both the Roman and the post-Roman periods in Britain.

## MONUMENTAL BRONZES OF THE 11TH-12TH CENTURY: THE CASE OF BRONZE DOORS

**Abstract author(s):** Mödinger, Marianne (IMAREAL, Universität Salzburg) - Bernabei, Mauro - Bontadi, Jarno (CNR-IBE) - Fera, Martin (Universität Wien) - Schlie, Heike - Utz, Judith (IMAREAL, Universität Salzburg) - Abate, Francesco (Istituto Italiano di Tecnologia; Università Ca' Foscari Venezia)

**Abstract format:** Oral

About 25 bronze doors from the 11th-12th century, most of them located in Italy, represent the only surviving bigger complex of large bronzes from the European Middle Ages.

All doors are made of different copper alloys most likely by the lost wax process: they could be cast as a whole, or individual metal fittings were attached to a wooden support. Some doors have inlays of various materials that allowed the colored depiction of different biblical scenes or saints. Through comprehensive material analyses of all doors on-site during the course of our project at the University of Salzburg, Austria, we aim to:

1) Characterize materials and techniques used in the construction of the doors; 2) Identify artists and workshops, and their specific alloys and techniques; 3) Visualize networks of material knowledge: Properties, affordance and the material iconology in image systems also in a wider mediterranean perspective.

Methods used include 1) three-dimensional photographic recording of the doors and documenting their relief structure for further studies; 2) non-invasive chemical analyses to identify the alloys used; 3) dendrochronological analyses to identify and date the types of wood used, providing important information about restorations, additions and the use of local woods; 4) metallographic and isotopic analyses on selected doors, providing information about material treatments after casting and the origin of the copper used.

The data obtained expand our knowledge of the comprehensive complex of medieval large bronzes, which relate to each other and whose material communicates closely with the meaning of the pictorial representations. We reconstruct the production as well as the cooperation and networks of the individual craftsmen and patrons and thus shed light on an important chapter of medieval craft and art history.

## MONKS AND MARY, PATRONS AND THE PARISH: A HOLISTIC APPROACH TO MEDIEVAL RELIGIOUS LIFE IN THE MONASTIC CHURCH IN TEWKESBURY

**Abstract author(s):** March, Eleanor (University of Exeter)

**Abstract format:** Oral

Monastic and church archaeology's shared roots with architectural history has traditionally meant that studies have adopted more functionalist approaches, concerned with identifying the main phases of a site's physical development and different architectural styles. In the more recent years however, the spatial and sensory turn in archaeology has encouraged the consideration of church space in relation to religious performance and medieval Christianity has increasingly been recognised as an 'embodied experience'. Through a specific case study focusing upon Tewkesbury Abbey, Gloucestershire (England), this paper explores the way in which church buildings were a sensory environment through which individual religious experience was mediated.

Tewkesbury is a rare example of a British medieval Benedictine monastic church surviving almost in its entirety, its exceptionally well-preserved Norman core juxtaposed with later architectural developments. To date, the lack of archival sources surviving directly from the monastery has concentrated research upon the surviving fabric of the church and its architectural development. Nevertheless, a truly interdisciplinary, multifaceted approach connecting the surviving fabric of the church with what is known of the 'lost' fabric and the historical record, considering medieval liturgy, has facilitated the repopulation of the complex network of religious belief, practice and performance at Tewkesbury with people, texts, architecture and material culture. In turn this has enabled a three-dimensional exploration of the development of the church, from its foundation as a conventual church for a new reformed community of Benedictine monks, a place of Marian worship, a burial place for the 'great and good', and a site of popular devotion and parochial worship.

## ARCHITECTURE AS EVIDENCE OF RELIGION

**Abstract author(s):** Hoxha, Zana (Institute of Albanology)

**Abstract format:** Poster

The fast spread of Christianity across the Roman Empire and beyond affected the development of public buildings. As of this time, the temples were built for the people instead of the gods. The large number of believers coming into the presence of God led to big and monumental buildings. This paper analyses and presents the appearance of Early Christian Architecture in the territory of Kosovo. Besides historical sources, the appearance of Christianity can be easily traced through architecture. Even though a "suburb" of the empire, it is quite rich in buildings of this period. Moreover, the region was part of the building program of the Emperor Justinian, enriching the region even more. Until today, forty six early Christian buildings have been identified. In the first part of the paper a general introduction of historical fact regarding the period will be given, continuing with a detailed analysis of the architecture using the

examples from the territory of Kosovo. The paper will conclude with the social, economic and topographic analysis, to understand the differences of the buildings of the period throughout Kosovo. Concluding, Christianity played a big role in the life of the local community and architecture is an evidence to prove it.

## 291 INTERACTION IN NEOLITIZATION, NEOLITIZATION AS INTERACTION. ARCHAEOLOGICAL DATA AND ANALYTICAL PROCEDURES FOR DEFINING INTERACTION CONTEXTS [PAM]

**Theme:** 2. [Re]integration

**Organisers:** Cortell-Nicolau, Alfredo (University of Cambridge) - García Martínez de Lagran, Íñigo (Universidad Nacional de Educación a Distancia) - García-Puchol, Oreto (Universitat de València)

**Format:** Regular session

Taking Europe as an example, the spread of agriculture and husbandry has been defined as a mixed model that involves demic diffusion and local interaction in a general eastern/western gradient. Recent results provided by ancient DNA reinforce this approach, previously highlighted by diverse theoretical models considering the archaeological record. The demographic success triggered by the new way of life would be in the basis of the fast expansion around some areas. Nevertheless, the rate and, consequently, the Neolithic time of arrival depends on several factors including geographic and environmental conditions in regards with the requirements of crops and stockbreeding, the social mechanisms of the spread and the networks developed, and the presence and density of local hunter-gatherers. Thus, a patched mosaic of situations, considering time and space is currently visible in the archaeological record.

From a broader perspective, the focus of this session is on interaction contexts involving potential contacts between Mesolithic last hunter-gatherers and Neolithic newcomers and, therefore, it welcomes proposals where this situation is present worldwide. Specifically, we want to open a new window in this changing world considering several analytical procedures and conceptualizations from taphonomy, chronological modelling, mathematical and computational approaches and the analysis of patterns in cultural variability. Papers from specific archaeological contexts and/or macroscale frameworks will also be welcome. Ultimately, the goal is to bring a new scenario to discuss potential interaction contexts considering novelties in archaeological data and analytical development.

### ABSTRACTS

#### 1 CONTINUITY, DISCONTINUITY AND THE SOCIAL ROLE OF HOARDING OVER THE MESOLITHIC-NEOLITHIC TRANSITION IN SOUTHERN SCANDINAVIA

**Abstract author(s):** Børnevad-Ahlqvist, Mathias (University of Copenhagen) - Fischer Stephansen, Clara (Museum Østjylland) - Sørensen, Lasse (National Museum of Denmark)

**Abstract format:** Oral

In this paper, new results on the continuity and discontinuity of ritual hoarding over the Mesolithic-Neolithic transition of Southern Scandinavia are presented as a means to explore the processes and mechanisms behind this period of cultural change. Using a multi-scalar approach, we put forward a new framework focusing on the important psychosocial role hoarding and ritual practices, in general, may have played within the Neolithization process and the various forms of interaction that underpin it. We interpret our analytical results using an interdisciplinary framework built around the combination of practice theory, migration theories, communities of practice, sociology, symbolic anthropology, and cognitive science of religion. Based on the observable hoarding developments, we hypothesize that the hoarding practice seen in the Southern Scandinavian Funnel Beaker culture is a product of cultural transmission processes involving influences from incoming immigrating Neolithic groups and pre-existing local Mesolithic practices. Rather than considering the hoarding a by-product of other societal changes, we further hypothesize that these hybridized practices played a key role in negotiating interactions, societal tensions and cultural identity throughout the Neolithization process in Southern Scandinavia.

#### 2 THE BEGINNING OF THE LBK IN THE EXTREME SOUTHWEST OF ITS SPREAD IN EUROPE

**Abstract author(s):** Krauss, Raiko (Institut für Ur- und Frühgeschichte und Archäologie, es Mittelalters) - Bofinger, Jörg (Landesamt für Denkmalpflege Baden-Württemberg)

**Abstract format:** Oral

Since 2017, we have been researching Early Neolithic occupation in a region in southwestern Germany, west of the city of Tübingen. The area shows an unusually high density of LBK sites. New data on Mesolithic settlement and environment in the 5th millennium BCE shed new light on the beginning of the Neolithic. For example, a paleo-watercourse was found in a valley, which represents an important archive for the reconstruction of the environment in the course of the Pleistocene up to the beginning of the Neolithic settlement. Of supra-regional importance is also the chronology of the settlement, which has been possible since a few years on the basis of the evaluation of the

settlement material. Another aspect of our research are the ties of the Early Neolithic groups to the areas of origin of the LBK in the Eastern Carpathian Basin. These can be seen in the burial customs, but also in specific finds. With our lecture we would like to present the project itself and first results of our evaluations.

### 3 **MODELLING PARA-NEOLITHIC "RECONQUISTA": HUNTER-GATHERERS' REVIVAL OF THE EARLY VTH MILL. BC IN THE SOUTH OF EASTERN EUROPE**

**Abstract author(s):** Kiosak, Dmytro (Ca' Foscari University of Venice, Italy) - Radchenko, Simon (Università degli Studi di Torino)

**Abstract format:** Oral

The issue of hunter-gatherers / early farmers interaction is particularly vivid in the south of Eastern Europe. Here, two subsistence systems co-existed for millennia in VI-IV mill. BC. Sometimes in a single microregion there are sites of hunter-gatherers and those of early farmers separated just by few kilometers of distance. However, sites situated close in space can be separated in time and vice-versa. An intriguing pattern appeared when refining the chronological controls with AMS-dating. The early farming settlement had a punctuated nature: after a demise of a certain agricultural society there usually were some centuries with a little known evidence of human occupation. Such a gap is evident in the early Vth mill. BC after disappearance of Linear Pottery culture and prior to expansion of Early Trypillia agriculturalists. Surprisingly some dates from "ceramic" hunter-gatherers (para-Neolithic) sites fell into this time slot, thus suggesting that deserted fields were resettled as hunting grounds.

Under the conditions of still insufficient radiocarbon dating and dubious stratigraphies, "scenario" modelling seems to be the only way to investigate the mechanisms of this revival. The GIS-aided modelling pointed to the possible "refugia", where hunter-gatherers population could continue its way of life during agricultural expansion. The demographic potential of "reconquista" is estimated as well as routes and geographical "targets" of re-expansion of para-Neolithic groups. The possibilities of their interaction with early farmers in the decline phase are highlighted as relatively limited, while possible zones of such contacts are defined on chronologically and geographically evident basis.

### 4 **MESOLITHIC RESILIENCE, INTERACTIONS AND ACCULTURATION IN THE TRANSITION TO NEOLITHIC. THE VIDIGAL CASE STUDY IN THE PORTUGUESE SOUTHWEST COAST**

**Abstract author(s):** Soares, Joaquina (Museum of Archaeology and Ethnography of the District of Setúbal/AMRS; Archaeological Centre of the University of Lisbon- UNIARQ) - Tavares da Silva, Carlos (Archaeological Centre of the University of Lisbon- UNIARQ)

**Abstract format:** Oral

The circulation of Neolithic innovations, available in the Western-Central Mediterranean area, might be proceeded much faster through cultural osmosis, crossing Mesolithic networks of interaction than by demic colonisation. The diversified hunter-gatherer communities of Southern Portugal were porous rather than bounded and are likely to have perceived the advantages and disadvantages of adopting new economic and technological resources, while their integration into different social and cultural systems. Thus, they adopted selectively Neolithic novelties in accordance with their needs for subsistence and cultural beliefs. In then resource-rich Sado paleo-estuary, Mesolithic communities resisted the adoption of agro-pastoral economy that was in fact a trap for the hunter-gatherer way of life, reducing mobility and individual freedom, and imposing an economic intensification with greater labour investment. From the Neolithic package, they only adopted polished stone tools and pottery. For the Southwest Coast similar behaviour can be defended and is also likely to have occurred in the middle basin of Guadiana River.

The settlement of Vidigal in the coastal plain between Sines and Sardão Cape, occupied in the time span of 5730 - 5081 calBC,  $2\sigma(\text{Beta-452078,6800}\pm 30\text{BP}; \text{Beta-470466,6260}\pm 30\text{BP})$ , developed a subsistence pattern based exclusively on wild resources (fishing, hunting, shellfish harvesting). Polished stone axe and rare pottery are the sole Neolithic material markers recovered. About 20Km north, the early Neolithic (middle of the sixth millennium calBC) community of Vale Pincel I, who may have been of indigenous origin, combined the exploitation of wild and domesticated resources; while ceramics, stone tools and millstones are abundant. What kind of interaction could have existed between these groups? So far, the model of opposed Mesolithic hunter-gatherers and Neolithic peasants as bounded entities have been rejected. On the contrary, we propose the co-existence of several stages and rhythms of neolitization between neighbouring groups, even for a sub-region like the Southwest Coast.

## 5 **NERJA-CONDUCT OF DISCOVERY: NEW DATA ON THE RECENT PREHISTORY OF THE SOUTHEAST OF THE IBERIAN PENINSULA**

**Abstract author(s):** Alvarez-Fernández, Esteban (University of Salamanca) - Agirre, Amaia (Universitat Autònoma Barcelona) - Aura, J. Emili - Carrión, Yolanda (Universitat de València) - Cerezo-Fernández, Rosana (Universidad de Salamanca) - Fernández-Mallo, Carla (Universitat de València) - García Borja, Pablo (UNED) - Portero, Rodrigo (Universidad de Salamanca) - Rufà, Anna (Universidade do Algarve) - Sanchidrián, José Luis (Universidad de Córdoba) - Aparicio, M<sup>a</sup> Teresa (Museo Nacional de Ciencias Naturales-CSIC, Madrid) - Jordá Pardo, Jesús F. (UNED, Madrid) - Marlasca, Ricard (Posidonia SL, Eivissa) - Rubio del Hoyo, Juan Manuel (Universidad de Salamanca)

**Abstract format:** Oral

In the summer of 1985, a team led by Professor D. Francisco Jordá Cerdá excavated the so-called Discovery Conduit ("Conducto del Descubrimiento") of Nerja Cave, located between the Sala de la Mina ("Mina Chamber") and the Sala de la Torca ("Torca Chamber"), which allows access to the Sala de la Cascada ("Cascada Chamber"). The excavation made it possible to document at least two levels, based on the archaeological material recovered, the upper one belonging to the Chalcolithic and the lower one to the Neolithic. These levels are not in primary position but were dragged from Sala de la Mina. In the lower levels of Sala de la Mina, occupations of the last groups of hunter-gatherers (Mesolithic) have been documented.

The materials at Nerja-Conduct of Discovery have remained unpublished until now. The preliminary study of the anthracological remains, fauna (macrovertebrates, fish, birds, continental and marine molluscs), ceramics, lithic and bone industries (above all, awls) and personal ornaments (shell beads and pendants, stone brazalets) allows us to specify the early Holocene occupations carried out in Nerja Cave.

## 6 **POTTERIES FOR ARROWS?... - IT'S A DEAL! POSSIBLE CONTEXTS OF MESOLITHIC-NEOLITHIC INTERACTION IN THE EBRO VALLEY (SPAIN)**

**Abstract author(s):** García-Martínez De Lagrán, Ñigo (UNED)

**Abstract format:** Oral

In the Ebro Valley (Spain) there are a number of sites with different archaeological contexts that could be defined as interaction contexts between Mesolithic and Neolithic groups. In addition to this, in these sites it is also possible to analyze the evolution of the last hunter-gatherer communities of this territory and the consequences of the Neolithization for these groups. In this contribution, I will analyze the stratigraphy, the chronology, the subsistence and the lithic and ceramic technologies to define three fundamental milestones of this process. First, the development of the last hunter-gatherers just before the arrival of the Neolithic. This point is essential to understand the social, economic and anthropological processes that were triggered with the Neolithic. It is also very important to determine the relationship between these groups and certain climatic events. Secondly, I will analyze the possible archaeological evidences of the interaction phenomena between Mesolithic and Neolithic groups, especially in relation to pottery and projectile points. Finally, I will analyze in perspective the stratigraphic and socioeconomic evolution of these Mesolithic communities in order to understand the outcome of the Neolithization. At this point, the chronological determination of the Neolithic expansion phenomena, which could be divided into two distinct phases, will be fundamental. In conclusion, I intend to define these contexts of interaction from a double perspective, on the one hand, evolutionary and protagonist of the hunter-gatherer groups, and, on the other hand, from the time determination of the phenomena of expansion of the Neolithic groups and the nature of the processes of interaction between these communities. All this to test the existence or not of these contexts of interaction.

## 7 **NEOLITHIZATION AS INTERACTION IN THE HIGH CANTABRIAN MOUNTAINS**

**Abstract author(s):** Diez Castillo, Agustín (Universitat de València)

**Abstract format:** Oral

With this communication I try to contribute to explore why the time of arrival is different in High Cantabrian Mountains of what is known in the neighboring territories of the Northern Meseta or in similar environments like the Pyrenean mountains. The relevance of the role of the last local hunter gatherers could be one of the several factors involved in the explanation. Through chronological modeling and other mathematical approaches including landscape models, I try to explore the different scenarios that could explain the late adoption of the agricultural way of life in the High Cantabrian Mountains. The high density and the successful adaptations to the environment (mainly to the coastal resources) of the local hunter-gatherers could partially explain the late adoption of the agricultural way of life in the High Cantabrian Mountains. However, the well established neolithic networks south of the Cantabrian Mountains should have triggered the neolithization of these mountains as is the case in the Pyrenean where early Neolithic evidences related to the lowlands of the Ebro valley are well documented.

## 8 TESTING MODELS FOR CULTURAL DIVERSITY IN THE NEOLITHIZATION SPREAD AT THE EAST OF IBERIA

**Abstract author(s):** Cortell-Nicolau, Alfredo (University of Cambridge) - García-Puchol, Oreto (Universitat de València) - Juan-Cabanilles, Joaquim (Servei d'Investigació Prehistòrica. Museu de Prehistòria de València)

**Abstract format:** Oral

The starting point of the so-called "Dual model", in the 80s of the 20th century, established the basis of a narrative model in regards to the neolithization process in eastern Iberia, accounting for the possibility of farming spread with and without relation to the previous Mesolithic settlers. Since then, several developments considering archaeological fieldwork, the radiocarbon framework, ancient DNA results and computational approaches, have provided a renewed basis to discuss this pivotal process triggered from the spread and consolidation of the agricultural way of life. Nevertheless, the theoretical efforts conducted are flawed by the poverty of the resolution of the archaeological context. Even more so when we point out to interaction contexts influenced by several factors, which can include taphonomic processes affecting both stratigraphical sequences and the chronological record.

Considering this challenging scenario, we will put the focus on shared cultural variants across the last Mesolithic and Early Neolithic records: more specifically on geometric projectile points. From an evolutionary perspective, we will test several hypotheses about patterns of cultural change considering a remarkable archaeological record, which includes pivotal Mesolithic and Neolithic sites in the context of the neolithization process in Eastern Iberia, such as Cueva de la Cocina, Cova de l'Or and Cova de les Cendres among others.

## 9 SOCIAL NETWORK ANALYSIS AS AN INTERACTION METHODOLOGY. A PRACTICAL EXAMPLE IN PREHISTORY

**Abstract author(s):** Jiménez-Puerto, Joaquín R (Departamento de Prehistoria, Arqueología e Historia Antigua de la UVEG) - Puerto, M<sup>a</sup> Pilar (Universitat de València. Facultat de Geografia i Història)

**Abstract format:** Oral

The Archaeological contexts may be studied from different perspectives. Analytic procedures from other academic fields such as Statistics, Computer Science or Social Network Analysis (SNA), have been recently applied. Such methodologies have produced interesting results in Evolutionary Archaeology and prehistoric cultural processes.

The SNA is a powerful tool when analyzing large and complex databases, since its procedures can provide intuitive visualizations and reveal the existence of patterns locked in raw data. Moreover, it allows to work at different scales of analysis at the same time, making unnecessary to choose between structure or agency.

In this work, a practical example of these new archaeological analytical approaches is discussed with a network study in the Copper Age, through material culture items: flint arrowhead. This network perspective has been used to trace the information flows between social groups in a diachronical axis. Therefore, the success in application to flint arrowheads could make this methodology easily applicable to geometric assemblages, early cardial pottery or any other archaeological information available, in order to apply community recognition and data flow characterization. Thus, our goal was to identify social dynamics and evolutive trajectories in the East area of Iberian Peninsula, which could be easily applied to other chronological scenarios, such as the Meso-Neo transition.

## 10 DECOLONIZING THE NEOLITHIC RESEARCH CURRICULUM: A NEW MODEL CHARACTERIZING THE NEOLITHIC TRANSITION IN TURKEY

**Abstract author(s):** Menemenli, Yasemin (Umea University)

**Abstract format:** Oral

Many models attempt to study Neolithic lifeways, but these still define the transition in the Near East in terms of its subsistence mode, and treat it as a 'package', with the view that it is a 'revolutionary' step towards the 'rise of the modern civilization'. Moreover, these models focus on studying the origins and the causes of this so-called 'phenomenon', and do not really attempt to characterize or define Neolithic itself.

The problem is that existing models only seek to highlight changes in one or two aspects of human societies as drivers of the transition, and they hesitate to combine too many different parameters to study it. As a consequence, previous attempts to study the transitions to Neolithic lifeways often homogenize human agency, commemorate academic imperialism, separate theory from political realities, fail to consider the material aspects of colonialism, and fail to address the role of history in cultural change satisfactorily.

The only model that attempts to tackle the stated problems is Zvebil and Rowley-Conwy's (1984) 'availability model' that endeavoured to define the boundary between Mesolithic and the Neolithic lifeways, highlighting continuity between Mesolithic and Neolithic social organizations. However, a limitation exists in that this model argues that subsistence strategies do not relate to any social organization or ideology. The availability model demonstrates that the 'revolutionary' aspects of the transition are in fact simply context laden misrepresentations of the reality.

This article presents a new model that aims to characterize the Neolithic in Turkey by considering environmental, biological, social and cultural factors, defining the boundary between the Mesolithic and Neolithic, and decolonizing the Neolithic research curriculum in Turkey.

## 11 **ALONG THE SPECTRA: AN INTEGRATIVE MULTI-SCALAR APPROACH TO INTERACTION BETWEEN "FARMERS" AND "FORAGERS"**

**Abstract author(s):** Schlicht, Jan-Eric (Kiel University; CRC 1266 - Scales of Transformation)

**Abstract format:** Oral

Farmers" and "Foragers" conventionally tend to be understood as two rather fixed categories in archaeological narrative, especially in the context of producing lifeways developing into the dominant mode of subsistence during the process labeled as "Neolithization". Since ethnographical research could show a remarkable diversity in lifeways "between" these two categories, this project aims to investigate cases of interaction between people following more producing and more appropriating lifeways on several scales. Global, large scale quantitative analyses of ethnographic cases aims at detecting patterns of similarity/dissimilarity through the application of practice spectra and clustering methods. To get a hold of lower scales, a selection of particular archaeological, ethnohistorical and ethnographic cases from different times and different locations is being addressed in-depth. In conjunction with a theoretical footing in systemic complexity as an ontological guideline the interplay between these perspectives is intended to function as a qualitative "ground for experiment" in the assessment of universals and particulars, categorization as well as the opening of paths towards more nuanced approaches in the investigation of transformative relationships.

---

## 298 **RAW MATERIAL ACQUISITION, MANAGEMENT AND TECHNOLOGICAL CHOICES FROM THE MESOLITHIC TO THE BRONZE AGE IN SOUTH-EASTERN EUROPE [PAM]**

**Theme: 3. The Carpathian Basin: Integration, Mobility and Diversity**

**Organisers:** Vitezovic, Selena (Institute of Archaeology, Belgrade) - Arampatzis, Christoforos (Archaeological Service of Rhodope, Ministry of Culture and Sports; Aristotle University of Thessaloniki) - Rajkovic, Dragana (Archaeological Museum, Osijek)

**Format:** Regular session

The system and the organisation of acquiring and exploiting different raw materials represent the most important part of every economical system. Questions such as the availability of some of the raw materials, degree of their exploitation versus their availability, mode of exploitation, method of their extracting, connected with the technological choices, are particularly important for studying both economic and other social aspects. Analyses of raw materials may provide information on the human-environment relations; the relative distance of the sources from the settlement may point to the territories used or controlled by certain group, trade and exchange routes, etc. Technology of extracting materials such as stones or ores may indicate the level of technological knowledge. Furthermore, some materials can be considered as luxurious and prestigious among certain communities; this is often, but not exclusively related to the rarity or to the difficulties in obtaining a given raw material.

This session will focus on the lithic, osseous and perishable raw materials used by prehistoric communities of South-Eastern Europe from the Mesolithic to the Bronze Age. This is an interesting time period when communities became more sedentary, thus creating new relations with their environment, and the period when important changes in technology, but also subsistence and economy occurred, which in turn created the need for new activities, new everyday tools and changes in raw material choices, acquisition and management.

Potential themes include, but are not restricted to:

- exploitation of local and distant sources of flints and other lithic materials;
- trade and exchange of exotic raw materials (obsidian, marine molluscs, etc.);
- raw material choices and management of osseous raw materials;
- use of perishable raw materials (wood, plant fibres, etc.).

We would like to invite case studies, synthetic papers, as well as papers discussing theoretical and methodological problems.

**1 UNDER PRESSURE –LITHIC RAW MATERIAL PROCUREMENT STRATEGY: A CASE STUDY OF VLAKNO CAVE (CROATIA)**

**Abstract author(s):** Bodružić, Mario (University of Zadar) - Perhoč, Zlatko (Independent researcher) - Vujević, Dario (University of Zadar)

**Abstract format:** Oral

Systematic archaeological excavations of the Vlakno cave on Dugi Otok Island have revealed the continuity of settlement on the site from the last glacial maximum to the early Holocene. The site is one of the starting points in studying the adaptations of late Pleistocene hunter-gatherers to climate and environmental changes occurring in this dynamic period. It is presumed that the transgression of the sea level changed the socioeconomic perspective of its occupants, creating changes both in settlement patterns as well as in exploitation strategies. Lithic raw material procurement strategies, whether seen as embedded, purposely driven, or socially implemented, reflect on mobility and/or possible regional socio-economic connections. In the case of Vlakno, a strongly locally orientated procurement strategy is established through all phases of its occupation. Nevertheless, a steady increase in local cherts and the decline of western Adriatic and southern Alpine cherts in Holocene layers could reflect environmental, technological, and socioeconomic changes, and should therefore be discussed.

**2 CHERT DEPOSITS IN ISTRIA, CROATIA - POSSIBLE SOURCES FOR PREHISTORIC COMMUNITIES**

**Abstract author(s):** Šprem, Katarina (Juraj Dobrila University of Pula)

**Abstract format:** Oral

Chert or flint is a fine-grained sedimentary rock mostly composed of silica and very frequently used during prehistory due to its sharp edges and hardness. However, no chert is composed of pure silica; all cherts have impurities which give the rock its visible characteristics. These are also one way of determining the provenance of archaeological artifacts using geochemical analysis, a method on the rise in the archaeological science in Croatia. There are several chert deposits known in Istria, Croatia, most of which can be found in carbonate sediments of Cretaceous age in the form of irregular nodules or lenses. Several of the deposits are known to have been used during Neolithic; for example, the Vižula or Marlera deposits. We will present our work in locating, sampling, documenting, and researching the chert deposits in the Istrian peninsula, which mostly focused on the deposits used during the Neolithic. We will also present the first ever results of a geochemical analysis done on Istrian cherts, their characteristics noted during micropetrographic analyses, as well as our reference database of samples collected during our fieldwork.

**3 LITHIC RAW MATERIALS AND INTERACTION SPHERES: AN EARLY NEOLITHIC CASE STUDY FROM BULGARIA**

**Abstract author(s):** Gurova, Maria (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences) - Bonsall, Clive (School of History, Classics and Archaeology, University of Edinburgh)

**Abstract format:** Oral

The Neolithization of Southeastern Europe between c. 6700–5800 cal BC witnessed the emergence of three major interaction spheres centred, respectively, on: 1) mainland Greece and the Aegean islands (Greek Early Neolithic), 2) the Balkans east of the Dinaric Alps (First Temperate Neolithic [FTN]), and 3) the Eastern Adriatic (Impressed Ware Neolithic). Archaeologically, these are distinguishable not only in terms of architecture, burial practices and ceramic traditions, but also in the patterns of exchange of lithic raw materials. The circulation patterns of obsidian and high quality flint differ between these interaction spheres. The obsidian used in the Greek EN came predominantly from sources on the island of Melos in the Aegean, that found at EN sites along the East Adriatic coast mainly from the Central Mediterranean island of Lipari, while that present in FTN sites originated largely from sources in the eastern Carpathians in Hungary and Slovakia. While the circulation patterns of high quality flint are less well-documented, current evidence points to marked geographical differentiation in the sources exploited.

In this paper we draw on the results of techno-typological analyses of lithic assemblages combined with petrographic and geochemical provenance studies to investigate the contrasting patterns of acquisition and use of obsidian and 'Balkan flint' at FTN sites in Bulgaria.

**4 OBSIDIAN EXCHANGE IN EARLY NEOLITHIC EASTERN HUNGARY**

**Abstract author(s):** Priskin, Annamária - Szeverényi, Vajk (Deri Múzeum)

**Abstract format:** Oral

In autumn 2017, during preventive excavations preceding motorway construction, a unique deposition of obsidian nodules was discovered at a site near Váncsod (Hajdú-Bihar County, Eastern Hungary). The find contained 13 large nodules ranging in size between 10 to 20 cm in diameter and belongs – most probably – to the Early Neolithic Körös

period. According to PGAA results, the source of the raw material can be determined as the Slovakian sites of the Eperjes-Tokaj Mountains (Carpathian C1). The find is unique in terms of the quantity and form of obsidian raw material in Hungary, and possibly in all of southeastern Europe. The special context of the assemblage – a hoard of nodules without other associated finds – requires extra effort regarding dating. Taking the Váncsod assemblage and other finds from Hajdú-Bihar County as our starting point, we analyse access to obsidian raw material, the character of obsidian exchange and interaction networks in the Early Neolithic of Eastern Hungary.

## 5 RAW MATERIAL CHOICES IN EARLY HOLOCENE CYPRUS AND THE DEVELOPMENT OF THE EASTERN MEDITERRANEAN SOCIALSCAPE

**Abstract author(s):** Moutsiou, Theodora (University of Cyprus)

**Abstract format:** Oral

This paper discusses the occurrence of rare raw materials in archaeological assemblages at the transition from the Epipalaeolithic to the Aceramic Neolithic on the island of Cyprus in the Eastern Mediterranean (~11,000 – 5200 Cal BC). Locally available picrolite and exotic obsidian from mainland sources are used in the manufacture of stone tools and ornaments diachronically. Artefacts made of these distinctive materials are found at various locations across the island. The distinctive physical qualities of these raw materials, their rarity and the effort exerted in their curation suggest active choice by their makers. Why was so much effort exerted in the acquisition of the specific raw materials? Do these choices reflect landscape affordances or other criteria? The paper interrogates the island's lithic record focusing on these questions with the aim to improve our understanding of how these early communities interacted with their landscape to build their social networks and exchange their goods.

## 6 RESULTS OF THE RECENT EXCAVATIONS OF THE LATE NEOLITHIC SITE KOTLINA, BARANYA COUNTY: FLINT, STONE AND BONE ARTEFACTS

**Abstract author(s):** Rajkovic, Dragana (Archaeological Museum Osijek) - Šprem, Katarina (Juraj Dobrila University of Pula) - Vitezović, Selena (Institute of Archaeology)

**Abstract format:** Oral

The site of Kotlina was discovered in 2009 during a large archaeology prospection project of Baranya in NE Croatia. Systematic archaeological research of the site was initiated in 2018 and the project "Kotlina, the prehistoric site" encompassed non-invasive field survey and excavations. Until today, the area covering approximately 150 m<sup>2</sup> was excavated, revealing diverse archaeological structures: post holes, rubbish pits and graves. The portable archaeological finds were rich and diverse and consist of pottery sherds, animal bones, bone artefacts, chipped stone artefacts, polished and abrasive stone artefacts as well as one bead made from mollusc shell. One very small fragment of copper was discovered. Also, a large quantity of obsidian tools was recorded during the excavations. Portable archaeological finds and absolute dates show that the site can be attributed to the Late Neolithic Lengyel culture.

In this paper, the results of the analysis of flint, stone and bone artefacts using variety of techniques that focus on the raw materials selection, technology and typology will be presented. Both local and imported raw materials were used, thus showing a complex pattern of raw material acquisition and management.

The study of archaeological implements provided important information about the Lengyel communities located to the south of the Drava River. It will be very interesting to compare these data with other Lengyel sites in the north.

## 7 STRATEGIES OF RAW MATERIAL ACQUISITION AND TOOL PRODUCTION AT THE NEOLITHIC LAKESIDE SETTLEMENT ANARGHIRI IXB, WESTERN MACEDONIA, GREECE

**Abstract author(s):** Papadopoulou, Stella (Archaeological Museum of Thessaloniki)

**Abstract format:** Oral

The intensive and large scale excavations of the last decades in northern Greece have brought to light the remains of many Neolithic settlements, including tells, flat-extended sites and lakeside settlements. Along with the study of other categories of material culture, numerous chipped stone assemblages have been part of specialized studies. Research on lithic materials has revealed various aspects of the organization of chipped stone tool production and patterns of regional variations among the Neolithic communities.

The presentation focuses on the chipped stone assemblage from the Neolithic lakeside settlement Anarghiri IXb, located at the Amindeon basin in Western Macedonia, Greece. The settlement lies at the marshy shore of Lake Chimaditis and was occupied from the Late Neolithic I to the early Final Neolithic period (5400/5300-4200 cal B.C.). The extensive excavation at Anarghiri IXb revealed a rich chipped stone assemblage comprising more than 10,000 products. Various raw materials were exploited for the production of chipped stone tools, including excellent quality regional and exotic materials. The discussion focuses on the strategies of raw material acquisition employed by the Neolithic community and the technological choices related to tool production and use through the settlement's lifetime.

## 8 ANTLER EXPLOITATION IN THE NEOLITHIC WETLANDS OF WESTERN MACEDONIA, GREECE. EVIDENCE FROM THE SETTLEMENT ANARGHIRI IXB

**Abstract author(s):** Arampatzis, Christoforos (Aristotle University of Thessaloniki)

**Abstract format:** Oral

The last twenty years the Archaeological Service of Florina has conducted extensive surface surveys and large-scale excavations in the Prefecture of Florina in Southwestern Greece. According to this research, a lot of prehistoric settlements were established between the four lakes of the area (Lake Chimaditis, Lake Zazari, Lake Vegoritida and Lake Petron) that date back from the Greek Early Neolithic (6700/6500- 5800/5600 BC) to the Greek Late Bronze Age (1700/1500-1100 BC).

One of the biggest settlements of the area is the lakeside settlement Anarghiri IXb which was situated in the northeastern shore of Lake Chimaditis. The four rescue excavation campaigns (2013-2016) unearthed a settlement that was inhabited almost uninterruptedly from the middle of the 6th millennium BC to the end of the 5th millennium BC (Greek Late Neolithic and part of the Greek Final Neolithic) while there is scant evidence that it was also inhabited during the Greek Early Bronze Age (3300-2000 BC). The extensive investigation so far yielded thousands of wooden piles, thermal structures and thousands of figurines, chipped stone tools and osseous artifacts.

The worked antler assemblage from the Neolithic layers of the settlement forms one of the biggest assemblages in prehistoric Greece and Balkans. Their study showed that the antler artifacts played a great role in the everyday activities inside and outside of the settlement. In this presentation there will be an analysis of the raw material preferences, the technological choices and the typological repertoire, which can be used as the basis for the creation of a typology of all antler artifacts in Western Macedonia.

## 9 BONE WORKING AND IDENTIFYING CHANGES IN BONE-WORKING TECHNOLOGICAL KNOWLEDGE. THE CASE OF 'MANUFACTURE-BY-WEAR' TECHNIQUES

**Abstract author(s):** Margarit, Monica (Valahia University of Targoviste, Romania) - Boroneant, Adina ('Vasile Pârvan' Institute of Archaeology, Romanian Academy)

**Abstract format:** Oral

This study proposes to identify the changes that intervened in the processing of osseous raw materials, during the North Danube Neolithic and Chalcolithic, starting from three cases of 'manufacture-by-wear' techniques: bipartition by abrasion, segmentation by sawing and perforation by wear. The three techniques appeared suddenly at the beginning of Neolithic and again suddenly disappeared (bipartition by abrasion) or become sporadic (segmentation and perforation) during the Chalcolithic. In our opinion, the disappearance of these procedures is linked to the disappearance of certain artefact types (such as belt elements and rings) and their replacement by other ones allowing a faster production. A first goal of our study targets the raw materials used: were certain bones selected for a certain technique?; were the choices of animal species and consequently their bones maintained as long as these techniques were employed?; were these materials readily available? A second goal looks at the reasons of their appearance and abandonment, and the technological advantages and disadvantages of these procedures when compared to other transformation chains. Based on their experimental reconstructions and by comparing them with other much faster techniques producing similar results, we aimed to see if they represented a real technological innovation. The experiments indicated that the manufacturing techniques replacing them during the Chalcolithic produced similar results but were apparently simpler with a reduced time-investment. Given the technological data discussed above, the osseous material industry can indeed be regarded as a cultural marker if we can identify clearly the moment certain object types were abandoned thus leading to the abandonment of these techniques, perhaps with the influx of new changing socio-economic imperatives.

The work presented here was supported by Romanian Ministry of Education and Research grant CCCDI - UEFISCDI, project number PN-III-P2-2.1-PED-2019-1279, within PNCDI III.

## 10 MANAGING OSSEOUS AND OTHER RAW MATERIALS IN A MIDDLE BRONZE AGE STRONGHOLD FROM THE EASTERN CARPATHIANS (SILIȘTE-PE CETĂȚUIE, ROMANIA)

**Abstract author(s):** Bejenaru, Luminița ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology) - Drob, Ana ("Alexandru Ioan Cuza" University of Iași, Interdisciplinary Research Institute, Science Department, Arheoinvest Research Center) - Bolohan, Neculai ("Alexandru Ioan Cuza" University of Iași, Faculty of History)

**Abstract format:** Oral

The economic and social configuration of the Middle Bronze Age requires technological diversification, which also attracts more diverse raw materials. The proposed case study capitalizes on the results of research conducted in a fortification from Eastern Carpathians (Siliște-Pe Cetățuie, Neamț County, Romania), which although located at a considerable distance from immediate resources, it managed to control a territory and secure its position. Archae-

ozoological analysis indicates the importance of animal husbandry (98% of domestic animal remains, of which 60% cattle, 16% sheep/goat and 15% pig).

Among the concerns of the communities from Silișteea-Pe Cetățuie, the processing hard materials of animal origin is also proven archaeologically, which attests to a sustainable behaviour. Numerous bone sharp objects used for household activities (pottery, weaving, sewing), bone chisels, deer antler handles also suggesting the use of metal objects have been identified. The raw materials of animal origin come mainly from the skeletons of domestic species, but also of the wild ones. In the same context, the local communities also used the "raw material" as a support for the materiality of the ritual activities, as evidenced by the animal meat offerings placed at the base of the buildings. Local resources were used for construction (sandstones), tools (bones), food (salt), and remote resources for household activities (river stones), pottery (minerals).

## 11 IMPORTED MOLLUSCS IN THE CENTRAL BALKANS AND SOUTHERN CARPATHIAN BASIN IN THE NEOLITHIC REVISITED

**Abstract author(s):** Vitezovic, Selena (Institute of Archaeology, Belgrade) - Rajković, Dragana (Archaeological Museum Osijek)

**Abstract format:** Oral

The trade and exchange of marine mollusc shells in the Neolithic and the Eneolithic in Europe is a very interesting topic that attracted attention by many scholars. The phenomenon of Spondylus trade in particular was addressed from different perspectives. However, the entire European region is not researched in an uniform way. In regions such as present-day Bulgaria or Hungary the evidence of marine molluscs is rich and diverse, mainly due to intensive research of cemeteries with rich burial equipment. The archaeological record from the area in between, namely western and central Balkans and the southern Carpathian basin (roughly present-day Serbia and Croatia) is somewhat different; furthermore, it was never systematically studied. The aim of this paper is to provide an overview of current evidence regarding the distribution of the imported marine mollusc shells in this region and also to re-analyse earlier hypotheses in the light of the current evidence. Some 40 years ago, it was suggested, after the information available at the time, that only the sites along the Danube took part in the Spondylus trade during the Late Neolithic. However, mollusc shells were present in the area already in the Early Neolithic Starčevo culture, furthermore, they may be found in the Late Neolithic in the entire Balkan area. The main obstacle for the interpretation is inadequate research, but also specific trait of the Neolithic in the area with very few burials discovered. Findings are limited to predominantly discarded, broken and/or lost ornaments from settlements and the quantity of ornaments seems modest in comparison with other parts of Europe. However, current evidence shows that the ornaments from mollusc were highly valued items, and that the central Balkan area was an important trading route through which these ornaments were further distributed throughout the Neolithic period.

## 12 PRECIOUS ITEMS FROM THE SOUTH AND THEIR LOCAL IMITATIONS: SHELL ORNAMENTS IN THE NEOLITHIC IN POLAND

**Abstract author(s):** Kurzawska, Aldona (Institute of Archaeology and Ethnology Polish Academy of Sciences) - Sobkowiak-Tabaka, Iwona (Faculty of Archaeology, Adam Mickiewicz University in Poznan)

**Abstract format:** Oral

In Poland, ornaments made of mollusk shells are recorded relatively frequently in funeral contexts at archaeological sites associated with the Neolithic and the Early Bronze Age. Among them, Spondylus shells were always considered by archaeologists as the most significant – precious items acquire through trade or exchange, associated with the introduction of agriculture and the emergence of a new social order. The importance of Spondylus however partially caused all other shell finds to be less important for archaeological interpretation.

The study of shell ornaments from the Neolithic and Early Bronze Age sites in Poland revealed that except Spondylus ornaments also other species were imported from the South; freshwater *Lithoglyphus naticoides* and Mediterranean *Glycymeris* and *Venus*. The majority of shells used for ornaments production are of local origin, freshwater mussel, and fossil Miocene shells. However, their choice was not random. Only particular "types" of shells with a specific external morphology (shape, structure, color, pattern, size) were selected. Our research indicated that the shells collected locally by the so-called "Danubian societies" imitated the shell forms used by prehistoric societies of south-eastern Europe during the Neolithic. Certain "types" were in demand due to their meaning in a shared tradition of body ornamentation. Imported shells, their presence at the sites provide evidence for migration routes, long-distance cultural interaction, and exchange. Their local imitations might have been of similar value a sign of belonging to the same cultural tradition, a visual marker of identity, maintaining ties with the representatives of the cultural idea communities living far apart.

## FROM TURQUOISE TO COPPER – THE ROLE OF BEADS AND COLOUR IN THE EARLY PRELUDES TO METALLURGY

**Abstract author(s):** Bruvoll, Hallvard (University of Oslo, Department of Archaeology, Conservation and History)

**Abstract format:** Oral

In central Anatolia, the Late Neolithic to Early Chalcolithic transition marks several important changes in material culture. At the large tell site of Çatal Höyük, this is seen in the relocation of the settlement from the East to the West Mound, and the first appearances of two-storied houses and painted pottery. Beads and bead-making technology on the other hand, has received little attention by prehistorians when it comes to studying cultural change, though this material holds a considerable potential for improving our understanding of such processes.

At Çatal Höyük, the blue and green beads show remarkable changes in material and technology from the late seventh to the early sixth millennium BCE. Early examples of these beads are in naturally coloured materials, like turquoise, which are later replaced by heat-treated odontolite, and eventually by strongly coloured glazes. Glazed steatite beads appear for the first time on the West Mound, and, though the results are still preliminary, the used colorant was probably copper. These glazed beads predate previously known examples from Upper Mesopotamia by several centuries.

The "fake turquoise" hypothesis is known from earlier bead studies in the Levant. As turquoise deposits are extremely rare, odontolite (fossilized ivory) could be used to imitate the turquoise colour through a heating process. I argue here that odontolite, also very rare, would in turn be imitated by baking of steatite, and adding copper as colorant, as seen on the Çatal Höyük beads. This gradual process may explain how copper first became entangled with pyro-technology, a millennium prior to the development of proper metallurgy in the region.

The research presented here is included in a forthcoming volume on the recent excavations at the West Mound, as part of the Çatal Höyük Research Project.

## THE EXPLOITATION OF LOCAL RESOURCES AND INTERCOMMUNAL EXCHANGES IN NEO-ENEOLITHIC. SOME OBSERVATIONS FOR THE SUBCARPATHIAN AREA FROM EASTERN ROMANIA

**Abstract author(s):** Diaconu, Vasile (Neamt National Museum Complex)

**Abstract format:** Oral

The Neo-Eneolithic communities from the Subcarpathian area have exploited different local resources. From an archaeological perspective, the most important resources were the useful rocks and the salt.

Even if in the concerned space we can find several types of useful rocks (mostly sedimentary ones), the analysis of several batches of artefacts from Neolithic and Eneolithic sites stated that the flint has the biggest share, even if it originates from the Prut river basin, situated at a distance of approximately 100 km from them, which was most probably brought by exchanges. In the same manner, we could explain how obsidian is present to sites from the concerned area, as the petrographic analysis stated that it originates from the Carpathian zone of Slovakia, over a distance approximately 400 km away. It is worth mentioning that the obsidian findings are more common in the Neolithic sites, as they are quite rare on the Eneolithic ones.

Unlike other geographic areas from Eastern Romania, the sub-mountainous part contains important salt deposits, which attracted the old human communities there. Some of the archaeological sites dug in the near proximity of the salt water streams were strictly linked to the exploitation of this resource. Besides the needs of the community, the salt obtained from recrystallization was also used for regional trades. It is very possible that this local resource was the base of the intercommunal links from which they obtained high quality rocks for the lithic industry or other "luxury" goods (copper pieces, amber, marine shells).

## EVIDENCE AND OPTIONS OF THE PREHISTORIC SALT EXPLOITATION IN THE CARPATHIAN MOUNTAINS

**Abstract author(s):** Porubcanová, Zuzana (Department of Archaeology and Museology, Masaryk University Brno)

**Abstract format:** Oral

This contribution presents the options of the exploitation and extracting the salt from the various salt sources in Neolithic, Eneolithic and Early Bronze Age. It is also dealing with its distribution in the selected area. The salt sources, which could be available to the prehistoric population include salt springs, brines, saline soils, halophytic plants and rock salt deposits that were visible or situated just below the ground. Based on the distribution and availability of these salt sources it is possible to identify areas and sites, where salt production was likely to occur during the period between 5600 and 1600 BC. The contribution is also dealing with the problematic of the evidence of the salt sources exploitation in the regions of the Carpathian Mountains, which can be very different in the Western part and in the Eastern part of the Carpathians, despite of that they are the same kinds of the salt sources. Various salt sources require different method of their exploitation. Although they provide us with many kinds of the evidence, it can be very difficult (for archaeology) to find them. Therefore, this paper is suggesting hypothesis and possible solutions of these problems.

## PECICA-ȘANȚUL MARE (ROMANIA): A REGIONAL CENTER FOR CRAFT AND TRADE IN THE MIDDLE BRONZE AGE

**Abstract author(s):** Nicodemus, Amy (University of Wisconsin-La Crosse) - O'Shea, John (University of Michigan)

**Abstract format:** Oral

Pecica-Șanțul Mare (Arad County, Romania) was a major trade and craft production center during the Middle Bronze Age (ca. 2000-1500 BC). Its inhabitants participated intensively in local, regional, and extra-regional exchange networks, bringing a range of utilitarian and prestige raw materials into the Mureș River valley. The quantity and diversity of imported items at Pecica far exceeds that of contemporary settlements in the region, with goods often by-passing other Mureș communities along the major river trade routes. Pecica appears to have had preferential access to valuable extra-regional raw materials, such as unworked Baltic amber and marine shell, as well. This settlement also was a major producer and exporter of craft items, including fine metalwork and composite ornaments prominently displayed by elites. Control over both craft production and exchange was critical to Pecica's role as a regional center. From its initial founding, Pecica had specialized economic functions, including serving as a gateway community to the Lower Mureș region.

## THE USAGE OF CLAY SOURCES IN MIDDLE BRONZE AGE. A CASE STUDY FROM EASTERN ROMANIA

**Abstract author(s):** Drob, Ana ("Alexandru Ioan Cuza" University, Interdisciplinary Research Institute, Department of Exact Sciences and Natural Sciences, Arheoinvest Center, Iași) - Bolohan, Neculai ("Alexandru Ioan Cuza" University, Faculty of History, Iași) - Vasilache, Viorica ("Alexandru Ioan Cuza" University, Interdisciplinary Research Institute, Department of Exact Sciences and Natural Sciences, Arheoinvest Center, Iași) - Rățoi, Bogdan ("Alexandru Ioan Cuza" University, Faculty of Geography and Geology, Iași) - Brebu, Mihai ("Petru Poni" Institute of Macromolecular Chemistry, Iași)

**Abstract format:** Oral

The archaeometric study of pottery from the Middle Bronze Age stronghold from Siliștea-"Pe Cetățuie" (Neamț County, Romania) highlighted the presence of a local kaolinic clay, with a high iron content, which was used in pots manufacturing. The Siliștea-"Pe Cetățuie" settlement, located in the South-Eastern extremity of the Cracău river watershed, is naturally defended from three directions (N, E, W) by steep slopes, the defensive system being completed by an anthropic ditch (S), characteristics that generate difficulties concerning the plateau's accessibility. In this regard, the two communities documented in the settlement, Costișa and Monteoru, used a local clay, suggesting the existence of preferences regarding immediate and effortless access to resources.

Based on this information, we carried out an experimental study in order to identify the source of the clay raw material exploited by the two Bronze Age communities. Thus, a first source is represented by a ravine located at approximately 600 m West from the settlement, close to the base of the slope and the second source, which is on the inhabited plateau, is represented by the clay on the Eastern upper slope of the settlement.

In order to identify the source of the raw material we used more interdisciplinary methods of analysis, such as mineralogy, Scanning Electron Microscopy (SEM) and Energy-Dispersive X-Ray (EDX) Spectroscopy, Micro-Fourier Transform Infrared Spectroscopy (FTIR) and Thermogravimetry (TGA/DTA). The results of this experiment provided information on the behavior of the Middle Bronze Age communities that occupied areas East of the Carpathians, especially regarding the exploitation and use of the natural resources required for pottery manufacturing.

## INVESTIGATING SZÉKELY HISTORY THROUGH REGIONAL AND INTERDISCIPLINARY APPROACHES

**Theme:** 3. The Carpathian Basin: Integration, Mobility and Diversity

**Organisers:** Zejdlík, Katie (Western Carolina University) - Bethard, Jonathan (University of South Florida) - Nyárádi, Zsolt (Haáz Rezső Múzeum, Odorheiu Secuiesc)

**Format:** Regular session

Perpetual fission and fusion of people and ideas have characterized the lived experience of Carpathian Basin inhabitants. In contrast to this constant change, Hungarian-speaking Székely have maintained relative stasis in the eastern portion of the region since they arrived a millennium ago. The stability offers a unique, foundational perspective to explore the lifeways of a steadfast culture as well as the ever-changing milieu within which they have been ensconced. This symposium seeks to connect scholars examining the lives of past Székely, and the people with whom they interacted, through a regional perspective as well as by using different disciplinary approaches and at various scales. Insight into migration through ancient genetics, broad patterns of diet through isotope analysis, and lifeways and mortuary practice through materials and landscape studies help with understanding the connection of the Székely to the larger Carpathian Basin and European context, while studies of refined contexts of single individuals or family groups deepen our understanding of personal relationships. We welcome regional and interdisciplinary contributions that explore medieval, early modern, and contemporary Székely lifeways and interactions with inhabitants

of the Carpathian Basin. Ultimately, the purpose of this session is to explore cutting-edge approaches to the dynamic interconnectedness of people in this area.

## ABSTRACTS

### 1 INVESTIGATING THE ARCHAIC AND MODERN-DAY SZÉKELY GENE POOL AROUND SZÉKELYUDVARHELY

**Abstract author(s):** Borbély, Noémi (Institute of Archaeogenomics, Research Centre for the Humanities, Budapest) - Szeifert, Bea (Institute of Archaeogenomics, Research Centre for the Humanities, Budapest; Doctoral School of Biology, Institute of Biology, ELTE Eötvös Loránd University, Budapest) - Kerestély, Koppány (Institute of Archaeogenomics, Research Centre for the Humanities, Budapest) - Pamjav, Horolma (Laboratory of Reference Samples Analysis, Institute of Forensic genetics, Hungarian Institute for Forensic Sciences, Budapest) - Egyed, Balázs (Department of Genetics, Faculty of Natural Sciences, ELTE Eötvös Loránd University, Budapest) - Nyárádi, Zsolt - Sófalvi, András (Haáz Rezső Museum, Odorheiu Secuiesc) - Gál, Szilárd Sándor (Muzeul Județean Mureș, Târgu Mureș) - Benkő, Elek (Institute of Archeology, Research Centre for the Humanities, Budapest) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, Research Centre for the Humanities, Budapest)

**Abstract format:** Oral

We examine DNA from archaic and modern-day Székely samples from the region of Székelyudvarhely to expand our knowledge about Hungarian population genetics relationships and complete the genetic map of the Carpathian Basin with high quality uniparental (whole mitogenome and 17-23 Y-STR data) and full-genome data.

The modern sample set we analyzed includes more than a hundred Hungarian-speaking Székely individuals from isolated villages near the town Székelyudvarhely. The donors' maternal and paternal ancestry was thoroughly documented in order to exclude the effect of population migration in the last 100-150 years and to avoid sampling of close relatives. The archaic sample set contains nearly a hundred medieval (12- 15/16. century) individuals from the region of Székelyudvarhely (Székelyudvarhely, Székelykeresztúr, Fenyéd, Kányád, Nagyalambfalva, Patakfalva, Máréfalva, Bögöz) mostly from church-related burials.

We analyzed maternal lineages with whole mtDNA next-generation sequencing, and the results were compared to published modern and ancient mitogenomic datasets. The majority of the modern and archaic Székely population can be assigned to European mtDNA haplogroups, but the presence of Asian haplotypes is not negligible either. Phylogenetic analyses confirmed the presumed eastern origin of certain lineages and in some cases, they can be linked to ancient DNA data of early Hungarians.

In the modern data set, we found mostly European-related Y-haplogroups and the smaller proportion of the samples belonged to haplogroups with Asian-origin. These are the few Y-haplotypes that may reflect a Central Asian connection. Further observations are aimed to achieve from comparative analyses of the paternal lineages and the thorough analysis of whole-genome data. Through these studies, we can monitor the continuity and relationships of the region's populations.

This study was funded by the NKFIH FK-127938 research grant.

### 2 UNDERSTANDING SZÉKELY LIFE THROUGH BURIAL PRACTICES FROM A MORTUARY CONTEXT IN TRANSYLVANIA

**Abstract author(s):** Reinman, Lauren (George Mason University) - Bethard, Jonathan (University of South Florida) - Nyárádi, Zsolt (Haáz Rezső Múzeum, Odorheiu Secuiesc)

**Abstract format:** Oral

Through the study of burial contexts, bioarchaeologists can identify patterns of burials to understand the lives of people in the past. This work focuses on a mortuary context from the present-day city of Cristuru Secuiesc (Székelykeresztúr), Romania. Historically, this town was inhabited by Hungarian-speaking Székely people and remains so today. During salvage excavations in 2021, the remains of 16 well-preserved individuals were excavated from a mortuary context adjacent to one of churches in Cristuru Secuiesc. Burial patterns of the interments were broadly consistent with Christian burials across Europe during this time. Three of the thirteen individuals were middle-aged or older adult females, while all the other individuals were non-adults ranging in age from birth to early adolescence. This presentation will highlight general description of the site and its historical context. Additionally, a description of isotopic analysis will provide insight into the broad dietary practices of these individuals. Ultimately, this presentation aims to provide a better understanding of Székely life and death rituals through a combination of bioarchaeological and historical research.

### 3 UNDERSTANDING THE USE OF COINS IN SZÉKELY BURIALS, 12TH TO 17TH CENTURY

**Abstract author(s):** Privette, Cameron - Zejdlik, Katie (Western Carolina University) - Nyárádi, Zsolt (Haáz Rezső Múzeum, Odorheiu Secuiesc)

**Abstract format:** Oral

Coins recovered as grave offerings provide insight into a community's mortuary beliefs beyond the typical information concerning temporality or political influences. The most common interpretation of coins in burials relates to the tradition of Charon's Obol, the coin placed in the mouth of the deceased to pay for passage to the afterlife, or some variant of that practice. Coins may also serve as charms against evil or as a type of almsgiving to the dead. They have been found on eyes, in mouths, hands, and remnants of purses; and simply scattered alongside the body. Coins are frequently associated with females and children. This paper will consider the importance of coins in mortuary practices, across different times and regions, as well as break down the assumptions surrounding Charon's Obol. Then, using a case study of burials from the Papdomb site in Patakfalva, Romania, it will approach the interpretation of coin presence in Székely graves. In the Székely region of Transylvania, coins found in burial contexts from the 12th to the 17th century are usually assumed to be a form of Charon's Obol, however, this area has been subject to drastic political and religious changes throughout history and this general interpretation may not get at the nuanced meaning of these coins. In particular, the introduction of Christianity may have had considerable influence on the use and meanings of coins.

### 4 FORGED IN BAIÁ MARE: SOCIAL RELATIONSHIPS AND THE EMBODIMENT OF MEDIEVAL GOLD MINING IN A 14TH-17TH CENTURY TRANSYLVANIAN CEMETERY

**Abstract author(s):** Mollard, Priscilla - Zimmer, Adam (Rivulus Dominarum Bioarchaeology; University of Massachusetts Amherst)

**Abstract format:** Oral

Maramureş was the metallurgical epicenter of Transylvania for almost 3,000 years and Baia Mare, present-day capital of Maramureş county, was among the most important Transylvanian gold-mining towns in the medieval Kingdom of Hungary. In return for their skilled labor, citizens enjoyed special privileges granted by royal charter, which gave Baia Mare political and social freedoms denied non-mining towns. From the 14th century onwards, the town functioned as an entity set apart from others, giving its citizens unique political and social benefits at a relatively small cost and attracting diverse groups of workers. Cultural diversity has always been a hallmark of mining towns, whose working conditions tend to force laborers to intermingle in ways they otherwise may not. Within the exceptional complexity of relationships that coalesce around contemporary mining projects, structural inequality, harsh working conditions, and social isolation tend to produce conflict, opposition, and dispute among workers, leading to power hierarchies rooted in ethnicity. Were these same structures in place in medieval Baia Mare? The economic and social autonomy granted royal Transylvanian mining towns attracted diverse groups of laborers throughout Europe but we have little knowledge of how those individuals navigated social relationships within a society brought together by occupation rather than familial or ethnic unity. Few bioarchaeological studies of pre-industrial mining exist, and fewer still consider the biosocial role that mining played in mortality, community health, and social identity outside the mines. The research presented here places the embodiment of mining, and its biosocial consequences, at the center of a community-engaged bioarchaeological study of the medieval Piaţa Cetăţii cemetery from 14th-17th century Baia Mare. The project employs bioarchaeological methods to investigate social relationships at Piaţa Cetăţii, and the role that mining played in shaping adult mortality, community health, and social identity both historically and into the present.

### 5 DEMOGRAPHIC VARIATION AMONG MULTI-PERSON, CEMETERY INTERNMENTS IN MEDIEVAL AND BAROQUE SZÉKELY TRANSYLVANIA

**Abstract author(s):** Zejdlik, Katie (Western Carolina University) - Bethard, Jonathan (University of South Florida) - Nyárádi, Zsolt (Haas Rezső Múzeum, Székelyudvarhely) - Kulhavy, Kathryn (University of Tennessee, Knoxville)

**Abstract format:** Oral

The interment of multiple people in a single burial context is rare when evidence of widespread disease or warfare are absent, and the practice is not part of standard mortuary treatment. When found, individuals are typically females with children or children together. Interpretation of multi-person burial is often espoused as biological or kin relationships and is sometimes related to non-natural catalysts. Despite the seemingly unusual occurrence of multiple burial in Europe and Eurasia through time, multi-person burial is not an uncommon practice among medieval and baroque individuals in the Székelyföld with investigations reporting interment of several children with an elderly female or family members interred together in a family crypt. The range of variation in multi-person interment at the Papdomb site ranges from the interment of an adult male with a pre-term infant, to two children interred holding hands, to two males buried together but immediately on top of one another. Location within the Papdomb landscape also varies with individuals recovered from within the church proper to outside the church yard wall. This paper provides an overview of type, period, and location of multi-person interments at the Papdomb site and then places it within

the larger context of Transylvania and Europe. The paper concludes with a discussion of the in-progress ancient DNA work being conducted.

## 6 UN-ERASING THE INVISIBLE ELDERLY IN BIOARCHAEOLOGY: AN EXAMPLE FROM THE SZÉKELYFÖLD

**Abstract author(s):** Bethard, Jonathan (University of South Florida) - Zejdlik, Katie (Western Carolina University) - Nyárádi, Zsolt (Haáz Rezső Múzeum)

**Abstract format:** Oral

In recent years, bioarchaeologists have noted that demographic reconstructions of past communities have a conspicuous absence of elderly individuals. Does this observation mean that the human lifespan was shorter long ago? Did people not live as long as they do today? Do present-day definitions of who is an elder blur how we define old age in the past? Answers to each of these questions require some understanding of how bioarchaeologists approach the subject of age-at-death estimation from the human skeleton, as well as the methodological shortcomings associated with our most common age estimation methodologies. Additionally, bioarchaeologists often do not have the luxury of working in contexts where documentary sources shed light on social categories of the human lifespan. Despite this obvious shortcoming, how do we proceed without further sidelining elderly individuals from the past? In this presentation, we discuss the problems and pitfalls of age-at-death estimation in bioarchaeology, as well as approaches which might provide improvements for future work on this question. Lastly, we present a snapshot of Székely elders we have identified from our on-going, multi-site bioarchaeological project in the Carpathian basin.

## 7 AN ANALYSIS OF DENTAL-SKELETAL AGE DISCREPANCY IN A MEDIEVAL TRANSYLVANIAN POPULATION

**Abstract author(s):** Bews, Elizabeth (University of South Florida) - Zejdlik, Katie (Western Carolina University) - Nyárádi, Zsolt (Haáz Rezső Múzeum) - Gonciar, Andre (ArchaeoTek Canada, LLC) - Bethard, Jonathan (University of South Florida)

**Abstract format:** Oral

A basic assumption of bioarchaeology is that in non-adult individuals, post-cranial skeletal growth is more sensitive to environmental stressors than dental development. As a result, dental development is a more accurate indicator of chronological age than post-cranial skeletal maturation in non-adult individuals, while skeletal development is a better indicator of frailty and differential health statuses within archaeological populations. What is less clear, however, is the age at which this divergence in skeletal-dental maturation rates begins to manifest, and if specific age cohorts experience this discrepancy more profoundly than others. The medieval church site of Papdomb is notable for its high density of non-adult burials, of which a large subset of individuals has a dental age that is well ahead of their post-cranial skeletal age. Therefore, this site presents an ideal environment in which to investigate the intricacies of dental-skeletal development discrepancies in non-adult individuals from archaeological contexts. The cemetery at Papdomb is associated with a multi-phase medieval church in Harghita county, Romania, near the village of Văleni (Hungarian: Patakfalva) and lies within the Székelyföld. The church cemetery was used from the 11th – 17th century and contains the remains of both male and female individuals ranging in age from perinate to old adult. This study will examine all non-adult individuals (n=239) who have an estimated age of 16.5 years or younger. Each individual's skeletal remains will be analyzed according to age cohort, level of discrepancy between dental and skeletal age estimates, and will be assessed for other skeletal markers of frailty such as linear enamel hypoplasia, cribra orbitalia, porotic hyperostosis, and rickets. Ultimately, this analysis aims to clarify when and how the phenomenon of dental-skeletal development discrepancy manifests in non-adult individuals from archaeological contexts.

## 8 AN EXPLORATION OF STRESS AND DIET THROUGH CARBON AND NITROGEN STABLE ISOTOPE ANALYSIS IN LATE MEDIEVAL-EARLY MODERN ROMANIA

**Abstract author(s):** Watson, Jenna (The University of Tennessee Knoxville) - Constantinescu, Mihai (Francisc I. Rainer Institute of Anthropology, Romanian Academy; Faculty of History, University of Bucharest)

**Abstract format:** Oral

Romania during the Late Medieval and Early Modern period was a feudal society consisting of the wealthy noble and ruling classes, peasants, and serfs. Staple crops such as wheat, rye, and barley (C3 plants) were commonly consumed during this period as well as millet and eventually maize (C4 plants). Terrestrial and aquatic animal protein sources like pork, beef, ruminant milk, and fish were also common food sources. However, the way an individual's social status, age, and sex may have differentially affected access to these food resources and impacted their experiences of stress and disease during the Late Medieval-Early Modern period is not fully understood. This research uses demographic, pathological, archeological, and stable isotope data to explore how age, sex, social status, and diet influenced patterns of stress and frailty in human skeletal remains excavated from three sites in Moldavia (northeast Romania) dating to the 14th – 18th centuries CE. These skeletal collections are currently housed at the Francisc I.

Rainer Institute of Anthropology (FRIA) in Bucharest, Romania. Age-at-death and sex were estimated using standard methods, skeletal indicators of non-specific stress and dental pathology (periostitis, porotic lesions of the skull, linear enamel hypoplasia, caries, and abscesses) were analyzed and documented, and both the ribs and femora were sampled for carbon and nitrogen stable isotope analysis at the University of Bucharest Stable Isotope Laboratory. This research aims to 1) determine the dietary composition of these populations 2) improve our understanding of how dietary composition correlates with age, sex, social status, and skeletal stress, 3) and provide more insight into patterns of stress and dietary composition of human populations in Moldavia during the Late Medieval and Early Modern periods in Romania.

## 9 **TRANSYLVANIA DIET: A COMPARATIVE INVESTIGATION OF A SAXON COMMUNITY FROM BRAȘOV, ROMANIA (14TH-18TH CENT.)**

**Abstract author(s):** Barkmeier, Jonathan (University of Central Florida)

**Abstract format:** Oral

This study investigates a late medieval/early modern Transylvanian skeletal assemblage from Brașov, Romania by assessing dietary tracers through isotopic analysis. During this period, the Transylvanian region was characterized as a multi-ethnic region with intermixing groups such as Hungarians, Székely, Saxons, and Romanians. The skeletal assemblage from Brașov represents an enclave community of high-status Saxons and offers a unique case in which potential dietary practices can be compared to neighboring communities. Isotopic data from sixty individuals were examined from bone tissue for nitrogen ( $\delta^{15}\text{N}_{\text{col}}$ ) and carbon ( $\delta^{13}\text{C}_{\text{col}}$  and  $\delta^{13}\text{C}_{\text{ap}}$ ). Data from  $\delta^{15}\text{N}_{\text{col}}$  and  $\Delta^{13}\text{C}_{\text{col}}-^{13}\text{C}_{\text{ap}}$  are used to investigate protein sources available to those in Brașov. Additionally, these data were combined with demographic analysis to assess intra-community variation between the sex or age cohorts. Isotopic data is compared to other geographically similar groups to understand regional dietary variation in Transylvania. This research helps elucidate dietary patterns within the region and addresses the influence that socio-cultural factors (e.g., ethnic identity, socio-economic status, sex/age) may have on diet at the inter-/intra-population level.

## 10 **SZÉKELY SUBSISTENCE AND SOCIAL STRATIFICATION REVEALED THROUGH STABLE ISOTOPE ANALYSIS**

**Abstract author(s):** Bethard, Jonathan (University of South Florida) - Zejdlik, Katie (Western Carolina University) - Nyáradi, Zsolt (Haáz Rezső Múzeum) - Gonciar, Andre (ArcheoTek, LLC)

**Abstract format:** Oral

Dietary reconstruction from stable isotope analysis of carbon and nitrogen is a routine component of bioarchaeological scholarship. Bioarchaeologists working across time and geography utilize these isotope systems to understand the ways in which people incorporated plant and animal resources into their diets. Moreover, nuanced understanding of how carbon and nitrogen isotopes are routed to different bodily tissues such as collagen and bioapatite provide an even more granular understanding of how dietary practices occurred in the past. Throughout European archaeological contexts, scholars have utilized stable isotope analyses to understand 'big picture' topics such as how dietary resources were linked to social status or how weaning practices shifted with migration from rural to urban locales. Additionally, stable isotope analysis has helped provide rich detail to the interpretation of single individual osteobiographies. Despite these advances, less research utilizing this approach had occurred in the Carpathian basin and even less has focused on Székely communities. This presentation helps close that gap and details medieval and early modern Székely dietary practices by presenting results from a large (n=120) multi-isotope study focused on data derived from both collagen and bioapatite. Results indicates that a majority of Székely adults had a primarily herbivorous diet, most likely derived from cereals grains such as wheat. Additionally, evidence for social stratification related to the availability of foodstuffs is apparent in the Székely community presented in this talk. In sum, stable isotope analysis is a powerful tool for better understanding communities from the understudied region of the Carpathian basin.

---

## 305 **UNRAVELLING THE URBAN PALIMPSEST: THE RE-USE AND INTEGRATION OF URBAN FABRIC IN TIME AND SPACE [URBAN ARCHAEOLOGY COMMUNITY]**

**Theme:** 2. [Re]integration

**Organisers:** Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands) - Belford, Paul (Clwyd-Powys Archaeological Trust) - Kolláth, Ágnes (Archaeological Institute Hungarian Academy of Sciences)

**Format:** Regular session

A town is a palimpsest of different periods of building and development. New buildings arise above older ones, and older buildings are reused. A famous example is the Roman Theatre of Marcellus. In many cases re-use was not confined to buildings, but all or part of the urban fabric was re-used as well. Earlier urban forms are preserved in modern street plans. The Roman origins of many places are evident today. Components of medieval town plans – burgrave

plots, market places and town walls – are often embedded in the grain of the modern urban landscape. At the same time parts have been erased. This process of negotiation and compromise continues today: heritage management is often about incorporating older buildings and areas in new developments in order to preserve them.

This main session of the EAA Urban Archaeology Community focuses on unravelling this palimpsest. This can be about modern urban development, but also about urban development in previous ages. We would like to focus on two specific themes:

- The re-use and integration of buildings;
- The re-use and integration of space.

The main questions are how this re-use is manifested and why and when. Are these local or supra-local phenomena? Are connections between towns, regions and periods recognisable and how are they represented? Is there a connection with the landscape? How can we preserve the old urban fabric, but also weave new threads into it, so that it may still serve the inhabitants' needs?

In this session we will explicitly not focus on one specific period and region. Exploring diversity through time and space can help us develop a better understanding of underlying patterns and interconnections. This will also be the focus in the discussion slots of this session.

We welcome papers from within and outside Europe.

## ABSTRACTS

### 1 INTRODUCTION TO UNRAVEL THE PALIMPSEST

**Abstract author(s):** Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands)

**Abstract format:** Oral

Like any other settlement, the city cannot be separated from the landscape in which it lies. The city may have come into being when an existing settlement began to flourish and continued to expand, acquiring more and more urban characteristics. At the same time, there are also cities that are deliberately placed in a particular spot, for geopolitical reasons, economic reasons or both. Accessibility is important for a city. It is a gathering place for people and goods and a node in a much larger network. Each node in this network is a connection to the hinterland. This hinterland could provide the city with raw materials for trade and crafts. The node could also be a strategic point to protect the hinterland.

In this lecture, the relationship between the city and the landscape will be explored on the basis of some Dutch examples. Relationships between the structure of the city, the function of the city in relation to the hinterland, and the landscape are explored. How is a city structured? What functions can be distinguished and where are these functions located within the city? It is not only about the origins of the city but also about how it developed further. Think of the shifting city periphery with, for example, polluting and fire hazardous functions, which often moved outwards when the city expanded. What happens in urban decline?

This lecture provides the context for the session Unravelling the Urban Palimpsest.

### 2 THE RECUPERATION AND REINTEGRATION OF MODERN AGE QANATS IN MADRID: AN EXAMPLE OF A HIDDEN BUT ESSENTIAL LANDSCAPE

**Abstract author(s):** Zamora, Aurea (Independent researcher) - Briones Martínez, Cecilia (Ayuntamiento de Madrid) - Arnáiz Barrio, Fernando - González García, Toñi (Cofas 0,00 s.l.)

**Abstract format:** Oral

The qanats are ancestral infrastructures for water supply adapted to arid environments, originating in Iran. In the Iberian Peninsula, the Muslims introduced this particular system in the 8th century, and it is still in use in some regions.

The foundation of Islamic Madrid is related to two water springs still traceable within the urban topography; at this time, few qanats were supplying the small village. However, the exponential growth of Madrid from the 16th century onwards as the Court of the Spanish Empire is historically lacking an explanation regarding the proliferation and importance of these infrastructures. The qanats did not only bring clean water to fountains, convents, or palaces in Madrid but were also the catalyst for the creation of intricate networks of water carriers, inns, and roads. Besides, they were often regarded in Modern Age sources, even though most of the population had never seen it: p.e. the fame of their waters praised in literature, or the popularity of public fountains or water carriers, painted as part of the folklore.

In Madrid, kilometers of 16th-19th centuries qanats remain underground, mostly unknown by the population, and as invisible today as then. However, a synopsis of the topography of the historical city, alongside the distribution of the qanats, unveils that the latter was the backbone of Madrid's Modern Age urban development.

This paper shows the results of ongoing works undertaken by Madrid's City Council since 2018 in collaboration with archaeologists, architects, and heritage specialists. These works have focused on historical research, archaeological

recording, GIS mapping, and restoration of building elements with the aims of reintegrating parts of the Modern Age quarters within the current topography of Madrid, as well as creating accessible knowledge of this crucial landscape, and stress its importance for the enhancement of the lives of others.

### 3 **CROSS, HALF MOON, GUNPOWDER – CHURCHES OF HUNGARIAN CITIES IN THE OTTOMAN-HABSBURG WARS' NORTH-WESTERN BORDER ZONE**

**Abstract author(s):** Kolláth, Ágnes (Bölcsészettudományi Kutatóközpont)

**Abstract format:** Oral

The Ottoman conquest in the middle part of Hungary (1526-1698) brought dramatic changes for the country. The region between the Danube and the Bakony Mountains - called earlier "the Middle of the Kingdom" (Medium Regni) - had become a warzone with ever-changing borders. The old royal and episcopal seats, Buda, Esztergom, Székesfehérvár, Győr and Veszprém had been transformed into fortress-towns, sometimes switching owners within a few years during big military campaigns. These cities had housed quite a few of the most important and most splendid ecclesiastic institutions of medieval Hungary, that all suffered damages, however to a varying extent.

The paper aims to examine, how these institutions, especially the bishopric cathedrals and other major churches were handled by the Ottoman and/or the Habsburg administrations. The buildings' historic and symbolic significance was known to the occupiers and they tried to use these factors to their own benefit by claiming to protect them, by transforming them to their own religious and cultural norms or by profaning them. Some of these edifices were also coveted by the practical military commanders and engineers because of their sheer dimensions, thick stone walls and strategic positions within the settlements.

These clashing interests could result in the complete devastation of a given church, while others were saved because of them. After the reconquering wars had succeeded at the end of the 17th century, people tried to put the fragments of their old cities together. The second half of the presentation explores, how these buildings - or their memory - influenced the development of the renewed settlements.

### 4 **MAKING ROOM FOR SPECTACULA: THE ENTERTAINMENT BUILDINGS IN THE URBAN DEVELOPMENT OF ROMAN THRACE**

**Abstract author(s):** Andreeva, Petya (Austrian Archaeological Institute)

**Abstract format:** Oral

The long-standing archaeological investigations of the ancient cities in Roman Thrace have resulted in several well-documented entertainment districts built up amid dense urban fabric. They have been plausibly recognized by the remains of monumental buildings (theaters, amphitheatres, stadium), which not only embellished the urban area, but also responded to Thrace's newly articulated role as a province arranged in the "Roman urban order".

The interventions in the ancient urban fabric embedded in the modern city planning gave rise to controversy as to the functional interpretation of some of these buildings and structures, yet characterized by a unique architectural layout. However, rescue excavations conducted recently have made it possible to precise the diachronic development of their architectural design and integration into the urban environment: Hellenistic structures beneath some of these monumental buildings have been identified, more light has been shed on their architectural and functional adaptation, and reconfiguration of urban areas to make space for spectacles has been attested archaeologically so far. The latter conceal additional motivations behind the provincial community attitude towards urban environment and the implicit relation to the urban context regarding any changes in the general layout undertaken.

The reconfiguration of urban landscape in Late Antiquity, inside and outside the city walls, so as to integrate such significant public buildings indicated changes to the urban fabric. An amphitheater built within the city walls re-using the urban space (Diocletianopolis) and an extramural amphitheater constructed above theater of an earlier date (Serdica) have been subject to archaeological research.

Last but not least, the buildings designed to stage Roman spectacles were charged with symbolic values and served as monumental symbols of the Roman urban life and way of entertainment. Once they were defunctionalized, their remains were superimposed by buildings and structures related to the process of Christianization of the ancient cities.

## 5 PHENOMENA OF RE-USE AND INTEGRATION OF THE URBAN GRID IN THE CITYSCAPE OF NEA PAPHOS; THE CAPITAL OF HELLENISTIC-ROMAN CYPRUS

**Abstract author(s):** Miszk, Lukasz (Institute of Archaeology Jagiellonian University) - Kubicka-Sowińska, Anna (Warsaw University of Technology) - Papuci-Władyka, Ewdoksia (Institute of Archaeology Jagiellonian University; University of Warsaw) - Brzozowska-Jawornicka, Aleksandra (Wrocław University of Science and Technology) - Ostrowski, Wojciech (Warsaw University of Technology) - Michalik, Michał (Institute of Archaeology Jagiellonian University)

**Abstract format:** Oral

Nea Paphos, which served as the capital of Hellenistic-Roman Cyprus, was a city founded according to the Hippodamian principles of a regular planned urban centre. However, given the 700-year history of the city's existence in antiquity, Paphos is a perfect example of the processes of re-use and integration to primer layout in the successive phases of development.

The phenomenon of the reuse of buildings' space and their disappearance in Nea Paphos cityscape is recorded in many districts of the city. Our research focuses on the analysis of these processes within the residential area of the so-called Maloutena, especially in the area of the buildings of the "Hellenistic" House and the Villa of Theseus, as well as the main square of the city, the Agora. Changes in plans and layouts of the Paphian residences and other buildings may indicate some modifications of their function or the way they were used. However, despite the city's development, the Hellenistic town plan is still preserved in buildings orientation and the course of main roads. The aim of the presentation will be to present the best archaeologically identified examples of the re-use of space in regularly planned towns and their integration into the urban landscape of Paphos.

## 6 SETTLEMENT PATTERN MODELLING AND THE STRUCTURE OF URBANISM OVER TIME AT ANGKOR, CAMBODIA

**Abstract author(s):** Klassen, Sarah (Leiden University) - Fletcher, Roland (University of Sydney)

**Abstract format:** Oral

The Greater Angkor Region contains one of the largest known, agrarian-based, low-density urban settlement in the world. Recent research has modelled the development of this landscape with implications for population growth and agricultural subsistence. This work suggests that the Greater Angkor region reached a maximum population of up to 900,000 at its peak. As part of this process, the urban fabric developed in ways that are consistent with the Alonso-Muth-Mills model of urban land where infrastructure incorporated agricultural production into the urban system. In this paper, we review recent work to map and model the growth of the urban complex. We also investigate the internal structure and the scaling patterns, which emerge in the residential layout and the infrastructure of Greater Angkor. Our results indicate that the Greater Angkor Region displays elaborate, internal development histories, distinct travel-time patterns and internal differentiation of occupation areas by scale and connectivity within the urban complex of Greater Angkor.

## 7 URBAN STORIES FROM A SEVEN HILLS CAPITAL IN EASTERN ROMANIA

**Abstract author(s):** Bolohan, Neculai („Alexandru Ioan Cuza" University of Iași) - Drob, Ana - Asăndulesei, Andrei (Alexandru Ioan Cuza" University, Interdisciplinary Research Institute, Science Department, Arheoinvest Research Center, Iași)

**Abstract format:** Oral

The development of a regional capital involves an interweaving of narratives. Of these, in this case, stands out the way in which a site situated at an important crossroads and on a communication axis has acquired multiple functions. It all starts with the capitalization of a periphery to be found beyond the city walls, continues with the construction of a boyar residence that has undergone renovations, will develop in the form of public institutions and will acquire mundane values in the contemporary period.

The narration developed under the sign of the functional palimpsest, as it resulted from a recent archeological investigation, which confirmed the older cartographic data as well as some of the histories of the place called Casa Canta. At the same time, all these data express the gradual rhythms of urbanization and modernization of the city of Iași, capital of the principality of Moldova, since the end of the 18th century. The proposed case study involves analyzing the relationship between a residence and a „loisir landscape" , a post office located on the main axis of communication with the north of the principality and a succession of re-uses until the current destination. The existence of different stages is supported by the archaeological investigation of the urban context, by the analysis of the materiality and by the association of the written data.

## 8 VALORISATION OF LIVING SPACE IN MEDIAEVAL AND EARLY MODERN CITIES. EXAMPLES FROM CENTRAL EUROPE

**Abstract author(s):** Legut-Pintal, Maria (Institute of Archaeology - University of Wrocław) - Grosel, Mikołaj (Faculty of Architecture - Wrocław University of Technology)

**Abstract format:** Oral

The space within the walls of a mediaeval city was not uniform. Social inequalities in a historic city also had their spatial and architectural dimensions. Some areas of the city were considered prestigious, while others had a bad reputation. Valorisation of space is understood as an assessment of the level of fulfilment of the needs of residents - due to its location and functional and spatial features. The quality of the residential spaces in a city could be determined by a distance from the centre and other important landmarks, including main squares, but also important infrastructure elements affecting the quality of life (main roads, water supply networks). The value of space could be lowered by unfavourable and burdensome neighbourhoods. The value of a specific real estate depended on its function, size, technical condition of the building and many other factors, sometimes difficult to identify. In this paper, we would like to propose a simplified model of the valorisation of residential space, understood as a space built up with buildings with predominantly residential functions, in a historical city. Our considerations are based on examples from two Central European cities, Prague and Wrocław, for which we use historical, archaeological, iconographic data and geospatial analysis. We perform value assessment for several different time periods, trying to track changes that occurred as a result of the evolution and development of space and various historical events. We assume that the approach we propose can be applied to valorising space of other historical cities.

## 9 URBAN ARCHAEOLOGY IN DURRËS (ALBANIA) – PROBLEMS AND THE FUTURE

**Abstract author(s):** Lafe, Ols (Center for the Development of Ancient and Medieval Albanian Heritage; University)

**Abstract format:** Oral

The development of urban centers quite often takes place on the same location where the earlier traces of that settlement are located. This immediately brings forward an inevitable clash between the desire for development and the need for the protection of traces of the past. Precisely these ruins of various monuments are found separated from the city's development over them and the task of archaeologists (not alone) is to integrate them in the everyday life offering the best possible solutions for their protection and presentation. This is the most important phase, perhaps more important than the excavation itself, it is the moment when the discussion on their in situ or ex situ preservation begins. Durrës, as a millennial city offers the most complete panorama of urban development intertwined with archaeology and where in the last 100 years there are at least 15 monuments and archaeological ruins of all categories (walls, mosaics, towers, roman baths of the city etc.), which have been brought to light and are situated under public or private buildings alike. Our analysis contributes towards the creation of the GIS map of the protected underground of Durrës (the "known" underground), and discusses the 15 locations which today are still visible and elaborates their current conditions. Do they have to stay under such modern buildings and presented to visitors in situ? Do they need to be transferred to the archaeological museum for a better ex situ presentation? Are they all declared cultural monuments, are some of the crucial questions that this presentation discusses.

## 10 A TOWN OF RUINS - REUSE, URBAN INFILL AND DECLINING POPULATION IN LATE MEDIEVAL LÖDÖSE

**Abstract author(s):** Lazarides, Anton (Lödöse museum)

**Abstract format:** Oral

The medieval town of Lödöse, by the river Göta älv, was once the only port in Swedish control with access to the western coast of the Scandinavian Peninsula. Its primary function was to access maritime trade routes towards the European continent and the British Isles between the late 11th century until late 15th century when its functions were moved south down the river to New Lödöse.

This paper will focus on the urban development in Lödöse during the late medieval period through a case study of recent excavations in the port area of town. These results has brought new light to the last centuries of Lödöse as a town and how it continued to survive even after a formal decision was made to move its functions to New Lödöse in 1473. Even though a rapid decline in population occurred throughout the 15-16th centuries, the port area has been subjected to urban infill, notably around the time the town saw an increasing decline. The subject of reuse is evident in the late medieval period in Lödöse. Through the ruins from a greater past, a small but dense town arose, closer to the river.

What prompted the inhabitants of Lödöse to densify the urban area during this time? A likely interpretation is the competitive advantage of a dense urban area with proximity to the port. The urban centre had earlier been in the area east of the port, between the castle Lödösehus and the church of Saint Peter, on both sides of a creek that

was used as an important route for the infrastructure of the town. Towards the end of the medieval period this creek started to sludge and dry up - another reason to densify closer to the river.

## 11 NEW TOWNS RENEWED? DEVELOPMENT AND ARCHAEOLOGY IN THE MEDIEVAL TOWNS OF WALES

**Abstract author(s):** Belford, Paul (Clwyd-Powys Archaeological Trust)

**Abstract format:** Oral

Much of Wales is a landscape of steep hills, river valleys and rugged coastline. Communication can be challenging. Some prehistoric and early medieval settlements may have had urban characteristics, and Roman influence was stronger in the more accessible lands of southern and eastern Wales. However most towns in Wales were founded from the 11th century onwards, either as part of the Anglo-Norman conquest or in response to it. Some were short-lived, but many developed as fully urban centres supporting a wider hinterland. Although small, they had (or aspired to have) all the urban characteristics – defences, markets, civic buildings and well-ordered public and private spaces. The medieval new towns of Wales have been characterised as the imposition of an urban 'colonial' mindset on a resistant rural population. However archaeological work undertaken as part of development process in the last 30 years has shown a more subtle picture. Themes include

- Longevity of medieval urban planning, often incorporating earlier landscape features for symbolic or practical reasons
- Urban centres as places of exchange and communication, as well as foci for domination and resistance
- Similarities and differences between 'English' and 'Welsh' experiences and encounters in the urban landscape

This paper will review some of this evidence, and explore issues of sample bias in a purely development-driven approach to archaeological research – both between towns and within them. Discussion will focus on the value of incremental knowledge gain over many decades, emphasising the importance of regional expertise to aid understanding of development in local context.

## A. CASTLE IN THE HEART OF THE TOWN. THE FUNCTIONS OF TATA CASTLE (HUNGARY) FROM THE MIDDLE AGES TO THE PRESENT

**Abstract author(s):** Kovács, Bianka (Institute of Archaeology, Research Center for the Humanities)

**Abstract format:** Poster

The town of Tata lies on the shore of a lake with a castle in its centre. This building had been constructed between 1397 and 1410 as a summer resort of Hungarian kings and became a favoured residence during the 15th century. In the 16th century the Ottomans conquered the central part of the Hungarian Kingdom. Consequently, the castle became a military border fortress, which brought significant reconstruction and destruction in its life. After the wartime, the area was repopulated and the building lost its former functions. However, its new owners, the Esterházy family, tried to find a suitable role for it and integrate it into the life of the town. The building gave room to a bailiff's house, a prison, a stable, a vineyard and later dwelling houses. The castle was completely built around with a watermill, a mansion and houses during this period, so the building was integrated into the townscape. The need to study, restore and present the original medieval building arose after the Second World War. Nowadays, the building serves primarily as a museum, but also as a space for other cultural and social activities (e.g. restaurant, café, escape room). Its external protection system, the moat and the lake operate as a fish farm. The poster illustrates how the functions of the castle were adapted to the needs of the different periods and shows the demolitions and rebuildings that this entailed.

---

## 306 EARLY IRON AGE LANDSCAPE TRANSFORMATIONS IN THE CARPATHIAN BASIN AND ADJACENT AREAS

**Theme:** 3. The Carpathian Basin: Integration, Mobility and Diversity

**Organisers:** Czajlik, Zoltán (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest) - Črešnar, Matija (Department of Archaeology, University of Ljubljana) - Benediková, Lucia (Institute of Archaeology SAS) - Mele, Marko (Universalmuseum Joanneum) - Czifra, Szabolcs (Hungarian National Museum)

**Format:** Regular session

The period between the 8th–5th centuries BC in the Carpathian Basin is characterised by a slow, yet important transformation that changed the social structure, subsistence strategies, technological/manufacturing approaches and trading. At the same time – especially in the eastern Hallstatt zone – a monumentalized landscape transformation occurred, namely the construction of site complexes of hillforts and tumulus necropolises. The relationship between the communities and the landscape appears to have been changing, as fortifications and cemeteries became much more visible in the landscape, possibly functioning as respected places for future generations. Nonetheless, beyond the glitter of the huge earthen monuments, we know very little about the contemporary villages and farm-

steads, where a significant part of the population lived. Moreover, the transregional differences in land use practices of non-Hallstatt cultural entities to the north, east and south of the Carpathian Basin have never been subject to a detailed analysis. Even though they inhabited many settlements already known to us, and the communities emerging around 650 BC in the eastern part of the Carpathian Basin were far from being exclusively nomadic stockbreeders, they remain mostly unmentioned in the mainstream European discussion. The aim of this session is to bring together various scientific fields to gain insights into the settlement structure/network and landscape utilization of the Iron Age in the Carpathian Basin and the neighbouring regions. Furthermore, modern landscape research methods may shed light on the nature of the Iron Age transformation. Therefore, every aspect of multidisciplinary research is welcome, e.g. past landscape reconstruction employing non-destructive and destructive fieldwork methods; reconstruction of past land cover and environment using palynological and other ecological data; reconstruction of production/consumption approaches at rural and central sites, employing archaeobiological methods; hydrological/geographical reconstruction at a regional level; exploitation of natural resources at local, regional and transregional levels.

## ABSTRACTS:

### 1 WESTERN CARPATHIAN MOUNTAINS LAND-USE DURING THE BRONZE AND IRON AGES : CASE STUDY FROM LIPTOV (SLOVAKIA)

**Abstract author(s):** Benediková, Lucia (Institute of Archaeology of the Slovak Academy of Sciences, Nitra) - Hajnalová, Mária (Constantine the Philosopher University Faculty of Arts, Department of Archaeology, Nitra) - Jamrichová, Eva (Department of Paleoeology, Institute of Botany of the Czech Academy of Sciences) - Barta, Peter (Comenius university Faculty of Arts, Department of Archaeology, Bratislava) - Petr, Libor (Department of Botany and Zoology, Masaryk University, Brno) - Dreslerová, Dagmar (Institute of Archaeology of the Czech Academy of Sciences, Prague)

**Abstract format:** Oral

Western Carpathian Mountains in its northernmost part in the Liptov Basin in Slovakia were used by people since the Palaeolithic. During the time span from the Late Bronze Age till the turn of era they see the heydays of their prehistoric settlement.

In the recent research project(s) the Bronze and Iron Age settlement structure was investigated by the multi-proxy approach combining several scientific disciplines – archaeology, palynology, archaeobotany, AMS dating.

The results show that the employment and combination of several methods enable to shed a new light on the dating and function of particular types of the sites situated in extreme mountain locations as well as to correlate major cultural changes with the palaeoecological data retrieved from the palynological profile(s).

This work was supported by the Slovak Research and Development Agency under the Contract no. APVV-20-0044, by the projects VEGA 1/0399/18, VEGA 2/0035/22, VEGA 2/0018/19, VEGA 1/0100/19 and by OP RDE, MEYS under the project Ultra-trace isotope research in social and environmental studies using accelerator mass spectrometry, Reg. No. CZ.02.1.01/0.0/0.0/16\_019/ 0000728.

### 2 CLIMATIC CHANGES DURING THE LBA – EIA TRANSITION IN THE CARPATHIAN BASIN AND THEIR IMPACT ON HUMAN SOCIETIES

**Abstract author(s):** Magyari, Eniko (Eötvös Loránd University, Department of Environmental and Landscape Geography; MTA-MTM-ELTE Research group for Paleontology) - Buczkó, Krisztina (Research Centre for Ecology; Hungarian Natural History Museum) - Czifra, Szabolcs (Hungarian National Museum) - Fejér, Eszter (Institute of Archaeological Sciences, Eötvös Loránd University) - Szabó, Zoltán (Eötvös Loránd University, Department of Environmental and Landscape Geography) - Czajlik, Zoltán (Institute of Archaeological Sciences, Eötvös Loránd University)

**Abstract format:** Oral

The Late Bronze Age/ Early Iron Age (LBA/EIA) transition period took place around 850-700 cal yr BC in the Carpathian Basin. In the Great Hungarian Plain this is the time of appearance of eastern steppic Prescythian groups, while Transdanubia became part of the Eastern Hallstatt circle. Pollen records covering this transitional period point to increasing land use, forest clearance and an intensifying use of the lowland for grazing. In recent decades the number of lake and peat sediment archive based quantitative climate reconstructions increased in Eastern Central Europe (including pollen, chironomid and stable isotope based temperature reconstructions; diatom and testate amoebae based lake hydrological reconstructions). These data point to a series of abrupt climate fluctuations between 1300 and 800 cal yr BC, with a distinct cooling and moistening trend since 800 cal yr BC that coincides with the onset of the Subatlantic Period in the classical chronostratigraphy. In this lecture we will summarize these results and will compare them with published archaeological records, including 14C-data; "late" LBA-sites, Prescythian and later Scythian migration patterns from the East, and for Transdanubia we will examine the timing of these abrupt climate shifts with the period of eastward expansion of the Hallstatt groups. We thank financial support of SNN-134635 and NKFIH K129167.

### 3 SPATIAL ANALYSIS OF THE SCYTHIAN CULTURE MONUMENTS IN THE EASTERN PODOLIA (PRELIMINARY CONSIDERATION)

**Abstract author(s):** Shelekhan, Oleksandr (Institute of Archaeology, National Academy of Sciences of Ukraine)

**Abstract format:** Oral

Eastern Podolia is the historical area that lay in the forest-steppe part of the Southern Buh and along the left tributaries of the Dniester rivers. For today, it remains the least studied region of the Scythian culture that flourished in Eastern Europe from the early 7th to the late 4th c. BC.

Here I want to discuss preliminary suppositions concerning the spatial arrangement of the archaeological monuments. The mapping shows that the surveyed settlements lay at the high plateau with grey forest soils whereas wealthy kurgans are erected at the edge of this plateau close to the black steppe soils. This could be evidence of the two main components existing within the local community. One – is the indigenous farmer tribes, descendants of the Late Bronze Age peoples, who were closely connected with the Central European cultures. Second – is the nomadic horse riders, namely the Scythians in the strict sense. They originated from the Steppe and dominated over the region possessing high ranks in society.

Also, the third component can be seen in the north of the region. It is about not numerous Milograd culture sites whose main area was the forest landscape zone. But still, it is not clear what reasons pushed them southward close to the Scythian farmers and in what circumstances they lived close to each other.

However, I should note that the culture of the Early-Scythian period is studied mainly on the settlement material while the Classical Scythian culture is known mostly after the burial excavations. Also, no sites of the late 6th – early 5th c. BC are known here but this gap can't be explained persuasively yet. Therefore, a lot of further work waits for the researchers in the future.

### 4 SCYTHIAN AGE SETTLEMENT PATTERNS IN THE MIDDLE TISZA REGION (HUNGARY)

**Abstract author(s):** Czifra, Szabolcs - Mesterházy, Gábor (Hungarian National Museum) - Mali, Péter (Damjanich János Museum)

**Abstract format:** Oral

Traditionally, the appearance of the Scythian influenced Vekerzug culture on the Great Hungarian Plain by the 7th century BC onwards has been interpreted as a spread of nomadic groups and subsistence strategy. Accordingly, the Middle Iron Age communities of the region are often described as stockbreeders nomads, the portrayal initially supported by the relatively low number of published settlements. However, the upswing of preventive excavations brought to light a dozen of Scythian Age sites that contradict this assumption. Roughly covering the northern and central parts of the Great Hungarian Plain, the Upper and Middle Tisza regions are ideal arenas to study Iron Age settlements. Until the mid 19th century these lowland areas were rather watery regions (characterised by meanders and marshes), which undoubtedly influenced the prehistoric settling strategies. Combining archive information with the results of systematic field surveys and large scale excavations, this paper draws a sketch of the Scythian Age settlement pattern in the Upper and Middle Tisza regions.

With the focus on Vekerzug sites in Polgár and Tuszazug (micro)regions, general Middle Iron Age settling strategies will be analysed and modelled. Environmental and social factors of settlement locations, their route network between habituated locations will be examined in order to gain a better understanding of the Scythian Age settlement patterns. Next to the microregional scale, the inner structure of the settlements will be also presented based on excavation datasets. Additionally, the interpretation possibilities of the Vekerzug „house” and „household” remains will be dedicated special attention.

### 5 A BIRD'S EYE VIEW BEYOND THE CARPATHIANS: THE FUNERARY LANDSCAPE IN FERIGILE ARCHAEOLOGICAL GROUP

**Abstract author(s):** Mandescu, Dragos (Arges County Museum)

**Abstract format:** Oral

The late stage of the Early Iron Age south of the Carpathians is defined by the Ferigile archeological group, which has evolved over almost three centuries (the 7th-5th centuries BC). In the absence of imposing settlements or easy to spot in the field, archaeological research has focused on the study of cemeteries (where only cremation was practiced). In my paper I will try to argue that there was a well-defined relationship between these Iron Age communities and the peculiarities of the landscape, natural resources (especially salt) and geographical and hydrographic conditions. Regarding the funerary landscape specific to this archeological group, my field researches in Argeş and Vâlcea counties showed that there was a constantly respected pattern in the choice of burial places, strictly dependent on the hydrographic network. What did these necropolises look like? What did the mounds that made them look like? Is it possible to detect a relationship between them, possibly a hierarchy within the cemeteries, in the manner of occupying the land? In this “democratization” of the mound as a common form of funeral expression, can the graves of elites

still be distinguished? In addition to revisiting previously known necropolises (i.e. Ferigile, Tigveni, Cepari), the answer will be sought in the clues provided by the Stâni Valley necropolis, the most recently explored cemetery within the Ferigile group (since 2014 and ongoing).

## 6 LANDSCAPE TRANSFORMATIONS AND LAND USE ON THE MIDDLE MUREŞ VALLEY (SOUTH-WESTERN TRANSYLVANIA) DURING THE EARLY IRON AGE

**Abstract author(s):** Rustoiu, Aurel (Institute of Archaeology and History of Arts Romanian Academy Cluj-Napoca) - Berecki, Sandor (Muzeul Judeţean Mures Tg. Mures)

**Abstract format:** Oral

The Mureş River was the main route of communication between Transylvania and the westward areas in Central Europe throughout history. The river was already mentioned among the major waterways by Herodotus (IV.48), who was writing that the Măpîş has its source in the territory of the Agathyrsi and flows into the Danube.

Since prehistory until the modern times, the Mureş facilitated the transportation of Transylvanian salt to the plains of the Tisza River and to the north-western Balkans. Both regions lacked this kind of resource which was essential for human subsistence, animal husbandry and a number of manufacturing processes. Therefore, the access, exploitation and distribution of the mineral resources from Transylvania (primarily salt, but also some nonferrous metals, like copper, silver and gold) attracted the interest of both local and more distant communities, often becoming the subject of complex social-political and economic interactions. Due to their value, Transylvania in general, and its south-western area in particular, also experienced an increased human mobility, both at the individual and the collective level, the former frequently involving different categories of skilled artisans. Likewise, the particular lifestyle, practices and social organization of these communities had a significant impact on the local physical, economic and ritual landscape through time.

Therefore, the paper is going to discuss the manner in which human mobility contributed to the transformation of the landscape throughout the Early Iron Age (primarily during the 8th – 5th centuries BC), and the nature of these transformations from one chronological stage to another based on the analysis of the economic, social and ritual practices of different communities. The analysis is based on a range of archaeological, aero-photographic, archaeozoological, anthropological and palynological data.

## 7 SETTLEMENT DYNAMICS IN THE IRON AGE LANDSCAPE OF SOUTHERN STYRIA (AUSTRIA)

**Abstract author(s):** Mele, Marko (Universalmuseum Joanneum)

**Abstract format:** Oral

One of the most famous European Early Iron Age sites, tumulus cemeteries and settlement of Großklein in southern Styria (Austria), will be the starting point for uncovering the settlement dynamics, land use and communication routes in the wider region. In no time period the region of Großklein had such a central role and an impact as in the Early Iron Age. The hilltop settlement on the Burgstallkogel and the monumental tumulus cemeteries in the surrounding dominated a region for almost 400 years. Domination should be understood as governance, interaction, exchange and control.

In our paper we would like to present new results of the research in the region of Großklein conducted in the recent years. In the presentation the known facts about the site will be considered in the light of the new landscape research and recent excavations conducted by the Universalmuseum Joanneum and the University of Graz. This includes also new results from archaeobotanical analysis, will be presented in a wider regional context. The models developed for the micro-region of Großklein, will be attested in a wider macro-regional context, including contact and exchange with the Carpathian basin."

## 8 IS THERE ANY PATTERN IN THE EARLY IRON AGE LANDSCAPE FORMATION? A CASE STUDY OF SÜTTŐ AND POŠTELA

**Abstract author(s):** Czajlik, Zoltán (Eötvös Loránd University) - Črešnar, Matija (Department of Archaeology, University of Ljubljana) - Novinszki-Groma, Katalin (Eötvös Loránd University)

**Abstract format:** Oral

The authors of this paper collaborated in „Iron Age Danube” European project. In this transnational framework they investigated some of the most important and complex Early Iron Age monumental landscapes of the Eastern Hallstatt circle. One of the case study areas was Süttő, located on the Danube River, and the other one is Poštela, situated on the SE fringes of the Alps. From 2020, a Hungarian-Slovenian bilateral project (SNN134635 and N6-0168) support the researches in these EIA sites.

The monumental Early Iron Age landscapes are complex systems; often build up from different settlement and burial features, corridors of movement, extraction areas etc. Until recently, the topographical knowledge of these site complexes was based only on the most evident archaeological features and on excavated areas. Following these

research methods it was generally accepted that fortified settlements were accessed by pathways aligned by burial mounds. In the last decade the new non-destructive methods, especially ALS and geophysics gave us a chance to gain even more complex

multi-layered information especially about the surrounding landscapes. Therefore, we should go one step back and try to re-evaluate the topographical and other data. Only in this way, we can further search for similarities and differences at these huge site

complexes and therewith go one or two steps forward from where we are now.

Our paper focuses mainly on the monumental landscapes of Süttő and Poštela, both also well investigated with modern methods. Our aim is to compare their geographical characteristics and the placement of typical settlement and different burial features in the landscape with a special attention to the chronological role of each of the elements, e.g. flat cremation cemeteries, burial mounds, settlements and fortified settlements.

## 9 THE EARLY IRON AGE LANDSCAPE AROUND THE SOMLÓHEGY

**Abstract author(s):** Soós, Bence (Hungarian National Museum, Archaeological Department; Eötvös Loránd University, Institute of Archaeological Sciences)

**Abstract format:** Oral

Due to the tumulus burials and the exceptional finds in them that were unearthed in the late 19th and early 20th century, the prominent butte Somlóhegy has long been considered as one of the most important Early Iron Age centres in western Hungary. The burials situated to the south and north of the butte clearly indicate that in the Ha C period a strong new elite group emerged here that maintained an extensive contact network towards various regions in Central Europe. The burial mounds of this elite group have been significant elements of the landscape surrounding the butte for the last 2700 years.

This paper sets out to present the results of the research of the Early Iron Age landscape around the Somlóhegy. Contrary to the burial mounds situated south of the butte, information about the exact structure of the mounds near the modern village Doba have been largely unknown. The geophysical survey conducted in recent years at Doba have clarified the structure of the tumuli and we gained information about how the structural properties of these mounds signify the close relationship between the aforementioned elite and the Somlóhegy. In addition, with the help of satellite images and aerial photography our research showed that the cemetery north of the butte is more extensive than previously thought.

This paper also intends to show how the Early Iron Age centre of the Somlóhegy integrates into a larger landscape of the Pápa-Devecser Plain that includes several Early Iron Age burial mounds, so-called flat cemeteries, and settlements.

This research is supported by the ÚNKP-21-3 New National Excellence Program of the Ministry for Innovation and Technology from the source of the National Research, Development and Innovation Fund.

## A. IRON AGE COMMUNITIES IN THE LOWER DANUBE AREA: ARCHAEOLOGICAL AND ARCHAEOZOOLOGICAL DATA ON THE FOOD ECONOMY AND PALEOENVIRONMENT

**Abstract author(s):** Stanc, Simina Margareta (Alexandru Ioan Cuza University of Iași) - Ailincăi, Sorin Cristian (Eco-Museum Research Institute of Tulcea) - Mototolea, Aurel Constantin (Museum of National History and Archeology Constanța)

**Abstract format:** Poster

One of the most famous cultural manifestations from the beginning of the Iron Age on the Lower Danube is the Babadag culture (11th-8th centuries BC). The main vestiges left by these human communities are the settlements, identified especially on the high loessoid terraces on the Dobrudja bank of the Danube or the ponds and lakes adjacent to it, but also in the Razelm-Sinoie lagoon (ancient Halmyris bay). A similar arrangement can be noticed on the left bank of the river, where the sites are located mainly along the main affluents (Prut, Siret, Ialomița). Over time, this landscape has undergone many anthropogenic and natural transformations (the evolution of the Danube Delta and the Black Sea coast), a partial reconstruction of which is possible through the analysis of faunal material from several sites of Babadag culture, such as Enisala, Niculițel, Jijila, Garvăn or the eponymous settlement. Our approach intends to compare contemporary sites, but located in different landscapes, in terms of animal resource exploitation. Interdisciplinary analyses play an important role in understanding the organization of human communities in the North Dobrogea area at the beginning of the first millennium BC. Our synthesis takes into account the studies referring to the sites from Enisala-Palanca, Rasova-Malul Roșu, Telița-Amza, Babadag, Niculițel-Corneț, Jurilovca-Capul Dolojman and Satu Nou-Valea lui Voicu. In all the studied settlements, the most important role for the procurement of animal food products was played by animal husbandry (especially cattle, ovicaprids, pig); fishing and hunting were much less important. Domestic mammals predominate in all analysed sites, while wild animals (especially red deer, wild boar) represent about 10% of all identified mammals. In terms of fishing, the Babadag communities exploited only

the nearby resources (small rivers, ponds and the coastal area of present-day Lake Razelm) and used little or no at all marine resources.

## **B. IMPRINT IN THE LANDSCAPE THE MONUMENTAL LANDSCAPE OF SÜTTŐ AND ITS CONTACTS ALONG THE RIVER DANUBE IN THE EIA**

**Abstract author(s):** Novinszki-Groma, Katalin (Eötvös Loránd University)

**Abstract format:** Poster

The late prehistorical Süttő archaeological site is situated westward from the today settlement on a high loess plateau above the bank of the river Danube, in Hungary. The better known part of this complex landscape are the hillfort settlements on the north and the tumuli field southward from that. The first burial mounds were already excavated in the 1920's, 1930's, and the modern field works started in the end of the 1970's. During these later researches Éva Vadász excavated a tumulus with a dromos-art entrance corridor, which is well known from the archaeological literature.

The biggest surprise during the excavation of Éva Vadász and Gábor Vékony was the turning up of a flat, cremation cemetery of the Hallstatt period. Some of the 82 excavated burials contained rich metal assemblages, while the appearance of the 6 skeletal graves was truly unexpected.

The material of the Early Iron Age burials of Süttő is the topic of the author's phd-thesis. Many of the analysed objects show parallels from sites along the river Danube and its affluents in the south, from the nowadays Slovenia, Croatia, Serbia and Romania.

Among them, we can mention fibulae, pins, but also some forms of pots, like the deep bowls with pointed rim. The above mentioned extraordinary traits make Süttő unique among the other flat, cremation cemeteries of the northern part of Transdanubia. It also suggests that not only the local elite buried under tumuli, but the other inhabitants of the Süttő monumental landscape should have an outstanding social position compare to the communities used the flat, cremation cemeteries in the surrounding area.

The here presented research proved by SNN 134635 project (Early Iron Age Land Use between the Alps and the Danube; comparative landscape archaeological analyses of Süttő and Poštela site-complexes).

---

## **309 FROM THE PRESENT TO THE PAST AND BACK: CROSSING DISCIPLINARY AND TIME BOUNDARIES IN AGRICULTURAL RESEARCH**

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Varalli, Alessandra (CaSEs–Culture and Socio-Ecological Dynamics Research Group, Department of Humanities, Università Pompeu Fabra - UPF) - Lancelotti, Carla (CaSEs–Culture and Socio-Ecological Dynamics Research Group, Department of Humanities, Università Pompeu Fabra - UPF; ICREA) - Biagetti, Stefano (CaSEs–Culture and Socio-Ecological Dynamics Research Group, Department of Humanities, Università Pompeu Fabra - UPF; School of Geography, Archaeology and Environmental Studies - GAES, University of the Witwatersrand) - Gur-Arieh, Shira (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University Munich) - Martin, Lucie (Laboratory of Prehistoric Archaeology and Anthropology, University of Geneva; UMR EDYTEM, CNRS, Université Grenoble Alpes, Université Savoie Mont-Blanc)

**Format:** Session with keynote presentation and discussion

Agriculture has unquestionably been one of the human activities that has heavily shaped environments and landscapes worldwide from the last 10k years up to present day. More and more interdisciplinary research indicates how the understanding of socio-ecological dynamics of past farming systems over time is fundamental to predict environmental and subsistence strategies changes at a multi-scale level.

In this session we explore how archaeological research can both benefit from and inform on present agricultural practices. Currently, the study and reconstruction of past agricultural systems encompass a variety of methodological approaches including, e.g. archaeobotany, biochemistry, modelling. The contributions in this session will span from different geographical, chronological and disciplinary contexts to build a comprehensive picture on current research on long-term agricultural systems. Particular emphasis will be given to the contributions focused on data generated from archaeological and ethnoarchaeological research towards reaching the UN Sustainable Development Goals.

More specifically we invite contributions within, but not limited to, the following topics:

- multi-isotopic investigations of cultivated plants to create past local and regional isoscapes to better understand changes in agricultural practices and their relevance for human subsistence strategies
- multi-proxies studies (geoarchaeology, plant macro and microfossils) to detect the global land-cover and land-use change useful to identify human–environment interactions
- application of modern techniques (e.g. pXRF, molecular footprints) on anthropogenic sediments of different cultural and environmental contexts in order to improve our comprehension of the exploitation of the soil

- modelling approaches to present and past agricultural systems, including the application of spatial-explicit and cross-cultural models
- case studies on the application of knowledge derived from archaeological research for present-day sustainability of agricultural systems.

Transdisciplinary papers drawing evidence from bioarchaeological approaches, ethnoarchaeological evidence, survey and field excavations are especially welcome.

## ABSTRACTS

### 1 A DEEP HISTORY OF AGRICULTURE

**Abstract author(s):** Madella, Marco (Universitat Pompeu Fabra; ICREA)

**Abstract format:** Oral

For thousands of years, human communities have developed complex, diverse, and locally adapted agricultural systems. These ancestral small- or larger-scale agricultural systems constitute the foundation for contemporary and future agricultural innovations and technologies.

For this reason, there is a strong need for a long-term perspectives on how and why agricultural systems have emerged and developed. It is pivotal to appreciate how these systems evolved and how they might have changed under specific cultural or socio-environmental pressures. Such long-term dynamics of experimentation, acquisition, exchange and identity in relation to plants are well observable in current landscapes, which reflect thousands of years of interaction between people and their environments. Understanding the deep history of instances of successful "experiments" as well as maladaptation is key to understand traditional systems that can be well integrated with the environment and involve resilient management practices.

Furthermore, there remains disagreement over the forms, scope, and intensity of prehistoric land use and the degree to which early land use and land cover affected the global climate system. All agree that the intensity and extent of human land use increased with early pastoral and agricultural societies. However, some studies indicate that land cover change was fairly minor at global scales prior to the Industrial Revolution. Others have argued that the Holocene carbon cycle and climates were strongly influenced by early agricultural and pastoral activities. This uncertainty is fostered by the lack of high-quality, data-based syntheses of global land use and anthropogenic land cover change for the Holocene.

Archaeology of agriculture and the methodological approaches that can raise our understanding of early human use of plants and land can be pivotal in helping modern societies in facing current changes in the Earth system, especially those connected to climate change.

### 2 A MULTIPROXY APPROACH TO PAST AND PRESENT AGRICULTURE IN DRYLANDS

**Abstract author(s):** Biagetti, Stefano (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra; School of Geography, Archaeology and Environmental Studies - GAES, University of the Witwatersrand, Johannesburg) - Jiménez-Arteaga, Carolina - Ruiz-Giralt, Abel (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra) - Madella, Marco (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra; ICREA – Institució Catalana de Recerca i Estudis Avançats; School of Geography Archaeology and Environmental Studies - GAES, University of the Witwatersrand) - Varalli, Alessandra (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra) - D'Agostini, Francesca (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra) - Lancelotti, Carla (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra; ICREA – Institució Catalana de Recerca i Estudis Avançats)

**Abstract format:** Oral

Agriculture in drylands, especially where rainfall is scarce and erratic, is often deemed unfeasible in the absence of irrigation. However, there exist modern ethnographic instances of rainfed agriculture of millets in areas where annual rainfall is well below the supposed lower limit for cultivation. These examples hint at the possible occupations of areas, in the present and in the past, that were up to know thought to be uninhabitable. Therefore, being able to detect this type of agricultural practices in the past has the potential to change the established narratives of drylands.

This paper illustrates the results of experimental, ethnoarchaeological, archaeobotanical and modelling approaches to the study of millets cultivation, from the present to the past and back, carried out within the Resilience and Adaptation to Drylands project (RAINDROPS). In particular, it centres on: (i) results of ethnographic interviews conducted in Sudan, Ethiopia and Pakistan with local millet farmers, which highlight the preference towards local crops and the relatively little importance of irrigation; (ii) the modelling of worldwide ethnographic information collected on millets cultivation practices, which indicates how modern local ecological knowledge can be used to approximate past

land use patterns; and (iii) the creation of a "reference collection" of archaeobotanical proxies to detect plant water availability directly from archaeobotanical remains.

We maintain that the combination of modelling, based on Traditional Ecological Knowledge, and the analysis of phytoliths and stable isotopes from grains and phytoliths, can provide a suitable frame of reference to reconstruct dryland agricultural practices.

### 3 **NEW TECHNIQUES ... FOR OLD PURPOSES. THE MODERN FAO'S LAND EVALUATION SYSTEM FOR RECONSTRUCTION OF THE ANCIENT AGRICULTURE LANDSCAPE**

**Abstract author(s):** Sotgia, Agostino (Sapienza - Università di Roma; RUG - University of Groningen)

**Abstract format:** Oral

Agriculture represents one of the most complete expressions of rational exploitation of the landscape by the communities that have inhabited it. Therefore, its study plays a central role in historical reconstructions, especially as regards prehistory in which agriculture is the most evident sign of the action of human groups.

Even from the point of view of the study of the ancient economy, one cannot in any way disregard agricultural exploitation. For this reason, to reconstruct and analyze the agricultural dimension of a landscape - over time - different and various methodologies and approaches have been proposed.

Among these - although little known - is the use of the Land Evaluation. This technique - developed by the FAO (Food and Agriculture Organization of the United Nations) in '70s for contemporary agriculture - aims to quantify the suitability of a land for agricultural exploitation with a system of quality classes generated by the analysis of some fundamental factors for these practices.

These factors are analyzed both based on the specific needs of the cultivated plants and on the degree of development of agricultural techniques and knowledge of the communities examined.

Through small modifications this modern technique can be applied "backwards" even to ancient contexts with excellent results, especially if combined with modeling in a GIS environment.

This contribution therefore presents the application of these techniques to the ancient archaeological context of Southern Etruria (Central Italy) in the Late Bronze Age between 1150 and 850 BCE. Through this approach, thanks also to the simulation possible with the developed GIS model, it is possible to better understand not only the ancient agricultural landscape but also the human communities that lived there and their transformations, both ecological and social over time.

### 4 **HISTORIC RURAL LANDSCAPE AND SOIL SUSTAINABILITY: A RUSLE MODELLING APPROACH**

**Abstract author(s):** Brandolini, Filippo - Turner, Sam (McCord Centre for Landscape, School of History, Classics and Archaeology, Newcastle University)

**Abstract format:** Oral

Developing more sustainable agricultural systems represents a challenge and urgent global venture. Over the long term, rural activities have given rise to a wide variety of historic landscapes. Historic Landscape Characterisation (HLC) uses a qualitative but formalised method to map historic landscapes' chronological and spatial complexity. Meanwhile, in environmental studies, the diachronic land-use-land cover (LULC) analysis has helped illustrate how different anthropogenic activities have altered the soil erosion rate in specific areas. Modelling can provide a quantitative and consistent approach to estimating soil erosion under a wide range of conditions. GIS integration with the RUSLE (Revisited Universal Soil Loss Equation) model has been applied to estimate soil loss at a regional scale. In previous HLC studies, LULC has been evaluated from the perspective of cultural heritage. In contrast, RUSLE modellers have used it as a proxy to estimate the soil erosion of an area.

This study proposes an innovative methodology that combines both the historical/cultural and the environmental values of LULC to inform the development of a model to evaluate the increasing/decreasing soil erosion rate. From a cultural heritage point of view, the diachronic analysis of historical features (mapped as HLC types) informs understanding of the LULC, which characterised a landscape. At the same time, these features had an impact on local soil erosion rates. In this study, the HLC types have been employed to define the C and P factors, the two most challenging factors to be determined in the RUSLE equation.

The methodology proposed has been tested in the Tuscan - Emilian Apennines historical landscape (Vetto - Italy). Environmental sustainability and historic landscape conservation are typically treated as two separate fields. Still, this research proposes a new way to embrace cultural and natural values as components of the same landscape management plans.

## A MULTI-DISCIPLINARY MODELLING APPROACH FOR UNDERSTANDING HUMAN AND AGRICULTURAL NICHES IN THE WESTERN MEDITERRANEAN AREA DURING THE NEOLITHIC

**Abstract author(s):** Castiello, Maria Elena (Department of Natural Sciences, German Archaeological Institut - DAI, Berlin) - Russo, Emmanuele (Institute for Atmospheric and Climate Science, ETH Zurich) - Martinez-Grau, Hector - Prats, Georgina - Jesus, Ana (Integrative Prehistory and Archaeological Science - IPAS/IPNA, University of Basel) - Antolin, Ferran (Department of Natural Sciences, German Archaeological Institut - DAI, Berlin)

**Abstract format:** Oral

According to the most recent research results, the first Neolithic farmers, arrived in the Western Mediterranean (WM) area, established their settlements in different ecological regions and, over time, migrated to more favourable environments, adapting to changing environmental conditions quickly as the need arose. Farming practices and the nature of settlements differ greatly from those known from the Eastern Mediterranean. The WM area offers a wide topographic and bioclimatic diversity and as such it represents an excellent case study to investigate the influence of climatic fluctuations that challenged both the ecosystems in which the first farmers lived, both their agricultural system and strategy.

In this research, based on a multi-proxy and machine learning (ML) approach, we coupled and connected an increased amount of heterogeneous data, available at multiple scales, to investigate the impact of ecological and climate constraints on the first Neolithic niches of humans and crops. We used high-resolution and downscaled paleo-climate data, absolute dated archaeobotanical and archaeological information, as well as computed environmental variables, to model and estimate the potential areas suitable for settlements location and for discriminating distinct types of crop cultivation under changing climate scenarios that characterized the period cal. 5900 – 2300 BC.

The results of this study have helped understanding not only the past climate variability and its influence on settlements distribution and crops adaptation in the WM area, but also to pointing out sensitive parameters for a successful application of ML procedure, from continental to regional scale.

## PRESENT AND PAST AGRICULTURE IN ARID ENVIRONMENTS: A MULTI-PROXI APPROACH TO RECONSTRUCT THE HISTORY OF THE MASAFI OASIS (U.A.E.)

**Abstract author(s):** Djerbi, Hatem (Université Côte d'Azur, CNRS-CEPAM UMR 7264; Eveha) - Garnier, Aline (Université de Paris Est-Créteil, Département de géographie; LGP-CNRS UMR 8591) - Costa, Sophie (Université Côte d'Azur, CNRS-CEPAM UMR 7264) - Herveux, Linda (Archéorient-CNRS UMR 5133, Maison de l'Orient et de la Méditerranée) - Charbonnier, Julien - Carré, Alain - Purdue, Louise (Université Côte d'Azur, CNRS-CEPAM UMR 7264)

**Abstract format:** Oral

Oases are anthropogenic landscapes which have been occupied and exploited for several millennia in South-east Arabia. Today, they are subject to strong climatic and socio-economic stresses. To assess their capacity of resilience through time, it is important to understand their genesis and their evolution. The first step to do so requires to identify ancient cultivated soils, understand practices and characterize the diversity of agricultural productions. Modern environmental references were created in different anthropized areas (irrigated, amended and abandoned palm cultivation, fruits and cereals cultivation) of the Masafi oasis (U.A.E.) within the framework of the ANR OASIWAT (Dir L. Purdue) and the French archaeological mission in the United Arab Emirates (Dir. S.Méry). A multi-proxy sampling for ecological (malacology, phytolithology, anthracology) and pedological (physico-chemistry, geochemistry, micro-morphology) studies allowed us to identify signatures in soils of current agrosystems. The results reveal a differential preservation of these proxies and taphonomic biases in the interpretation of the ecological assemblages, demonstrating the need to combine them with pedological studies to identify irrigated, amended and degraded areas. These results were applied to a long geoarchaeological sequence in the oasis of Masafi and have allowed us to reconstruct the evolution and management of this oasis for the last 5 millennia.

## OASIS LANDSCAPES AND LONG-TERM AGRICULTURE IN ARID ENVIRONMENTS: AN ASSESSMENT FROM THE OASIS OF ALULA (SAUDI ARABIA)

**Abstract author(s):** Purdue, Louise (CNRS CEPAM-UMR 7264) - Lespez, Laurent (Université Paris 12; LGP-UMR 8591) - Djerbi, Hatem - Davtian, Gourguen (CNRS-CEPAM UMR 7264) - Girard, Jean-François (Institut de Physique du Globe) - Carré, Alain (CNRS-CEPAM UMR 7264) - Rouvier, Claude (Independent Researcher) - Andrieux, Eric (Durham University) - Costa, Sophie - Villa, Valentina (CEPAM-UMR 7264)

**Abstract format:** Oral

The political, socio-economic and spatial organization of agricultural societies in arid environments has and still relies on the development and management of oases, artificially irrigated and cultivated landscapes. Oasian agro-ecosystems are currently fragilized by decreasing resources and changing human activities. Due to their rich heritage, their preservation and revitalization is currently implemented in the Arab world. While archaeological studies of these

spaces have increased for the last decades, their holistic study from a socio-environmental perspective remains under-explored. In order to provide keys for their management, it is necessary to better understand the links between settlement pattern, socio-economic dynamics and soil and water resource availability/management through time.

In the framework of the ArcAgr-AU project (Dir. L. Purdue), which aims at reconstructing oasian landscapes and hydro-agrosystems in the fluvial oasis of AIUla (Saudi Arabia), we propose a systemic field and laboratory approach to study oases as research objects, combining geoarchaeology, geomorphology, chronology, geophysics, paleoecology, agronomy and spatial analysis.

Our results, which include the study of nearly 30 agricultural sequences, have revealed the preservation of circa 4 meters of sediments and paleosoils in the oasis, dated from the Neolithic onwards. Taking the example of 4 of these sequences, we illustrate the complexity of oasis landscapes and provide keys on how to study and interpret them. Phases of landscape artificialization (eg. Iron Age, Islamic Periods) alternate with episodes of agricultural abandonments and geomorphological events characterized by uncultivated alluvial or dune deposits (eg. Bronze Age). Our results highlight that the oasis of AIUla is and has been a dynamic and mobile territory through time, but has been facing a drastic social and ecological collapse for the last 60 years.

## 8 TRANSHUMANCE IN ICELAND: SUCCESSFUL HISTORICAL LAND MANAGEMENT OR A VECTOR FOR LAND DEGRADATION?

**Abstract author(s):** Erlendsson, Egill - Gísladóttir, Guðrún (Institute of Life and Environmental Sciences, University of Iceland)

**Abstract format:** Oral

Iceland was settled by mainly Scandinavian peoples around 870 CE. This process saw the emergence of a society in which pastoral farming was emphasised. Since then, Iceland has lost virtually all of its native birch woodlands and perhaps half of the pre-settlement carbon stock stored in the volcanic dryland soils. Active to severe soil erosion characterises almost half of the island. A key feature of the historical pastoral farming was the seasonal relocation of workforce and livestock (mainly milking cows and ewes) to rangelands over summer. Around 2100 recorded sites with ruins of small turf houses that characterised the sites are scattered across the Icelandic landscape, which underscores the possible significance of transhumance for environmental change.

Through palynological and sedimentary analyses, we examine the trajectories of terrestrial ecological responses to concentrated grazing pressures exerted by transhumance activity. The data derive from three sites from Kjarardalur in W-Iceland, a valley that was used predominantly for transhumance in the past. Historical sources and archaeological features show that two of the three are former shieling sites. Key questions include whether land management was successful in preserving the land quality and resources necessary for the operation of the shielings or whether grazing pressures were of sufficient magnitude to initiate and/or precipitate ecosystem decline.

Our results show: 1) Onset of grazing from the time of settlement set in motion woodland decline and soil erosion; 2) continued degradation, but management of woodland resources, until the 18th century AD, interrupted by 3) reversal from ecological regression to succession during the 15th century CE in response to the plague; 4) a final phase of rapid decline from c. 1800 CE, probably in association with increased sheep numbers and changed emphasis in agricultural production. The results highlight a vulnerability of the island's terrestrial ecology to grazing.

## 9 UNDERSTANDING PAST WATER AVAILABILITY IN RAIN-FED CONTEXTS THROUGH THE USE OF PHYTOLITHS: AN EXPERIMENTAL APPROACH IN SELECTED C<sub>4</sub> CROPS

**Abstract author(s):** D'Agostini, Francesca (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra; UMR DIADE, Université de Montpellier) - Vadez, Vincent (IRD - Institut de Recherche pour le Développement, UMR DIADE, Université de Montpellier; ICRISAT – International Crops Research Institute for Semi-Arid Tropics) - Kholova, Jana (ICRISAT – International Crops Research Institute for Semi-Arid Tropics) - Ruiz-Pérez, Javier (Department of Ecology and Conservation Biology, Texas A&M University) - Madella, Marco - Lancelotti, Carla (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra. Barcelona; ICREA – Catalan Institution for Research and Advanced Studies)

**Abstract format:** Oral

In drylands the interpretation of water management practices and the use of irrigation for agricultural intensification has been central to the archaeological debate. Traces of water managements are difficult to detect as a consequence of the ephemeral strategies put in place to water. In contexts with low rainfall, rain-fed cultivation -when water is provided by rainfall alone- is often considered to have a minor role in human livelihood. We argue that rain-fed cultivation might have played an underestimated role in the development of food production in arid areas.

No direct strategy has been presented for the discrimination of water regimes in C<sub>4</sub> crops, which represent the main components of the agricultural assemblage in drylands in the past as in the present. The objective of this research is to test phytoliths as a proxy to reconstruct past crops water-management of C<sub>4</sub> species. We carried out two experimental cultivations of ten traditional landraces each of sorghum (*Sorghum bicolor*), pearl millet (*Pennisetum glaucum*)

and finger millet (*Eleusine coracana*), simulating irrigated and rain-fed scenarios. Experiments were conducted in lysimeters, which allowed us to keep a control of water regimes while plants grew in field-like conditions.

We present the results of analyses on phytolith concentration and morphotype assemblages. Phytoliths –inorganic silicified bodies produced in plant tissues– and indices based on morphotypes ratios have been tested because phytolith formation is related to the plant's transpiration stream, which in turn depends on water availability. We found that both millets produced more phytoliths in well-water conditions, whereas sorghum biosilica response was independent of the water regime. Elongated cells, bulliforms and stomas are the morphotypes that better respond to different water treatments. Stomata are more abundant in well-water condition. This allows for a consideration of phytoliths production of C<sub>4</sub> as proxies for environmental reconstruction and water managements.

## 10 ASSESSING THE EFFECTS OF CHARRING ON C AND N STABLE ISOTOPE VALUES OF C<sub>4</sub> PLANTS FOR RECONSTRUCTING PAST AGRICULTURAL PRACTICES

**Abstract author(s):** Varalli, Alessandra - D'Agostini, Francesca (CaSEs–Culture and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra - UPF) - Fiorentino, Girolamo (Laboratory of Archaeobotany and Palaeoecology, Department of Cultural Heritage, University of Salento) - Madella, Marco (CaSEs–Culture and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra - UPF; ICREA) - Vadez, Vincent (Institut de Recherche pour le Développement - IRD, Université de Montpellier – UMR DIADE; International Crops Research Institute for Semi-Arid Tropics - ICRISAT) - Lancelotti, Carla (CaSEs–Culture and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra - UPF; ICREA)

**Abstract format:** Oral

Previous experimental studies on C<sub>3</sub> species have shown that charring has an effect on stable isotope values of archaeobotanical material. In this contribution, we explore the effects of charring on  $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$ , %C, %N and C:N ratios in seeds of two C<sub>4</sub> species, *Sorghum bicolor* and *Pennisetum glaucum*, grown under two water treatments. For each treatment, sorghum and pearl millet seeds were charred for 1, 2 and 3 hours at 200, 250 and 300°C.

Our analyses show that the different water treatments affect the isotopic results more than the charring in both species. Second, heating temperature has a higher impact on the preservation, mass loss, %C, %N, C:N ratios and on the  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values than the time of charring. Every 50°C increase resulted in an increase of 0.41‰ for  $\delta^{15}\text{N}$  and 0.08‰ for  $\delta^{13}\text{C}$ , while increasing the duration of charring by 1 hour resulted in an average increase of 0.07‰ for  $\delta^{15}\text{N}$  and 0.06‰ for  $\delta^{13}\text{C}$ . Major variations, particularly in terms of mass loss, are recorded between 200°C and the higher temperatures than between 250°C and 300°C. The heating at low temperatures for prolonged times (200°C for up to 3h) is conducive to well preserved, undistorted charred grain, with a mass loss lower than 14% and with no/low impact on the %C, %N and C:N ratios. Increasing the heating up to 300°C preservation deteriorates, with a mass loss higher than 54%, and with %C, %N and C:N ratios strongly affected. Therefore, this study highlights the importance of experimental studies for correctly assessing the isotopic results offered by archaeobotanical analyses.

## 11 INVESTIGATING THE GROWING CONDITIONS OF BROOMCORN MILLET (*Panicum miliaceum* L.) IN NORTHERN GERMANY IN THE LATE BRONZE AGE

**Abstract author(s):** Filipovic, Dragana (Institute for Pre- and Protohistoric Archaeology, Kiel University) - Herrscher, Estelle (Aix Marseille University, CNRS, LAMPEA, UMR7269) - Schlütz, Frank (Niedersächsisches Institut für historische Küstenforschung) - Schneeweiß, Jens (Zentrum für Baltische und Skandinavische Archäologie, Stiftung Schleswig-Holsteinische Landesmuseen Schloss Gottorf; Cluster of Excellence ROOTS, Kiel University) - Kirleis, Wiebke (Institute for Pre- and Protohistoric Archaeology, Kiel University)

**Abstract format:** Oral

Archaeobotanical evidence suggests that early cultivation of millet in northern Germany took place on light sandy soils that warm up fast during summer months and were, therefore, beneficial for the growing of this crop. However, these soils are relatively poor in nutrients and improvement of their properties may have been practiced – for example, through fertilisation. Stable isotope analysis of archaeologically preserved grains reveal field conditions under which crops were grown in the past, such as soil water status and fertility levels. This method has been widely used in archaeology and has enabled reconstructions of the field management of wheat, barley and leguminous crops. However, it has not yet been applied systematically to broomcorn millet. Only a few small-scale isotopic studies of archaeological millet grains in Eurasia have been conducted so far and they pointed out difficulties in understanding and interpreting the results due to the different photosynthetic pathway of broomcorn millet (C<sub>4</sub>) compared to that of wheat, barley and pulses (C<sub>3</sub>). This paper introduces a new German-French collaborative project aimed at exploring the growing conditions of broomcorn millet (*Panicum miliaceum* L.) in northern Germany in the Late Bronze Age. Following the methodology and procedures applied in similar and related studies, the practical aims are to: (a) produce stable carbon and nitrogen isotope values for millet grains recovered from several 2nd-1st millennium BC sites in northern Germany; (b) produce these values also for the modern grains of millet, grown under controlled conditions in several locations in central and northern Germany; the isotopic content will be measured for fresh and

experimentally carbonised grains; (c) compare the isotopic measurements of archaeological and modern grains, in order to identify the carbonisation effect, which will be taken into account when assessing the values obtained from archaeological specimens.

## 12 INFERRING AGRICULTURAL PRACTICES IN SOUTHWESTERN NORWAY USING STABLE ISOTOPE ANALYSIS OF CHARRED CEREAL GRAINS

**Abstract author(s):** Fredh, Erik Daniel - Bishop, Rosie (University of Stavanger)

**Abstract format:** Oral

The agriculture known from historical times in Norway used permanent fields, which required a regular supply of nutrients, commonly from the manure of livestock, which grazed in grasslands close to the farms. Essentially all the nutrients added to the arable land came from the land belonging to the farm, which created a certain balance between livestock numbers and different land-use types within this unit. This contrasts to modern agriculture, which relies on imports of artificial fertilizers from outside the local farms. The practice of regular manuring to permanent fields is commonly assumed to have started during the Iron Age when archaeological evidence suggests that agriculture expanded, and the land was more clearly divided between infield and outland. The preceding Neolithic and Bronze Age agriculture may instead have used a type of shifting cultivation that regularly exploited new land and did not require significant manuring for cultivation. Although some have suggested that the pollen and archaeobotanical record supports this development, the origins of manuring and the nature of the soil amendment practices employed over the longue durée is still poorly understood. In this study, we explore this long-term development in crop management practices in South-Western Norway using stable carbon and nitrogen isotope analysis of charred cereal grains dating from the Neolithic to the Iron Age. In particular, we consider the nature of the manuring practices used by the earliest farming communities and the extent to which manuring strategies changed during the Iron Age expansion.

### A. PRELIMINARY DATASET ON CARPOLOGICAL REMAINS FROM ITALIAN BRONZE AGE

**Abstract author(s):** Cortese, Francesca (Department of History, Humanities and Society, University of Rome Tor Vergata) - De Angelis, Flavio (Centre of Molecular Anthropology for Ancient DNA Studies, University of Rome Tor Vergata) - Bontempo, Luana (Edmund Mach Foundation, Food Quality and Nutrition Department – Traceability Unit) - Carrara, Nicola (University of Padua) - Dalla Longa, Elisa (Independent researcher) - Moggi Cecchi, Iacopo (Anthropological laboratories – Department of Biology, University of Florence) - Silvestri, Letizia (Department of History, Humanities and Society, University of Rome Tor Vergata; Durham University, Department of Archaeology) - Rickards, Olga (Centre of Molecular Anthropology for Ancient DNA Studies, University of Rome Tor Vergata) - Rolfo, Mario (Department of History, Humanities and Society, University of Rome Tor Vergata)

**Abstract format:** Poster

Agriculture spread in Europe during the Neolithic, bringing new techniques to improve soil productivity. Molecular studies demonstrated that in the Italian peninsula, agriculture developed intensively only during the Bronze Age. New applications of carbon and nitrogen stable isotope analysis on carpological remains show their potential in identifying soil management practices, such as manuring and irrigation. Published works revealed that animal manuring raises nitrogen values of cereals and legumes, while water availability is related to increasing carbon values. This work provides the first preliminary dataset of stable isotope analyses on domesticated seeds from Bronze Age Italian sites, i.e., Grotta di Pastena, Grotta Nuova, and Molina di Ledro. The first site, located in central Italy, dates back to the Early-Middle Bronze Age; it is a funerary and ritual cave that provided one of the largest carpological deposits of Italian Protohistoric contexts. Grotta Nuova, also in central Italy, is a cult cave dated to the Middle Bronze Age. It revealed several burnt seeds into vessels found along the shores of an inner stream. Molina di Ledro is a pile-dwelling in northern Italy, which was occupied between the Early Bronze Age and the first phases of the MBA. About 60 seeds of broad beans, emmer, wheat, and barley have been analyzed. The results appear to vary based on sites of provenience, suggesting different local isotope signatures of soil and the different use of agricultural practices. Stable isotope analyses on seeds are not common in Italian protohistoric contexts, unlike other European sites (e.g., Spain, Switzerland, and Greece); therefore, it is imperative to make crops values available, in order to reconstruct agricultural practices, past local isoscapes, and local ecological substratum to be useful for future human diet analysis and beyond.

### B. CONSTRUCTION AND PRACTICE OF EXPERIMENTAL PADDY FIELDS IN THE YAYOI AND KOFUN PERIODS IN THE JAPANESE ARCHIPELAGO

**Abstract author(s):** Shiroishi, Tetsuya (Yamagata University) - Yamada, Masahisa (Tokyo Metropolitan University)

**Abstract format:** Poster

In the Japanese archipelago, rice farming was introduced from the continent during the Yayoi period (10-8 C.B.C.). The result was a transition from a hunting and gathering society to an agrarian society. Archaeological research has shown that rice cultivation and agriculture brought about a major transformation in society and culture. In other words, the dietary revolution brought about by rice paddies during the Yayoi period is very significant.

However, it is not clear how paddy fields were operated at that time. Therefore, with the aim of clarifying the operational capacity of rice paddies in the early agricultural period, the presenters have constructed experimental sites in various regions of the long, north-south Japanese archipelago. In the experiment, the paddy fields were excavated with the restored wooden products to measure the excavation force to determine the degree of growth. The harvesting was done with restored harvesting tools (stone knives) to examine the harvesting time, yield, etc., and the number of people per unit area calculated. Then, the harvested rice was cooked with the restored earthenware to clarify the cooking method through comparative analysis with the use marks on the earthenware. Thus, we aim to elucidate the food system of the paddy field in the Yayoi period through a multi-faceted and comprehensive survey of the various events related to the paddy field.

In this report, we present the specific experimental process and results obtained for the experimental paddy fields in Yamagata Prefecture, which started in FY2020, and Kanagawa Prefecture, which are currently under construction, and we discuss future research prospects.

## COMMUNITY ARCHAEOLOGY OF THE EDGES: CHALLENGES AND SOLUTIONS

**Theme: 1. Archaeologists and Archaeology Here and Now**

**Organisers: Todaro, Simona (Catania University) - Kyriakidis, Evangelos (The Heritage Management Organization)**

**Format: Round table**

In the past 15 years, the engagement between archaeology and the public has intensified and, as a result, a growing number of countries have moved from top-down approaches that aim to increase community awareness of cultural heritage through modification of dissemination practices, to more dynamic and inclusive approaches that entail the active collaboration of citizens and archaeologists.

The new path has inevitably forced practitioners to rethink how and why we do archaeology and has eventually led to a shift of focus from top-down, often enforced, box-ticking exercises, to projects aimed to empower local communities.

While the outcomes of archaeological research are regulated by specific legislation and publication responsibilities, the truly collaborative practice poses often unresolved location specific challenges. True collaboration requires the permeability of boundaries between "professional" and "community member", which can become extremely difficult to transcend when working with marginal groups, even in cases in which researchers are both community members and professionals.

Yet, marginal groups, i.e. communities that can be regarded as critical for socio-economic reasons (e.g. peripheries of urban centres, groups characterized by a lack of access to facilities, that have not been integrated, are illiterate or new), are those that could benefit more from collaborative research projects in which the cultural heritage can become a trigger for creating and/or reinforcing integration. The aim of this session is to bring together researchers who have been working with such communities so as to address, through specific cases studies, challenges and attempts at overcoming them.

## CONTINUITY AND DISCONTINUITY OF TRANSPORT SYSTEMS FROM ANTIQUITY TO THE PRESENT

**Theme: 4. Polis, Empire, League and Beyond – Living in Interconnected Societies**

**Organisers: Rajala, Ulla (Stockholm University, Sweden) - Fulminante, Francesca (UCL; University of Bristol; Roma Tre University) - Lewis, Joseph (University of Cambridge) - Stamerra, Laura (Roma Tre University) - Citter, Carlo (University of Siena)**

**Format: Regular session**

Recently Danish economists have combined data on Roman roads and historical data on dwellings in Europe to assess the enduring effect of the Roman transportation network (Daalgard et al. 2018). Such research indicates that these roads created a united Europe that was an outcome of much older traditions. Pre-Roman Europe was not a blank slate but already highly interconnected. The Iron Age network of proto-urban and later urban centres (oppida) into which the Mediterranean world latched onto allowed the whole Western European network to "take-off" within the Roman system. The network also affected areas that were not even part of the Roman Empire, for example in Scandinavia. This Roman infrastructure was so robust that it could survive even the end of Roman Empire, for example in Britain. Even today, the roads may run along the same routes used for millennia. However, the centres and their connectors were not immutable and sometimes disrupted more notably. For example, the Roman road network incorporated in some instances old routes, but in the others diverted from them.

Urban networks and networked cities are becoming an increasingly dominant theme of research and international planning and understanding the routes and effects of these networks is vital for making informed decisions for the present and future. The modern planning tries to save old heritage and avoid historic routes. Thus, we encourage

papers that discuss the connections between centres and the continuity and discontinuity of ancient transport networks. The potential topics include:

- diachronic approaches to transport
- settlement networks and connectivity
- road networks
- harbours and marine networks
- transhumance
- modelling past networks and least cost routes
- imports and exports
- modern road planning and heritage

Dalgaard, C.J., et al. 2018. On Roman roads and the sources of persistence and non-persistence in development. <https://voxeu.org/article/roman-roads-and-persistence-development>

## ABSTRACTS

### 1 NETWORKS AND RESILIENCE: USING SOCIAL NETWORK ANALYSIS AND AGENT-BASED MODELLING TO EVALUATE THE SIGNIFICANCE OF MESOPOTAMIAN HOLLOW WAYS

**Abstract author(s):** Priß, Deborah (Durham University)

**Abstract format:** Oral

Understanding the connectivity of past complex societies and its impact on their ability to cope with significant disturbances can help us to address modern issues like climate change; if we know what helped ancient civilisations to increase their resilience, we can use this knowledge to shape our future. I aim to investigate how and to what extent relationships and connections between settlements helped past societies to overcome crises.

My research focuses on so-called hollow ways in northern Mesopotamia to assess ancient route networks. They date back to the Late Chalcolithic/Early Bronze Age (c. 4000 – 2000BC) and were still visible on satellite images from the 1960s, before most of them were eventually destroyed by development and irrigation measures.

The hollow ways build the foundation of my studies which draw upon a mixture of open-source and non-public data to characterise the hollow ways and the location of settlements. As with all archaeological data, the evidence of the hollow way system and the settlements is fragmentary and incomplete. Hence, the issue of missing data is one of the essential problems to be resolved. In collaboration with experts from disciplines including neuroscience and computer science, I aim to find a method to account for incomplete data and to test the resilience of the system.

I use innovative, network-based approaches including social network analysis (Exponential Random Graphs Models) to assess the dominant processes that led to the system as it presented itself until a few decades ago, and agent-based modelling to trace the evolution of the network through time.

This paper will give an overview of my research and present the first steps of data preparation and the use of computational methods to handle missing data as well as the first results of the Exponential Random Graph Models.

### 2 ROADS AND RIVERS. THE IMPORTANCE OF REGIONAL TRANSPORTATION NETWORKS FOR EARLY URBANIZATION IN CENTRAL ITALY (1000-500 BC)

**Abstract author(s):** Fulminante, Francesca (University College London; Bristol University; University Roma Tre) - Prignano, Luce - Cozzo, Emanuele (Departament de Física de la Matèria Condensada, Universitat de Barcelona; Universitat de Barcelona Institute of Complex Systems - UBICS) - Candelas, Pablo (Departament de Física de la Matèria Condensada, Universitat de Barcelona)

**Abstract format:** Oral

Ancient regional routes were vital for interactions between settlements and deeply influenced the development of past societies and their "complexification" (e.g. urbanization). For example, terrestrial routes required resources and inter-settlement cooperation to be established and maintained, and can be regarded as an epiphenomenon of social interactions. Similarly, navigable rivers provided a complementary inter-settlement connectivity, which conditioned the development of roads and pathways.

In this sense, fluvial and terrestrial connections can be seen as the two layers of an integrated regional transportation system, which was the product of social relations and of the interplay between past societies and environment. This paper discusses transportation networks and interaction in central Italy (1000-500 BC ca) at a time of changes and developments in the Italian Peninsula, which led to the creation of regional ethnic and political groups and to the formation of the first city-states in Western Europe.

To better understand the emerging Latin and Etruscan urban polities and the mechanisms underlying their variable success, we adopt a novel network approach (modelling, multiplex networks). In particular we propose to understand the interplay between both infrastructures by exploring the navigability of such multi-layered transportation

networks when varying the parameters that model (1) the relative maintenance cost of fluvial and land connections and (2) the additional harbour maintenance costs associated to each node in the fluvial layer. The results shed new light on how the Latin and the Etruscan polities emerged and functioned, and also suggest potentially why, in the end Rome prevailed over its rival.

### 3 CONNECTING LANDSCAPES ON THE LONG DURÉE. THE CASE OF CENTRAL SICILY

**Abstract author(s):** Citter, Carlo (University of Siena) - Mazza, Michele (Soprintendenza Archeologia, Belle Arti e Paesaggio per la città metropolitana di Reggio Calabria e la provincia di Vibo Valentia)

**Abstract format:** Oral

This paper focuses on the central Sicily's historical road systems, through a diachronic analysis of ancient cartography, historical sources and data from recent researches carried out in the area.

A long lasting Mediterranean tradition stresses the role played by the towns in shaping the countryside and its connections' network. On the contrary, we stress the bottom up process of connecting communities over time.

Routes and paths can be rooted in the Proto-history, when the movement used to be constraint by the geographical settings. They were transformed, according to the needs of local communities. They were abandoned, reshaped, reused many times until the present day.

We focus on central Sicily to highlight this rhythm of continuities and breaks on the long term from the Bronze age to the present. We will also stress the role that this network played in the transformation process of the selected area and its settlement pattern.

Finally, we will evaluate, through a GIS based approach, how much the recorded paths are influenced by environmental and/or human agents.

### 4 THE CHANGING ROAD NETWORKS OF THE FALISCAN AREA: ASSESSING ROAD NETWORKS AND ROAD CUTTINGS

**Abstract author(s):** Rajala, Ulla (Stockholm University, Sweden)

**Abstract format:** Oral

In his recent PhD thesis Juha Tuppi (2015) discussed the road cuttings of central Tyrrhenian Italy. His work contained only a handful of road cuttings from the Nepi area, whereas in my PhD work I found more frequent evidence for these monuments. However, Tuppi's work concentrated on pre-Roman road cuttings, whereas many of the cuttings in the Nepi area can be related to the Roman and Medieval road networks. Even if the road cuttings in the Faliscan area are essential for moving from one canyon-like river valley to another, only those near Falerii Veteres and Novi and Corchiano have been analysed in a more detailed fashion (cf. Quilici 1990; Tuppi 2015).

In this talk I will analyse the road networks reconstructed in previous research (e.g. Frederiksen and Ward-Perkins 1957) and compare this data to those of Tuppi (2015) and to the main settlements connected. I will discuss my own observations during my PhD work and identify the key areas for fieldwork and analysis within the new project 'From protohistory to the Middle Ages: the road cuttings in the south-eastern Etruria', financed by the Amos Anderson Fellowship. I will also outline the computer modelling related to the project.

### 5 MINDING THE GAP: SITUATING THE LANDSCAPES OF THE VIA AMERINA AND VIA FLAMINIA IN SOUTHERN UMBRIA

**Abstract author(s):** Harder, Matthew (University of Missouri)

**Abstract format:** Oral

The landscape of Southern Umbria in Central Italy is characterized by mountain ranges, rolling hills, and the Tiber River Valley. This region was an important crossroads for millennia thanks to the network of transhumance routes, two Roman roads (the Via Amerina (c.241 BCE) and Via Flaminia (c.220 BCE)), and of course, the Tiber River. Despite the importance of these two Roman roadways for the continued development of urban centers in the region (Ameria, Narni, Oriculum), our understanding of their exact routes and relationship with the surrounding landscape is limited. This paper seeks to fill this gap in our knowledge and reconstruct the ancient road network of Southern Umbria Tiberina through a combination of historical and archaeological data with Least Cost Path analyses. A fundamental

component to this project was the digitization of disparate strands of data (aerial photography, distribution maps, DEMs, excavation data) into a GIS database to assist in the analysis of the landscape over time. Other data comes from publications concerning the communal museum collections, primarily in the form of disparate finds, reports of scatters of material on the surface. Through this sort of investigation, we can develop hypotheses about how the route network affected regional and supra-regional trade networks over time. In particular, we can analyze the evolving relationship between urban and rural sites, brick production facilities, and port sites during the Roman period. For the first time, the interconnected landscape of Southern Umbria, an important crossroads for centuries thanks to the proximity to the Tiber River, the Via Flaminia and the Via Amerina, can be analyzed together. In sum, this paper argues that this multifaceted approach can serve as a model for understanding the functions and characteristics of these important Roman roads in Republican and Imperial Central Italy.

## 6 INNER MOBILITY, LOCAL MOVEMENT AND WIDER CONNECTIONS IN THE LONG-TERM LANDSCAPE OF THE NUCLEATED SETTLEMENT OF BOEOTIA (CENTRAL GREECE)

**Abstract author(s):** Stammera, Laura (Roma Tre University) - Farinetti, Emeri (Department of Humanities – RomaTre University)

**Abstract format:** Oral

Mobility is an essential aspect of human behaviour. It affects the way we perceive and conceptualize space and time, our relationships and interactions with people and even our own identity. For its role in human evolution and in the circulation of ideas, cultural behaviors and innovations, it is frequently a subject of focused archaeological research.

A way to understand human mobility is through the study of viability, which constitutes its physical embodiment. Along with settlements, roads and pathways represent how societies control and organize their territory. On one hand, they fulfil functional needs of human communities; on the other hand, they embody a series of ideological, socio-political and identity-related issues, hence closely influence the definition of space, as well as the significance and values of human landscapes, and their changes or permanence over time. Therefore, pathways act as material places for communication, contacts, trade and cultural exchanges, and play a leading role in shaping human societies.

In this paper, we present some case studies from Boeotia, in central Greece. Employing a GIS-based approach, enhanced by spatial analysis, cost-surface analysis, least cost path and network analysis, social and cultural effects of mobility and movement patterns at different scales will be examined. We will investigate regional mobility in a long-term perspective, the inner mobility at the urban scale, with a focus on the role of the city gates in the movement patterns between town and countryside (polis-chora) in the Greco-Roman period, as well as examples of long-term on-site mobility on significant sites.

## 7 ROMAN FRONTIERS CONNECT RATHER THAN DIVIDE

**Abstract author(s):** Rummel, Christoph - Hofmann, Kerstin - Rasbach, Gabriele - Schröer, Sandra (RGK - Romano-Germanic Commission DAI)

**Abstract format:** Oral

The Frontiers of the Roman Empire are often seen and portrayed as an exclusive, fortified outer edge of the Roman world, designed to withstand incursions and attacks from outside the Empire. Recent research has shown, however, that they were not only porous and frequently designed to concentrate movement and communication across them at certain points (often pre-existing Iron Age routes), but also served as a major artery of communication along their course, connecting military camps, cities, provinces and socio-economic spheres. Rather than the commonly found dividing element, *limites*, as the origin of the word suggests, and *ripae* also served to connect – by land and by water.

While Roman roads and their impact on later transport and communication networks are commonly studied, this paper therefore seeks to lay out the impact of the Roman frontier on European connectivity, in Antiquity as today. Using several case studies from different parts of Europe and the theoretical concept of past dependencies, it will show how they served and facilitated movement, often along pre-existing prehistoric routes, and how they echo in transport systems and communication networks to this day.

## 8 EVEN MORE FROZEN IN TIME: AN ANALYSIS OF POMPEII'S STREET NETWORK TO COMPARE METROLOGICAL PRACTICES BETWEEN THE CITY AND HINTERLAND

**Abstract author(s):** Picker-Kille, David (Florida State University, Department of Classics)

**Abstract format:** Oral

Over the past fifteen years, research on Roman city street networks have significantly expanded our ability to engage with questions of movement, space, and infrastructure in ancient urban centers. This increasing wealth of data, however, has yet to be sufficiently considered in its applicability to address social and economic questions about life outside the city. In Pompeii, where there is a marked dichotomy between the archaeological record of the city and

the surrounding countryside, a closer investigation of the city's well-preserved street network reveals important differences in daily practices across the two environments. Dividing Pompeii's street grid into discrete "units of movement" enables us to map topographically and chronologically a collection of wheel-rut measurements onto patterns of vehicular movement into and out of the city. Using this model, we are then able to visually consider how the response to the early-Augustan introduction of Roman metrological standards may have differed between city-dwellers and those living beyond its gates. Such patterns provide crucial insight into how inhabitants of the Campanian countryside engaged with social, economic, and cultural developments within the city. Going forward, more extensively excavated sites such as Pompeii may remain more conducive to a GIS-intensive study of ancient urban-rural movement. Nonetheless, the underlying tenet of such an approach – that the street surface is no less an archaeological resource as the places it interconnects – offers much potential for research on a variety of ancient sites and settlements seeking to better understand the social, cultural, and economic relationships of their occupants with the inhabitants and topography of the surrounding hinterlands.

## 9 **POSTAL RELAY SYSTEM IN MONGOLIA ACCORDING TO THE CHINESE TRAVELERS OF THE 13TH CENTURY**

**Abstract author(s):** OGUZ, Anil - Özsoy, Nusret (Erzurum Technical University)

**Abstract format:** Oral

In world history, the Mongolian Postal System, known as Jam or Yam, was the most important catalyst that led to the formation of Pax Mongolica by facilitating the east-west interaction of Eurasia. Postal routes, which probably were first laid before the Chinggis Han and started to extend from Mongolia since the Chinggis Han, were the main tracks, through which personalities such as Zhang Dehui, Changchun, Yelu Chucui, Chang De passed in the 13th century. In fact, there were three postal routes (called Morin, Tergen and Narin) connecting North China with Mongolia since the Ogodei Ka'an Period, and Tamir-Altay postal routes leading to the postal tracks extending around Lake Balkash and north of Jungaria. Changchun in 1221, Zhang Dehui in 1247, and Yelu Chucui in 1218 were travelling from North China to the vicinity of Karakorum, using the oldest postal relay tracks in Mongolia.

Thanks to the narratives of these travelers, we learn that the postal stations in Mongolia were tent camps to which nomads provided food, horse, employee etc., that the tracks was built in the steppe and semi-desert land, the distances between the stations, the speed of the postal relay system in Mongolia and the routes. This information allows us to learn that the postal relay routes in Mongolia followed certain places and that the route actually connected the ordos of the Mongolian nobility. With postal companions (ula'achi), authority tablet and document (gerege), horse stamps (tamga) etc., it is possible to re-create the transportation system in 13th century Mongolia and also to understand the interconnectedness of settlements such as Karakorum, Bitigtu, Yisu Buqa's Palace in Inner Mongolia, and Khirkhira in Yenisei.

## 10 **THE CONTINUITY OF ROMAN ROAD TRANSPORT INFRASTRUCTURE IN LATER MEDIEVAL ENGLAND: THE GOUGH MAP OF C. 1400**

**Abstract author(s):** Oksanen, Eljas (University of Helsinki) - Brookes, Stuart (University College London)

**Abstract format:** Oral

The Gough Map of c.1400 (and revised in the 15th century) is one of the oldest surviving maps of Great Britain and unparalleled among its predecessors in detail and scope. One feature of the map that has excited great interest among historians of the Middle Ages are the so-called 'red lines' that connect together many of the settlements depicted. Some scholars believe these red lines to represent a network of contemporary routes; others have suggested they simply indicate distances and a sense of connectedness between settlements. In this paper we will argue that the red lines do in fact depict routeways. Utilising digital GIS mapping of routes of Roman and early medieval date, we will show that in almost every instance a red line can be matched with a historical road; in one case a navigable river. While the Gough Map by no means contains a full and comprehensive depiction of the medieval travel network, the historical importance of its red lines lies in their representation of the most comprehensive single depiction of contemporary travel routes across the kingdom, as chosen by its creator. Using the red lines as a proxy we can quantify the contribution Roman roads made to the medieval road network, evaluate some of the spatial characteristics of the surviving sections, and assess their continuity into the Early Modern period. Used in this way the Gough Map provides important insights into the evolution of transport systems in England and Wales.

## NEW OR OLD? EXPLORING THE CONSTRUCTION AND CONTINUITY OF THE ROMAN ROAD NETWORK IN THE SOUTHERN LEVANT

**Abstract author(s):** Pažout, Adam - Brughmans, Tom (Centre for Urban Network Evolutions - UrbNet, Aarhus University) - de Soto, Pau (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

This presentation explores a new highly-detailed and spatially accurate model of the Roman road network in the Levant. The model offers an opportunity to study the development of the Roman-period road network, its relation to pre-Roman roads and its continuity into the Islamic period. Selected case studies from the southern Levant will be discussed, exploring the influence of settlement patterns and Roman expansion on the shape of the road network in the region. It is argued that very few 'Roman' roads are new constructions dated to the Imperial period, and these often become disused in the Early Islamic period due to different socio-political circumstances and changing settlement patterns.

This Roman road digitisation is developed within the context of projects MINERVA (<https://projectmercury.eu>) and Viator-e (<https://viatore.icac.cat>). These projects aim to draw on all available historical and archaeological data to develop a highly detailed model of the Roman road system across the entire Empire. The digital data will be made openly available on Itiner-e: an open online gazetteer of ancient roads. It aims to become an online platform for a community of scholars to explore, query, download and edit historical road data, leading to a continually improving resource. This presentation will provide an overview of current work in these projects.

## NEW TECHNOLOGIES, NEW TRENDS, NEW ETHICS IN CULTURAL HERITAGE MANAGEMENT

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Chroni, Athina (Hellenic Ministry of Culture and Sports-General Directorate of Antiquities and Cultural Heritage; National Technical University of Athens) - Hamari, Pirjo (Finnish Heritage Agency) - Nilhamn, Bonnie (University of Helsinki, Doctoral Programme in Geosciences; "Nilhamn" - Dutch Museum and Cultural Heritage consult company)

**Format:** Regular session

The COVID-19 crisis has profoundly affected societies around the world, tearing apart the social fabric and plunging the global economy into a deep recession. Despite its negative impact, the cultural sector has gained new experiences, contributing to the successful management of multiple issues and highlighting the essential role of cultural heritage in communication, social inclusion, and economic regeneration. In recent years new technologies, like remotely sensed imagery, GIS, web databases for remotely managing cultural heritage, VR, AR and MR for highlighting cultural heritage, widening the museum experience for keeping stable the visitors' numbers, social web platforms for sharing cultural experience and gathering the community globally, have prevailed as new trends, thus contributing to a new ethics model which is being formed. The footprint is also visible in tourism, further affecting the sector of economy.

Remote access and remote management, open linked data, common sharing, are some of the "new normality's" main aspects. People's cultural and social experience is moving from the physical to the virtual. As a result, the term "virtual collective memory" might be considered rather appropriate.

Considering the pandemic as a catalyst for change, reinventing, through new practices, the common values that connect people worldwide, this session addresses issues like: "Where does the cultural sector really stands today? Have the new technologies worked out? What is in fact the new cultural heritage management model arising? Should we consider linked open data and crowdsourcing as the new scientific framework? How would the role of professionals in the cultural sector be shaped? How might the respective economic footprint be shaped? Should we talk for a virtually based future in the cultural sector?" Protecting, re-evaluating, revitalizing our common heritage, interpreting society's needs and supporting tourism, should form our priorities for gaining back the balance between the physical and the virtual and achieving people's re-integration.

### ABSTRACTS

#### 1 PERCEPTIONS OF CULTURAL HERITAGE IN POST-COVID TIMES: IASIS FOR RE-ORIENTATING CH MANAGEMENT

**Abstract author(s):** Chroni, Athina (Ministry of Culture/Hellenic Republic, National Technical University of Athens) - Georgopoulos, Andreas (National Technical University of Athens)

**Abstract format:** Oral

"Space is not static, material as a whole and empty, as is often defined in the sciences. It is artificial, as an imprint in space, and social, as a field of human life, absolute or abstract." (Lefebvre, 1974)

Further accepting that the urban environment is conceived through the notion of the urban assets, both tangible and intangible, a three-dimensional notion for architecture is quite expected: the function, i.e., religious or secular, public or private, the space, i.e., location, size and type, the time, i.e., dating.

In this framework, "IASIS" has focused on tracing and 3D digitally approaching specific lost landmarks of Ioannina city, Greece, thus studying and pointing out the alterations of the city's urban web during its Byzantine and Post-Byzantine/Ottoman period, consequently figuring out and rediscovering Ioannina's pluralistic profile and cultural palimpsest, as it was shaped, mainly, after the year 1430, resulting from the city's Christian, Jewish and Muslim cultures' osmosis.

The research project proposes an integrated workflow, ranging from remote heterogeneous data collection and digital processing, to communicating information to the people's community by applying new technologies, mainly GIS and 3D visualization via web-based platforms, as well as QR coded interactive labels integrated in the urban web, thus overpassing extreme situations, like the lockdowns. The short-term target is to share cultural heritage information, while the long-term goal is to keep on backfilling and updating the related web database, thus rendering IASIS a never-ending project. Under the perspective of increasing the public's involvement, citizen interviews highlighted topics such as cultural/historic context, significance, heritagization process, intangibility and associative values, living history/living heritage, community needs, cultural mapping, authenticity, also, studied in this paper.

Open source, open data, open access form the project's foundation stones, thus proposing new ways for cultural and social inclusion and re-orientating CH management to a values-based approach.

## 2 RETHINKING HISTORICAL COLLECTIONS AND MUSEUM PRACTICES: PROSPECTS AND CHALLENGES FROM THE SPINELLI ARCHAEOLOGICAL COLLECTION PROJECT AT MANN

**Abstract author(s): Savelli, Sveva (Saint Mary's University) - Santaniello, Emanuela (Museo Archeologico Nazionale di Napoli)**

**Abstract format: Oral**

The "Spinelli Archaeological Collection Project" was born in 2021 as a collaboration between the MANN and Saint Mary's University (Halifax, Canada) aimed at conducting a comprehensive study of the Spinelli Archaeological Collection and promoting its dissemination to the broad public. The initiative is a direct offspring of the COVID pandemic that, benefitting from the Museum's temporary closure and consequent slowdown of everyday activities, created opportunities for self-reflection in curatorial and heritage protection practices. The collection originates in the archaeological excavations carried out between 1878 and 1886 by the Marquis Marcello Spinelli in the necropolis of the ancient city of Suessula (Naples, Italy) and represents crucial testimony of peoples living in the "Piana Campana" long in advance of the arrivals of Etruscans, Greeks, and Romans and reveals their interactions with the broader Mediterranean region. It comprises 2300 ceramic vessels and 3000 bronze and iron implements dated between the end of the Bronze Age and the Roman conquest (3rd c. BCE). The original nucleus of the assemblage was donated by Spinelli's heirs to the Italian Government after World War II and is conserved at the MANN; other finds were dispersed across international Museums.

This paper will discuss objectives, strategies, and accomplishments of "Spinelli Archaeological Collection Project" and will address the challenges of studying and disseminating to a vast public a complex and extensive context in such a challenging period. The goal is to recast the history of the Museum as a place of knowledge of Ancient Campania, from its prehistory to the birth of Capua, Kyme, Neapolis, Puteoli, and the very rich surrounding area.

## 3 REMOTELY MANAGING AND COMMUNICATING ARCHAEOLOGICAL INFORMATION TO THE PUBLIC: GIS FOR DOCUMENTING ANCIENT QUARRIES IN GREECE

**Abstract author(s): Chroni, Athina (Ministry of Culture/Hellenic Republic, National Technical University of Athens) - Megalooikonomou, Pavlos-Stylianos (National Technical University of Athens)**

**Abstract format: Oral**

GIS has become a human science research tool virtually eliminating the distance of physical space. Georeference is now considered necessary for the integrated documentation and management of every archaeological site and its finds; GIS, as a new documentation methodology for cultural heritage, mirroring analogue documentation principles, constitutes a methodical challenge strongly related to the massive digital and technical development globally.

The rapid increase in the number of ancient quarries located in Greece, many of them not yet excavated or mapped, calls for an urgent plan concerning the related documentation, under the perspective of rendering the study of their techniques more systematic and comprehensive, as well as the interactions with other centres, thus allowing to draw conclusions about stone mining in the ancient Greek world, its movement across the Mediterranean and the resulting inter-local contacts, revealing commercial, political and cultural networks, sea and land routes.

The digitization of spatial information in combination with the introduction of qualitative and quantitative data for each of the digitized points, in distinct layers of information, allows the flexible and accurate management of a large volume of data.

Integrated cultural data management is further enhanced by the adoption of standardized models and controlled vocabularies for the documentation of cultural assets, thus multiplying the possibilities of interoperability and communication with a wider network of cultural content databases at a transnational level.

Ultimate goal, a web-based platform, under a regular status of updating, revealing buffer zones for the located archaeological sites, as well as site details such as condition, threats, and other monitoring updates, freely available to the public, in order to remotely protect, preserve, and assess the potential impact to irreplaceable and non-renewable archaeological resources within the context of encouraging and promoting sustainable development, thus overpassing extreme situations of crisis, like the pandemic COVID-19.

#### **4 NETWORKED LEARNING AND ONLINE ARCHAEOLOGICAL TRAINING: THE DIGITAL HORIZONS PROJECT**

**Abstract author(s): Romanis, Thomas (Australian Archaeological Institute at Athens)**

**Abstract format: Oral**

The COVID-19 lockdowns throughout Australia left tertiary heritage students with few avenues for practical archaeological experience and career development. Field schools were cancelled, and many internship programs were suspended throughout 2020 and 2021. Without these vital opportunities to attain skills training and professional experience, a real concern for students becoming a 'COVID Generation' without experience arose.

Recognising this void, the Australian Archaeological Institute at Athens (AAIA) adapted its Digital Horizons Project (DHP) to redress it. The project has two aims: 1), providing engaging and practical experiences in archaeology to enhance interdisciplinary skills development and career prospects, and 2), preparing archival field data excavated at the Greek Iron Age site of Zagora, Andros (1971-1974) for open-access publication. The initiative employed Zoom and shared online databases to create a social environment for student-led teams to easily access to archaeological training and archival content. This team structure and online model proved highly popular and effective, seeing rapid expansion in the project despite the limitations of COVID-19. The DHP now provides training to over seventy-five volunteers from six Australian universities and continues to grow.

This online and onsite approach has provided significant research advantages for the AAIA. Over 23,000 legacy archaeological records, photographs, and sketches have been digitised and input into a Heurist database within two years. With such a wide variety of archaeological processed and structured, progress towards publication has accelerated. This has allowed the DHP to develop more sophisticated roles to teach advanced vocational skills, including: stratigraphic interpretation and query, digital illustration, GIS mapping and spatial analysis, and artefactual analysis. Multidisciplinary skills, including communication, data management practices, and public engagement, are also instilled to aid students in being adaptable to a changing, ever digital working environment. This networked, flexible volunteer program model demonstrates the educational and research benefits to online volunteering.

#### **5 THE CAST PROJECT. EXPLORING THE KNOWLEDGE OVER THE DARK. ADVANCED MULTIDISCIPLINARY ARCHAEOLOGY INVESTIGATIONS FROM PERTOSA CAVES, ITALY**

**Abstract author(s): Di Meo, Andrea - Minelli, Antonella (Università degli Studi del Molise) - Caprioli, Federico (Independent Researcher) - La Greca, Giuseppe (Independent Researcher)**

**Abstract format: Oral**

The CAST project (Caves through Archaeology, Science and Technology) is configured as a methodological intervention program, which makes use of innovative technologies, enabling the acquisition of significant information on timeframes and on how the caves of Pertosa-Auletta (southern Italy) can be used.

If on the one hand the objectives are the continuation of historical and archaeological research, on the other we want to develop an integrated museum system between nature and high impact popularization models using virtual survey technologies.

Using innovative methodologies, the aim is to make the information acquired during the interventions available through a platform for continuous monitoring of the progress works.

The direction marked by this pandemic phase has made the use of these methodologies even more urgent, favoring the spread of a New Digital Humanism that can determine a social impact capable of guiding future approaches to the management and scientific treatment of data.

In this regard, through the web platform dedicated to the Virtual Reality Experience it is possible to carry out a virtual tour of the 3D reconstruction of the pile-dwelling settlement, identified at the entrance to the Caves, developed on the basis of archaeological data and the high-resolution three-dimensional survey carried out through the integration

between laser scanner and photogrammetry. During the virtual tour it is also possible to interact with the 3D models of the finds that can be explored obtaining information of a different nature.

This platform contains virtual reproductions connected to the archaeological and natural history of the Caves, with diversified levels of access to information, which constitute a model of virtual experience with a strong scientific and social impact.

The purpose of the platform, constantly implemented and updated, is also to allow you to check the progress of the research in a single environment that is easy to access.

## 6 CLICKBAIT HERITAGE

**Abstract author(s): Nilhamn, Bonnie (Helsinki University)**

**Abstract format: Oral**

Some museums only exist in the virtual world, while most museums interact online with their audience. The degree can vary from only presenting a website to having elaborate online exhibitions and virtual tours.

For many years, this digital development has been on but took a high flight with the Covid-pandemic. In a rapid tempo, we have seen that museums had to adapt to survive the last two years.

The heritage experience has become only one click away from our smartphones. This 24/7 accessibility of searchable and browsable collections has become a blessing for researchers. Still, has it really increased the experience of enjoying heritage or has the virtual access just become a fast means to collect a number of visitors for the museum statistics.

In this paper, we discuss the fast-changing heritage landscape. The blessings and the drawbacks for the heritage institution itself as for the individual visitor. It will also include some inspirational "best-practices" examples of some heritage institutions that have embraced the new technologies as essential tools, not as "the solution".

## 7 THE ROLE OF 3D TECHNOLOGIES IN HEALING THE LOSS OF ARCHITECTURAL HERITAGE

**Abstract author(s): Denker, Ahmet (-)**

**Abstract format: Oral**

Since the Renaissance period, when the value of architectural heritage and the respect for its value were laid, unearthing and comprehensive research of ancient monuments have been one of humanity's primary obligations and interests. As a result, archaeological excavations of monumental buildings became common practice from the 18th century onwards and intensified in the 19th century. However, what these excavations revealed most of the times were completely destroyed architectural structures. Awareness of the lost architectural heritage is the necessity and result of the self-consciousness of contemporary society. Healing the pain of deprivation caused by the loss of ancient monuments today concerns not only the past, but also the present and the future. Understanding how valuable these monuments are depends on revealing and sharing information about their importance and splendor in the periods they were standing. Making such information visible to everyone is one of the main challenges and opportunities of 3D technologies. The ghost images of the lost monuments of our architectural heritage created in the virtual world are examined with a focus on the character, origins and uses of the virtual models of the architectural heritage. Emphasis is placed on the healing role of ghost images as meta-representations of architectural heritage. In all cultures on our globe, ghost images have a significant role in connecting people with the past, with the lost. In light of this cultural reference, the role of 3D ghost images in sustaining the lost architectural heritage and alleviating the pain of the loss is discussed.

## 8 REVIEW OF YOUTH PARTICIPATION PRACTICES IN CULTURAL HERITAGE MANAGEMENT THROUGH DIGITAL TECHNOLOGIES

**Abstract author(s): Zhang, Yingxin (Eindhoven University of Technology)**

**Abstract format: Oral**

Youth, aged between 15 to 24, has been increasingly involved in the decision-making process of cultural heritage management. The UNESCO, the European Commission, and other international heritage organizations have undertaken various projects and events in arising youth awareness and willingness in heritage conservation practices, promoting their engagement in heritage management projects. Despite the growing attention on youth participation, little research has been done so far that summarizes and assesses different digital tools that have been used by heritage professionals for engaging young people in heritage projects. This paper aims to fill the gap by providing an assessment that indicates the effectiveness of the varying digital participatory tools for engaging young people in heritage management, as well as a recommendation of a potential set of digital tools. Based on qualitative analysis of empirical case studies worldwide, a systematic literature review was conducted to critically assess the existing participatory methods, steps in heritage management process, and degrees of participation. Both top-down and bottom-up approaches have been critically assessed with special attention to the application of digital technologies.

This review concludes that educative methods which often incorporate immersive and visualization technologies (e.g. virtual reality, augmented reality, and gamification) have been largely adopted by government, schools, and other educational institutions, while digital platforms and social media are more accepted by local communities as grassroots approaches to empower young people in decision-making process. However, in general, youth participation is still limited to a low participatory level and is mostly dominated by institutions and experts. The result of this review will contribute to the construction of a theoretical conceptual framework of youth engagement in cultural heritage management. This framework can be informative and consultative for heritage professionals regarding policy-making process and development of bottom-up strategies.

## 9 NEW TECHNOLOGY AS A TRUE ENRICHMENT IN THE MEDIATION OF CULTURAL HERITAGE

**Abstract author(s):** Toulouse, Catherine - Lengyel, Dominik (BTU Brandenburg University of Technology Cottbus-Senftenberg)

**Abstract format:** Oral

New technologies not only keep communication going in the pandemic. To a certain extent, thanks to the pandemic, new trends are finding new acceptance worldwide. And this acceptance can be used to communicate cultural heritage in ways that depend on VR, simply because they would not be possible in the physical world. Then VR does not only expand the museum experience by transferring it one-to-one into VR. Purely virtual experiences are then not simply moving from the physical to the virtual, but instead are original virtual experiences that more than justify a virtual collective memory. Considering this potential, new technologies have definitely not yet worked out. And likewise, a future that is not virtually based, but enriched, can already be predicted. After all, not only will society's and tourism's needs be fulfilled, but entirely new needs will be raised. This form of enrichment naturally causes a shift towards more virtual experience and thus towards a new balance between the physical and the virtual, but explicitly not at the expense of the physical world. As an example of such enrichment, we would like to present a cultural heritage project that was developed and exhibited in cooperation with historical building research and art history, and which already contains virtuality in itself: the hypothesis that the extensive building programme of several hundred parish churches, which despite their consistently individual appearance are at the same time amazingly similar in principle, had an underlying idea. To make this idea not only perceivable as an ideal building, but at the same time to make the architectural design practice, from the composition of the building masses to the colourful ornamentation, experienceable and thus learnable, is a unique and purely virtual experience that opens up completely new paths for the museum.

## 10 REMOTE SENSING, CLIMATE CHANGE, NATURAL HAZARDS: ASSESSING OBELISKS OF EASTERN EURASIA

**Abstract author(s):** Langer, Christian (Peking University)

**Abstract format:** Oral

The pandemic has accelerated the digitization of research methods across the board. This paper explores the benefits of remote sensing in research on cultural transmission and cultural heritage management. Taking modern obelisks of eastern Eurasia – whilst focusing on China and the Philippines – these monuments can be conceptualized as global cultural heritage beyond the dominant western narrative. Remote sensing applications like Google Earth allow the identification of individual monuments as well as their mapping in GIS software. What ultimately surmounts to an atlas of obelisks can be amended with publicly available data to compile comprehensive geodatabases. This not only assists research into cultural transmission, here of the concept of the obelisk, but also allows to assess to what extent the given monuments may constitute heritage at risk. Rising sea levels – although likely in the more distant future – would pose a danger to the numerous obelisks located in coastal eastern Eurasia. Yet one also has to consider urban sprawl and volcanism in this rapidly developing and geologically highly active part of the world. Remote sensing, public data, and computing can help raise questions concerning research and heritage management and develop responses to these issues.

## 11 SOCIAL LANDSCAPES: NEW APPROACHES TO QUALITATIVE DATA FOR INCLUSIVE PLANNING AND DEVELOPMENT

**Abstract author(s):** Tenzer, Martina (University of York)

**Abstract format:** Oral

Archaeology, history, and heritage play a crucial role in developing a sense of place, identity, and belonging. The question of how much local heritage in the everyday environment matters to people has become a focus of research and practical approaches to social values over the past 50 years. The unfolding events of the Covid-19 pandemic in the past two years, restricting people's interaction, movement, and way of socialising, also impacted on approaches and methods in academic research and how museums and heritage organisations had to operate. The internet as a means of data collection, communication, and a medium for distributing information has become more important for the development of new approaches, practices, and ethics.

This paper will present the AHRC/UKRI funded PhD research project, aiming to explore a practical approach to social value evaluation, integration into the planning process, and the visualisation of 'everyday heritage' in a new era of heritage management. To overcome the restrictions to in-person contact, online surveys, interactive web map applications, and social media research were applied to integrate local knowledge and communicate between academia, practitioners, and the public. An automated process allows processing of qualitative data in a new time-effective way. Interactive web maps support the communication and information exchange for an inclusive and transparent process of change and development in the heritage sector. This methodology shows a new way to include subjective, qualitative data, such as people's perceptions and social values into official local authority maps as a tool for planning and development to facilitate sustainable change. Visualising people's place attachment based on their individual connection to the past in present landscapes may lead to a new way of heritage management as inclusive and immersive storytelling.

## 12 **ENGAGING WITH ARCHAEOLOGICAL LANDSCAPES: NARRATIVES FROM BRITISH NATIONAL PARKS**

**Abstract author(s):** Bowyer-Kazadi, Emily (University of Liverpool)

**Abstract format:** Oral

How can engaging with archaeological landscapes impact both our wellbeing and our sense of identity? Is the impact of this engagement positive or negative and why might this be? It is of great importance to take into consideration issues such as access, diversity, inclusivity and equality, as well as the way they are affected by the Covid-19 pandemic. This is one of the main lines of enquiry of the related PhD research authors, aiming to find answers by taking interviews from focus groups and by submitting questionnaires to a variety of stakeholders, such as British National Parks' representatives, estate owners, farmers, visitors etc. As part of the PhD research methodology, the photographic method of «deconstructed photography», introduced by photographer Niall Benvie, will be applied to create a series of images of different elements of heritage sites within British National Parks, which will be used as discussion points in focus groups. This photographic method breaks normal landscape photography conventions as it focuses on individual elements rather than the landscape as a whole, providing a different view of archaeological landscapes. This presentation shall discuss the relevant data already collected and analysed in relation to the way they provide answers to the questions afore-mentioned. The results of the specific PhD research project have the potential for a variety of applications in several areas of cultural heritage management.

---

## 316 **SMALL OBJECTS REFLECTING GREAT CHANGES**

**Theme:** 2. [Re]integration

**Organisers:** Rácz, Tibor (Ferenczy Museum Centre) - Fedorina, Anastasia (-)

**Format:** Regular session

Middle Ages may be described as an epoch of continuous changes in respect of political power, social and cultural settings, some of them pronounced, some barely palpable. Among such changes, one could mention the formation of states, the adoption of a new religion, or the introduction of new agrarian and industrial technologies. Transition periods comprise key events in the life of a population and have always been of particular interest. The exact ways of transformations, the spatial and chronological context may be highlighted with archaeological methods.

Material culture stands at the base of our session proposal. We can use medieval artifacts as instruments for tracking social, cultural, or economical transformations. This session is aimed to discuss and explore the effects of political and cultural changes at the level of objects. How much time does it take to change behavior or beliefs? How did fashion or ideology affect everyday life? How do people adapt to changes? How can an idea materialize? Are there environmental changes, only the objects can tell?

Processing of new excavation materials, typology-based studies, comments on metal detector finds are particularly welcome from all across the European Continent covering the periods of the High and Late Middle Ages.

## **ABSTRACTS**

### 1 **CERAMICS CHARTING CHANGE IN THE MEDIEVAL COUNTRYSIDE**

**Abstract author(s):** Lewis, Carena (University of Lincoln)

**Abstract format:** Oral

Pottery is often viewed as one of the humbler items of material culture recovered from most excavations, but it can hold clues to some of the most impactful changes in medieval society. This paper will review ceramic evidence from rural settlements in England and beyond to consider how the demographic, cultural and social upheavals of key events on contemporary populations are reflected in the distribution and date of ceramics.

The paper will review and contextualise data from more than 2,500 1m square archaeological 'test pits' excavated in more than 75 different inhabited rural settlements in England to show how ceramics can reveal change in medieval society, showing how communities ebbed and flowed, shifted and relocated, as people responded to changes over which they had little control, but with which they had to live. Firstly reviewing evidence showing how places responded to the eleventh century Norman takeover and the fourteenth century Black Death plague pandemic (both experienced widely across Europe), the paper will then explore what light similar data might be able to throw on even more poorly understood earlier changes including the sixth century Justinianic plague pandemic and the conversion to Christianity.

## 2 CERAMIC VESSELS WITH TWO HANDLES FROM 10THC. AD – A SHORT RECAPITULATION OF DATA

**Abstract author(s):** Czuppon, Tamás (Hansági Museum, Mosonmagyaróvár; Pázmány Péter Catholic University) - Takács, Mikós - Langó, Péter (Research Centre for the Humanities, Eötvös Loránd Research Network)

**Abstract format:** Oral

Our presentation aims to give a short analysis about the form, chronology, territorial spread and the major trends of interpretation of vessels with two handles from 10th century AD. The ceramic vessels with two handles from 10th century form a type of artifacts, which was frequently analyzed. It was usually studied as part of the vessel type, or several vessel types with ribbed neck. Our aim is to give a new approach, by treating not the ribbed neck, but the presence of handles as a main criteria for the separation of the given vessel type. The first part of the interpretative part of our study is going the deal with the question of production, and within this issue with the problem of workshops. The second part of the interpretation will analyze the questions connected with the possible ways of usage. The last part of our study will focus on the issue questions of the origin of the given vessel type. This importance of this issue is emphasized by the fact, that the given vessel form with two handles seems to be not present in the material culture of the 9th century Carpathian Basin.

## 3 MASTERPIECE OF 14TH CENTURY RUSSIAN CERAMIC ART

**Abstract author(s):** Koval, Vladimir (-)

**Abstract format:** Oral

In 1989, in the city of Kolomna (Moscow region), fragments of a light-clay glazed vessel with relief images (hunters, warriors, musicians, bear and camel, monster) were found on the bishop's estate. More than half of the vessel has survived, which suggests that it was an aquamanile, perhaps, with a tubular spout. Today, on the territory of Russia, we know only a few small fragments from similar vessels (most were found in Novgorod) in the contexts of the second half of the 14th - early 15th centuries. The glaze and ceramic mass of the vessel suggest that it was not an import. Probably, the vessel was made by a Russian craftsman who lived in Novgorod or Tver (the largest centers of Northern Russia). The uniqueness of the finds indicates that very few such vessels were made for no more than 20 years, i.e. they were all masterpieces of one man. The vessels made by him, undoubtedly, had a very high cost, and only the richest people (the aristocrats of the upper stratum) had the opportunity to buy and use such vessels. The Bishop of Kolomna was just such a person. It is interesting that there is not a single religious plot on the vessel - all images are exclusively secular, connected with the life of the aristocracy. The vessel has no connection with the European Renaissance, however, jugs with relief images produced in the 12th-14th centuries in Northern Europe could serve as a model for its creation. It testifies to the perception by Russian masters of the artistic achievements of European colleagues already at such an early time.

## 4 THE SOUTHERNMOST EXCEPTIONAL ARCHAEOLOGICAL DISCOVERY FROM THE HUNGARIAN CONQUEST PERIOD: THE SIGNIFICANCE OF SEVERAL FINDS FROM BAČKA REGION (SERBIA)

**Abstract author(s):** Radišić, Milica (Institute of Archaeology, Belgrade) - Uzelac, Viktorija (City Museum, Sombor)

**Abstract format:** Oral

This paper will present several interesting archaeological finds from the period of the Hungarian Conquest, originating from Stanišić in Bačka – a part of a gilded belt set, a golden hoop and a golden finger-ring set with carnelian gem. These objects were discovered on a necropolis located on a mound, which was damaged in intense ploughing activities during the 1980s. After having been sold to the City Museum in Sombor the findings were kept in a safe, without being presented to a wider scientific public. According to their traits they correspond to the material culture of the Hungarian warrior elite from the first half of the 10th century, and they have close analogies in necropolises from the Upper Tisza valley (e.g. Karos). On the other hand, certain similarities can also be noted with sites from the wider area of Eastern Europe. In this paper, we will analyse the origin, symbolism and artistic and crafting milieu of the items from Stanišić, with a special attention given to the interpretation of the gem with representation of a lion carved into it. According to preliminary analyses, the gem is most similar to Sasanian glyptic specimens, which imposes interesting

questions regarding its use. In this sense, a wider social-historical context and routes of long-distance trade in early Middle Ages will also be taken into consideration.

All the data available suggests the possibility that the findings from Stanišić belonged to a prominent member (members) of the military elite. As the southernmost findings with clear emblematic meaning, they bear witness of the invasion routes of the Hungarian army outside of their primary settling zone in the north of the Carpathian Basin, on which there is little archaeological data for the time being.

## 5 THE ADOPTION OF CHRISTIANITY OF THE HUNGARIAN RURAL POPULATION IN LIGHT OF THE MATERIAL EVIDENCE

**Abstract author(s):** Rácz, Tibor (Ferenczy Museum Centre) - Füredi, Ágnes (Hungarian National Museum)

**Abstract format:** Oral

The foundation of the state in Hungary around the year 1000 assumed the adoption of Christianity, a long and complex process itself. It is difficult to reconstruct the main features of the spiritual life of the rural population, as contemporary written sources inform on the history of the elite and the ruling dynasty. Archaeology however has the means to research the material traces of the adoption and practice of the new religion. The emergence of the political and social systems of the Christian state can be understood only in a wide perspective, including the archaeological material of the 10th-century population.

Research focusing on the development of Christianity is a fashionable topic these days; however, it resulted primarily in theoretical foundations and overviews. The elaboration of details and the evaluation of regional archaeological material can bring us closer to the way of thinking of the masses. The present paper focuses on the central part of Medieval Hungary, today's Pest County in the 10-12th centuries, comparing different layers of information on a series of maps.

From the period before the conversion to Christianity, burial customs and grave goods indicate the spiritual life of the population. The cognitive antecedents of the use of amulet-like or superstitious objects in the popular belief that are clearly identifiable in the post-11th century Christian period must be related to the concepts of the "pagan" ancestors, as the population was clearly continuous in the 10-11th centuries. The spread of non-Christian amulets and Christian liturgical objects (primarily discovered by intensive metal detecting surveys) will be contextualized in the network of early settlements, row and field cemeteries, as well as church sites. Statistical and network analysis may help to clarify the details of this long and contradictory process of transmittance and adoption.

## 6 PORPHYRY OBJECTS, EARLY CHRISTIAN BURIALS IN BORGUND, AND THE IMPLEMENTATION OF CHRISTIAN PRACTICE IN NORWAY

**Abstract author(s):** Hansen, Gitte (University Museum of Bergen, University of Bergen) - Laugerud, Henning (Department of Linguistic, Literary and Aesthetic Studies, University of Bergen) - Jansen, Øystein (Dep of Natural history, University Museum of Bergen, University of Bergen) - Lørvik, Katharina (NIKU, Norwegian Institute for Cultural Heritage Research)

**Abstract format:** Oral

During excavations in Borgund in the 1960's an early 11th century Christian burial ground was found and more than 300 graves uncovered. An early 11th century Norwegian Christian graveyard is a rather unique find since at this time Christianity was barely established yet in this country. Borgund is a deserted 10th-16th century town in western Norway and according to written sources there were three or four churches there during the Middle Ages. The ruins of two or three 12th c. stone churches are known archaeologically in addition to a fourth which is incorporated in the still standing parish church. No church ruin has been identified in the vicinity of the 300 graves. During excavations in the 1960's the burial ground puzzled the archaeologists, was this an early Christian burial ground without a church or what? In the cross disciplinary Borgund Kaupang Project (2019-2025) legacy data from decades of excavations in Borgund is re-assessed and studied. Among 18th century pottery a stone-fragment classified during the 1960s' as a 'possible stove tile' was recently found. The fragment is a piece of an object of green porphyry. This stone type is in current research associated with sepulchral stones. It is furthermore seen in travelling altars 'altare portable', which have survived in European collections of medieval church art. The paper discusses the significance of the porphyry fragment from Borgund as an object, which may reflect the introduction - and implementation - of Christian practice in Norway.

## 7 LITERACY IN MEDIEVAL RUS' TOWNS: EVIDENCE FROM SUZDAL'

**Abstract author(s):** Fedorina, Anastasia (-)

**Abstract format:** Oral

Conceptions of level of literacy of the medieval population largely depend on the source base. As for Rus', before the discovery of numerous birch bark documents in Novgorod, the narrative culture in between the 11th century and

the first half of the 13th century had been believed to be sporadic and infrequent. There is no doubt now that literate people in Novgorod were quite common. Paradoxically, this notion is rarely extrapolated to other Russian lands.

The main reason for this is the lack of birch bark manuscripts. For the majority of towns, however, it is explained mostly by the fact that bark is not preserved in their soil. This is especially true for the North-Eastern Rus'.

So, one of the possible ways of research is the analysis of archeological finds dealing with narrative culture like styluses and book buckles. It seems advisable to analyze not only on the quantity of all the finds that belong to the above-mentioned categories but also to take into consideration archeological context of the households these items came from. The spatial analysis of styluses and book buckles from Suzdal excavations would let us assess the literacy of a Russian town population of the 11th-13th centuries. Suzdal seems to be a suitable place for dealing with such issues, because all of its districts were explored equally: periphery of the medieval town is known as well as the central part. So the urban structure, as well as social image of different areas of Suzdal in its prime in the 12th-13th centuries, are quite fully documented.

## 8 TRACING POSTHOLES – A CHANGING SOCIAL LANDSCAPE AND A PUZZLING METAL DETECTOR FIND

**Abstract author(s):** Hakansdotter, Lina - Johansson, Thomas - Aldén Rudd, Petra - Azzopardi, Amanda (Rio Göteborg)

**Abstract format:** Oral

The archaeology around Vårgårda, a small inland town in the southwest of Sweden, was until recently known mostly through monuments visible above ground. Recent road construction work created a need for large-scale archaeological excavations along European highway E20, resulting in a wide variety of settlement material including more than 40 longhouses. Although relatively few artifacts are preserved, a gradually transforming material culture can be traced through a vast amount of settlement structures such as post holes.

Evidently, the Vårgårda area was intensely populated during Roman and Late Iron Age, corresponding to European Early and High Middle Ages. The scale of these settlements have exceeded expectations. Moreover, they are located in a striking landscape position. Vårgårda is situated on a fertile plateau between two rivers, giving it a prime location with access to trading routes with the Swedish West Coast and the emerging centres of political power in Eastern Sweden.

The lack of artifacts have highlighted the method of dating longhouses typologically, based on shape and size. Among the few artifacts found in Vårgårda, however, is a small gilded and enameled object uncovered using a metal detector. Possible interpretations range from Roman seal box to Medieval jewellery, but its origins have yet to be identified. Either way, it serves as an example of how one piece of material culture highlights economic and social change.

While excavation results are still being processed, our work evolves around such questions as: what was the drive behind the development of these settlements? How did the settlements evolve chronologically? Did trading commodities such as iron play a crucial role?

## 9 CONTACTS OF THE OLD PRUSSIANS WITH THE ANCIENT RUS' IN THE EARLY POST-VIKING PERIOD – NEW EXCAVATIONS IN PRIVOL'NOE-1

**Abstract author(s):** Prassolow, Jaroslaw Aleksei (Centre for Baltic and Skandinavian Archaeology - ZBSA; Institute of Archaeology of Russian Academy of Sciences - IA RAN) - Skvortsov, Konstantin (Institute of Archaeology of Russian Academy of Sciences - IA RAN)

**Abstract format:** Oral

The results of a field survey on the territory of a recently discovered medieval unfortified settlement Selišče Privol'noje-1, situated in the vicinity of the northern shore of the modern Kaliningrad (former Sambian) Peninsula, were reported in frames of the EAA 2021 conference. In the fall of the same year, the research was continued and first full-scale archaeological excavations of this monument were performed. An excavation area of 100 qm provided 2021 an unusually high number of individual finds as well as numerous ceramic fragments and settlement stone constructions. New finds perfectly prove and complete the initial preliminary conclusions: they provide evidence of a long-distance trade activity as well as of a presence of a gold- and blacksmithing manufacturing center on the settlement dated so far into the second half of the 11th - 12th centuries. Archaeological material predictably witnesses intensive cultural contacts with the Curonians, whose tribal area laid further to the North-East over the Curonian Bay. Quite unexpectedly in the local context but consistent with the discovery of the first Ancient Russian finds on the monument back in the year 2016 a further lead seal of the Drogičin type, several Ovruč spindle whorls and a fragment of an orthodox cross-pendant with enamel were found in 2021. Thus the in the recent years accumulated observations make it necessary to review traditional ideas on the role and cultural influence of the Ancient Rus' in the Baltic Sea region already in the early post-Viking period. Further planned archaeological field investigations in the northern part of the Kaliningrad Peninsula are intended to provide new insights into this exciting topic of supraregional significance.

## A. THE NON-CERAMIC MATERIAL CULTURE OF THE MEDIEVAL CENTRAL SITE OF PRÁCHEŇ (CZECH REPUBLIC)

**Abstract author(s):** Pták, Martin (University of South Bohemia; Charles University)

**Abstract format:** Poster

The contribution presents an ongoing project The early medieval hillfort Prácheň near Horažďovice (Czech Republic), which represents an important central place within the Přemyslid castle system in the younger phase of the Early Medieval period. In the High Middle Ages, a castle was built on the acropolis and the sub-settlement was transformed into a High Medieval village. The paper presents the most interesting small non-ceramic finds that were obtained during all research seasons. These are small silver, bronze, iron, lead, bone, and glass artifacts. Recently their number has been significantly expanded due to a detailed sampling and wet sieving of object fillings (e.g. fragments of metal objects, fragments of glass rings, small fish bones, charred plant macro-remains) and also due to a metal detector prospection of the hillfort and its surroundings (e.g. coins, scabbard capes, flat circular-shaped lead objects with a hole, metal ingots). All these findings prove the exceptional position of the site within the South Bohemian area in the Middle Ages. The targeted metal detector research appears to be an effective tool not only for exploring the site but also becomes a necessity in the case of preventive protection of the site from illegal metal detector prospecting.

## B. "EASTER EGGS" OF OLD RUSIAN PERIOD FROM THE TERRITORY OF BELARUS

**Abstract author(s):** Makouskaya, Viktoryia (Belarusian State University; Belarusian State Museum of Folk Architecture and Rural Lifestyle)

**Abstract format:** Poster

Egg-shape artefacts made of different materials are widespread on the territory of East-Central Europe. The most well-known objects from this category are ceramic glazed eggs with a ceramic ball inside usually named "Easter eggs", "egg-shape rattles" or "pisanki". The distribution area of glazed eggs covers the territory from Scandinavia to the Lower Danubian region and from the West Slavic territories in modern Germany to the Kama river basin, but these items are mainly concentrated in the territories occupied by the Slavs. They are dated back to a second half of the 10–13th centuries, but the peak of their popularity in the Old Rus' was in the second half of 11th century.

Only five glazed ceramic eggs are known from the excavations of Old Rusian towns on the territory of Belarus (Biaros'cie, Hrodna, Navahradak, Lukoml' and Mscislaw). They are dated from the first half of 12th to the first third of 14th centuries. They appear in the region at the same time with their wide spread in the West Slavic territories. We can say that the territory of present-day Belarus had a function of transit regions in the distribution of glazed eggs.

Not only ceramic eggs, but also egg-shape objects made of horn, wood and stone are known from the Old Rusian towns on the territory of Belarus. They are also dated to the 12–13th centuries. From the 13th century finds of "pisanki" become very rare. But we could say that the idea of "Easter egg" continues to exist in subsequent centuries. The finds of egg-shape rattles without ornament from Pskov (13–16th centuries) or an ornamented egg from Polack without glaze (14–15th centuries) could be a confirmation of such assumption.

---

## 320 ARCHAEOLOGIES OF DISPLACEMENT HERITAGE, MEMORY, MATERIALITY

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Munawar, Nour A. (Brown University) - Symonds, James (University of Amsterdam - UvA)

**Format:** Regular session

Displacement and forced migrations were a major feature of the 20th century in many regions of the world and are increasing rather than decreasing in the second decade of the 21st century. Civil wars, conflicts and political unrest have all created movements of refugees and internally displaced people. Other people have fled their homes due to famine, environmental disasters, nuclear or chemical disasters, or major development projects, such as dam building. Currently, the seemingly endless cycle of violence and conflicts in the Middle East has served to create a humanitarian catastrophe. More than 10 million people have left their homes and have been internally displaced or sought refuge in neighbouring countries. Others have made their way through the Mediterranean to reach Northern Europe, stirring up political tensions and debates about the rights of migrants and refugees.

Many displaced refugees and migrants seek to safeguard their cultural identities by attempting to maintain contact with their homeland. This can lead to the creation of 're-invented ethnicities' where nostalgic memories of a homeland are added to and embellished in a place of sanctuary. In some cases, the assertion of alien identities can lead to ethnic tensions and hinder integration into new communities. It can also lead to distrust and the segregation or ghettoization of incoming migrants and refugees.

This session aims to understand how and why the voices of displaced people are so often forgotten in the narratives of globalisation. We will focus on how the trauma of forced migration creates interconnections between material objects, memories, oral histories and people and explore the potential for creating sustainable archaeologies of dis-

placement. Finally, we will examine how the authentic voices and testimonies of refugees can be used to revive the forgotten and unexplored narratives of global displacement.

## ABSTRACTS

### 1 GERMANS ON THE RUN. ON GERMAN DISPLACEMENT DURING WORLD WAR II AND ITS AFTERMATH

**Abstract author(s):** de Vos, Julie (Museum Skanderborg)

**Abstract format:** Oral

When World War II was lacking to its end, and in its immediate aftermath, hundreds of thousands of Germans were displaced from their homes in the North-eastern part of Germany as a consequence of the Soviet offensive since the autumn of 1944. About 250.000 German refugees crossed the Baltic Sea and ended their traumatic journeys in Denmark.

After passing by temporary internment at seized schools and other public buildings, the refugees were interned at a variety of camps all around Denmark until the last ones left Denmark in 1949. Many of these camps were infrastructures left by the German soldiers who left Denmark during the month of May 1945, while other bigger camps were habilitated for the purpose in a later moment.

In this paper, I will present the preliminary ideas and field work results of my recently commenced post-doc project DIS/PLACE based on archaeological fieldwork that will be done in the refugee camp in Dyrehaven (Skanderborg, Denmark), where Luftwaffe had had their headquarters during the last year of the war, in April and May 2022. The German refugees in post-war Denmark have mainly been ignored and thereby forgotten. The main objective at the time was to prevent any contact between the local population and the refugees, impeding any attempt of integration. The camps served as a waiting room to be sent back to Germany. Their memory was deliberately erased together with their material traces and this project seeks to reinstall their memory, not as "evil Nazis", but as what they were: human beings.

### 2 ENVISIONING MIGRATION FLOWS IN THE LANDSCAPE: MATERIAL CULTURE AND ORAL TESTIMONIES FROM THE MIGRANT HOLDING FACILITY "REGINA PACIS" SOUTHEASTERN, ITALY

**Abstract author(s):** Farina, Emma - Iacono, Francesco (Dipartimento di Storia Cultura e Civiltà, University of Bologna)

**Abstract format:** Oral

In the early 1990s, as a consequence of the fall of the eastern bloc, the Italian region of Apulia has experienced the arrival of immigrants on its coasts. Thousands of migrants crossed the Adriatic Sea to reach Italy in the first mass migration phenomenon experienced in western Europe in decades. While the first waves of migrations were handled almost autonomously by the local communities, from the end of the decade to the early 2000s the State and the Catholic Church managed the emergency. In this climate, the "Regina Pacis" temporary holding facility was inaugurated in 1998 in San Foca (Lecce), one of the earliest examples and the largest of its kind.

Located in a former holiday camp for children, it hosted migrants from Eastern Europe and Northern Africa and functioned also as expulsion centre. The facility was closed in 2005 due to accusations of abuse, and corruption pressed against the management. The centre deeply affected the community: it led to a quasi-militarization of the area and a radical protest movement objecting to the treatment of migrants. For the past ten years, a private firm has tried to turn the former facility into a luxury resort: yet the building still lies abandoned and dominates the surrounding landscape due to its considerable size and position. On the other hand, the people who passed through the centre mostly moved to another area of Italy or the EU.

This research aims at investigating the migrant experience through the landscape and spatialities of the centre: how space was used to detain/subjugate the immigrants and how, in return, they adapted and reshaped it through resistance and material culture strategies. Finally, we will seek to assess the impact on the local communities while tracing the political and sociological shift concerning the migration emergency.

### 3 "EVERYTHING WAS LOST, BUT GIMMICKS REMAINED" MEMORIES AND LIVELIHOOD OF KARELIAN INTERNALLY DISPLACED PEOPLE AFTER WW II

**Abstract author(s):** Kauhanen, Riku (University of Turku)

**Abstract format:** Oral

This paper discusses the material culture of Finnish Karelian internally displaced people (IDP), especially those who were fishermen in parishes of Koivisto and Säkijärvi. Karelian Isthmus was the center of Finnish fishing industry, with over thousand fishing families and many more families to which fishing provided supplementary income. For several reasons after the war resettlementing of these evacuated families was especially difficult.

Representation has two focuses. First, I will discuss the memory of lost homes as seen and processed through material remains, such as old and recent mementos like nails or locks from homesteads, maps, and photos. During the research project "Effects of Swedish speaking minority, law and local circumstances on resettling Finnish speaking internally displaced persons in Finland after WWII Project" large amounts of data was gathered with interviews, archival research and going through contemporary magazines. Several clear ways of remembering the lost Karelia were recurrent, and in homes of the IDPs mementoes signifying identity as Karelians are highlighted.

Second, I will take a look at the subsistence of evacuated Karelians, which is a neglected subject in studies of accommodation of displaced people. Many Karelians managed to take their agricultural tools and fishing equipment with them, and this played an important part in their resettlement after the war. This material point of views is often forgotten when rather discrimination and political turmoil is highlighted. However, material reality and it's limitations rather than attitudes explain stories of many Karelian families. This also brings forth IDP's as subjects with a voice of their own rather than as objects of official procedures.

These two fields are not separated, but together they explain the history, accommodation and the interpretation of identity of these Karelian people.

---

## 321 HUMAN RESILIENCE DURING EURASIAN PALEOLITHIC AND MESOLITHIC FROM A BIOARCHAEOLOGICAL PERSPECTIVE [PAM]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** MARIN-ARROYO, ANA (EvoAdapta Group. University of Cantabria) - Cristiani, Emmanuela (DANTE Group - Sapienza University of Rome)

**Format:** Regular session

Understanding how climate change affected past environments and resource availability are vital for disentangling how ancient human populations adapted biologically and technologically. It is well-known that local and regional climatic and environmental changes affected the development of fundamental biological, cultural, and economic human behaviours between the Late Pleistocene and the Early Holocene. These periods are marked by critical transitions, such as the Middle to Upper Paleolithic, which documents the encounters of different human species and their specific technological adaptations, while the transition from the Upper Paleolithic to the Mesolithic attests to human resilience to postglacial changes.

In this session, the most recent advances in bioarchaeological science will be presented and discussed in relation to how they can obtain broader and higher-resolution data about past subsistence strategies, mobility, technological uses and applications, and local and regional climatic and ecological conditions. We welcome interdisciplinary contributions which combine vertebrate archaeozoology to technological and use-wear studies of material culture, the application of stable isotopes, dental macro/microwear and dental calculus analysis, proteomic and ancient DNA studies on humans and animal archaeological remains. We aim to promote discussions regarding the resilience of Neanderthal and Homo sapiens in different Eurasian climatic phases and ecological contexts throughout the Paleolithic and Mesolithic.

## ABSTRACTS

### 1 MODELLING ENVIRONMENTS AND CLIMATIC CONDITIONS DURING THE MIDDLE TO UPPER PALEOLITHIC TRANSITION IN NORTHERN IBERIA

**Abstract author(s):** Fernández García, Mónica - Vidal-Cordasco, Marco (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Jones, Jennifer R. (School of Natural Sciences, University of Lancashire; Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Marín-Arroyo, Ana B. (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria)

**Abstract format:** Oral

Climate and environmental changes have been commonly proposed as possible driver factors for the disappearance of Neanderthals in Europe. The Cantabrian Region, in northern Iberia, offers a natural access route from the Pyrenees, where abundant late Middle and Early Upper Palaeolithic sites containing rich archaeological sequences are preserved. This is a key area for understanding the replacement of Neanderthals by Anatomically Modern Humans. To evaluate how climate during late Marine Isotope Stage 3 might have influenced human behaviour, an accurate palaeoecological characterisation is required. This work offers a synthetic and complete review of the regional environmental trends observed during this period based on the available terrestrial proxies link to archaeo-paleontological sites, mainly considering pollen sequences, charcoal data and small vertebrate assemblages. Some relevant records from macrofaunal assemblages and stable isotope studies are also considered.

In our analysis, pollen and small vertebrate sequences are transformed into quantitative climatic data (temperature and precipitation), to standardise the information and allow inter-sites comparison. Results show highly variable climatic shifts between archaeological levels, which is consistent with the marine and ice records climatic fluctuations during MIS3. A mosaic landscape of open meadows and forested areas predominate in the Cantabrian region throughout the study period. Some records indicate a progressive trend towards greater aridity during the Middle to Early Upper Paleolithic transition, reflected by changes in vegetation, faunal composition, and existing stable isotope evidence from hunted ungulate remains accumulated by Neanderthals and Modern Humans in the region. Our review indicates that there is a fragmentary environmental record for the region during this key period for human evolution, restricting our knowledge about the effect of climate on human adaptations and survival. Further research, by acquiring high-resolution palaeoenvironmental and paleoclimatic data, is needed and here we present our ongoing research methods to overcome these limitations.

## 2 FLUCTUATIONS OF TROPHIC RESOURCES DURING THE MIDDLE TO UPPER PALAEOLITHIC IN IBERIA

**Abstract author(s):** Vidal Cordasco, Marco (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Ocio, David (Mott MacDonald Ltd) - Marín-Arroyo, Ana (EvoAdapta I+D+I Group, Dpto. Ciencias Históricas, Universidad de Cantabria)

**Abstract format:** Oral

Abrupt climatic changes were common during the Marine Isotope Stage (MIS) 3. However, to what extent these climatic fluctuations affected the productivity of the ecosystems remained largely unexplored hitherto. In this study, we quantified the effects of the stadial and interstadial conditions in the productivity of the ecosystems in Iberia and analysed its association with the spatiotemporal replacement patterns of the Mousterian by the Aurignacian. First, we built Bayesian age models to reconstruct the timing of the Middle to Upper Paleolithic transition; second, we used a generalized dynamic vegetation model to estimate the Net Primary Productivity and, third, we developed a macroecological model to estimate herbivore abundance. Results obtained indicate that in Northern and hinterland areas of Iberia the end of the Mousterian was coeval with a significant drop in the available biomass for secondary consumers. However, the Mediterranean region had more stable conditions and, during the cold stadial moments, a higher biomass of medium and medium-large herbivores. Accordingly, we propose an ecological driver for the hiatus between the Mousterian and Aurignacian in Northern Iberia, and the longer persistence of Neanderthals in southern latitudes.

## 3 THE EARLY UPPER PALEOLITHIC OCCUPATIONS AT LA GARMA A (NORTHERN IBERIA): PRELIMINARY RESULTS OF THEIR SUBSISTENCE STRATEGIES

**Abstract author(s):** Sanz Royo, Alicia - Marín-Arroyo, Ana (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Arias Cabal, Pablo (Instituto Internacional de Investigaciones Prehistóricas de Cantabria – IIIPC - Universidad de Cantabria, Santander, Gobierno de Cantabria) - Agudo Pérez, Lucía (Grupo de I+D+i EVOADAPTA, Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Ontañón, Roberto (Museo de Prehistoria y Arqueología de Cantabria; Instituto Internacional de Investigaciones Prehistóricas de Cantabria – IIIPC - Universidad de Cantabria, Santander, Gobierno de Cantabria)

**Abstract format:** Oral

Investigating the early Upper Paleolithic groups that occupied Northern Iberia is crucial for a better understanding of the dispersion process and adaptations that Anatomically Modern Humans (AMH) carried out in a region where Neanderthal populations had disappeared only a few millennia earlier.

La Garma (Cantabria, Spain) is a karstic complex divided into several passages with a long sequence of human occupations, from the Lower Paleolithic to the Medieval Period, where a relevant paleolithic rock and portable art have been documented. One of these passages, called La Garma A, contains Proto/Early-Aurignacian dated levels with abundant faunal remains.

In this work, we present the preliminary results of the archeozoological and taphonomical analyses of these early Upper Paleolithic layers.

The faunal assemblage is characterized by the predominance of prime age ungulates, where complete body skeletal elements are represented, being *Cervus elaphus* the most abundant species, followed by *Bos/Bison* and *Equus ferus*. Carnivores and their activity, although very scarce, are also present.

Human activity at the cave is proved by different anthropic modifications on the bone assemblage, such as butchering marks, percussion marks, impact points, fresh fractures, some retouchers and bone tools, and termoalterations.

This work provide new insights about the subsistence strategies and human behaviour of the Proto/Early-Aurignacian groups in the region, which will allow a better understanding of the dispersion and adaptations of the first AMH populations in Northern Iberia.

#### 4 **LATE NEANDERTHAL SUBSISTENCE AND PALEOECOLOGY STRATEGIES AT SAN BERNARDINO CAVE (NE ITALY) DURING MIS 3**

**Abstract author(s):** Terlato, Gabriele (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria; Università degli Studi di Ferrara, Dipartimento degli Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche) - Marín-Arroyo, Ana - Fernandez Garcia, Monica (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Jones, Jennifer (University of Central Lancashire, School of Natural Sciences; Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Peresani, Marco (Università degli Studi di Ferrara, Dipartimento degli Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche)

**Abstract format:** Oral

San Bernardino cave, located in the northeastern region of Italy, is a key archaeological site for studying Neanderthal behaviour. The site preserves a discontinuous sedimentary sequence, spanning from Marine Isotope Stage (MIS) 7 to 3, and is culturally represented by the Mousterian technologies in all the stratigraphic units. Here we present the data about the paleoeconomic behaviour undertaken by Neanderthal and the paleoenvironmental setting they faced, through the study of Unit II faunal assemblage, recently dated to the first half of MIS 3. Macrofaunal remains were analysed from an interdisciplinary perspective: taphonomy, archaeozoology and stable isotope analysis in bone collagen. The results indicate that Neanderthal groups were the primary mammal accumulator, mainly focused on red deer and roe deer hunting, whereas the procurement of large ungulates and chamois was sporadic. Neanderthal groups adopted a notable degree of energetic efficiency in carcasses processing, with a selective prey transport – even for roe deer – which might have implied a long-distance transportation from the hunting site to the cave. Seasonality data indicates summer and autumn human occupations. The excellent preservation of bone collagen allowed us to measure carbon and nitrogen isotope ratios in herbivores and carnivores. The isotopic data indicate that, during the first half of MIS3, the Neanderthal groups at San Bernardino lived in a mosaic-like landscape where they exploited different ecological niches.

#### 5 **FAUNAL EXPLOITATION AT RIPARO MEZZENA (VERONA, ITALY)**

**Abstract author(s):** Thun Hohenstein, Ursula (University of Ferrara)

**Abstract format:** Oral

This study aims to investigate the role played by the ecological settings and the economical sources management during the crucial OIS 3 stage in the Lessini Mountains in order to investigate Neanderthals behavioural choices. The analysis of the faunal remains coming from Riparo Mezzena (Verona, North-eastern Italy). Palaeontological and archaeozoological analysis have been carried out revealing a great uniformity of composition in the faunal assemblage from the whole stratigraphic sequence of Riparo Mezzena: cold environment taxa are rare opposite to red deer and roe deer which are dominant. An analysis of the bone surface has been carried out in order to identify the different taphonomical agents that have altered the assemblage. The specimens were affected by different post-depositional factors but some modifications of anthropic origin have been recognized too. Particularly the taphonomical analysis shows an intensive anthropic activity mostly in layer III which is especially testified by the increased number of cutmarks, notches, bone retouchers and burned remains. Carnivore specimens are few and gnawing marks are absent in all the layers as a possible consequence of the intense anthropic occupation of the site. Furthermore, no cutmarks on carnivore bones have been identified.

## HOW TO ASSESS HUMAN RESILIENCE THROUGH THE PALEOLITHIC DIET

**Abstract author(s):** Marin-Arroyo, Ana - Terlato, Gabriele (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Vettese, Delphine (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria; Università degli Studi di Ferrara, Dipartimento degli Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche) - Fernández-García, Monica (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Jones, Jennifer (University of Central Lancashire, School of Natural Sciences; Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Vidal-Cordasco, Marco (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Peresani, Marco (Università degli Studi di Ferrara, Dipartimento degli Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche)

**Abstract format:** Oral

During the Paleolithic, human resilience could be defined as the ability to overcome distressful episodes that might have caused a reduction in the resources within the ecological niches to be exploited and, therefore, affecting human subsistence. If we focus on the ungulate exploitation during the different stadial and interstadials along the Upper Pleistocene is not an easy task to evaluate quantitatively how those episodes affected the animal populations and then, the hunting decisions and human diet. Here, we propose several measurable indices be applied in the archaeofaunal assemblages that permit evaluating stressful nutritional episodes suffered by human groups. Hunting pressure could be noticeable on the high presence of energetically-low prey types, a higher ratio of juveniles vs adults, more intense carcass processing, animals selected from further catchment areas from the central place or a prey competition with carnivores. Whether resource intensification might have an active engagement with the climate and environment changes, with demographic pressure or other socio-cultural factors are factors that must be considered and analysed particularly in each studied region. Here, we apply these theoretical indices to the animal diet carried out by Neanderthals and AMH in Fumane cave (Italy) and compare them with the environmental conditions they had to face.

## NEANDERTHAL ECOLOGY AT LAPA DO PICAREIRO: A STABLE ISOTOPE STUDY OF UNGULATE TOOTH ENAMEL

**Abstract author(s):** Carvalho, Milena (University of New Mexico; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, Universidade do Algarve) - Jones, Emily (University of New Mexico) - Ellis, M. Grace (Colorado State University; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, Universidade do Algarve) - Cascalheira, João - Bicho, Nuno (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, Universidade do Algarve) - Benedetti, Michael (University of North Carolina Wilmington; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, Universidade do Algarve) - Friedl, Lukas (University of West Bohemia; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, Universidade do Algarve) - Haws, Jonathan (University of Louisville; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, Universidade do Algarve)

**Abstract format:** Oral

Neanderthals adapted to a series of environmental changes during the Late Pleistocene and may have sought refugia in the southern reaches of Europe in response to environmental degradation. Heinrich events, especially H5 and H4, however, may have created harsh climatic conditions that may have reduced Neanderthal populations below survival thresholds. Thus, reconstructions of paleoenvironmental conditions to which Neanderthals were subjected are key to understanding human resilience and whether Neanderthals periodically sought refuge in Iberia. This paper presents additional data from an ongoing paleoenvironmental study using stable isotopes analysis of carbon and oxygen of red deer and ibex tooth enamel from Mousterian levels from Lapa do Picareiro (Portuguese Estremadura). These data are then compared to previous isotopic data recovered from ungulate tissues as well as other paleoclimate indicators from Picareiro to assess whether central Portugal acted as a refugia during periods of unfavorable climates and to assess the severity of Heinrich events in westernmost Iberia.

## 8 LATE PLEISTOCENE SUBSISTENCE STRATEGIES AT ABRI KONTIJA 002 SITE (ISTRIA, CROATIA)

**Abstract author(s):** Radović, Sinisa (Institute for Quaternary Palaeontology and Geology, Croatian Academy of Sciences and Arts, Zagreb) - Janković, Ivor (Institute for Anthropological Research, Centre for Applied Bioanthropology, Zagreb) - Marín-Arroyo, Ana B. (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria)

**Abstract format:** Oral

Abri Kontija 002 is a small rockshelter, located on the north side of Lim Channel in Istria, Croatia. It was initially recognized as an Upper Palaeolithic site in 2007, but the systematic excavations were conducted between 2014 and 2021. The site yielded numerous vertebrate remains associated with the Upper Palaeolithic lithic assemblage and other finds (e.g traces of burning, ochre etc.). Here we present the results of zooarchaeological study of the mammalian remains in relation to their chronostratigraphic position within the deposits of the site. The most abundant throughout the sequence are the remains of wild horses, followed by cervids (mostly red deer), and large bovids. Other taxa, including carnivores and small size mammals are also present. Detailed taphonomic analysis suggests that humans were the primary accumulators of the assemblage, which is in agreement with rare modifications resulting from carnivore activity. Certain changes in the relative frequency of medium to large herbivores probably correspond to palaeoecological conditions. The field work at Abri Kontija and analysis of the material is supported by the Croatian Science Foundation grant (IP-2019-04-7821 – PREHISTRIA) and comparative work has been done within the scope of the ERC grant 818299 (SUBSILIENCE).

## 9 THE ROLE OF MARINE RESOURCES DURING THE LAST GLACIAL MAXIMUM IN N IBERIA: RECONSTRUCTING THE SEASONAL SHELLFISH COLLECTION PATTERNS

**Abstract author(s):** García-Escárcaga, Asier (Department of Human Sciences, University of La Rioja; Department of Archaeology, Max Planck Institute for the Science of Human History, Jena) - Arniz-Mateos, Rosa - Suárez-Revilla, Roberto - Gutiérrez-Zugasti, Igor (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria, Gobierno de Cantabria, Grupo Santander) - Duarte, Elsa - de la Rasilla, Marco (Department of History, University of Oviedo)

**Abstract format:** Oral

Variations in past climate conditions had very important implications for human behaviour, as well as for the subsistence strategies developed by human groups. Previous studies have revealed that N Iberian Peninsula acted as a refugia area during the Last Glacial Maximum (LGM), thus highlighting that this coastal location is a key place for understanding the impact of this harsh environmental condition over the modus vivendi of forager groups. Colder conditions during this time provoked changes in economic hunting strategies and mobility patterns along this coastal platform. Despite marine resources were continuously consumed by Upper Palaeolithic groups, information on the relevance of this food supply for human subsistence strategies during the LGM is still very scarce. To better understand the role played by littoral resources during this time is crucial to decipher if marine molluscs were intensively exploited during this cold climate period. To achieve this objective, stable oxygen isotope analyses on shells recovered from an archaeological site located in N Iberia and dated to the Solutrean period have been applied. Stable oxygen isotope ratios can act as powerful recorders of the seasonal seawater temperature variations experienced by a mollusc in the past, enabling us to accurately establish the period of the year when it died/was collected by humans. Here, stable oxygen isotope analyses on *Patella vulgata* (Linnaeus, 1758) limpets from the cave of Llonín (Asturias, Spain) were carried out to determine if this species was collected year-round, which would suggest a pattern of certain intensity in the collection of molluscs. Additionally, isotope data was used to reconstruct climate conditions during the LGM with an inedited seasonal resolution.

## 10 USE OF PEPTIDE MASS FINGERPRINTING TO ASSESS HUMAN SUBSISTENCE BEHAVIOUR AT LA VIÑA ROCK SHELTER DURING MIS 2

**Abstract author(s):** Torres-Iglesias, Leire (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Marín-Arroyo, Ana B. (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - Welker, Frido (Section for Ecology and Evolution, Globe Institute, University of Copenhagen) - de la Rasilla, Marco (Área de Prehistoria, Departamento de Historia, Facultad de Filosofía y Letras, Universidad de Oviedo)

**Abstract format:** Oral

Palaeolithic faunal assemblages are generally highly fragmented due to different taphonomic processes, including human activities. This bone fragmentation prevents an accurate taxonomic identification following morphological criteria. Zooarchaeology has solved this issue by attributing non-identifiable bone remains to a series of mammal size classes according to mainly bone cortical thickness. However, a vast amount of valuable data to interpret palaeo-economic behaviour is still lost. ZooMS is a proteomics method for taxonomic identification, based on collagen peptide

mass fingerprinting, and it is being increasingly used to provide information on a wide range of aspects of past societies: human evolution, paleoecology and animal-human interaction and artefact manufacture, among others.

In this study, we combine ZooMS and traditional zooarchaeological and taphonomic data to infer the subsistence strategies of the human groups that occupied La Viña rock shelter (northern Iberia) during the Solutrean and the Magdalenian. During both Upper Palaeolithic periods, human societies had to cope with the harsh climatic conditions of the Last Glacial Maximum and Greenland Stadial 2, which might influence their resources exploitation patterns.

The combined results provide information about subsistence strategies and paleoecology. The prey ranking is dominated by cervids, mainly red deer, and complemented with horse, large bovids and caprids. ZooMS results are consistent with the morphological identifications and identify horse as the main species included in the large mammal size, whereas large bovids are a minor component. In terms of paleoecology, ZooMS results also confirm the presence of cold-adapted taxa, such as reindeer and elephantids (likely mammoth).

The combination of this biomolecular method with zooarchaeology is useful to obtain a higher resolution of faunal identification, especially in contexts with high bone fragmentation or with morphologically similar species, and therefore, to increase the information available to infer past human behaviour.

## 11 MIDDLE AND UPPER PALEOLITHIC SETTLEMENT OF THE BALKANS INTERIOR DURING THE COLD PERIODS

**Abstract author(s):** Mihailovic, Dusan (University of Belgrade, Faculty of Philosophy) - Bogićević, Katarina (University of Belgrade - Faculty of Mining and Geology) - Dimitrijević, Vesna - Milošević, Štefan (University of Belgrade - Faculty of Philosophy) - Nenadić, Draženko (University of Belgrade - Faculty of Mining and Geology) - Roksandić, Mirjana (University of Winnipeg)

**Abstract format:** Oral

New dates obtained for the Middle Paleolithic and Upper Paleolithic sites in the Balkans indicate that Neanderthals and modern humans inhabited the central parts of the Balkans intensively only at the end of warm periods. Unlike the peak of interglacials - from which very few sites originate, sites dating to the end of the warm and early cold stages are relatively numerous, primarily the transition period from MIS 5 and MIS 4 and the period immediately before the beginning of the Last Glacial Maximum. Localities dated to the peak of cold phases (MIS 4, MIS 2) are also very rare. All this indicates that the Balkans interior did not represent a Paleolithic refuge at the peak of the glaciations, and that climatic changes had a similar effect on population density both in the Middle and Upper Paleolithic. Consistent with this suggestion are the indications of both Mousterian and Gravettian population movements from Central Europe to the south into the northern and central parts of the Balkans. Here we present sites, dates and environmental information available for the region. We outline the directions for further research.

## 12 EDGE DELINEATION AS A CLUE FOR THE EVOLUTION, ADAPTATION AND SPECIALISATION OF QUINA SCRAPERS IN THE LEVANT AND WESTERN EUROPE

**Abstract author(s):** Zupancich, Andrea (Archaeology of Social Dynamics Institución Milá y Fontanals, Barcelona; DANTE - Diet and ANcient TEchnology Laboratory, Sapienza Università di Roma) - Barkai, Ran - Gopher, Avi (Department of Archaeology and Near Eastern Cultures Tel-Aviv University)

**Abstract format:** Oral

Representing one of the main techno complexes within the European Middle Palaeolithic, Quina stone tool assemblages are dominated by scrapers exhibiting a specific edge retouch made of a succession of scaled and stepped enlevements. Recent research in the Balkan and the Levant leads to a rethinking of the Quina industry as a specific facies of the Mousterian of Western Europe. For example, scrapers exhibiting the same Quina retouch of their Western European counterpart have been unearthed at several Acheulo Yabrudian Levantine sites such as Qesem Cave. From a functional perspective, any significant difference in the primary use of these tools is recorded between Western Europe and the Levant, where Quina scrapers were used in tasks associated with the processing of hide. A major difference instead resides in the morphology of the tools, specifically in the delineation of the scrapers' active edge. Straight edges characterise Levantine Quina scrapers while their Western European counterparts show instead convex delineations. In this contribution, we argue that such differences in edge delineation can differences role played by Quina scrapers in the Levant and Europe. An integrated techno-functional study, combining use wear and techno-morpho functional analyses, of Quina scrapers coming from Qesem Cave, Roc de Marsal and Cueva de El Esquilleu, suggest that the role of Quina scrapers might have changed between the Acheulo Yabrudian and the Middle Palaeolithic - from multipurpose to specialised, task-specific tools. We show how techno-functional results, together with other strands of evidence from the studied contexts, allow us to trace the possible "evolution" of a specific kind of tool (i.e., Quina scrapers) and how a successful technology could adapt different needs, behaviours and environments.

## ON TEETH, STONES, AND PLANTS. EVIDENCE OF PLANT FOOD CONSUMPTION AMONG PALAEOOLITHIC AND MESOLITHIC FORAGERS OF ITALY AND THE BALKANS

**Abstract author(s):** Cristiani, Emanuela (Depart. of Odontostomatology and Maxillo-Facial Sciences; DANTE-Diet and Ancient Technology Laboratory, Sapienza University of Rome) - Zupancich, Andrea (DANTE-Diet and Ancient Technology Laboratory, Sapienza University of Rome; Institución Milá y Fontanals, Barcelona, Consejo Superior de Investigaciones Científicas - IMF-CSIC) - Carra, Marialetizia (DANTE-Diet and Ancient Technology Laboratory, Sapienza University of Rome) - Borić, Dušan (Department of Environmental Biology, Sapienza University of Rome; New York University)

**Abstract format:** Oral

Until recently, the significance of green foods in the diet of Late Pleistocene and Early Holocene foragers of southern Europe has remained elusive due to the poor preservation of macro-botanical remains. At the same time, the role of animal proteins in the diet of prehistoric foragers in this region is well understood based on the analysis of stable isotopes in human bones and zooarchaeological investigations. The study reported here presents complementary lines of evidence for the consumption of plant foods during the Palaeolithic and Mesolithic in Italy and the Balkans in order to contribute to the old debate about prehistoric foragers' reliance on plant species before the arrival of agriculture in these regions. We combine technological, use-wear, and residue studies of material culture and the analysis of human dental calculus. Plant micro-structures, such as starch granules and phytoliths, were recovered in dental calculus and stone tools in a sample of Upper Palaeolithic and Mesolithic sites in Italy and the Balkans. So far, these micro remains constitute the most reliable line of evidence to unveil the use of plants in ancient foragers' diets. Specific use-wear traces were also identified on stone artifacts, suggesting the existence of a particular technology for plant processing in these regions during the Palaeolithic and Mesolithic. Overall, our results challenge a deeply rooted idea of the "palaeo" diet primarily based on protein intake. Our data are further supported by the recovery of macro-botanical remains and specific dental macro/microwear on human teeth from the same sites.

## DIETARY RECONSTRUCTION FOR NEANDERTALS AND UPPER PALEOLITHIC MODERN HUMANS: A REVIEW FROM OCCLUSAL MOLAR MICROWEAR TEXTURE ANALYSIS

**Abstract author(s):** Estalrich, Almudena (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria; Department of Anthropology. University of Arkansas)

**Abstract format:** Oral

Diet has been recognized as one of the main factors that determine the behavioral and ecological differences among primates, which means that diet influences group size and composition, habitat range, activity patterns, and so on. One of the proxies that have been proved to be a valuable technique for inferring the diet and behavior of fossil and extant taxa is Occlusal microwear texture analysis. Microwear texture analysis is an automated and repeatable approach to the study of dental microwear in 3D, using white-light confocal profilometry and scale-sensitive fractal analysis. Besides, this technique has demonstrated its potential as a tool to differentiate inter-individual dietary variations, and not just in fossil humans.

Five variables are generated: complexity (Asfc), scale of maximum complexity (Smc), anisotropy (epLsar), textural fill volume (Tfv), and heterogeneity (HAsfc), measuring changes in surface roughness at different scales, degree of directionality in surface roughness at a fine scale, or variability of complexity across the surface, among others.

The variables obtained distinguish between Neandertals from cold open-steppe environments, who had a diet that consisted almost exclusively of meat, and those from wooded and mixed environments, who had a diet that, in addition to animal meat, also included an important plant component. Regarding the Upper Paleolithic modern humans, the variables reveal no environmentally driven dietary changes but culturally related ones. The diets for individuals from Aurignacian and Gravettian contexts had a more uniform diet, whereas the Magdalenian individuals had a more varied and abrasive diet, maybe due to different use of food preparation techniques.

## MIGRATION, DIET AND HEALTH OF THE FIRST PERMANENT SETTLERS OF BELGIUM FROM A BIOARCHAEOLOGICAL PERSPECTIVE

**Abstract author(s):** Halbrucker, Éva - Dhaenens, Maarten - Boeckx, Pascal - Costa Rodríguez, Marta (Ghent University) - Vandersloot, Pierre (Agence Wallone du Patrimoine) - De Groote, Isabelle - Crombé, Philippe (Ghent University)

**Abstract format:** Oral

Our new project aims to generate regional-scale insights into the lifeways of the first modern humans to settle permanently in Belgium during the Final Palaeolithic and Mesolithic. It achieves this through multi- and inter-disciplinary analysis of contextualised data from archaeological, palaeontological, and anthropological assemblages whilst developing state-of-the-art analytical techniques in the fields of proteomics and stable isotope analysis. We will present how we combine the complex analysis of different archaeological find types, such as human and animal bones, and

lithic tools in order to understand the life and death of the Mesolithic communities from the Meuse valley. Emphasis will be on the lithic tools and techniques involved in their analysis, such as traditional use-wear and residues analysis, palaeoproteomics, and aDNA. We will present how we connect all find types through the methods that are involved in our project. Preliminary results of experimental and baseline datasets will show our work methodology.

## 16 CARBON AND NITROGEN ISOTOPIC VARIABILITY IN HUMAN DIET AND ITS IMPLICATION FOR EVALUATING RESILIENCE DURING THE HOLOCENE IN NORTHERN IBERIA

**Abstract author(s):** González Rabanal, Borja - Marín-Arroyo, Ana B. (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas. Universidad de Cantabria) - González Morales, Manuel R. (Instituto Internacional de Investigaciones Prehistóricas de Cantabria. Universidad de Cantabria)

**Abstract format:** Oral

Stable isotopes analysis of human remains can provide valuable information about the economic behaviours of pre-historic human groups. Inferring how the human diet evolved is crucial to ascertain how human populations adapted to different climatic and cultural changes. Northern Iberia is a key area for disentangling the economic transformations during the Holocene because it contains a high-resolution funerary record to be used as a framework of human resilience. In the last years, the stable isotope evidence has been highly enriched, enhancing the knowledge about the subsistence strategies of the hunter-gatherer groups and the development of agricultural practices and animal management patterns from farming communities. In this contribution, we debate the evolution of the diet from the Mesolithic to the Bronze Age through the  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values of human and animal bone collagen. Dietary analysis helps to understand the end of the hunter-gatherer lifestyle and the emergence of social complexity of the first farming societies in Northern Iberia.

## 17 HUMAN DIET AND MOBILITY IN CENTRAL ITALY FROM THE UPPER PALAEOLITHIC TO THE NEOLITHIC: DENTAL REMAINS FROM GROTTA CONTINENZA

**Abstract author(s):** Boric, Dusan (Sapienza University of Rome; New York University) - Cristiani, Emanuela (Sapienza University of Rome) - Price, Doug (University of Wisconsin, Madison) - Nava, Alessia (Kent University) - Bondioli, Luca (Museo delle Civiltà, Roma) - Coppa, Alfredo (Sapienza University of Rome)

**Abstract format:** Oral

Grotta Continenza in the Fucino Basin of central Italy (Abruzzo) represents one of the unique archaeological sequences that has yielded a large collection of human remains from both articulated and disarticulated burials dating to different periods. The cave's largely continuous occupation strata span the late Epigravettian to the Neolithic (c. 15,500–7000 cal BP) and thus document in the setting of the same sequence several major environmental and cultural changes that affected prehistoric human groups—from climatic instabilities at the end of the Pleistocene to the forager-farmer transition. We have applied a suite of methods on this collection's dental remains to obtain information about diet and mobility in a diachronic perspective. Multi-isotope analyses include bulk ratios of  $^{87}\text{Sr}/^{86}\text{Sr}$  as well as  $^{13}\text{C}$  and  $^{18}\text{O}$  on dental enamel to discern mobility patterns in relation to the local baseline of the region, established on the basis of analyzed archaeological and modern animal and plant remains.  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  measurements on human bones from the same individuals analyzed for strontium isotopes are also obtained as indicators of dietary preferences and their changes over time. Previously, dental calculus from the available collection of teeth was analyzed for trapped dietary and non-dietary micro-residues while molars and premolars were analyzed for patterns of macro-wear and buccal micro-wear. We also report new AMS radiocarbon dates made directly on a select number of analyzed human remains.

## 18 PLANT-HUMAN INTERACTIONS AMONG LEVANTINE PRE-AGRICULTURAL COMMUNITIES REVEALED THROUGH GROUND STONE TOOLS AND DENTAL CALCULUS ANALYSES

**Abstract author(s):** Zupancich, Andrea (Archaeology of Social Dynamics Institución Milá y Fontanals, Barcelona; DANTE- Diet and Ancient Technology Laboratory, Sapienza Università di Roma) - Cristiani, Emanuela (DANTE- Diet and Ancient Technology Laboratory, Sapienza Università di Roma) - Gopher, Avi (Department of Archaeology and Near Eastern Cultures Tel-Aviv University)

**Abstract format:** Oral

Plants and plant foods have played an invaluable role in the life of prehistoric humans long before the advent of agriculture. In the Levant, several Epipaleolithic and Natufian contexts have yielded a wealth of material culture evidence (e.g., ground stone tools, mortars and pestles) and macro-botanical remains, suggesting an intensification in the use of wild plants during this period amongst these pre-agricultural communities. In this contribution, we discuss the preliminary results of the analyses carried out on human remains and material culture from the site of Eynan in Northern Israel. Specifically, functional analyses, comprising the study of use-wear and residues performed on ground stone tools and pestles, have been combined to the study of plant micro-remains, namely starch granules

and phytolith, entrapped human dental calculus. Integrating these two different yet related strands of evidence, we provide both direct and indirect clues about the consumption of wild plants and the technology used for processing vegetal foods at this site. Furthermore, we integrate archaeological evidence with the information obtained through a dedicated experimental framework to identify functional markers to characterise ground stones used to process wild cereal grains vs legumes. Overall, we stress how integrating the study of ancient material culture, dental calculus, and experimental activity can contribute to the debate about the intensification in the use of plant foods at the end of the Pleistocene in the Near East.

## 19 FORAGER VS. EARLY FARMER LIFEWAYS IN THE BALKANS REVEALED THROUGH TIME-RESOLVED RECORDS IN TEETH

**Abstract author(s):** Boric, Dusan (Sapienza University of Rome; New York University) - Nava, Alessia (Kent University) - Peripoli, Beatrice (University of Padova) - Price, Doug (University of Wisconsin, Madison) - Bondioli, Luca (Museo delle Civiltà, Roma) - Müller, Wolfgang (Goethe University)

**Abstract format:** Oral

Bioarchaeological studies of agricultural transitions have shown how major changes in dietary practices, mobility, and everyday corporeal conduct between forager and farmer groups can be detected in human skeletal remains cross-culturally. The study reported here uses histological analysis applied to a sample of Mesolithic and Neolithic teeth from the central Balkans in order to establish the temporal patterns of enamel growth following the method outlined in Birch and Dean (2014) and Guatelli-Steinberg et al. (2012). We further identify variation of stress prevalence based on accentuated lines (ALs), correlating these to previously established individual chronologies of enamel growth to discern any patterning of incidences of stress during early life in foragers vs. early farmers. We also utilize the same histological sections to obtain time-resolved continuous strontium isotope ( $87\text{Sr}/86\text{Sr}$ ) profiles along the enamel-dentine junction (EDJ) using laser ablation inductively coupled multi-collector mass spectrometry (LA-MC-ICPMS). The strontium isotope signal is then directly correlated to the established chronology of enamel growth, thus serving as a proxy for determining seasonal/annual mobility rates during early life. Finally, these strontium isotope profiles are compared to the existing bulk strontium isotopic data on the same pool of individuals.

---

## 323 MICROHISTORY AND SOCIAL ARCHAEOLOGY IN WESTERN EUROPE

**Theme:** 2. [Re]integration

**Organisers:** Quirós Castillo, Juan Antonio (University of the Basque Country) - Stagno, Anna (University of Genova)

**Format:** Regular session

The aim of this session is to explore how social archaeology can tackle some major societal topics and changes in postclassical times in the light of the microhistory experience. Developed, through different trajectories, by Italian social historians (Ginzburg, Levi, Grendi, Moreno, Poni, etc.), the Annales French School (Le Roy Ladurie), and other scholars (Davies, West, etc), this approach has been able to balance the tension between very detailed analysis and the discussion of relevant scientific issues (state formation, social identities, territorialities, social memories, landscape and agrarian system transformation, relational agencies, social mobility, etc.) considering a long-term and a multiscale approach.

Not only is it a methodological question about representativeness, but also a theoretical and conceptual one. This "historical microanalysis" is grounded on the context of practices, social relationships, and the cultural production of evidence and material culture. As a result, new avenues to explore the deep meanings of places and temporalities have been opened. Besides this, an explicit microhistorical approach empowers archaeology to overcome the classic contraposition between top-down and bottom-up perspectives, événementiel and longue durée processes, and textual and material sources.

There is an interest in papers centered on topics such as social inequality, local societies, collective action, ownerships and commons, possession and jurisdiction, social mobility, environmental resources management and environmental issues, subaltern studies, and other social issues. Although the interest is placed in long-term approaches, a microhistorical approach is very useful for the analysis of postclassical societies (5th-21st centuries).

The final aim is to promote a discussion about the potentiality of historical micro-history within the archaeological research opening new possibilities for dialogues between different disciplines: archaeology, history, social anthropology, geography, historical ecology, and landscape studies.

## 1 DELUSIONS OF GRANDEUR: CONFUSING SIZE WITH DEPTH IN ARCHAEOLOGICAL PRACTICE.

**Abstract author(s):** Ribeiro, Artur (Christian-Albrechts-Universitat)

**Abstract format:** Oral

With the rising popularity of Big Data, modelling, and data mining, all of which have been sustained by increased funding opportunities, archaeologists have slowly turned their attention to notions of scale. This attention is due to the perception that archaeology is operating on two incommensurable scales – the transregional and sometimes even transcontinental scale and the regional, local, site-level scale. Some of the proposals to bridge these two scales rely on microhistory, Annales School, structuration theory, globalization theory. However, I believe there is much confusion when it comes to the topic of and the solutions to bridging scale.

Despite several ongoing discussion on scale, the true issue is methodological. Underlying large-scale research in archaeology are quantitative methods that are more commonly applied in Economics and Human Geography, whereas the small-scale relies on qualitative methods that are common in Social and Anthropological Theory. In addition to this, there is also the current economic mindset in the western world, where funding tends to be assigned to fast quantitative science, in detriment of slow qualitative research.

This paper will address ongoing work on prehistoric demography, to exemplify that scale is not the issue, and that any attempt at connecting scales, while laudable, is ultimately ignoring deeper-seated issues related to archaeological methodology and funding inequity.

## 2 MICROHISTORY AND HISTORICAL ARCHAEOLOGY. TOWARD A MICRO-HISTORICAL ARCHAEOLOGY?

**Abstract author(s):** Panetta, Alessandro (University of Genoa) - Casimiro, Tânia (Universidade Nova de Lisboa)

**Abstract format:** Oral

Both in the years of its emergence as an autonomous discipline (1970s) and more recently, historical archaeology has often evoked microhistory as an approach with which it shared many aspects. For instance, in its focus on the small things forgotten, James Deetz directly recalled the work of Carlo Ginzburg, while in recent times Charles Orser has approached the microhistorical perspective with the concept of "dig locally, think globally" at the basis of his idea of Historical Archaeology. The crossing of sources, at the basis of the methodology of both, as well as the proximity of some social history themes such as the subaltern classes, and the chronology related to recent centuries are certainly other points of connection.

However, the potential that the lesson of microhistory offers to archaeology has probably not been fully explored. For example, with regard to the methodology of contrasting archaeological and documentary sources, or with regard to the biographical approach, with the possibility of studying the different temporalities of phenomena and reasoning on a history of "places" instead of a history of "sites".

This paper aims to try to reflect on these issues starting from two case studies of the Western Mediterranean, located in Portugal and Italy, and on the possibility of a "Micro-historical archaeology" as a peculiar place for the dialogue between archaeology and history related to the societies of recent centuries.

## 3 THE RISE OF RURAL RENTIERS IN MEDIEVAL NORWAY: APPROACHING A SOCIAL ARCHAEOLOGY OF THE MOST RADICAL SHIFT IN NORWEGIAN HISTORY

**Abstract author(s):** Hill, David (NIKU - Norwegian Institute for Cultural Heritage Research)

**Abstract format:** Oral

From the end of the Viking period Norwegian social structure radically evolved. Chieftain based society with large households and slavery (trelldom) evaporated during a historically short period of time, large post-built structures were replaced by smaller cross-timber buildings suitable for small households. Access to cultivable land came to be regulated by economic rather than social bonds. Previously strong elites weakened, and urban based institutions of the church and crown came to dominate to the economic landscape. Historical documents show that third party ownership of rural production grew by the 13th century to 47%, and that rural producers had become a class of rentiers. Integrating the historical narrative with archaeological data is challenging, but not impossible. Social relationships visible in historical data do not necessarily leave physical traces at a micro level. How can high resolution historical economic data be used with slower, more incomplete archaeological data? - a view from the North.

#### 4 PEASANTS, TRADESMEN AND CAVALRY SOLDERS – ARCHAEOLOGY AND MICROHISTORY OF AN EARLY MODERN FARM

**Abstract author(s):** Heinsonen, Tuuli (University of Helsinki)

**Abstract format:** Oral

In Finland, the written source material concerning early modern rural settlement is quite one sided and tells very little about the everyday life or actions of the peasants and their families. Archaeology offers a great possibility to widen the picture given by the historical sources. Even though the excavated material is often fragmentary, when it is combined in a dialogue with the written sources, it is possible to treat the different fragments as clues, which together can reveal new sides of past social life.

This paper aims to illustrate the possibilities of studying archaeological and historical data together in a manner typical to microhistory by using a farm called Lillas, located in southern Finland, as an example. Using both historical and archaeological data, it is possible to study the history of the farm on a more detailed level than previously. Lillas was a peasant farm, but the inhabitants were also deeply involved in commercial activities during the 16th century, and in the 17th century, they started to equip a cavalry soldier. The farm offers a good example of the varied ways peasants could arrange their livelihoods to enhance their economic and social position. A microhistorical approach to the material concerning Lillas offers a chance to discuss the early modern peasant agency and different identities the peasants could have also on a wider level.

#### 5 MICROHISTORY, LOCAL SOCIETIES AND SOCIAL POWER IN EARLY MEDIEVAL AGE. A BASQUE CASE STUDY

**Abstract author(s):** Quirós Castillo, Juan Antonio (UPV-EHU, Dpto Geografía, Prehistoria y Arqueología)

**Abstract format:** Oral

The goal of this paper is to discuss why people have accepted or tolerated social domination, taxes payments, and political asymmetries in fluid and changeable political contexts. Power is a central concept of social sciences, but historical archaeologists rarely discuss the deep roots of everyday social powers in order to understand practices and customs rather than norms and institutions. Early medieval age is a relevant laboratory to discuss this topic due to the experimental and transformative nature of social power in different scales.

Using a microhistorical and comparison approach, I will discuss social power in different contexts of the Basque country in terms of micropolitics and influence, opposing the concepts of moral and political economies, as well as the Gramsci concept of hegemony. The notion of local societies will be considered as an arena of social competition of different agents where meanings, relationships and entanglement play a role in social life.

#### 6 LOCKS AND THE ACT OF LOCKING WITHIN AN 18TH-CENTURY SWEDISH URBAN TENEMENT

**Abstract author(s):** Qvistrom, Linda (Uppsala University)

**Abstract format:** Oral

Although locks have existed for a long time, the use and practices regarding locks and locking have changed. The actual locking-devices have altered over time, but also what has been locked – whether fixed or portable, chests and drawers or other items of furniture, different types of buildings, or individual doors and rooms.

These changes can be discussed from a number of perspectives. This paper focuses on dwelling-practices and the relations between the people who inhabited or visited the different rooms. What has been locked, in relation to who had access to different spaces in the building? Can locking practices be related to other contemporary changes in dwelling practices?

The discussion is based on a micro-historical study of “Kullzénska gården”, a tenement in Kalmar, south-eastern Sweden, built in the 1770s. A detailed study of the buildings, including spatial analysis, fixtures and fittings, is here combined with written sources, mainly fire insurance documents.

#### 7 ANDRÚAS. MICROHISTORY OF A SPACE FOR COLLECTIVE USE IN THE CANTABRIAN MOUNTAINS

**Abstract author(s):** López, Pablo (University of León) - Carballido González, Elías - Rebollar Flecha, Luis Miguel - Fernández Mier, Margarita (University of Oviedo)

**Abstract format:** Oral

Andrúas is a space for collective use located between 1,000 and 1,500 meters above the sea level on the western side of the Sierra del Aramo. It stands out for being a seasonal grazing area used by the different communities that practice vertical or valley transhumance.

The combined study of textual sources, ethnography and archeology allow us to have an exhaustive knowledge of this small space, from the present management forms to the first occupations of this territory in the 3rd millennium BC.

It is a real archeological palimpsest in which we have documented different occupation moments of the same area, as well as the asymmetric pressure exercised by the communities through different times. From the first prehistoric occupations to the intensification of its use in the High Middle Ages, considering the several attempts to create stable and private settlements at the end of the Middle Ages and the community reactions to maintain their collective rights of use until the present.

Management forms in which the property and rights of use come into tension generating a complex governance system ("facería"), that codifies the local and multifiscal relations through the customary law.

## 8 BETWEEN ARCHAEOLOGY AND HISTORY: THE AMBIGUITY OF THE COMMONS, CASE STUDIES FROM TREBBIA VALLEY (LIGURIAN APENNINES)

**Abstract author(s):** Stagno, Anna Maria (Università di Genova - Laboratory of Environmental Archaeology and History) - Tigrino, Vittorio (Università del Piemonte Orientale) - Beltrametti, Giulia (University of Primorska - Faculty of Humanities)

**Abstract format:** Oral

The hypothesis explored in this paper is that archaeological investigation (in particular of landscape archaeology) can document or ask new questions about the ownership and jurisdictional structures that have occurred in specific areas, while at the same time being able to define and qualify environmental management practices, can find analytical resonance through the use of textual sources. The intersection, on a local scale, of source typologies (ecological, historical, archaeological) poses some problems of method, which also have a theoretical reflection, to which microhistory deeply contributed.

A first issue is that of scale, a second issue concerns the problem of chronology. About scale, the analytical option promoted by the Laboratory of Environmental Archaeology and History has always been that of site research, or at least topographically oriented research to allow a contextual approach, and documentary sources are plentiful right at the sites of the field investigations.

Chronologies, secondarily, are for obvious reasons not perfectly overlapping: the results of a pollinic diagram, the dating of a wall or a documentary production have clear and significant shifts.

History of law and legal anthropology allow us to reflect on the different temporalities of legal actions and norms, a slower temporality in the first case and a decidedly accelerated one in the second. The operations we see on the ground, be they the construction of objects (walls, buildings of various uses), the repetition of practices (grazing, gathering wood, cultivation, or the burning of wood to make charcoal), analysed with an extensive chronology, or the very action of cartographic and textual documentation (production of cartography and reports), concentrated in a few months or years, all speak about negotiation of rights. They are actions, claims, mobilisations, at the same time social, legal, technical and knowledge-producing, which contribute to modify the reality in which the social actors act.

## 9 MARBLE LIME KILNS IN THE POHORJE MOUNTAIN (SLOVENIA): MODERN HERITAGE OF A RURAL INDUSTRY

**Abstract author(s):** Zanier, Katharina - Djurić, Bojan (Department of Archaeology, Faculty of Arts, University of Ljubljana)

**Abstract format:** Oral

The Pohorje Mountain in north-eastern Slovenia is so far especially known for its marble quarries, used since ancient until modern times. The collapse of the economy of ancient quarries resulted in large spoil deposits, covered by vast forests, the perfect place for the arrangement of lime kilns. These extensively show up in LiDAR imaging, surface survey, archival, and oral history sources, being a widespread phenomenon until the Reconstruction after World War II, so far neglected by the scientific community. In 2020/2021 the Department of Archaeology of the University of Ljubljana excavated one of these kilns documenting interesting details of its construction and use. Additional information about this kind of rural industry is provided by typical microhistory sources. Marble lime kilns in the Pohorje region offer a precious insight into practices of the local societies, issues related to property and use, as well as environmental resource management, also in relation to recycling of spoil and unfinished marble elements.

## UNVEILING LOCAL CONFLICTS THROUGH MICROHISTORY: A MULTIDISCIPLINARY AND COMPARATIVE ANALYSIS OF THE COMMON LANDS IN NORTHERN IBERIA (18TH-19TH CENTURIES)

**Abstract author(s):** Cristina, Giovanni - Tejerizo-García, Carlos (Università di Genova) - Menéndez-Blanco, Andrés (Universidad de Oviedo; Università di Genova)

**Abstract format:** Oral

The proposal analyses the complex interweaving of relations between local interests and supra-local powers (e.g. the State and its several legislative, administrative and institutional articulations) in the management of the common lands of two rural areas of Northern Iberia between the 18th and 19th centuries.

In particular, the comparison between the two case studies (e.g. Casayo, Galicia, and the Parzoneria de Entzia, Basque country), which are already investigated by ongoing projects (INPACT and ANTIGONE, respectively) will take place by combining the micro-historical analytical dimension with Bourdieu's concept of "battle arenas".

The perspective is multidisciplinary in the sense that it critically compares historical and archaeological sources in order to reconstruct the dialectical connections between structure and agency in the diachronic evolution of the management of agro-sylvo-pastoral activities in the common lands of these two areas. The comparison will identify some possible turning points (privatization laws, forest enquiries, attempts at rationalization, etc.) through which to measure, both in the documents and in the archaeological surveys, the different interests converging in the same local area and the conflicts opposing several actors in these "battle arenas". At the same time, the analysis of the relationship, also complex and dialectical, between norms and practices in the use and management of resources will also be considered.

### A. THE LIFE HISTORY OF A SMALL TERRITORY OF INNER SICILY THROUGHOUT ARCHAEOLOGICAL RESEARCH

**Abstract author(s):** Lo Monaco, Viviana (UNESP)

**Abstract format:** Poster

From the late 1970s, Landscape Archeology turned its attention to the role of the interior territories in the economic, political and social changes of the different historical epochs. The countryside, which supplies products for consumption and commerce, was populated by a multitude of people who were active part of the development of large urban centers. Archaeological methods and post-processual approaches may offer insightful tools for reading the landscape, interpreting settlement patterns from the past until the present and observing the relationship between the inhabitants and their history.

This presentation shows my post-doctoral research project on a territory of Central Sicily (Caltanissetta). This project, funded by São Paulo Research Foundation (FAPESP), aims to reconstruct the life history of this small territory and to contextualize it in a general framework, from a long-term perspective. The field research will be carried out next summer, between June and August, by me and other colleagues who offered their collaboration. The inquiry will be developed through methodologies of topographic survey, which also includes the use of instruments that allow non-invasive interventions. The elaboration of the data through the GIS system will allow the spatial analysis of the movements of the human groups and their relationship with territory and landscape. The poster presented at the Congress intent to show the very first data collected in the field work and our first considerations about the preliminary results.

---

### 324 ROMAN HOUSING ON THE SHORES OF THE EASTERN MEDITERRANEAN. GLOBAL TRENDS, LOCAL RESPONSES?

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Rekowska, Monika (University of Warsaw) - Gasparini, Eleonora (independent researcher)

**Format:** Session with keynote presentation and discussion

In research on the Roman residential architecture in the East, scholars frequently refer to Roman and Greek (Hellenistic) traditions to be seen as derived from different socio-cultural contexts. In fact, analyses of plans and house décor (including pavements, paintings, and architectural and sculptural decorations) can be successfully used in the "Romanization debate" or in discussion on the scope of disseminating the Roman culture. The houses were quick and easy to read forms of self-presentation. Archaeologically, they have a potential to reveal different identities of their owners. Instead of applying bipolar interpretative schemes, we must be aware, however, that even in the globalized Roman world there were many local responses to global trends coming with Roman authorities, politics, administration and culture. In this respect, the evidence from each provincial context and even each urban context across the provinces can reveal peculiarities connected to specific local conditions, that turn out to be extremely reach in the East, were urban cultures had already found monumental developments since many centuries.

Within this framework, private architecture on the shores of the Eastern Mediterranean deserves special attention, as more susceptible to new ideas and the subject to dynamic exchange processes. The mingling between diverse inputs was the hallmark of a unitary and multi-faced Empire.

All papers exploring different features of the Eastern Mediterranean housing tradition and innovations, with a particular focus on the coastal cities are particularly welcome. The houses architectural language, assimilating new fashions by adapting local tastes and habits would serve as the basis for assessing Romanization. Reflections on individuals and society, expressed in their conscious or unconscious architectural choices would be an important voice in the discussion on the creation of glocal cultures in the global world.

## ABSTRACTS

### 1 READING THE HOUSE OF ORPHEUS AT NEA PAPHOS (CYPRUS)

**Abstract author(s):** **Rekowska, Monika (University of Warsaw) - Michaelides, Demetrios (University of Cyprus, Nicosia) - Gasparini, Eleonora (Independent researcher) - Pensabene, Patrizio (University La Sapienza, Rome) - Kaniszewski, Jakub (Independent researcher)**

**Abstract format:** Oral

The House of Orpheus, an urban residence in the port city of Nea Paphos in Cyprus, discovered and explored decades ago, has, so far, been studied only fragmentarily. Recently, it is being studied again under the project "Residence as self-presentation of urban elites. Architecture and decoration of the House of Orpheus in Nea Paphos, the ancient capital of Cyprus", carried out in 2018-2022 and financed by the National Science Centre in Poland (2017/27/B/HS3/01131). On-site studies with the use of non-invasive methods allowed for updating the old data as well as gathering new data on the architecture. This comprehensive assessment of the house's architecture took into account its multi-faceted decor, in which the architectural decoration played a substantial role. A set of over 200 decorated/worked stone blocks (currently available in the database) helped us redefine the functional spaces of the house. After four years of work, we are able to present the results of in-depth studies on the interplay between the layout, architecture and decoration of the house, in search of an answer to the question of how individual choices made by the owner, apparently a wealthy and educated representative of the city's elite, reflect his identity. Thanks to the possibilities offered by three-dimensional documentation, we can present a credible virtual reconstruction of selected architectural units in order to show a local (Cypriot) response to global (Roman) trends.

### 2 ALEXANDRIAN TRADITIONS AND TRANSFORMATIONS IN THE RESIDENTIAL ARCHITECTURE OF CYPRUS DURING THE IMPERIAL AGE

**Abstract author(s):** **Pensabene, Patrizio (Sapienza University)**

**Abstract format:** Oral

Roman housing in Cyprus represents a well-established research field, that, since the second half of the last century, has benefited from the excavation of residential complexes of great relevance. The architectural features of Cypriot luxury residences represent an excellent instrument for analyzing historical issues, such as the socio-cultural substratum of the main cities and the relation, enhanced by the coastal location of the sites, between local élites and the main centres of the Imperial Mediterranean.

However, these observations must develop on the light of the importance that, during the Imperial Age up to Late Antiquity, Hellenistic roots continue to hold in the architectural language of the island. Starting from the evidence of Alexandrian traditions and transformations in the housing architecture of several urban contexts (Paphos, Kourion, Salamis), this paper is aimed at contributing to the discussion on the legacy of Alexandrian architecture in the Roman Empire and, more generally, on local responses to global trends in Eastern provinces.

### 3 HALLS AND COURTYARDS IN THE HOUSE OF DIONYSOS AT NEA PAPHOS (CYPRUS): INDIVIDUAL RESPONSES TO LOCAL AND GLOBAL TRENDS

**Abstract author(s):** **Gasparini, Eleonora (Independent researcher)**

**Abstract format:** Oral

The House of Dionysos represents one of the most luxurious examples of Imperial élite urban housing not only in Nea Paphos but in the whole island of Cyprus. Its specificity is immediately visible thanks to its extension and the richness of its mosaics, that are dated to the late 2nd-early 3rd century AD. However, further elements of the plan and architectural decoration testify to choices that, although clearly related to local and global trends, turn out to be unique. Between these elements are the halls used for reception and banqueting as well as the main and secondary courtyards. Their uniqueness is perceptible above all by observing their size, distribution and spatial connections.

A multi-layered complex such as the one in question, which shows evidence of occupation since the Hellenistic age, also raises the problem of the conditioning imposed on the building by the pre-existing structures. In fact, these last

could partly lead the design of domestic spaces and the forms of their decoration. Therefore, Cypriot housing as well as the broader scenario that developed on the shores of the Eastern Mediterranean will be the reference for discussing to which extent entanglement and freedom are recognizable in the architectural layout of this Paphian residence.

#### 4 **ORDINARY OR EXTRAORDINARY? ANCIENT RESIDENCES IN NEA PAPHOS AGAINST A WIDER BACKGROUND OF THE EASTERN MEDITERRANEAN CITIES**

**Abstract author(s):** Brzowska-Jawornicka, Aleksandra (Wroclaw University of Science and Technology)

**Abstract format:** Oral

Nea Paphos, an ancient city on the south-western coast of Cyprus, was a flourishing rich town due to its location on the sea routes between the Middle East, Egypt and North Africa, and Asia Minor. Surrounded by stronger empires, the Cypriots were always under the external impacts including those relating to the construction, architecture and art. In Maloutena, the residential area of the city, many houses of different scale, décor and equipment were erected becoming a testimony of their times and the changing tastes of their owners who lived in the eastern part of the Graeco-Roman World. From the local building traditions, through the Alexandrian influences of the Ptolemaic Kingdom to Roman innovations – all those factors were present in Paphian houses reflecting changes in the Cypriot society which took place during the long history of the ancient city. The aim of the presentation will be to show the architecture of the selected Paphian residences, especially the so-called 'Hellenistic' House, and the changes they underwent against a wider background of the houses from the Eastern Mediterranean cities. Were the houses in question typical for those ancient areas? Is it possible to indicate a set of typical features for a Graeco-Roman residence or were there many characteristics that could have been freely combined creating a different effect each time?

#### 5 **THE ROMAN HOUSES AT EPHESOS AND THEIR REPRESENTATIVE SPACES FOR THE LOCAL ÉLITE**

**Abstract author(s):** Barresi, Paolo (Università Kore Enna)

**Abstract format:** Oral

The houses known as "Hanghäuser", or Terrace Houses, are the most famous private buildings in Roman Ephesos, excavated by Austrian archaeologists in the last century: they are placed in two large blocks of the regular city planning, following hill slope. The wall and floor decoration of the house units within, are evident indicator of the wealth of their owners, belonging to local high class, who chose an imposing and central space as place of representation. For these houses, it was chosen a localization at the very centre of the city, near the monument of the mythical founder Androklos: but there, public buildings had grown during Hellenistic and Roman period, and for this cause, the house units have dimensions relatively small, even if their luxury character emerges from the high-level decoration. There are also other examples of large houses, not well published yet, such as the "Bishop Palace" over the odeion: such examples are useful, anyway, to enforce the overview. This paper is particularly aimed at the discussion of floor and wall luxury decoration of Ephesos' houses, in relation to the architecture and the meaning of power spaces managed by local ruling élites.

#### 6 **LIVING AND WORKING IN A SUBURBAN WINERY ALONG THE EAST. COAST OF THE ARGOLIS PENINSULA: THE SUNKEN VILLA OF EPIDAUROS**

**Abstract author(s):** Davide Petriaggi, Barbara (National Superintendency for Underwater Archaeological Heritage, Italy) - Galiatsatou, Panagiota (Ephorate of Underwater Antiquities of the Hellenic Ministry of Culture and Sports) - Medaglia, Salvatore (Department of Cultures, Education and Society, University of Calabria)

**Abstract format:** Oral

The marine transgression, triggered by very complex geo-tectonic and seismic phenomena, has caused the many archaeological remains scattered along the Peloponnesian coast of the Saronic Gulf during the Upper Holocene. Among them, one of the most significant is the so-called 'villa of the dolia', a rural complex on the southern outskirts of Epidaurus dated to the Middle Imperial Age and investigated since 2018 by an Italian-Greek archaeological mission. The submerged architectural remains of the villa are now visible at a depth of about -1.00/-2.00 m and extend over an area of about 1600 square metres. What characterises the rustic villa more than any other element is the presence of a vast wine cellar with several large dolia still in situ. The hypothesis that the productive vocation of the villa rustica was mainly linked to viticulture is strengthened by the discovery of the remains of a lenos and a hypolenion.

The excavation of the latter has yielded a considerable amount of finds related to the last phase of life in the complex, the study of which is providing numerous data for reconstructing certain aspects of the daily life of those who lived and worked in the farm. The investigations currently being carried out are making a contribution to shedding light on an aspect on which the ancient sources converge regarding the landscape of the Epidaurus countryside, which was geared more towards specialised agricultural production. According to Plutarch most of its inhabitants worked in the fields, and it is no coincidence that Stephen Byzantine uses the adjective *λειμηρῆς* to describe the area. But even more significant is the evident connection between the wine vocation of the Epidaurus farm and the

tradition, dating back to Homer and recorded by Strabo, that its territory was more than anything else cultivated with vineyards.

## 7 PERSISTENCE AND CHANGE. TOWARDS A THEORY OF LOCAL DIVERSITY IN VERNACULAR ROMAN ARCHITECTURE

**Abstract author(s):** Kienzle, Peter (LVR-Archaeological Park Xanten)

**Abstract format:** Oral

Traditionally, architectural history focussed on representative public buildings such as temples, palaces and baths, thus, identifying the dominance of a universal Roman architecture all over the Empire. This was linked to army-engineers, who came to all parts of the Roman Empire, bringing with them the actual knowledge of Roman building technology and design. However, this is different in vernacular architecture. These new ideas were brought to an existing building tradition, well suited to climatic conditions, available materials, craftsmanship and economic requirements. As a result, regional and local housing landscapes developed integrating both, local traditions and new ideas.

Building traditions in vernacular architecture may be perceived as "style" in academic research. However, the particular design of a housing landscape is the result of a well-adapted economic responses to an existing environment. The lower Rhine area encompasses the lowland parts of western Germany (North-Rhine-Westphalia) and parts of the Netherlands. In Roman times, this was the Province Germania Inferior. In some areas of the province, a new Roman housing design became dominant while in other areas the traditional design persisted. This was not accidental but followed identifiable reasons.

This paper explores the concept of housing landscapes in general and tries to identify the parameter for regional differences. In a long term, perhaps, a map of regional or local housing landscapes in Roman times can be developed, identifying the local conditions, which cause distinct local house design in the Roman period.

---

## 325 "OPEN SCIENCE" IN ARCHAEOLOGY AND HERITAGE: CHALLENGES AND FUTURE PERSPECTIVES

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Edinborough, Marija (The University of Melbourne) - Palmisano, Alessio (Ludwig-Maximilian University of Munich) - Bonacchi, Chiara (University of Stirling)

**Format:** Regular session

For some time, archaeology and heritage have been experiencing a huge increase in the amount of available "Open Science", in terms of digitized and born-digital data concerning human history and prehistory with all their contemporary legacies. This has been due to a combination of numerous research and cultural resource management initiatives, for example, fieldwork expeditions, grey literature, digitization of museum, archive, and library collections, co-production of data through crowdsourcing, and the creation of open repositories of remote sensed data. Archaeology and heritage are often at odds with well-established practices of data sharing in data-rich disciplines such as astronomy, physics, and medicine for the following reasons: 1) there is a variable level of consensus over use and curation of data and related analytical methods in both archaeology and heritage; 2) it is not clear what the norms and requirements of "ethical open science" are; 3) the communication among different interested parties regarding the requirements and expectations of open data is limited.

To address these issues, our session brings together researchers interested in the practices of ethical open science and data sharing in both archaeology and heritage. The session will explore the different practices used in these fields so far, whilst comparing them to those used in other research areas and disciplines. We hope to foster practical cross-pollination and useful discussion between archaeology and heritage researchers. Our goal is to open a forum that will lead to implementation and standardization of the best open science ethical practices. We aim to bring tangible benefits for all stakeholders in open science data, citizens, communities, individual researchers, and researchers, with special attention paid to the requirements of indigenous stakeholder communities.

We invite papers that present new open science research, and also how this research relates to the notion of ethical open science.

## ABSTRACTS

### 1 XRONOS: CHALLENGES IN BUILDING A GLOBAL OPEN REPOSITORY FOR CHRONOMETRIC DATA

**Abstract author(s):** Roe, Joe - Hinz, Martin (Institute of Archaeological Sciences, University of Bern)

**Abstract format:** Oral

Radiocarbon data has been at the forefront of archaeologists' recent embrace of open data and open science. Comprehensive compilations of radiocarbon dates have become available for many parts of the world in the last

decade and, as natural next step, there are now several initiatives to collate this data globally, including the retrieval tool c14bazAAR (Schmid, Seidensticker, and Hinz 2019), the IntChron exchange format (Bronk Ramsey et al. 2019), and the synthetic database p3kc14 (Bird et al. 2022). Here, building on a complementing these initiatives, we present XRONOS (<https://xronos.ch>): a new web-based platform for chronometric data from archaeological contexts worldwide, combining an open data repository with tools for importing, curating and analysing chronometric information from diverse sources. The development of XRONOS has raised a number of challenges. Conventions for sharing radiocarbon data are relatively well-established, but integrating other classes of chronological information—dendrochronology, typhochronology, Bayesian priors, etc.—demands a more sophisticated technical infrastructure. The scale of the dataset, and our aim of “one date, one record”, also requires new systems for the continuous ingestion, synthesis and curation of data from multiple sources; systems that should be scientifically robust and sustainable in the long term. Finally, beyond the technical, we must acknowledge several ethical and practical limitations on the how ‘open’ archaeological data can be, building tools that respect these limits, but also continue to foster an appreciation of the ethical imperatives for data-sharing within our discipline. In this talk, we present our progress towards meeting this challenges in the development of XRONOS so far, and invite discussion with the community of practitioners who produce, compile, and use chronometric data on the future direction of the project.

## 2 RETHINKING DATA SHARING IN PHYTOLITH RESEARCH: FROM FAIR PHYTOLITHS TO KEY INSIGHTS FOR ARCHAEOLOGY

**Abstract author(s):** Lancelotti, Carla (CaSEs, Universitat Pompeu Fabra Department of Humanities; ICREA) - Karoune, Emma (The Alan Turing Institute) - Ruiz-Pérez, Javier (Texas A&M University) - García-Granero, Juan José (Spanish National Research Council) - Kerfant, Céline (CaSEs, Universitat Pompeu Fabra Department of Humanities) - Madella, Marco (CaSEs, Universitat Pompeu Fabra Department of Humanities; ICREA)

**Abstract format:** Oral

Our project ‘Increasing the FAIRness of phytolith data’, funded by EOSC-Life, is striving to set the basis for implementing the FAIR (Findable, Accessible, Interoperable and Reusable) data principles within the phytolith research community. Phytoliths are micro-botanical remains that are formed within the cells of living plants. They can be used to address archaeological questions concerning anthropogenic plant exploitation and landscape changes.

The phytolith community has been making efforts to standardise data through the development of a common nomenclature and other guidelines. However, the routine adoption of these standards has not been straightforward. Data sharing is minimal and data is often exclusively within paywalled published articles rather than in open repositories.

An assessment of open science practises in phytolith research (Karoune 2020) found that only a small percentage of research provided reusable data. These findings initiated the FAIR Phytoliths project to take the first steps along the FAIRification journey.

The FAIR Phytoliths project has engaged with our community to find shared views on opening up research. We have also conducted an assessment of publications containing primary phytolith data and associated methods to fully investigate the key variables needed to improve data sharing in line with the FAIR principles.

This presentation will share the results of this work and the FAIR guidelines that we have drawn up with community support. We will discuss what this means for future phytolith research and the wider learnings that can be taken from this project for the archaeological community. We hope this work will initiate more sustainable data sharing practices in the future for phytolith research and related disciplines.

## 3 FROM POLICY TO PRACTICE – HOW TO BE FAIR AND OPEN IN HERITAGE

**Abstract author(s):** Larsson, Asa (Swedish National Heritage Board)

**Abstract format:** Oral

While Open Science and FAIR data have become requirements among many funders and policy makers, there is still a huge disconnect between these general goals and the reality of researchers and specialists who receive little in terms of practical instructions or training in data management. This is especially true for the Humanities, whose output does not always match the model used by the Natural Sciences. Heritage studies tend to straddle both these worlds and therefore face additional challenges, combining “hard” technical data with terminologies dependent on cultural, regional, temporal and research contexts.

Heritage researchers and professionals find themselves without clear motivations for sharing data apart from the demands of funders, who rarely if ever give advice beyond general policy documents. Complicating the situation further is the confusing plethora of standards and vocabularies available online, with both overlaps and troublesome gaps. There is need for a systematic and collaborative effort to identify and meet the requirements of cultural heritage research.

I will present results from projects undertaken at the Swedish National Heritage Board to help researchers, archaeologists and heritage specialists identify the tools and practices needed to achieve Open Science. This involves breaking down the FAIR principles into practices for individuals, highlighting the importance of digitalised collection data, and explaining the potentials of linked data, vocabularies and persistent identifiers. It is of vital importance to communicate to researchers and heritage professionals how they can benefit from adopting these practices. However, the rush towards open data and digitalisation of collections can cause unintended harm. We must take responsibility for what is published and set the necessary limitations that are possible with proper implementation of technology.

#### **4 'OPEN' HERITAGE RESEARCH IN BIG DATA ECOLOGIES**

**Abstract author(s): Bonacchi, Chiara (University of Edinburgh)**

**Abstract format: Oral**

This paper discusses 'open' practices and ethical implications of undertaking heritage research in big data ecologies. It draws on the experience gained during two collaborative projects funded by the UK Arts and Humanities Research Council – Ancient Identities in Modern Britain (2016-19) and Deep Cities (2020-22). In both projects, people's interactions with different kinds of heritage as well as the meanings and values assigned to those heritages were studied online and offline using a combination of qualitative and data-intensive methods. Through an examination of these case studies, the presentation will address both the possibilities and the limitations of adopting an open science ethos within heritage research that relies on the collection, analysis and interpretation of web data – and social media data in particular. What kinds of data can and should be shared? How can they be meaningfully reused and by whom? In what situations can the sharing of research workflows and data be harmful and for what constituencies or researchers and citizens?

#### **5 PARTICIPATORY RESEARCH AS MEANINGFUL OPEN SCIENCE: FIRST RESULTS OF THE C-LIMES PROJECT**

**Abstract author(s): Stevens, Saskia - Plets, Gertjan (Utrecht University)**

**Abstract format: Oral**

In archaeology, Open Science is often theorized in relation to open data. This contribution focuses on the application of citizen science and public engagement as two significant cornerstones of open science. Today, citizen science and public engagement are included in many grant applications to "tick the box". As a result, when citizens engage in the production of (open) data, it is mainly the scientific project and discipline at large that benefit from "opening" up the black box of research. To prevent citizen scientists from ending up empty-handed and demotivated, it is important to foster a sustainable relationship that will encourage further involvement, even after the project has ended.

In this paper we present the Constructing the Limes Project; a large interdisciplinary research project investigating the Roman borderscape in The Netherlands, Germany and Belgium. The project is unique in its approach, since more than 20 societal partners have been involved in every step of the research. In this paper, we present the organization and structure of the project and discuss which mechanisms we apply to include societal stakeholders and which challenges we have encountered. Furthermore, we will also present some first outcomes of our citizen science projects.

#### **6 THE LONG AND WINDING TOAD TO 'OPEN SCIENCE' IN ARCHAEOLOGY: DATA DISSEMINATION, REPRODUCIBILITY AND ETHICAL ISSUES**

**Abstract author(s): Palmisano, Alessio (Ludwig-Maximilians-Universität München)**

**Abstract format: Oral**

The recent advancements of digital methods for the acquisition and dissemination of data have resulted in an increasing flood of evidence about the human past. In this context, archaeology, as a discipline relying on empirical methods in data collection and analysis, has to deal with several new challenges. In particular, the common norms of data sharing and reproducibility of research are still nebulous and lack a proper operative protocol widely recognised in the scientific community.

In this paper, I will illustrate the best practices of data sharing, dissemination and reproducibility in archaeology and their benefits for researchers and the public. I will survey a series of approaches and practical examples from different case studies (e.g., fieldwork, desk-based research, synthesis of large datasets) that contribute to fostering transparency and open scholarship. In the end, I will discuss the ethical issues that archaeologists can face when disseminating openly their datasets and the resulting impact on the local communities and the cultural heritage.

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Giroto, Chiara (Ludwig-Maximilians-Universität München) - Price, Henry (Imperial College London)

**Format:** Discussion session

Machine learning in archaeology, especially in combination with social theories offers tremendous potential for the reconstruction of past interaction, social systems, and interaction. However, there is little user experience compared to other scientific techniques and more established statistical methods among archaeologists. The models - often necessarily based on ambiguous or sparse data - generate results which require interpretation. More often these are based on "commonly accepted" social theories, values, and ideals rather than embracing the problems and uncertainties in modelling. In her 2007 article, "Honoring Ambiguity/Problematizing Certitude", Joan Gero argues for archaeological research which acknowledges and values the ambiguities and uncertainties of its data and the importance of "protecting and preserving ambiguities as a valuable rather than a necessarily painful aspect of archaeology" (323).

In the previous years our sessions ("Is ML in archaeology fact or fiction?" (2021) and "Tracing reality in archaeology using machine learning" (2020)) explored the potential, possibilities, ambiguities, and pitfalls of machine learning in social and bioarchaeological contexts. This year we specifically want to address the ambiguity of ML models, problems in their interpretation as well as their potential and danger to create narratives. Since all ML models are only capable of highlighting internal patterns of their respective data universes, they can easily perpetuate ideas of excessive certainty and amplify pre-existing biases of the data. Touching on ethics, representation, and oversimplification this perceived "sureness" has the power to distort the past, either involuntarily or voluntarily as a misuse of archaeology in the present.

We specifically invite contributions addressing ideas on how to retain ambiguity in modelling, spotting unwarranted presuppositions, colouring the conclusions, inclusion of ethics in archaeological machine learning applications, and more generally the dangers and pitfalls of creating narratives in archaeology through ML.

## ABSTRACTS

### 1 CAN WE RELY ON DATA OBTAINED SOLELY THROUGH ML? AN ARCHAEOASTRONOMICAL APPROACH TO THE PREHISTORIC TOMBS OF NORTH-WESTERN ARABIA

**Abstract author(s):** Urrutia-Aparicio, Maitane - Asensio Ramos, Andrés - Westendorp Plaza, Carlos - Belmonte, Juan (Instituto de Astrofísica de Canarias) - González-García, A. César (Instituto de Ciencias del Patrimonio - Incipit - Consejo Superior de Investigaciones Científicas - CSIC)

**Abstract format:** Oral

The pathways in the north-west Arabian regions leading to the oases of Khaybar and Al-Hait are surrounded by a myriad of drystone funerary structures, dating to mid-to-late third millennium BCE. Due to the vast number of them, their individual identification in situ or through transects in high-resolution satellite imagery becomes laborious and time-consuming. Therefore, it constitutes a potential case for applying Machine Learning (ML) techniques which may facilitate and accelerate their detection and, moreover, extract useful information such as the orientation of a comprehensive and large sample, the basic data in archaeoastronomy.

Archaeoastronomical analysis has proven to be a unique tool for the construction of narratives in cultural land- and skylines, mostly reinforced by material evidence. When archaeological prospections are scarce or not accessible, the weight of eventual data, obtained by ML, increases.

So far, the studies carried out in the Khaybar Harrat monuments state that most of these 'pendant' tombs are perpendicular to the pathways, but no systematic analysis on the topic has been performed. The present work attempts to identify the funerary structures and their orientations through ML techniques and afterwards, explore possible patterns perhaps related to local topography or astronomical targets. Preliminary results suggest a predilection for cardinal directions, predominantly close to the East-West line, indicating a preference for the solar range. Besides, orientations towards South-Southeast have been identified to a lesser extent. A putative target for such orientation could be the bright star Canopus, whose long-lasting importance in the Arabian Peninsula is well documented. However, substantial evidence supporting these hypotheses, is indeed lacking.

Consequently, there is a risk of creating certain narratives overestimating the outcomes of ML techniques which must not be ignored. This sort of data should therefore be regarded as valuable information that, nonetheless, ought to be corroborated by archaeological, topographic, and eventually, ethnographic evidence.

## EMPLOYING VISUAL FEATURE ANALYSIS WITH MACHINE LEARNING MODELS FOR THE AUTOMATED CLUSTERING OF SMALLER BUT SIGNIFICANT ARCHAEOLOGICAL ITEMS

**Abstract author(s):** Mircea, Cristina (Department of Molecular Biology and Biotechnology, Faculty of Biology and Geology, Babes-Bolyai University; Molecular Biology Center, Interdisciplinary Research Institute on Bio-Nano-Sciences, Babes,-Bolyai University) - Mircea, Ioan (Department of Computer Science, Faculty of Mathematics and Informatics, Babes-Bolyai University) - Urduzia, Claudia (Brukenthal National Museum) - Pinter, Zeno (Department of History, Heritage and Protestant Theology, Lucian Blaga University of Sibiu; Institute of Social Sciences and Humanities, Romanian Academy) - Kelemen, Beatrice (Department of Molecular Biology and Biotechnology, Faculty of Biology and Geology, Babes-Bolyai University; Molecular Biology Center, Interdisciplinary Research Institute on Bio-Nano-Sciences, Babes,-Bolyai University)

**Abstract format:** Oral

As we are situated at the crossroads of machine learning and modern (bio)archaeological research, we cannot neglect the importance of better harvesting archaeologically relevant information from all the levels of archaeological research: the excavation site, the archaeological laboratory, and the biological laboratory. This information is capital to the development and perfecting of machine learning models catered towards bioarchaeological needs.

The current proposal focuses on the visual features of pottery fragments that usually went neglected in traditional archaeology but are becoming the pivotal weapons towards uncovering the capital questions still unanswered about the past.

The analysis of the pottery bits and parts from the archeological site of Orastie (Hunedoara county, Romania, XVII-XVIII centuries, A.D.) is based on computer vision techniques enriched with machine learning enhancements to detect the contour as accurately as possible and the textural features. The fragments are first clustered based on the joint contour and textural extracted features and then used for optimized semi-automated labeling.

## COULD MACHINE LEARNING SEAL THE DEAL? EXPLORING MULTIPLE AVENUES TO RECOGNISE AND CLASSIFY DESIGNS OF COMMON MITANNI CYLINDER SEALS

**Abstract author(s):** Angourakis, Andreas (Institute for Archaeological Studies, Ruhr University Bochum; McDonald Institute for Archaeological Research, University of Cambridge) - Tsouparopoulou, Christina (McDonald Institute for Archaeological Research, University of Cambridge; Institute of Mediterranean and Oriental Cultures, Polish Academy of Sciences)

**Abstract format:** Oral

Machine Learning (ML) has been permeating archaeology progressively, and it has been prolific regarding the automatization of the analysis of recurrent material culture. Cylinder seals are one of the most ubiquitous types of archaeological objects in Southwest Asia throughout the Bronze Age, but are also exceptionally loaded with semantics, as their primary function as an artefact was communication. The pictorial assemblages that populate these objects, being them figurative or abstract, present a challenge to most generic approaches to ML in computer vision, despite the rapid development of the field. Much as any hand drawing, seal engravings are simpler than photographic pictures (as they hold less information), yet their features can be more diverse and conceal subtle patterns that express motifs and styles intrinsically linked to a specific cultural context; all of which must be captured with a relatively limited sample. As archaeologists are mostly users rather than developers of ML models, tackling domain-specific challenges such as these often leads to a tentative exploration of alternatives offered by applications in other fields or datasets. We present a summary of our exploration using our own database of Common Mitanni cylinder seals, which went progressively through three substantially different approaches aimed at measuring similarity/dissimilarity in images: locality sensitive hashing (LSH), pretrained convolutional neural network (CNN) models using the ImageGraph Python library, based on Tensorflow-keras, and training CNN models with SVGs using the deepsvg Python library, based on PyTorch. The journey has brought to light both issues and opportunities, from deepening our understanding of cultural diversity in the period to insights on how to improve the use of archaeological drawings in computer applications. In addition, the experience also yielded important lessons for the use of ML technology in archaeology and, particularly, in the analysis of figurative images in archaeological contexts.

## A. FRAGMENT GENERATION OF IBERIAN POTTERY PROFILES WITH MACHINE LEARNING FOR CERAMIC RECONSTRUCTION

**Abstract author(s):** Fuertes García, José Manuel (Department of Computer Science, University of Jaén; University Research Centre for Iberian Archaeology) - Navarro, Pablo (Instituto Patagónico de Ciencias Sociales y Humanas. Centro Nacional Patagónico; CONICET) - Cintas, Celia (IBM Research Africa) - Lucena López, Manuel José - Segura Sánchez, Rafael (Department of Computer Science, University of Jaén; University Research Centre for Iberian Archaeology) - Delrieux, Claudio (Departamento de Ingeniería Eléctrica y de Computadoras, Universidad Nacional del Sur.) - González-José, Rolando (Instituto Patagónico de Ciencias Sociales y Humanas. Centro Nacional Patagónico; CONICET) - Moreno Padilla, Isabel (University Research Centre for Iberian Archaeology; University of Jaén)

**Abstract format:** Poster

The reassembly of fragmented objects from a collection of hundreds or thousands of randomly mixed fragments is a problem that arises in several applied disciplines, such as archaeology, anthropology, failure analysis, and paleontology. Ceramic potteries are among the most frequently found archaeological artifacts, but complete remains are very scarce. These artifacts are usually short-lived, and thus this helps researchers document variations in style, used materials, and manufacturing techniques. Currently, there is no straightforward way to take advantage of the fragmented data due to the laborious and uncertain nature of the manual restoration process. In this work, we use available digitized profile potteries for training advanced machine learning techniques to enable scholars to recognize and study fragmented pottery. We propose a deep learning approach to generate artificial data departing from a set of known fragments in the model, thus creating new virtual pottery with the same features as the real ones. To do so, we propose a framework based on generative models that reconstruct pottery profiles from rim or base fragments. We have evaluated the performance of the method based on many aspects. Finally, the results obtained suggest that our approach is capable of generating potteries that satisfy the image, pottery morphometric structure and is flexible to work on different ceramic datasets that present a variety of fractured materials.

---

## 327 STONE AGE STRAY FINDS AND HOW TO USE THEM [PAM]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Bergsvik, Knut Andreas (University of Bergen) - Nilsson, Björn (University of Lund) - Johanson, Kristiina (University of Tartu)

**Format:** Regular session

Stone Age artifacts found by lay people – stray finds – have been important in European archaeology for more than a century. In many areas stray finds are fundamental for landscape studies and macro-scale investigations and they are central cues to locate sites and monuments. Nevertheless, today stray finds are often considered as lesser quality data compared to data generated through professional excavations, mainly because stray finds lack detailed context information. They are also sometimes considered superfluous due to the current volume and spatial extent of archaeology-led surveys. The question we ask here is how stray finds still can play a role in future archaeology. Several avenues are possible, and an obvious one is to draw on the sheer quantity. When systematically classified and georeferenced, stray finds may be excellent for a variety of both synchronic and diachronic “big data” analyses. Second, since they are found and collected by non-archaeologists, they represent a parallel find category, biased not by archaeological science, but by other practices outside of the antiquarian world, and may therefore help locating sites and phenomena (such as placed ritual deposits) that are beyond the capacity and problem orientation of most archaeology-led surveys. Third, they could play a complementing role in public outreach.

For this session we invite papers that work on local studies as well as studies that treat large-scale distribution patterns, and we welcome papers that discuss the relationship between archaeology-led field investigations and investigations of stray finds. Since there are major institutional and legislative differences in cultural heritage management across Europe, there is great variety in how Stone Age stray-finds are collected and stored. Papers that address these differences are welcome, as well as methodological papers that deal with how stray finds are treated, stored, and made accessible for research and public outreach.

## 1 WHAT DO YOU MEAN, THIS IS A STRAY FIND? DISCUSSING SOURCE CRITICISM IN THE LATE PALAEOLITHIC RECORD OF NORTHERN GERMANY

**Abstract author(s):** Grimm, Sonja - Eriksen, Berit (ZBSA - Centre for Baltic and Scandinavian Archaeology; CRC 1266 Scales of transformation) - Weber, Mara-Julia (Archaeological Museum Schloss Gottorf; CRC 1266 Scales of transformation)

**Abstract format:** Oral

The Late Palaeolithic record of northern Germany is often used as reference for other areas. However, when contributing to large-scale projects, colleagues are astonished about the high number of collections and excavations without modern standards. In projects with rigorous protocols many northern German sites are therefore excluded, including some famous sites such as Stellmoor and Meiendorf.

Schleswig-Holstein, the northern most German state, is mostly rural with large areas of pastures, ploughland, moor and marshland. Only a network of people can keep an eye on the archaeological remains in these variable areas. Hence, amateur archaeologists play an important role in identifying new sites, connecting scientists and local population, and in early mentioning of new project plans. Obviously, they are still the first to report interesting finds and sites. Excavated sites with Late Palaeolithic material are rare and many of them have been excavated without modern standards and occasionally also by amateurs. Hence, "stray finds" are still an important source. Yet, what exactly is a stray find? A single find? A surface find? A find identified by an amateur?

What we found relevant is the information connected to a find or assemblage and the analyses that can still be applied to them (e.g. <sup>14</sup>C and stable isotope analyses of osseous artefacts or technological analyses of lithics). With a rigorous source criticism, the quality of the sites, assemblages, and artefacts can be classified. Obviously some high resolution GIS-based research questions cannot be answered with these finds. Technological analyses and mid- to low resolution spatial distributions as well as palaeoenvironmental analyses with osseous artefacts are still possible. In this way, stray finds can still give us new insights into the Late Palaeolithic.

## 2 STRAY FINDS A SLEEPING (ALMOST DEAD) SOURCE OF KNOWLEDGE, LET'S BRING IT TO LIFE

**Abstract author(s):** Måge, Bjørnar (Museum Lolland Falster)

**Abstract format:** Oral

Stray finds are an important source for understanding the Stone Age people's use of the landscape. This is because commonly the archaeological activity in an area is evaluated over the number/density of stray find sites in an area.

In Denmark, the registered stray finds are directly used in risk assessment for encountering archaeological finds in connection with construction work. In Denmark, which is a very agriculture-based country, most stray finds have been found by farmers during field work. However, new cultivation methods and larger machines mean that today's farmers rarely walk on their fields and this source of stray finds is drying up. At the same time, knowledge about the stray finds and their circumstances of discovery is rapidly disappearing as the older farmers who made the finds are dying out. When stray finds just lie in drawers and cupboards out in the various farms and are not registered in a public national database, it is dead knowledge.

Archaeological museums and institutions have a major task in getting stray finds registered while there is time if we are to exploit the full potential of the stray finds. This is of special relevance, as stray finds have a direct influence on where actual archaeological investigations are initiated. To be able to utilize the full potential of them, it is therefore essential that a strictly uniform collection policy is introduced. This helps to evaluate, if the distribution of sites in the landscape reflects the real level of activity in the Stone Age. Otherwise, there is a risk that the distributions only testify to where the most tenacious amateur archaeologists live.

## 3 MUSARK AND GEOGRAPHIC VISUALISATION OF STONE AGE STRAY FINDS

**Abstract author(s):** Matsumoto, Mieko - Uleberg, Espen (Museum of Cultural History, University of Oslo)

**Abstract format:** Oral

This paper presents visualisations and analyses of georeferenced stray finds that are typologically dateable large stone tools. This dataset opens landscapes of sickles, daggers, and axes. Some of these objects are interpreted as symbols of power while others are seen as working tools. These landscapes are not necessarily the same as those described by excavated material and collected small artefacts and knapping debris.

The material is taken from MUSark, the database system for archaeological collections in the Norwegian University Museums. The objects are generally georeferenced, and the metadata includes the coordinate precision levels. The precision level reflects the find circumstances and the information recorded at the acquisition, and this varies greatly over 150 years of museum history. Early acquisitions often have lower precision levels while more recent finds can

have rather precise GPS-coordinates. The total dataset might be treated as archaeological Big Data – in the sense that it can be combined with a variety of datasets in different analyses.

The paper uses geographical Exploratory Data Analysis (EDA) to study the georeferenced artefacts. EDA is looking for patterns and anomalies in datasets, but does not imply a strictly inductive methodology, as some advocates of Big Data theory claim possible. The registered geographical precision levels and dating intervals in MUSark make it possible to include appropriate subsets at different time and space scale levels.

A major challenge is however to find optimal scale levels for each analysis. Certain patterns can be visible at only certain time and space levels, and the objects included in a certain analysis must have metadata values that make the combination meaningful. As an example, an analysis of covariation of artefacts with distance to prehistoric shorelines demands higher coordinate precision of the find and higher measuring precision of the elevation than covariation with large scale landscape types.

#### 4 **STONE AGE STRAY-FINDS IN WESTERN NORWAY: POTENTIAL FOR RESEARCH AND CULTURAL HERITAGE MANAGEMENT**

**Abstract author(s):** Bergsvik, Knut Andreas (University Museum, University of Bergen) - Aksdal, Jostein (Vestland county administration) - Lundström, Victor (University Museum, University of Bergen)

**Abstract format:** Oral

Stone Age stray finds from western Norway have been delivered to the Bergen University Museum since its foundation in 1825. These artifacts are found by non-archaeologists – mainly farmers – and make up more than 4000 entries in the database. Through the years, the finds have been important to local and regional research projects, however, until recently, they have not been subject to uniform classification systems. In a new project, which is a collaboration between the University Museum and Vestland county administration, the entire collection of stray-finds at the museum have been reclassified according to updated terminologies and systems, detailed georeferencing have been performed, and data on deposition is being collected and organized. This paper presents some results of this ongoing work and discusses the research potential of the databases. We argue that quantitative and chronological analyses of stray-finds are important proxies to studies of Stone Age demography, regional differences, and changes in land-use and settlement patterns, particularly when combined with distribution studies of surveyed and excavated archaeological sites. Important is also to relate the distribution of stray finds to digital environmental map databases on themes such as bedrock, soil types, temperature zones, and marine production. The database helps identifying new Stone Age settlements sites as well as locations for placed deposits. They therefore represent a great potential to cultural heritage management, considering that detailed knowledge of chronology and deposition of earlier finds is vital when preparing for archaeological fieldwork in areas planned for development.

#### 5 **UNITED BY CRISIS? A TRANSDISCIPLINARY LOOK AT THE EARLY NEOLITHIC COMMUNITIES IN THE SCHLETZ SETTLEMENT CLUSTER, AUSTRIA**

**Abstract author(s):** Maurer, Jakob (University for Continuing Education Krems, Center for Museum Collections Management) - Längauer, Julia (University of Vienna, Department of Prehistory and Historical Archaeology) - Irrgeher, Johanna (Montanuniversität Leoben) - Puschenreiter, Markus (University of Natural Resources and Life Sciences Vienna) - Novotny, Friederike (Natural History Museum Vienna) - Teschler-Nicola, Maria (Natural History Museum Vienna; University of Vienna, Department of Evolutionary Anthropology) - Pieler, Franz (State Collections of Lower Austria)

**Abstract format:** Oral

Schletz in the Lower Austrian Weinviertel ranges amongst the most prominent Linear Pottery culture sites in Europe, due to evidence suggesting a massive violent attack on the settlement around 5000 BC. However, the long history of the site and the surrounding region preceding this presumably final massacre is largely unknown. In our contribution, we present a summary of what we currently know, and an outlook on a proposed project, due to start in summer 2022, which aims to put the site into a regional context.

In recent years, new research on the site of Schletz delivered quite unexpected results. This includes e.g. first data of a systematic DNA-analysis of the excavated human remains as well as a reassessment of the stratigraphy of the sites fortification ditches. Furthermore, artefact scatters documented during line walking could indicate different functions of the various parts of the earthwork.

Schletz is often addressed as a "central site" and was likely surrounded by a cluster of smaller sites. We assume that knowledge of the surrounding settlements is crucial to better understand local LPC developments that might have led to the violent crisis on the central site. Most information we have on them exist in the form of stray finds (including human bone fragments with traces of perimortal injuries that might indicate that further sites within the settlement agglomeration were affected by violent events as well).

We want to show how we have used this existing "background of stray finds" to define working hypothesis and further project work. The latter includes line walking and finds processing together with Citizen Scientists, to find out more

about the structure and precise dating of the LPC settlements around Schletz, and the creation of a local isoscape map, in order to determine possible areas of origin of the dead of Schletz.

## 6 STRAY FINDS AND RITUAL DEPOSITIONS

**Abstract author(s): Larsson, Lars (Department of Archaeology and Ancient History)**

**Abstract format: Oral**

Deliberate depositions of objects in wetlands are extensive from virtually the entire prehistory of southern Scandinavia. These were probably especially common during Neolithic times

which is evident from the finds in a number of museum collections. Most extensive are the depositions that consist of flint axes. Almost all of these depositions have been found by the public during various works in former wetlands. One may ask whether it is possible to get an idea of how extensive the custom of depositing objects in wetlands really was? To try to get an idea of this, a special study was conducted of a limited area in the southernmost part of Scania, southernmost Sweden. Within the area, there was only one deposition of several flint axes stored in a museum collection. Previous inventories of the area have mainly registered objects from settlements on solid land.

The effort was carried out through inventories, but mainly by visiting the farms in the area, registering the finds that have been recovered, and thereby gaining knowledge about which objects have been found and where they came from. With few exceptions, they had been found in places that during Neolithic times consisted of wetlands. These sites were related to maps from the early 19th century before extensive drainage of wetlands began. This shows that almost all wetlands, even those of very limited extent, contain deposits of Neolithic objects. Not least with regard to exploitation, these results should provide a basis for considering wetlands, even those of limited scope, to a greater extent than previously prevailing.

## 7 FROM CHANCE FINDS IN BOGS TO WETLAND ARCHAEOLOGICAL SITES?

**Abstract author(s): Koivisto, Satu (University of Turku)**

**Abstract format: Oral**

Much of the early wetland archaeological fieldwork in Finland in the 19th and early 20th centuries was basically restricted only to revealing and recovering the sudden stray finds (e.g. wooden skis, paddles, sledge runners, and dugout canoes), which were exposed in wetlands through various land use processes, mainly manual ditching aimed at wetland drainage for agriculture and forestry. When these finds were suddenly recovered, there were no viable methods (apart from excavation) or interest in prospecting the surroundings of the find spots, and the artefacts were typically interpreted as stray finds lost accidentally or deposited intentionally in wet habitats for some ritual or otherwise unknown purposes in the distant past. Hundreds of wooden fish traps have also been revealed in Finnish bogs and shallow waterways through ditching and drainage operations. Recent studies have demonstrated that a fairly large proportion of the stationary wooden fishing structures are actually prehistoric and their find spots and environs are potential for human habitation and resource procurement. Re-evaluation and contextualisation of the fishery data has increased the number of Finnish wetland archaeological sites and furthered their consideration in archaeological research and interpretation. Older data in archives, reports and publications is thus relevant and useful for modern studies concentrating on the detection and evaluation of archaeological sites in wetland environments. Mapping and georeferencing the adequately documented find spots, studying and prospecting the sites, and targeting systematic dating programmes on the preserved organics (still at sites and in museums) would elucidate the contexts, types and dating of certain find categories. Their results would also provide better preconditions for heritage management authorities to evaluate the archaeological potential of certain wetland areas in land-use planning and threat mitigation procedures.

## 8 THE IMPLICATION OF STRAY BONE POINTS STUDIES TO THE FINAL PALAEOLITHIC AND MESOLITHIC RESEARCH IN LITHUANIA

**Abstract author(s): Rimkus, Tomas (Centre for Baltic and Scandinavian Archaeology - ZBSA)**

**Abstract format: Oral**

The 20th century in the territory of Lithuania was a period of a massive draining of wetlands and straightening of the riverbeds. Due to these reasons, many prehistoric bone and antler tools were unearthed that later became a part of private collections or were transferred to museums. Many of such finds ended up in scientific publications where their typology and shape were discussed, however, their chronology was only speculated.

Recent AMS investigations of osseous implements from the eastern Baltic revealed many new Final Palaeolithic and Mesolithic tools. These results enabled to highlight the continuation of Late Pleistocene technologies into the Early Holocene, and take a closer look into human adaptation to new hunting technologies. However, in comparison with other northern European territories, the dating and the significance of such finds in the territory of Lithuania have been poorly emphasized. In 2021 a new post-doc project focusing on the hunter-gatherer's technological development

in the eastern Baltic was launched. One of the main studied objects in this project is the bone points that are considered as the single finds or come from the wetland sites with complex stratigraphy. 16 bone points, that previously have been chronologically considered as the Final Palaeolithic and Mesolithic tools, have been sampled for AMS 14C analysis. The results presented in this paper allows not only to correct the bone points typo-chronological aspect but also consider the changes and adaptations in technologies, as well as shed light on the cultural history in the territory of Lithuania.

## 9 THE DISTRIBUTION OF ESTONIAN LATE NEOLITHIC AND BRONZE AGE STRAY STONE AND BRONZE ARTEFACTS: A QUANTITATIVE APPROACH

**Abstract author(s):** Johanson, Kristiina - Paavel, Kristiina (University of Tartu) - Sikk, Kaarel (University of Luxembourg) - Kriiska, Aivar (University of Tartu)

**Abstract format:** Oral

The distribution of Estonian Late Neolithic and Bronze Age (2800-500 BC) shaft-hole stone axes has been mostly used to describe the impact of early farming on the settlement pattern. However, the landscape context of these stray finds, their relationship to soils and partly contemporary stray bronze objects have not been examined.

We report the characterization of 141 find locations of stone axes and 48 find locations of bronze artefacts, as well as their associations to soils and settlements. The study takes a quantitative approach, by starting from site-specific data collection focused on local topography and hydrology, soils, and local environmental background. We seek to outline general tendencies in the distribution of stray finds on soils and the landscape, to discuss which activities or habitats they indicate, and to evaluate the influence of soils on human activities on the landscape within the broader context of the changing subsistence base.

The results show that the stray finds are not located randomly when it comes to soils. In particular, stone artefacts tend to be more often associated with dry land near rivers and streams, whereas bronzes have a quite clear preference for wet contexts. When compared to the find places of contemporary settlements, it is evident that the stray finds likely indicate various off-site systemic behaviours and the diversification of land use during the period, attested by distinct deposition activities for stone and bronze artefacts.

## 10 MESOLITHIC STRAY FINDS AS POINT OF DEPARTURE FOR A SURVEY ON WATERLOGGED SITES

**Abstract author(s):** Mahlstedt, Svea (Lower Saxony Institute for Historical Coastal Research - NIHK)

**Abstract format:** Oral

In northwestern Germany the Mesolithic is mainly known from stray finds. These include mostly flint but also random finds of organic material, from surface sites as well as rescue excavations, non-archaeological construction work and dredging. The finds are regularly registered in the state heritage database, which gives an overview and brings together information from very different collections.

To gain a better understanding of the regional Mesolithic especially in terms of chronology as well as developments in material culture and landscape use a survey for waterlogged Mesolithic sites was started in 2019, taking selected stray finds as a point of departure. After evaluating the site positions in respect to available landscape data about bogs, fens and transgression areas, some 20 sites seemed suitable for further investigation, such as field walking, coring, geophysical survey and excavations. The presentation shows first results and discusses the value of stray finds as indicator for preserved waterlogged find layers.

## 11 NICE TO HAVE OR NEED TO HAVE? STRAY FINDS, A KEY TO UNDERSTAND THE EARLY NEOLITHIC IN NORTHERN ZEALAND, DENMARK?

**Abstract author(s):** Aarsleff, Esben (Museum Nordsjælland)

**Abstract format:** Oral

Northern Zealand was an Eldorado for the people of the Early Neolithic (3900-3300 BC). The watery landscape with lots of open water and small dry elevations was highly attractive, and we find traces of activity on almost every field, in the shape of stray finds.

Stray finds are undoubtedly important in large scale analysis of different typology and distribution studies, just as they may be significant in identifying human presence in specific landscape setting. But on the small scale the impact of the stray finds is problematic, because what do they represent, when we do not have their exact context?

In the endeavor to comprehend the impact of stray finds, we have combined the mapped stray finds around the Søborg sø (Lake Søborg) with both surveying and excavations. It turned out that the soil contained hundreds of finds, mostly flakes, yet there were no neolithic features in the subsoil. This could of course be due to modern ploughing or erosion. Another explanation could be that some of the activities on the settlements did not leave traces in the subsoil, such as flintknapping for instance. The latter is supported by the fact that most of the excavated settlements in Northern Zealand contain numerous flakes in the cultural layers, but they are always secondarily placed. We have

never found actual knapping sites. Stray finds can, perhaps, indicate such knapping sites, but only if they are all collected with exact GPS coordinates, which is a huge work effort.

The paper will present recent attempts to combine stray finds with archaeological excavations, as well as some insight into the use of the thousands of stray finds that we store in the Museum of Northern Zealand.

## 12 LATE GLACIAL STRAY FINDS FROM THE COLONISATION OF BRITAIN DATABASE (ENGLAND AND WALES) AND HOW TO USE THEM

**Abstract author(s):** Mills, William (University of Oxford)

**Abstract format:** Oral

The Colonisation of Britain database (The Colonisation of Britain Project 2012; wessexarch.co.uk 2015) was developed from the personal archive collated by Roger Jacobi from the 1970's until 2009. It is the most extensive and detailed catalogue of Late Glacial sites in England and Wales. The database contains material from 67 cave sites, 95 open air sites and over 400 stray finds identified as Late Glacial. Whereas the cave and open air sites are relatively well defined, the stray finds are based on what are considered diagnostic characteristics and "type fossils". However the database is not without challenges, and "diagnostic" stray finds may vary considerably in resolution. The potential for these stray finds to provide further information on a landscape scale of Late Glacial occupation and dynamics is considerable. Not only do they fill in the gaps between recognised fully excavated assemblages, but also provide a means to examine multiple themes of landscape use and taphonomy. In some cases they may even lead to the identification of areas with high potential and the discovery of new sites.

## 13 STRAY FINDS AND THE MESOLITHIC OF NORTH-EASTERN ITALY: THE CASE STUDIES OF THE SILE RIVER SPRING AREA AND COMELICO

**Abstract author(s):** Fontana, Federica (Università di Ferrara - Dipartimento di Studi Umanistici - Sezione di Scienze preistoriche e antropologiche) - Visentin, Davide (Institución Milá y Fontanals, IMF-CSIC; Università di Ferrara - Dipartimento di Studi Umanistici - Sezione di Scienze preistoriche e antropologiche) - Bertola, Stefano (Università di Ferrara - Dipartimento di Studi Umanistici - Sezione di Scienze preistoriche e antropologiche)

**Abstract format:** Oral

North-eastern Italy is the best-known region regarding the Mesolithic of the peninsula and one of the richest in Europe both from a qualitative and quantitative viewpoint. Extensive research carried out during over 50 years allowed reconstructing a complex framework that is the result of three self-reinforcing factors: a) the high visibility of the record, especially in some topographic/ecological areas; b) the discovery of most sites by local amateurs; c) the intensive research activity carried out by research institutions.

The Sile River spring area in the Venetian Plain (between the provinces of Treviso and Padova) is the first case study presented. The second one deals with an upland territory known as Comelico (Belluno Alps), located close to the Austrian border. In both areas, stray finds identified by local amateurs represent the primary evidence. In the latest years, we have started profitable collaboration programs in both regions with the local offices of the Italian Ministry of Culture (i.e. Soprintendenze) and local public and private entities (e.g. municipalities, regional parks, private associations) and developed research projects aimed at valorising such evidence both from a scientific and disseminative perspective.

## 14 UNLOCKING THE INVISIBLE POPULATION OF THE LATE MIDDLE NEOLITHIC IN EASTERN DENMARK THROUGH STRAY FINDS. INVESTIGATIONS AROUND ROSKILDE FJORD

**Abstract author(s):** Struve, Emil (Roskilde Museum)

**Abstract format:** Oral

Documenting the Neolithic population on the island of Zealand, Denmark in period B (2800-2450 BC) of the Danish Middle Neolithic has proved difficult due to a lack of known settlements, as well as the continued use of previously constructed passage graves for burials throughout the period as well as the following Late Neolithic and Early Bronze Age periods. The only significant sites demonstrating the structure and organization of the population in the late Middle Neolithic around Roskilde Fjord are large palisaded enclosures built between 2800 and 2500 BC. So how do we get close to the population that constructed the enclosures without clear traces of settlements and graves?

The presentation gives an example of successful cooperation with local flint enthusiasts welcomed at the museum at special events, where stray finds are presented to professional archaeologists, benefitting both parties. The finder gains knowledge of the artefact, while the researchers gain knowledge of sites with scientific potential. In several cases, the events have been successful as a way for the museum to search the network for specific artefacts identified with research potential.

In the case of the missing late Middle Neolithic, the contacts gained by the network of enthusiasts led to a private collection not previously registered by ROMU (Roskilde Museum) or the database of the Danish Heritage Agency.

The collection gathered at the site of Grønshøj Mark displayed significant axe-types with characteristic scorching of fire. The stray finds demonstrate a site dated to the beginning of the sought after period and suggest a context with the potential to bring knowledge of both rituals and social structure of the period. Based on the potential of the stray finds, excavations are now underway at the site, and a shortcut between stray finds and research has been achieved.

## 15 HIDDEN LITHIC TREASURES. MUSEUM COLLECTIONS OF THE NEOLITHIC STONE TOOLS.

**Abstract author(s):** Kufel-Diakowska, Bernadeta - Chłoń, Marcin - Bronowicki, Wojciech (University of Wrocław) - Borowski, Michał (independent researcher)

**Abstract format:** Oral

In this paper we would like to present the result of studies on the collection of stray finds from SW Poland that consists of the macro-lithic tools dating to the Neolithic. The group of objects (more than 350) includes mainly axes, adzes and handstones made from various igneous, sedimentary and metamorphic rocks. Most of them became part of museum collections thanks to donations from the local community and surface prospection conducted by German archaeologist before WWII. Despite the undetermined context of the discovery, we consider them to be valuable source of information on the mobility, contacts and life of the Neolithic societies.

We used a combination of generally available methods in our research. Starting with application of systematic classification of macro-lithic tools, we were able to define cultural connections and chronological frames of the finds. While some of the objects are well recognised in other archaeological contexts in this area, number of specimens are represented only by stray finds. This is true mainly for a large group of the Eneolithic axes. The use of petrographic analysis allowed us to identify the type of raw material, as well as, in some cases, local and distant rock outcrops. Finally, the use of geographic information system (GIS) together with distribution of archaeological sites and settlement traces, gave use opportunity to link particular finds with the recognized episodes of the occupation of the early farming societies in the SW Poland. The studies are complemented by the technological and functional analysis based on microscopic observations in case of well-preserved pieces.

The obtained results confirm our opinion about the necessity to conduct research on collections of stray finds. These data complement the information gathered through excavations of the archaeological sites.

Studies are supported by the National Science Centre (NCN), Poland, decision No: UMO-2020/38/E/HS3/00285.

## 16 STONE BATTLE AND POLISHED AXES IN NW RUSSIA AS STRAY FINDS: POTENTIAL FOR ANALYSIS

**Abstract author(s):** Dolbunova, Ekaterina (-) - Mazurkevich, Andrey (-) - Stolyarova, Tatyana (-) - Kazakov, Eduard (-) - Rineyskaya, Tatyana (-)

**Abstract format:** Oral

Stone axes have been the most common category of Stone Age stray finds over the last 150 years in NW Russia. This has been the most overlooked and unexplored category, as they are often not precisely georeferenced and represent accidental single finds. They are housed in various regional museums and in local schools. Some of them did not survive and description in field diaries and catalogues appears to be the only source of information. As part of a scientific project on the study of the Stone Age in Northwest Russia, the collections of all regional museums in the Pskov and Smolensk Regions were analyzed and attributed, among which more than 400 axes were georeferenced and analyzed. The geographical distribution of axes covers the Upper Volga, Dnieper and Western Dvina rivers. A series of finds can be attributed to the Early Neolithic period (6th millennium BC), and the major part belongs to the Globular Amphora culture and CWC. Regional differences in distribution of different chronological types of axes were traced. Mapping of battle axes has shown that in addition to single finds, there are several concentration areas, most likely burial sites. Comparison with stone axes types found on the settlements in this region allows refining their chronological position and attribution. GIS-analysis of different axes types' distribution and known archaeological settlements allows reconstruction of networks for different Neolithic phases.

## 17 SCULPTED STONE WEAPONS IN NORTHEASTERN EUROPE IN THE 3RD MILLENNIUM BC: STRAY FINDS AS RITUAL DEPOSITS?

**Abstract author(s):** Kashina, Ekaterina (-) - Mantere, Ville (University of Turku) - Zhulnikov, Aleksandr (-)

**Abstract format:** Oral

More than 50 sculpted stone maces and axes have been found as stray finds in Northern Russia, Finland and Sweden during the 19th and early 20th century. They mostly represent heads of different animals, the brown bear (*Ursus arctos*) being the most common. The find contexts of the sculpted stone maces and axes strongly indicate their deliberate abandoning/burying outside settlements. In 1999, archaeologist Aleksandr Zhulnikov managed personally to find a bear-head axe in the vicinity of the excavated settlement Beryozovo in Karelia. This find provides unique modern-day insights on the find circumstances of sculpted stone weapons. Based on their raw materials as well as on their

technological, morphological, and stylistic qualities, the items can be dated to the 3rd millennium BC. The artefacts are closely associated with the cultural influence of Corded Ware/Battle Axe Culture groups, which apparently led to locally distinct changes in earlier hunter-gatherer beliefs. The different states of the sculpted stone weapons (intact, broken, re-made, polished) can give meaningful hints to the objects' life histories. Consequently, the study of the artefacts leads us to wider issues related to the interaction between hunter-gatherers and the first agricultural groups in northeastern Europe during the Late Neolithic/Early Bronze Age transition. It is thought-provoking that even though the widespread stone weapons and their find contexts clearly reflect the Corded Ware influence in the taiga region, there is still an absence of proper Corded Ware materials especially in Northern Russia. The sculpted stone artefacts also raise important questions concerning the new spiritual role of the bear, as bear imagery is almost absent in the hunter-gatherer art of the 4th millennium BC.

---

## 330 SUSTAINABILITY IN ARCHAEOLOGY AND TODAY: AN INTERDISCIPLINARY APPROACH

**Theme: 5. Climate Change and Socioenvironmental Perspectives**

**Organisers: Civilyte, Agne (Lithuanian Institute of History) - Zubrow, Ezra (New York State University of Buffalo)**

**Format: Regular session**

As archaeologists, we are aware that sustainability is not a new issue for human societies. There are many examples of sustainable practices in prehistoric and protohistoric societies, ranging from agricultural methods, organizational forms and economic traditions on the large scale, to specific materials and technological innovations on the small scale. This session first of all examines a range of what archaeologists have learned about how past people created sustainable, long-term solutions to their problems. Then, where they failed. Emphases will be placed on questions such as environmental diversity, social structure, cognition, and the role of clustering in innovations and technology to name a few.

Archaeologists are able to determine which materials were used for production and which for consumption. They consider the role of capital, rent, and labor in forming investment, quality control, and technology. One needs to analyze primary, secondary and tertiary uses as well as recycling to understand the above.

Techniques applied for the physico-chemical, structural and characterization of ancient materials are based on methods used in the Material, Natural, and Engineering Sciences. Consider the use of the Life Cycle of Artefacts where the cycle begins with comparative decision trees, investment of time, labor and capital in the harvesting and extraction of resources, followed by production, marketing, consumption, recycling and ultimately waste. For archaeologists, the Life Cycle can be the bridge between innovation and sustainability and may be analyzed through information flows as well as the application of transdisciplinarity to research. Thus with this session we hope to cooperate with the actors from various fields of material natural and Engineering sciences to resolve problems that could not be solved either by single disciplinary or multidisciplinary research.

### ABSTRACTS

#### 1 AN INTRODUCTION TO AN INTERDISCIPLINARY APPROACH TO SUSTAINABILITY

**Abstract author(s): Goldstein, Lynne (Michigan State University - Retired)**

**Abstract format: Oral**

This presentation serves as an introduction to the session topic. As archaeologists, we can provide many examples of past sustainable practices, and hopefully, point to lessons that are relevant today. Conducting a project in archaeology and sustainability generally requires a long-term commitment because of the complexity of issues and processes, the application of both traditional and new technologies, and place-based approaches to provide the best context. Also critical are true collaborations with a variety of local communities, stakeholders, and scholars, including those in other fields who may collaborate on examining these issues in detail and from other perspectives. Archaeology as a source of historical knowledge has been used to document and understand (1) long-term historical trajectories of human-environmental interactions, (2) responses to natural hazards, (3) legacies of past land-use patterns, (4) modeling or historical analogs of past human-environmental ecosystems, and (5) natural versus anthropogenic agents of change. Long-term, place-based, collaborative, interdisciplinary research and the development of collaborative relationships with local communities and other experts are significant additions to this traditional list.

#### 2 REVERSE ENGINEERING, SUSTAINABILITY AND ARCHAEOLOGY

**Abstract author(s): Zubrow, Ezra (University at Buffalo; University of Cambridge) - Lindström, Torill (University of Bergen)**

**Abstract format: Oral**

Erika Guttman-Bond's 2019 book "Reinventing Sustainability: How Archaeology Can Save the Planet" documents how archaeological discoveries are relevant to modern climate change and sustainability. It focuses on prehistoric

wetland agriculture, deserts, food security, saving the soil, and vernacular architecture. The principles of reverse engineering are pertinent to this task.

Engineering designs, manufactures, assembles, and maintains products and systems. Forward engineering typically moves from abstractions to new physical products. Reverse engineering is the opposite. The design and functioning of a product are recreated using a physical object as the starting point. The physical article contains all known information since all plans and documentation are missing. In many archaeological cases there is only a part of the physical artifact surviving. Reverse engineering begins by examining the object or system with its complicated geometry projecting the entirety and reconstructing it analytically and functionally. Second, one takes the article apart and reassembles it in order to make sure one knows the processes by which the object works. Third is the process of substituting obsolete or inefficient parts with more efficient replacement parts. Fourth, one reintegrates the parts and processes. Fifth is testing the reengineered prototype in its entirety. Finally, one releases the reengineered product.

This paper provides modern and prehistoric examples. If Guttman is right then reverse engineering will be an important innovation process to help develop sustainability as climate change proceeds.

### 3 “DIG DEEP, THINK BIG”: ARCHAEOLOGY AS CLIMATE ACTION

**Abstract author(s):** Riel-Salvatore, Julien - Burke, Ariane (Université de Montréal) - Lyon, Christopher (McGill University)

**Abstract format:** Oral

Archaeology informs us about the resilience of human societies as they faced past climate change. As a discipline, however, it has had a challenging time providing operationalizable strategies for contemporary use. Drawing on two recent multidisciplinary efforts involving archaeologists, we explore how lessons drawn from the archaeological record can be profitably recruited in the ongoing effort to mitigate and adapt to contemporary climate change. First, drawing on a study showing the importance of thinking about and modeling climate change over centuries, as opposed to decades, we argue that an 'archaeological temporality' where the long-term, compound effects of concerted actions take precedence over individual action is necessary if we are to transcend the tyranny of short-term thinking. Then, we show that the archaeological record contains numerous examples of humans coming together to engage in important, large-scale projects (e.g., monumental architecture) that unfolded over several generations, producing lasting cultural signatures. Finally, turning to the archaeology of climate change, we suggest drawing on these insights to propose that humanity must tap into its 'natural reliance' on long-term, multigenerational projects to reframe the scale at which climate action must be enacted and encourage people to recognize that they are participating in a project bigger than themselves, the fruition of which they may not live to see, but which constitutes a lasting heritage for future generations, transcending time and individual lifespans.

### 4 THE ANIMALS OF OLD EUROPE. THE BREAKDOWN OF THE NEOLITHIC MODEL OF SUSTAINABILITY

**Abstract author(s):** Marciniak, Arkadiusz (Adam Mickiewicz University, Poznań)

**Abstract format:** Oral

The profound transformation of constituent elements of the Neolithic mode of existence brought into Europe by farmers migrating from the Near East led to unprecedented growth of communities of Southeastern Europe, the development of genuinely European progenitorial economy, and their long-lasting persistence known as the Old Europe phenomenon. The development of new forms of husbandry practices arguably provided important foundations for the unprecedented growth of these groups and the development of distinct sustainable practices. These involved an effective re-designing of the inherited husbandry tradition of early Neolithic farmers, the development of secondary products mode of exploitation, the adaptation of major Neolithic domesticates to different environmental and ecological zones, and changes in cattle and sheep genomes and morphologies.

However, the persistence of the Old Europe sustainability model was not long-lasting. In subsequent centuries, dysfunctions in their different domains were becoming evident. As animals were clearly important for the development of the Old Europe system, the transformative character of husbandry practices upon its breakdown and ultimate demise must have played an important role in this process. In this paper, I will hypothesize three major effects of transformations in husbandry practices introduced by the local farmers that ultimately significantly contributed to the breakdown of the Old Europe mode of sustainability. These comprise: (a) the newly developed modes of consumption became inefficient and ineffective in a long run, (b) sheep and cattle husbandry practices, along with environmental conditions, affected their genomes and contributed to the decline in livestock productivity towards different animal products, and (c) shortening the distance to animal herds kept at settlements led to the emergence infectious zoonotic diseases and eventual prevalence of various pathogens in both humans and livestock.

## 5 NATURE AND NURTURE: EXPLORING APPROACHES TO LANDSCAPE MANAGEMENT IN THE LATE BRONZE AGE SOUTHEASTERN BALTIC

**Abstract author(s):** Minkevicius, Karolis - Piličiauskienė, Giedrė - Podėnas, Vytenis - Micelicaite, Viktorija - Čivilytė, Agnė (Lithuanian Institute of History)

**Abstract format:** Oral

Effective management of available resources plays a key role in the survival of human populations. This economic aspect is crucial not only for modern, but also for prehistoric populations. The earliest attempts to mitigate the risks posed by the resource scarcity could be traced back to the Neolithic as illustrated by the emergence of subsistence economy. However, this was only the initial step. The necessity to shift towards more sustainable ways of living gradually increased with the demographic growth and the ramping up of agricultural activities.

Agrarian intensification witnessed in northern Europe during the Late Bronze Age presents a case for similar effort. This topic is currently being explored in an ongoing research project "Late Bronze Age (1100–500 BC) economy in the eastern Baltic region: towards a new model", aimed at examining different subsistence strategies and economic adaptations of Bronze Age populations. Our findings are presented in two case studies from Lithuania.

Recent excavations of Mineikiškės and Garniai I enclosed hilltop settlements produced rich archaeobotanical and zooarchaeological collections. Further analysis of these finds provided new insights into the Bronze Age subsistence economy. Our results suggest that certain crops and domestic animal species were especially significant, which could be linked to the surrounding environment. Also, stable  $\delta^{13}C$  and  $\delta^{15}N$  stable isotope analysis of osteological and charred plant remains present information on local conditions and present an opportunity to explore landscape management practices employed by local Bronze Age populations.

## 6 DIET IN BRONZE AGE EUROPE AS REVEALED BY ZONOTIC PARASITES FROM SEDIMENTS AND COPROLITES

**Abstract author(s):** Ledger, Marissa (Faculty of Medicine and Dentistry, University of Alberta; Department of Archaeology, University of Cambridge) - Grimshaw, Elisabeth - Fairey, Madison (Department of Archaeology, University of Cambridge) - Ballantyne, Rachel (McDonald Institute for Archaeological Research, University of Cambridge; School of Archaeology, University of Oxford) - Knight, Mark (Cambridge Archaeological Unit, University of Cambridge) - Mitchell, Piers (Department of Archaeology, University of Cambridge)

**Abstract format:** Oral

Palaeoparasitology, the study of parasites in past populations, affords us the opportunity to not only understand gastrointestinal infections in the past, but also many aspects of diet and thus the sustainability of dietary sources. Due to the unique life cycles and specific intermediate hosts of many parasites, their presence can be used to study sources of nutrition, methods of food preparation, human-animal interactions, and disposal of waste in the past. Here we present the results of the palaeoparasitological analysis of sediments and human coprolites from the Late Bronze Age pile-dwelling settlement of Must Farm, Britain (865–840 cal BC) in conjunction with previous studies undertaken on Bronze Age sites in Europe. We will discuss the value of these parasites for understanding diet in the past.

Coprolites and occupation layer sediments from Must Farm were studied using microscopy and enzyme-linked immunosorbent assay to identify preserved helminth eggs. The samples from Must Farm contained eggs from four zoonotic parasite species including *Capillaria* sp., fish tapeworm (*Dibothriocephalus* sp.), *Echinostoma* sp., and giant kidney worm (*Diocotophyma renale*). Four other Bronze Age sites in Europe, located in Austria, Britain, France, and Czech Republic have been studied for parasites revealing further evidence for fish tapeworm (*Dibothriocephalus* sp.) and one other potential zoonotic parasite of humans, *Dicrocoelium* sp. Three of the identified zoonotic parasites are transmitted via ingestion of raw or undercooked marine organisms. The location of the sites, and proximity to freshwater, are clearly important factors in the acquisition of these zoonotic parasites. Those living at Must Farm appear to have lived a sustainable lifestyle by harvesting a portion of their food from the water around them. Similarly, food preparation methods and waste disposal practices that would have allowed for transmission of these parasites in the communities will be discussed.

## 7 TOWARDS SAFE AND SUSTAINABLE FOOD

**Abstract author(s):** Zabulione, Aelita - Šalaševičienė, Alvija (Kaunas University of Technology) - Alvalade Ximenes, Alexander A. (Columbia University in the City of New York) - Urbonaitė-Ubė, Miglė (Klaipėda university) - Bertasius, Mindaugas (Kaunas university of technology) - Čivilytė, Agnė (Lithuanian institute of history)

**Abstract format:** Oral

Europe's plates today will determine the plight of its people's health tomorrow: the way in which food is farmed, fished, processed, distributed, valued, prepared, consumed and wasted must change to ensure that environmental, social, and economic sustainability as well as food safety become core assets of the EU's food systems. This paper

represents the perspectives of research and innovation as critical tools for the EU in the transformation towards safe and sustainable food systems for people, our planet, and the climate (SSFS).

We are convinced that food is more than just biomass as input for life support, bio-fuel, or bio-based products. Food has relevant historical, social, cultural, geographic, environmental and economic dimensions. Accordingly, we strongly suggest a multi-sector analysis featuring the (bio-based) material, (bio)-energy, technology, health, tourism, and transport sectors. These entities would address co-product valorization, waste and co-products as energy sources and energy input for all steps in the food chain, novel technologies (including ICT), the relationship between food and health, multi-functional agriculture, globalized food chains and local-to-local production concepts respectively. Indeed, these examples may extend to various other sectors as well.

Collaborating with archaeologists is very important because their methodologies—such as ( $\delta^{13}\text{C}$ ), ( $\delta^{15}\text{N}$ ), chromatographic analysis, and others—enable us to reconstruct the food chain, gauge the sustainability of food production, as well as identify health problems caused by poorly prepared or distributed food. In turn, this interdisciplinary approach helps us understand the essential elements of healthy and sustainable food production.

## 8 A LONG VIEW OF THE ENVIRONMENTAL EFFECTS OF COPPER PRODUCTION

**Abstract author(s):** Fregni, Elpidia Giovanna (No affiliation)

**Abstract format:** Oral

This paper explores the environmental impact of early metal industries drawing on samples from archaeological cases and experimental work.

In modern copper mining operations, pollution from extracting and refining sulphide ores contaminates soil and waterways through processes of extraction, leaching, and smelting. This results in long-term environmental impacts that are toxic to nearly every living thing.

In prehistory copper was processed by smelting carbonate and sulphide ores using charcoal in open roasting beds and furnaces, allowing the contaminated slag and waste minerals to remain in the ground. Using examples from known ancient copper processing sites in Europe and Britain, this paper will examine the evidence of long-term contamination in different environments and soil types. This will further be compared to soil samples taken from sites where experiments in copper ore processing and smelting have been conducted that replicated Bronze Age metal technology.

This data in this paper is not only relevant to research in prehistoric metals technology, but it also illustrates the long view of metallurgical industrial waste. By understanding the environmental impact made by Bronze Age metal industries, through both ancient technology and in modern experiments, we will gain a greater understanding of the long-term environmental effects of these activities.

## 9 CHARACTERIZATION OF HEAVY METALS FROM PHOSPHATE ROCKS

**Abstract author(s):** Nzihou, Ange - Lyczko, Nathalie (IMT Mines albi)

**Abstract format:** Oral

Phosphates are among the most used compounds in various sectors of our daily life. This broader utilization is due to its wide range of chemical, physical and thermal properties of the phosphate-based materials that are produced.

The main source of phosphate is the sedimentary rocks mainly composed with apatite (Chlorapatite  $\text{Ca}_5(\text{PO}_4)_3\text{Cl}$  · Fluorapatite  $\text{Ca}_5(\text{PO}_4)_3\text{F}$  · Hydroxyapatite  $\text{Ca}_5(\text{PO}_4)_3(\text{OH})$ ). Apatite is also the main constituent of bones and teeth especially. In addition to the apatite, the phosphate rock is composed of a wide range of metal elements which the characterization is important prior processing towards phosphates-based materials.

In this presentation, we will address the characteristics and composition of phosphate rocks with a particular focus on heavy metal elements characterization. A comparison of the relevance of various techniques will be made as for their ability to generate quantitative and qualitative data, and how they could be combined to overcome some issues such as the precision and accuracy.

## 10 INSIGHTS ON TOXIC METALS AND THEIR IMPACT ON THE ENVIRONMENT AND HUMAN HEALTH IN THE BRONZE AGE

**Abstract author(s):** Civilyte, Agne (Lithuanian institute of History)

**Abstract format:** Oral

M. Harper examined the potential exposure of prehistoric Bronze Age workers to toxic metals [1]; however, this topic remains understudied. Metallurgical practices such as bronze soldering, in particular, endangered the wellbeing of the individuals that undertook activities of this nature. Indeed, we need to think about how many harmful substances people have used during the mass bronze production, what kind of vapors or fumes they inhaled and how danger-

ous it was for their health. To be sure, the treatment of metals was not the only hazardous activity. Wood and possibly other kinds of biomass used for huge bonfires and furnaces polluted the environment as well.

Permanent use of bronze artifacts was potentially furthermore problematic. Big metal necklaces and arm-rings may also have had adverse effects on the human body. Traces of such use indicate that bronze was worn every day. The question here becomes, what was the price of wearing bronze?

This paper addresses the above points of inquiry. It also deals with analysis conducted on select bronze artifacts from different periods of the Bronze Age, with the aim of presenting the percentage of metal components in the alloy with a special focus on toxic metals. Moreover, we will try to shed light on theoretical questions about the social positions of metalworkers and those who wore metal jewelry. Last but not least, this paper also aims to propose the collaboration of archaeologists and medical scientists to establish a multi-disciplinary understanding of metal toxicity and its impact on the environment and human health.

[1] M. HARPER. „Possible toxic metal exposure of prehistoric bronze workers,“ *British Journal of Industrial Medicine* 1987;44:652-656

## 11 WASTE OR NO WASTE. THE BENEFITS OF GOOD ORGANIC PRESERVATION IN WELLS

**Abstract author(s):** Staeuble, Harald (Archaeological Heritage Office Saxony)

**Abstract format:** Oral

Archaeological features with good preservation of organic materials, like prehistoric wells, offer exceptional possibilities in understanding more about the use and decay of these prehistoric structures. This applies to many aspects we can analyse, from planning to building and from using until its abandonment by backfilling. Apart from the conventional archaeological reasoning and analysis of the find materials as well as of the sediments within the wells, several results are obtained by non-archaeological methods. These range from the nowadays 'conventional' archaeobotanical, archaeozoological and entomological analyses to geochemical soil and thin section analyses of the sediments. Moreover, the well preserved wooden objects are analysed using dendrology and 3D scans are made to document the toolmarks in detail as well as to reconstruct the construction in a manner which neither builders nor excavators ever saw. Finally we also recovered unconventional ceramic vessels which were coated with bast stripes on tar. The only way to visualize the hidden ceramic surface and recognise the original decoration we use X-Ray micro computed tomography. This helps to understand the different steps of the life cycle of these special ceramics until their deposition in the well.

## 12 RECYCLING OF METAL IN BRONZE AGE. AN OVERVIEW OF SUSTAINABILITY PHENOMENON RELATED TO THE HUMAN BEHAVIOUR

**Abstract author(s):** Delfino, Davide (Geocience Center of University of Coimbra)

**Abstract format:** Oral

The numerous and widespread presence of bronzes hoards, as well as the evidence of bronzists workshops along with Europe, suggest that the phenomenon of bronze recycling was a fairly widespread phenomenon starting from the late Middle Bronze Age, but especially in the Late Bronze Age. A certain postmodernist vision of archaeological data has minimized an obvious human behavior, that is the optimization of resources, to the advantage of an outdated ritualistic vision for many hoards of the Bronze Age often taking into consideration only part of the available data. An overview of some archaeological clusters that include hoards of melters will be presented, also taking into account archaeometallurgical data, to then analyze the phenomenon on a larger scale from a point of view of transregional events and socio-economic scale especially for the Late Bronze Age. The sustainability that can be deduced from the use of recycling of the bronze in a particular phase of the Protohistory, is an indication of the part of human behavior that prefers the optimization of available resources: in the case of bronze metallurgy, among many considerations, there is it is also that of using less wood for the simple melting of the metal alone compared to the double operation of smelting from mineral to metal and subsequent melting.

## 13 HISTORICAL CHARCOAL PRODUCTION: ARCHAEOLOGY, ECOLOGY AND ECONOMY

**Abstract author(s):** Nelle, Oliver (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart)

**Abstract format:** Oral

Historical charcoal production had a crucial role in enabling metallurgical processing and supplying cities with energy. The production of charcoal in kilns was a common practice, with thousands of people working this trade, and with immense consequences for woodlands and landscapes until today. This importance for human civilisation is contrasted by a still to be developed "niche research" on charcoal production up to now. Charcoal kiln sites serve as archives for woodland history on a fine spatial resolution. They are witnesses of on-site woodland activities, as well as provide information on tree species composition since the charred wood originated in far most of cases from the direct vicinity. Such a spatial resolution makes a reconstruction of forest dynamics on a stand level possible. Kiln sites

are an archaeological legacy. Investigating historical charcoal production is a highly interdisciplinary field. Questions of geography and sustainability of charcoal landscapes, ecology of woodlands, economy of wood supply and sociology of the charcoal burners merge and interact. Different sources and archives contribute to an integrated understanding: written documents; archaeological monuments; charcoal as direct left-over of the activities; charcoals in soils and sediments as a fall-out and pollution. It is an ideal subject to bring together researchers and practitioners.

## 331 POSSIBILITIES AND CHALLENGES OF THE ARCHAEOLOGICAL SCIENCE REVOLUTION IN THE CAUCASUS

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Passerini, Annapaola (Cornell University) - Maurer, Gwendoline (University College London) - Batiashvili, Magda (Sapienza University of Rome) - Ismayilova, Narmin (University of Birmingham) - Antonosyan, Maria (Max Planck Institute for the Science of Human History; Institute of Molecular Biology NAS Armenia)

**Format:** Regular session

The advent of the archaeological science revolution has considerably changed archaeological research, but also raised issues regarding the integration of old and new data produced by fundamentally different approaches. This problem is particularly extant in the Caucasus, where the opening toward international collaborations has allowed an infusion of archaeological science applications to answer long-standing archaeological questions regarding the influence or role of the Caucasus in Eurasian prehistory (e.g. animal domestication, demographic changes, chronology). The position of the Caucasus at the bridge between Soviet and post-Soviet approaches often justifies the use of archaeological science as a "solution" to incorrect more "traditional" (often deemed less advanced) approaches. However, this highly undermines the potential of integrating old and new data and the complementarity of "new" and "traditional" approaches to the above-mentioned problems, from the Neolithic to the Middle Ages. This session emerges from reflections brought forward by "The Caucasus Through Time Network" (CTTN), a research network aimed at fostering the development of archaeology in the Caucasus. Inspired by over a year of CTTN interdisciplinary lectures, this session challenges speakers to rethink the dichotomy between the old and the new, and to reflect on how archaeological science can be better integrated with other archaeological traditions in the Caucasus. We welcome case studies that relate to archaeological science techniques (e.g. scientific dating, GIS, quantitative modeling, biomolecular and isotope studies, zooarchaeology and paleobotany) and that reflect on one or more of the following issues: what are the main challenges to include new techniques into field projects in the Caucasus? How reliable are new techniques in answering archaeological questions? And how do the old and new data compare and contrast in different case studies?

### ABSTRACTS

#### 1 COLOUR OF THE PAST. FIRST ARCHAEOMETRIC INVESTIGATIONS OF CAUCASIAN ROCK ART PAINTINGS IN GEORGIA

**Abstract author(s):** Batiashvili, Magda (Science and Technology for the Conservation of Cultural Heritage) - Gallinoro, Marina - Restelli, Francesca (Department of Ancient World Studies) - Medeghini, Laura - Bofficelli, Michela (Department of Earth Sciences, "Sapienza" University)

**Abstract format:** Oral

This research presents the first archaeometric study of the rock art sites of Damirgaya and Trialeti, as well as the Neolithic settlement of Khramis Didi Gora in Georgia's South Caucasus. The goal is to characterize rocks and pigments, assess painting technology, including the potential identification of organic binders and the compatibility of inorganic pigments with locally available minerals.

A first stylistic comparison is hereby provided with adjacent archaeological sites in Armenia, Azerbaijan, and Anatolia, where traces of monochromatic red pigment were found in settlements, barrows, on items such as grinding tools, and primarily on rock art. To determine the mineralogical and chemical composition of the materials (rocks and pigments), several analytical techniques were utilized, including Optical Microscopy (OM), cross and thin sections, X-ray Powder Diffraction (XRPD), and Scanning Electron Microscopy with Energy Dispersive X-ray analysis (SEM-EDX). Moreover, inorganic compounds were also better described in both rock art and grinding tools thanks to the contributions of Fourier-Transform Infrared (FTIR) and Raman Spectroscopy. Organic substances such as binders were not detected. In terms of pigments, hematite was the main coloring agent. For what concerns the rock samples, Trialeti proved to be an igneous basaltic rock - dacite, whilst Damirgaya is a rock primarily containing quartz, but also other minerals such as iron oxides and phyllosilicates.

## 2 A TECHNOLOGICAL ANALYSIS OF THE STONE ARTIFACTS FROM AGHITU-3 CAVE AND ITS IMPLICATION ABOUT UPPER PALEOLITHIC SETTLEMENT IN ARMENIAN HIGHLANDS

**Abstract author(s):** Jabbour, Firas (Eberhard Karls University of Tübingen, Department of Early Prehistory and Quaternary Ecology, University of Tübingen; The Role of Culture in Early Expansions of Humans - ROCEEH, Heidelberg Academy of Sciences and Humanities at the University of Tübingen) - Gasparyan, Boris (Institute of Archaeology and Ethnography, National Academy of Sciences, Yerevan) - Kandel, Andrew (The Role of Culture in Early Expansions of Humans - ROCEEH, Heidelberg Academy of Sciences and Humanities at the University of Tübingen)

**Abstract format:** Oral

This paper presents the results of a study of the Upper Paleolithic stone artifacts from Aghitu-3 Cave, situated in southern Armenia along the Vоротan River. Excavations revealed five archaeological horizons (AHs) that provide evidence of occupation. Notable finds include shell beads, an eyed bone needle, and other bone tools, plus a large assemblage of lithic artifacts. These layers date between 39,000 and 24,000 years ago.

Our previous work provided an overview of the typological nature of the toolkits and their associated cultural attributes. Here, we aim to better understand the lives of those who lived in the cave, the challenges they faced, and how their behavior changed over time. Therefore, we conducted a technological study of each of the cores, tools, and tool fragments. For the cores, we focused on their manufacture, preparation, and reduction. For the tools, we focused on their shape, manufacturing technique, selection, distribution of retouch, and functional details. We also conducted experiments to gain a deeper understanding of some basic patterns and to further examine unique artifacts.

As a result of the technological study, we divided the Upper Paleolithic settlement at Aghitu3 into three main phases. During the early Upper Paleolithic (AHs VII and VI), people relied on large, narrow-faced cores to produce their tools. Based on a smaller number of artifacts, we see diverse types of tools and the variety of activities, and conclude that people used the cave as a temporary camp for stays of shorter duration. During the middle and late Upper Paleolithic (AHs III D-A), people relied on smaller, wide-faced cores. Based on a greater number of artifacts, we observe many types of tools a variety of activities, and conclude that people used the cave as a seasonal camp for stays of longer duration.

## 3 ELEMENTAL COMPOSITION AND LEAD ISOTOPES OF COPPER-BASED ARTIFACTS FROM TEL BET YERAH (KHIRBET EL-KERAK): NEW INSIGHTS ON THE KURA-ARAXES DISPERSION

**Abstract author(s):** Ben-Yosef, Erez - Yagel, Omri (Tel Aviv University) - Harlavan, Yehudit (Geological Survey of Israel) - Shalem, Naama - Paz, Sarit - Greenberg, Raphael (Tel Aviv University)

**Abstract format:** Oral

Tel Bet Yerah (Khirbet el-Kerak) is a large, fortified site on the shore of the Sea of Galilee. During the earlier part of the Early Bronze Age (EB) III (c. 2880–2700 calBC) it attracted the interest of producers/consumers of "Khirbet Kerak ware" (KKW) – a Levantine variant of the Kura-Araxes ceramic tradition that originated in the southern Caucasus and eastern Anatolia. This phenomenon, which is often considered as an indication for the arrival of people from the Caucasus to the southern Levant, has been subjected to various interpretations, especially in regard to the process of migration. Here we aim at shedding new light on this process through the study of the metal artifacts from the site (using methods from the archaeological sciences). The 2003–2019 excavations yielded approximately 30 metal items from the EB III (from both contexts with KKW and without), and the preceding EB II (c. 3100 – 2880 calBC). They include mainly copper-based objects (short rods, pins, wires, and fishing hooks) as well as a gold nail and a gold bead. We analyzed ten of the copper-based artifacts for elemental and lead isotope composition in order to assess their quality and to identify the geological origin of the copper. The results indicate that already during the EB II the copper used in Tel Bet Yerah originated in northern and north-eastern regions (Anatolia and the Caucasus or northern Iran), and that this source remained dominant during the period associated with KKW finds. Only one of the artifacts (from the EB III) originated in the "local" source of the Arava Valley. The early trade with northern metals can be seen as a precursor of the ensuing movement of people, who most probably chose destinations based on existing connections and the world known to them at the time.

## 4 POSSIBILITIES AND CHALLENGES OF USING STABLE ISOTOPE ANALYSIS TO INVESTIGATE KURA-ARAXES 'PASTORAL' ECONOMIES AND MOBILITY PRACTICES IN NACHCIVAN

**Abstract author(s):** Maurer, Gwendoline (UCL - University College London)

**Abstract format:** Oral

Recent years have seen an infusion of the application of isotopic analysis on bio- and zoo-archaeological materials from the Caucasus. Even though isotopic analysis is an immensely powerful tool for exploring major themes in the Archaeology of the Caucasus such as past mobility, past economies, past human-environment interaction, and individual life histories, we should remain conscious of the limitations and caveats of stable isotope analysis as a

stand-alone approach to answer socio-economic questions. Often to enhance interpretations closer integration of isotopic data with more traditional archaeological data as well as inter-disciplinary datasets (geology, environmental sciences, earth sciences) is necessary.

This paper thereby focuses on evaluating the possibilities and challenges of using oxygen ( $\delta^{18}\text{O}$ ), carbon ( $\delta^{13}\text{C}$ ) and strontium ( $^{87}\text{Sr}/^{86}\text{Sr}$ ) isotopic analysis on tooth samples of domestic livestock (sheep and goat) from Maxta I, to answer questions regarding the poorly understood pastoral activities, i.e., degree and extend of mobility, seasonal organisation, and land use strategies of the Kura-Araxes cultural horizon (3500 – 2400 BCE) in Nachcivan. Framing pastoral mobility and economies among the Kura Araxes cultural complex has the potential to address its role in its widely debated spread across the Near East in the 3rd millennium BCE.

## 5 WHAT CAN MOLECULES TELL US? RECONSTRUCTION OF FAUNAL DIVERSITY IN THE LESSER CAUCASUS IN THE PAST 30,000 YEARS

**Abstract author(s):** Antonosyan, Mariya (Department of Archaeology, Max Planck Institute for the Science of Human History; Institute of Molecular Biology, National Academy of Sciences of Armenia) - Davtyan, Armine - Mkrtchyan, Satenik (Institute of Molecular Biology, National Academy of Sciences of Armenia) - Petraglia, Michael - Boivin, Nicole (Department of Archaeology, Max Planck Institute for the Science of Human History) - Yepiskoposyan, Levon (Institute of Molecular Biology, National Academy of Sciences of Armenia) - Amano, Noel (Department of Archaeology, Max Planck Institute for the Science of Human History)

**Abstract format:** Oral

Fossils are excellent sources of information for investigating past biodiversity, palaeoecology, and human activity. However, the accuracy of fossil identifications mainly relies on the easily observable morphological characteristics, making the classification of fragmented or taxonomically-mixed bone records challenging, if not impossible. With the advancement of biomolecular techniques in the past 20 years, novel methods have been developed to back up the identification and analysis of biological markers preserved in fossil bones. This has revolutionized the whole field of archaeological sciences offering excellent potential for extracting a greater array of information from the available data.

A necessary premise for biomolecular research is sufficient preservation. Cave systems represent an ideal environment for such investigations since they often contain relatively complete stratigraphic deposits coupled with stable environmental proxies, as minimal temperature and humidity fluctuations that proved to be favorable for molecular preservation. Karin Tak is one such cave that is characterized by a high rate of ancient biomolecules preservation, which creates wide possibilities for reconstructing ecology from the Pleistocene to our days.

Here we examine biostratigraphic changes in the site by looking at the taxonomic composition of acquired samples using traditional paleontological/zooarchaeological approaches and novel molecular methods of faunal identification including the use of collagen fingerprinting and aDNA metabarcoding.

## 6 DEFINING TECHNOLOGICAL TRADITIONS: MAIKOP AND LEYLATEPE/CHAFF-FACED WARE CASE

**Abstract author(s):** Iserlis, Mark (German Archaeological Institute)

**Abstract format:** Oral

After 124 years of research, the Maikop phenomenon is still a mystery with little understanding of its origin, structure and position. Various theories have been introduced, modified, and applied to archaeological data—the outcome being sometimes more bewildering than enlightening. Pottery, the most frequent, basic and informative component of the material culture, was poorly treated in the field, lab and in publications.

Was Northern Caucasus, located over the Caucasian Range part of the Chaff-Face Ware (CFW) *oikumene*? In what way are Maikop and Leylatepe/CFW pottery assemblages and societies actually related? Why there is almost no evidence for contacts between the Maikop and neighboring Kura-Araxes cultures?

The paper summarizes the results of a technological analysis of assemblages from 11 Maikop and Leylatepe settlements and kurgans, dating to the 4th millennium BCE. The application of a well-established ceramic sampling protocol, material science methods and contexts analysis has allowed the identification of a sequence of specific technological choices made by potters from both Northern and Southern Caucasus. The proposed paper presents these choices, contrasting them with those of the Kura-Araxes potters of the Southern Caucasus, Anatolia and Southern Levant.

## 7 ZOOARCHAEOLOGY AT SHENGAVIT, THE 2009-12 EXCAVATIONS

**Abstract author(s):** Crabtree, Pam (New York University)

**Abstract format:** Oral

Shengavit, located on the outskirts of Yerevan in Armenia, is an important site for the study of the Early Bronze Age Kura-Araxes II culture, dating to the first half of the 3rd millennium BCE. While excavations have been carried out

at Shengavit since the 1930s, much of the original work conducted between the 1930s and the 1950s was poorly documented, and it was impossible to pinpoint the location of the finds, including the faunal remains. More modern excavations began under H. Simonyan in 2000, and he was joined by Professor Mitchell Rothman in 2009. These recent (2009-12) excavations have focused on systematic collections of both artifacts and ecofacts and careful contextual analysis of the finds. This paper will focus on the analysis of the animal bone remains recovered from the 2009-12 excavations. This paper will provide a contextual analysis of the animal bone remains from Shengavit, as well as an overview of animal husbandry patterns, hunting practices and diet based on the well-collected animal bone assemblages that were recovered from the Simonyan-Rothman excavations.

## 8 **REFINING THE TIMING OF PLEISTOCENE HOMININ BEHAVIOURS IN ARMENIA; OPPORTUNITIES, CHALLENGES, AND FUTURE PROSPECTS**

**Abstract author(s):** Sherriff, Jenni (Department of Geography, King's College London) - Adler, Daniel (Department of Anthropology, University of Connecticut) - Arakelyan, Dimitri (Institute of Geological Sciences, National Academy of Sciences of the Republic of Armenia, Yerevan) - Blockley, Simon (Centre for Quaternary Research, Department of Geography, Royal Holloway, University of London) - Gasparyan, Boris (Institute of Archaeology and Ethnography, National Academy of Sciences of the Republic of Armenia, Yerevan) - Mark, Darren (NERC Argon Isotope Facility, Scottish Universities Environmental Research Centre, Glasgow) - Preece, Katie (Department of Geography, Swansea University) - Timms, Rhys (School of Archaeology, Geography and Environmental Science, Whiteknights, University of Reading) - Wilkinson, Keith (Department of Archaeology, Anthropology and Geography, University of Winchester)

**Abstract format:** Oral

Armenia, and the wider Caucasus region, has great potential to offer insights into the timing and nature of hominin dispersals into Eurasia. This is due to its rich Palaeolithic archaeological record and the association of archaeological material with volcanic and sedimentary products that can be dated using a suite of chronological techniques. Indeed, Palaeolithic excavations in Armenia have been ongoing since the 1930s, with many Lower, Middle, and Upper Palaeolithic open-air and cave sites published. Parallel to this research has also been the study of past volcanic activity in Armenia. This has focused largely on understanding the mode and timing of volcanism, with chronologies published since the 1990s based on radiometric dating of volcanic products. However, until recently, there has been limited integration of these chronologies with the archaeological record, despite the occurrence of some of these volcanic products in close association with the Palaeolithic records.

This presentation highlights ongoing interdisciplinary work in Armenia focused on integrating Pleistocene archaeological and volcanic records to further understand the timing and nature of hominin activity in the region. Using examples of the Hrazdan and Debed river basins, we will first review previous (both Soviet and post-Soviet) dating approaches, before discussing the results of recent chronological investigations. Based on these data, we will produce a model for volcanism, landscape change and hominin activity during the Pleistocene. Through this, we will highlight the opportunities, and challenges in integrating data from different research disciplines and paradigms to help understand Pleistocene hominin behaviours in Armenia and the wider Caucasus region.

## 9 **NEW FRONTIERS FOR DIGITAL RESEARCH @ SAMTAVRO CEMETERY, CAUCASIAN IBERIA**

**Abstract author(s):** Michalewicz, Aleks - Fitzgerald, Emily (University of Melbourne) - Birkett-Rees, Jessie (Monash University)

**Abstract format:** Oral

Precisely because we can often draw on well over one hundred years of data, Caucasian archaeology presents great scope for applying and testing digital research techniques. Rather than viewing archaeological data as Soviet ('traditional') and post-Soviet ('new'), we can reframe our perspective by considering how archaeological frontiers can be expanded through new and emerging interdisciplinary analytical methods. By approaching our collective enterprise in this manner, the focus becomes the data itself.

Our paper presents as a case study the Samtavro cemetery in Mtskheta, Georgia, which has been investigated since 1871. We concentrate on excavation results from two expeditions operating between 1976 to 2010: geographic location, human remains, grave goods, tomb architectural and chronological data. In addition, we are working with data generated through spatial mapping, database and visualisation research undertaken by the authors. This approach enables both granular analysis and consideration of the data from different perspectives.

An important component is the aggregation, 'cleaning' and linking of multiple and disparate datasets, which has implications for data governance, stewardship and management. Metadata also has the potential to reveal information about cultural materials and processes as well as earlier excavation methodologies. A further provocation is determining when data might be classified as 'legacy' data. In this way, archaeological methods come to be in stronger dialogue with other domains.

By undertaking complex analytics and mapping research, we can generate new understandings about mortuary rituals and broader cultural practices in Caucasian Iberia from the Roman to Late Antique periods. This is made possi-

ble through experimentation with data science tools and presents to us exciting opportunities on a number of fronts: application of cutting edge digital and analytical methods, cross disciplinary collaboration and – in turn – new kinds of questions about existing data in Caucasian archaeology.

## 10 **OUT OF TIME, OUT OF MIND: RADIOCARBON DATING THE EARLY BRONZE AGE IN THE SOUTH CAUCASUS**

**Abstract author(s):** Passerini, Annapaola (Cornell University)

**Abstract format:** Oral

Radiocarbon dating has radically changed temporal and social perspectives on European prehistory. Soviet archaeology also enthusiastically participated in the first “radiocarbon revolution”, as laboratories flourished across the USSR in the 1950s and 1960s and the new dating method was applied to archaeological contexts across Eurasia. Early applications in the South Caucasus were often part of attempts to systematize prehistory in broad brushstrokes by tracking widespread monumental phenomena, such as that of the kurgans. Though in limited series, these early endeavors produced the first radiocarbon-based chronologies for the Early Bronze Age and inaugurated the first canonical datasets that continue to be referenced in publications even today. However, technical discrepancies between Western and Soviet laboratories, the tendency to date isolated samples and contexts, and the use of different terminologies have distanced the Early Bronze Age of the South Caucasus from its neighbors. While some of these issues directly pertain to the conditions of reliability of radiocarbon, others speak to the deeper intellectual politics of choosing specific narratives to describe the Early Bronze Age.

Active fieldwork and broad-scale collaborations over the last three decades have greatly improved the radiocarbon record of the South Caucasus, both in qualitative and quantitative terms. Despite this, complications remain when attempting a systematic synthesis of the Early Bronze Age based on what is a very stratified radiocarbon record. This paper discusses the possibilities and challenges of radiocarbon dating in the South Caucasus on the background of the history of its application to investigate the Kura-Araxes phenomenon. It will address the complexity of integrating very heterogeneous (old and new) data, the problem of taxonomy for the purpose of Bayesian chronological modeling, and the relationship between radiocarbon and historical nomenclature. It will finally assess the potential of radiocarbon to provide, or not, an unbiased approach to prehistoric chronologies.

## 11 **NEOLITHIC REVOLUTIONARIES: SOVIET STUDIES ON EARLY AGROPASTORAL COMMUNITIES AND THEIR IMPACT ON THE CURRENT ARCHAEOLOGY IN SOUTH CAUCASUS**

**Abstract author(s):** Heit, Ilia (German Archaeological Institute, Eurasia Department)

**Abstract format:** Oral

Early agropastoralism was a topic followed with great interest by Soviet archaeologists. The appearance of the productive economy was considered as the first big leap in a universal historical progress in the Soviet Marxist sense. Accordingly, in many regions within and outside the USSR, the material evidence of early farming societies was the focus of attention and subject of cross-cultural comparisons. Additional input in this debate was provided by the works of V. Gordon Childe on the Neolithic Revolution, which, unlike publications of many other Western archaeologists, appeared in Russian in the Soviet Union and were well received by Soviet authors.

The South Caucasus region became prominent in this topic even before the actual archaeological exploration through the pioneer works on the origin of cultivated plants by agronomist and botanist Nikolai I. Vavilov in the 1920s. The investigations on the Neolithic and Chalcolithic sites carried out in the 1950s–1980s provided rich evidence of early village communities excavated and analyzed by Soviet archaeological methods.

In this talk I will consider the research in South Caucasus during the Soviet period. I will look at the aberrations but also at promising approaches of that period that may have been forgotten and possibilities of their integration into current research on the early agropastoralists in the region. I will also consider anticipated discoveries and narratives on historical development that have left an impact on the contemporary South Caucasian archaeology.

## 12 **DOMESTIC ARCHITECTURE IN THE SHULAVERI-SHOMUTEPE CULTURE IN THE KURA RIVER VALLEY IN SOUTHERN CAUCASUS IN THE 6TH MILLENIUM BC**

**Abstract author(s):** Sobko, Jakub (Adam Mickiewicz University in Poznań)

**Abstract format:** Oral

The purpose of this dissertation is to recognize the character of the Neolithization process in southern Caucasus on the basis of the comparison of Neolithic domestic architecture from the Kura river valley with the respective architecture in North Mesopotamia and Northwest Iran.. The Kura river valley was divided into three areas: a) the upper course of the Kura, b) the middle course of the Kura, and c) the lower course of the Kura. The domestic architecture from the following sites was examined:: Gadachrili Gora, Aruchlo, MenteshTepe, Hacı Elamxanlı Tepe, Göytepe and Kamiltepe. The empirical evidence studied in the dissertation was collected from academic publications pertaining

to the discussed issues. Analysis of each site, except for Kamiltepe, was accompanied by a table with quantitative dimensions of studied architectural structures performed in the QGIS program, based upon the published plans. The following step involved an analysis of domestic architecture from North Mesopotamia and North-West Iran. This made it possible to compare domestic architecture from southern Caucasus with corresponding architecture from these two region and draw some conclusion as regards the spread of Neolithic into southern Caucasus.

### 13 **PRESSING CONCERNS: URARTIAN WINE PRODUCTION EQUIPMENT**

**Abstract author(s):** Newson, Victoria (University of Sheffield)

**Abstract format:** Oral

Armenia has a long and significant history of grape cultivation and wine production, such that 8th century BCE Urartian kings referred to it as "the land of vineyards". Likewise, Assyrian armies marveled at the vast quantities of wine and chose to take wine as tribute rather than precious metals. The most notable 'stains' that grapes and wine made on ancient economies and societies occurred in three distinct periods: 1) the Chalcolithic/Early Bronze Age, specifically at the site of Areni-1; 2) the Iron Age Urartian wine economy and 3) the Medieval Period (Christian wineries). However, the archaeological evidence of wine production from the Urartians period (9th-6th centuries BCE) has mainly been textual (primarily Urartians and Assyrians) and ceramic based (i.e. karases), with minimal evidence of the technology of grape processing and winemaking (i.e. archaeobotanical data in association with specific wine production equipment). To help fill this gap in the archaeological record, the (minimal) chronology of wine production equipment in Armenia will be explored, along with contemporary production equipment from surrounding areas (eastern Mediterranean and the Levant). The ethnography of production equipment will be used as a heuristic tool to explore the possible locations for wine production and what types of production equipment were utilized to create such a significant wine industry during the Urartian Period.

---

### 336 **EXPERIMENTAL APPROACHES TO PALAEOOLITHIC AND MESOLITHIC ARCHAEOLOGY [PAM]**

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Bentsen, Silje (Nordland County Council; School of Geography, Archaeology and Environmental Studies, University of the Witwatersrand) - Milks, Annemieke (University of Reading; University College London)

**Format:** Regular session

Experimental archaeology in its broadest sense is instrumental to our current understanding of technology, structures, and lifeways of hunter-gatherer humans throughout the Pleistocene and Holocene. Stone and organic tool technologies, fire, adhesives, dwelling structures, art, taphonomy, landscape use, abstract thinking and symbolism are but some of the topics that are explored through both scientific experiments and experiential approaches. The benefits of advances in quantitative and highly-controlled experimental research for archaeology are clear. Yet, problems also remain regarding the foundational data upon which we base such controlled experiments. The skills and people behind technologies are often understudied and poorly understood, and the 'realism' behind high levels of control can also be lost. In that sense, both experiential archaeology, and research involving skilled participants, children, and the experience and skills of Indigenous peoples can and should also play an important role.

This session explores experimental approaches to Palaeolithic and Mesolithic Archaeology through historical perspectives of the development of experimental archaeology, theoretical papers on its role in interpreting the past, methodological developments, and case studies of experimental applications. It will include a discussion of the similarities, advantages and challenges with experimental and experiential approaches, and the role of experimental archaeology in science communication and community involvement. We invite papers from a wide range of geographical areas and subjects to showcase the impact that scientifically controlled experiments and experiential perspectives continue to have on our understanding of the Palaeolithic and Mesolithic.

### **ABSTRACTS**

#### 1 **A WHIRLWIND HISTORY OF EXPERIMENTAL APPROACHES TO THE PLEISTOCENE ARCHAEOLOGICAL RECORD**

**Abstract author(s):** Milks, Annemieke (University of Reading, Department of Archaeology)

**Abstract format:** Oral

Experimental archaeology is a key analogical method with which to understand Pleistocene human lifeways. The roots of experimentation and replication as methods to understand the Pleistocene archaeological record are over 150 years old. Swedish zoologist and archaeologist Sven Nilsson, and the British archaeologist John Evans for example, attempted to replicate stone tools during the 19th century. By the 1920's experimentation was expanding to include ever more early technologies: the American doctor and teacher Saxton T. Pope reconstructed and tested components of bows, while British tailor and archaeologist James Reid Moir explored woodworking with stone tools.

Experiments eventually became a cornerstone of archaeological research, particularly when processual approaches to the archaeological record took hold. During the 1970's the increasing use of the term 'experimental archaeology' symbolised a greater overall shift towards scientific methods. Ensuing debates around what did and didn't constitute experimental archaeology created a rift between those who aimed to test hypotheses and control variables (i.e. 'experimental archaeology') and those whose work focused on reconstructing and recreating past technologies and lifeways ('experiential archaeology'). This talk will conclude by exploring where we are today with experimental methods, particularly in regards to contemporary concerns including the effects of replicators' skill sets, and relatedly, the analogical power of experiments aiming to understand technologies that are divorced from social contexts. Working to bridge these 'experiential' and 'experimental' approaches may go some way to redressing such concerns.

## 2 WERE MIDDLE PALAEOOLITHIC SHELL BEADS USED AS ORNAMENTS: AN EXPERIMENTAL ENQUIRY

**Abstract author(s):** Bar-Yosef, Daniella (Tel Aviv University) - Groman-Yaroslavski, Iris (University of Haifa)

**Abstract format:** Oral

Glycymeris shell beads found in Middle Palaeolithic sites are understood to be artifacts collected by modern humans for symbolic use. In Misliya Cave, Israel, dated to 240-160 ka BP, Glycymeris shells were found that were neither perforated nor manipulated. At about 120 ka BP at Qafzeh Cave, Israel, modern humans collected perforated Glycymeris shells for symbolic use. To understand whether the perforations were natural or artificial, and how the shells were used we performed use-wear analyses backed by experiments. Those demonstrated that the Qafzeh shells were naturally perforated, however, they were suspended on string, reinforcing the notion that their collection was intentional. Additional use wear observations enabled the reconstruction of their arrangement. Similar to findings from South Africa and North Africa shells in the Levant, were collected between 160 ka BP and 120 ka BP and during that period there was a shift from collecting complete valves to perforated ones, which reflects both the desire and the technological ability to suspend shell beads on string to be displayed on the human body.

## 3 FROM LAB TO KITCHEN: TEACHING EXPERIMENTAL ARCHAEOLOGY DURING LOCK-DOWN

**Abstract author(s):** Bentsen, Silje (Nordland County; School of Geography, Archaeology and Environmental Studies, University of the Witwatersrand) - Nel, Turid (SFF Centre for Early Sapiens Behaviour, University of Bergen)

**Abstract format:** Oral

The course module «ARK213 Experimental archaeology» aimed to teach basic theoretical and practical skills to undergraduate students at the University of Bergen, Norway. The module of 5 ECTS was first offered in March-May 2021, and was designed to include standard lectures, practical experiments, and lab work for the students. However, the ongoing pandemic and subsequent health regulations prohibited students from meeting in large groups, thus virtual lectures became the standard teaching method. Instead of transforming the module to a theoretical course, the experiments and lab work were redesigned to assignments that the students could complete in their own home. The redesigned practical work involved colouring eggs, making cut marks in bone, and shaping a pot using hobby clay, as well as documenting the processes and the results. Basic materials for the practicals were provided by the university and basic instructions provided in writing as well as in a virtual classroom. The students responded positively to the change and reported that the practicals were interesting and provided insights into practical prehistoric skills as well as experimental research. Although students did not learn to use professional lab equipment, they did explore documentation techniques using cell phones and equipment from their own kitchen. Carefully sourced raw materials or equipment were not required for these practicals, which saved time and resources in preparing the work. Perhaps downscaling is the way forward to more sustainable and inclusive future course module?

## 4 ART EXPERTICESHIP, PERCEPTION AND MOTOR INTEGRATION IN PALAEOOLITHIC ART. AN EXPERIMENTAL ANALYSIS

**Abstract author(s):** Rivero, Olivia - García-Bustos, Miguel - García, Paula (University of Salamanca) - Garate, Diego (University of Cantabria)

**Abstract format:** Oral

The development of artistic abilities in Upper Palaeolithic societies has been analysed in recent years from the perspective of learning and transmission of artistic know-how, from both technical and formal points of view. The analyses, based on the study of the operational chains involved in engraving, have shown different levels of acquisition of technical knowledge among Magdalenian artists in Western Europe.

This study presents the result of an archaeological and psychological experimental program based on the analysis of the motor and cognitive actions performed when executing artistic motifs. For the motor actions, different patterns of movement and orientation have been analysed for a large group of engravers at different levels of technical ability, in order to determine the gestural parameters that characterize the different stages of artistic learning. For the

cognitive action, different psychological test have been developed in the same participants, in order to understand which cognitive abilities are involved in Palaeolithic art making.

The results, which have been processed with statistical analysis tools, make it possible to differentiate with greater precision the different mechanisms required to create palaeolithic art, as well as the different stages of acquisition of technical knowledge linked to the production of artistic motifs by engraving.

## 5 BY THE NUMBERS. COMBINING ATTRIBUTE ANALYSIS AND EXPERIMENTAL ARCHAEOLOGY TO RECONSTRUCT KNAPPING TECHNIQUES

**Abstract author(s):** Posch, Caroline (Naturhistorisches Museum Wien) - Ott, Marlina - Meusburger, Katharina (Pädagogische Hochschule Vorarlberg)

**Abstract format:** Oral

Since the 1970s, attribute analysis has been used as a standard practice to study lithic assemblages, especially regarding Palaeolithic and Mesolithic sites. Although this method is not without criticism, it constitutes a useful means to create a basis for quantitative and metric comparisons of lithic assemblages. However, attribute analysis data is often 'only' generated and presented for its descriptive value. In order to tackle this problem and to harvest the full potential of attribute analysis data, we propose a combination of attribute analysis and with results from archaeological knapping experiments. These experiments – undertaken amongst others by Jacques Pelegrin and Jürgen Weiner – have proven to be powerful tools to understand lithic production techniques and generated catalogues of attributes for specific techniques and tools.

This study aims to combine these catalogues with data from attribute analysis undertaken on two Mesolithic assemblages in Western Austria (Schneiderküren and Egg-Schwarzwasser). It focuses on a conversion of knapping features into multivariate statistical models (e.g. confirmatory factor analysis or cluster analysis). The underlying approach is the following: If we assume that combinations of features observed during knapping experiments on the ventral side and striking platforms represent trend groups that arise when applying a respective technique, similar trend groups should be found on archaeological artefacts. The first results are promising and show interesting possibilities to handle the large dataset of attribute analysis and harvest the full potential of its accumulated data.

## 6 A NEW METHOD FOR BIRCH TAR MAKING USING MATERIALS AVAILABLE IN THE STONE AGE

**Abstract author(s):** Koch, Tabea (Université Côte d'Azur, CNRS, CEPAM; University of York, Department of Archaeology; Eberhard Karls Universität Tübingen, Department of Early Prehistory and Quaternary Ecology)

**Abstract format:** Oral

Birch tar is the oldest known adhesive as it can be traced back to the European Middle Palaeolithic. However, it remains unclear what techniques were used during the Palaeolithic and Mesolithic to make birch tar. Most of the potential techniques that had been proposed based on experimental programmes rely on more or less complex underground structures. Such underground techniques require large investment in time and resources and imply that some of the processes cannot be observed or controlled. Here, we present a new way of making birch tar using a cobble-paved groove filled with strips of birch bark, the "cobble-groove". The technique is conducted aboveground and is relatively time- and resource-efficient. In the past, many studies have evaluated the likelihood that birch tar making methods were actually used based on proxies such as efficiency and complexity of the production process. In this paper, we investigate the performance of tar to understand whether this new technique might have been used. For this, we compare the quality of our tar with that of three other tar making techniques using lap-shear tests. We found that cobble-groove tar is usable, and that the technique may have been used by European hunter-gatherers. Our experimental study also documents the potential material leftovers of cobble-groove birch tar making, allowing to propose hypotheses that are testable through archaeological data.

## 7 FOUR DIFFERENT EXPERIMENTAL METHODS OF PRODUCING WOOD TAR IN THE MIDDLE PALEOLITHIC - IN SEARCH OF THE EASIEST WAY

**Abstract author(s):** Piotrowska, Beata (Adam Mickiewicz University Poznań)

**Abstract format:** Oral

The oldest evidence of birch bark tar production comes from the Middle Palaeolithic (> 191 kya) from the archaeological site of Campitello Quarry in Italy. It is well-known that the first binder producers were the Neanderthals. They did not use any ceramics containers. Some say that the ability to produce tar with aceramic methods does not prove the technological advancement and broad cognitive abilities of Homo sapiens neanderthalensis. The work describes four different experiments related to the extraction of tar from birch bark using aceramic methods: condensation, pit-roll, ash mound and raised structure, generally described in the literature on the subject, starting from the least complex construction method that condensation is, and ending with the most extensive structure, in the form of rised-structure. Chemical composition studies of known Middle Paleolithic tar samples confirm the use of various production methods. The experiment aims to establish the effectiveness of the above procedures, carried

out by the inexperienced tar production person, and to trace the learning process. For each aceramic method, there were three samples of the bark of the papillary birch (*Betula pendula*), weighing 100 g. With the acquisition of experience, the level of intuitivity is growing during each experimental attempt, which, as it turns out, does not remain irrelevant to the results of the entire experiment. Experience is key to the fact that the method itself becomes only a means to achieve the assumed goal. In this case, the less complicated method, the higher the likelihood of a successful experiment.

## 8 STUDY OF THE DISTRIBUTION OF PINUS REMAINS IN THE IBERIAN PENINSULA BY EXPERIMENTAL CHARRING

**Abstract author(s):** Garay Palacios, Blanca (Universitat Autònoma de Barcelona) - Berihuete Azorín, Marian (IPHES) - Piqué Huerta, Raquel (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The aim of this research is to shed light on the forms of use and management of plant resources during the Paleolithic, Mesolithic, and Neolithic occupations in the Iberian Peninsula. Specifically, this work approaches to the consumption of pine nuts in prehistoric sites. The archaeological visibility of these resources is related to the practices associated to their consumption, processing, and disposal. As wild resources are often consumed raw, they do not require processing, and this renders their archaeological recovery difficult. Moreover, pine nuts contain a large amount of oil that makes their preservation by carbonization quite complicated, so this species would probably be underrepresented in archaeological sites. The basis of this study has been the carpological analysis of the remains and experimentation. The charring process of pinecones and seeds has been replicated experimentally and analyzed using a biometric approach. The seeds were measured before and after carbonization to draw a comparative index of differences and detect any morphological changes. Through this study, we have been able to analyze in depth the distribution of *Pinus* plant remains to determine in which areas and periods they appear with higher intensity. Besides, thanks to the experimental carbonization, we have obtained a wide reference collection that will also be useful for future research.

## 9 THE VALUE OF INDUCTIVE REASONING IN EXPERIMENTAL ARCHAEOLOGY

**Abstract author(s):** Schenck, Tine - Groom, Peter (Mesolithic Resource Group)

**Abstract format:** Oral

For years, academic experimental archaeology has had a strong affiliation with natural science ideals, such as the hypothetico-deductive method (HDM), control, and variable isolation. Experimental archaeologists often talk about deduction, with Peter Reynolds a notably strong proponent of applying the HDM on archaeological data via an experimental test. This test, "in the form of a physical experiment which by definition requires replication," (Reynolds 1998:4 "A Unique Research and Educational Establishment") is hailed as the ultimate format of an archaeological experiment. But rarely discussed is what such a test means in practice. In particular, the following aspects are hardly touched upon:

- Is test replication actually feasible and ever satisfactorily performed?
- Does test replication solidify knowledge about actual past behaviours and activities of humans?
- Is a true HDM even possible in experimental archaeology?

The HDM is a self-contained logic relying on necessary inference. If the premises are true, then the conclusion cannot be false. The deduction itself lies in a test that provides one of the premises. But does one ever reach a conclusion that cannot be false in experimental archaeology? Since archaeology is in fact not a hard science, we maintain that the actual methodology of experimental archaeology follows the inductive mode of reasoning. Inductive reasoning is a non-necessary statistical prediction based on observations that results in a probable conclusion. In this talk, we want to explore the value of the inductive mode of reasoning in experimental archaeology, and the benefits of accepting induction as a more attainable format of an archaeological experiment. As an example, we will be showing how we structured and executed a series of experiments with Palaeolithic Birch bark tar production, and how the conclusion can be seen as a valuable addition to this discourse, although it has not been reached through HDM.

## 10 STICKS AND STONES CANNOT ONLY BREAK BONES. USING DIGGING STICKS FOR UNDERGROUNDS STORAGE ORGANS FORAGING

**Abstract author(s):** Lopez-Bulto, Oriol (Department of Prehistory, Universitat Autònoma de Barcelona) - Berihuete-Azorín, Marian (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Àrea de Prehistòria)

**Abstract format:** Oral

Wooden digging sticks have ethnographically and archaeologically been identified as a common tool between hunter-gatherer societies, used for a wide variety of purposes, among them digging Underground Storage Organs (USOs). USOs are a very valuable food resource, predictable and reliable because of their seasonality, as well as

relatively easy to gather and process. Data suggest that they were widely consumed by hunter-gatherer groups but to date, they have been undervalued for multiple reasons such as recovery issues, identification difficulties, and due to the difficulty to identify tools involved in their exploitation, i.e. digging sticks.

This work presents the results of an experimental program designed to assess the efficiency of this type of tool in USOs gathering with experimental wooden digging sticks. The experimental process allowed the characterization of use-wear traits in digging sticks after being used in different sorts of soils, namely marshy, sandy and rocky. Ultimately, the experimentation will allow the complement of a reference collection of use-wear to be used for archaeological identifications, with the potentiality of offering new evidence to identify the use of root foods in Prehistory.

## 11 **LOOKING FOR WORKSHOP AREAS AT THE GRAVETTIAN PALIMPSEST SITE? AN EXPERIMENTAL APPROACH**

**Abstract author(s):** Novák, Martin (Institute of Archaeology of the CAS, Brno) - Ourodová, Anna-Marie (University of Hradec Králové, Faculty of Arts, Department of Archaeology) - Chlachula, Dominik (Institute of Archaeology of the CAS, Brno)

**Abstract format:** Oral

Generally, the archaeological objects create spatial patterns and structures, which are understood and interpreted as an expression of human behaviour and adaptation to the natural and socio-economic environments. An experimental flint knapping was performed in autumn 2021 in order to (a) simulate archaeological situations; and (b) to create the analytical analogy of latent distribution patterns of lithic reduction. Our study correlates the spatial distribution patterns of experimentally knapped flint assemblages with respect to various levels of the knappers' experiences, from the beginner to the advanced. The experimental design and protocol focus on (a) obtaining blanks from an unprepared core, executed by three male right-handed knappers; (b) documentation of the scattered patterns of lithics; and (c) recording an amount of waste created during the different sequences in lithic reduction – especially in between the phase of core preparation and the phase of blank production. The knappers' raw material exploitation efficiency was counted by the number of blades produced from cores with a similar or close in size and weight. Our preliminary results confirm, for example, direct correlation in between knappers' experiences and (a) spatial distribution of knapping waste around them, and (b) his efficiency in flint core exploitation (causing a narrower and smaller scatter pattern with a higher density, followed by more efficient core exploitation in favour of the knapper with a higher level of experiences). Finally, we built an important and comparative framework necessary for the study of lithic spatial distribution on the Gravettian sites from the Dolní Věstonice-Pavlov-Milovice settlement area.

Acknowledgements: This contribution results from the research funded by the Czech Science Foundation as project no. 20-26094S "Hunters at a camp: Reconstruction of spatial behaviour at Moravian Gravettian sites".

## 12 **HUNTING STRATEGY AND PROJECTILE TECHNOLOGY DURING THE DISPERSALS OF MODERN HUMANS INTO ASIA: AN EXPERIMENTAL APPROACH**

**Abstract author(s):** Takakura, Jun (Archaeological Research Center, Hokkaido University) - Yamaoka, Takuya (Faculty of Humanities and Social Sciences, Shizuoka University)

**Abstract format:** Oral

Early projectile technology of hominins during the Middle and Late Pleistocene has attracted attention to many researchers over the last few decades. This issue has also been regarded as a phenomenon deeply related to the rapid spread of modern humans to Asia. In this paper, we would like to explore projectile technology during the Early Upper Palaeolithic in the Japanese islands by analyzing edge damage and use-related fracture velocity on trapezoids. Trapezoids are a major formal flaked tool in the Early Upper Palaeolithic and are thought to be used by the first modern human groups that migrated into the Japanese islands. A series of experiments using replicated trapezoids were conducted to investigate the relationship between the velocity of impact fracture and the projectile delivery modes (arrows, spearthrower darts, javelins, and spears). To measure use-related fracture velocity, this paper focuses on the fracture wings which are microscopic markings found on the fracture surfaces. We present the results of analyses of fracture wings observed on trapezoids from the several Early Upper Palaeolithic sites, such as Doteue, Kojou, Hinatabayashi-B in central Japan. The results of analyses demonstrate that the Early Upper Palaeolithic trapezoids were delivered mechanically. This may provide us with an important insight into the behavioral strategy and technology of the first modern human groups that migrated into the Japanese islands.

## A. **PALAEOLITHIC BIRCH BARK TAR PRODUCTION IN MOUND STRUCTURES**

**Abstract author(s):** Schenck, Tine - Groom, Peter (Mesolithic Resource Group)

**Abstract format:** Poster

Following on from previous research into the prehistoric aceramic distillation and production of birch bark tar, this series of exploratory experiments investigated the use of raised structures within a fire. These field-based experiments were conducted using sand, gravel, wood fuel, and bark from *Betula pubescens* (downy birch). The structures that

were created were simple raised sand mounds, which reflected known Neanderthal combustion surfaces from the Middle Palaeolithic. The bulk of the experiments were recorded throughout using a thermocouple to provide temperature readings from the base of the bark pyrolysis chamber. The experiments proved successful at producing birch bark tar and several containers were used to catch the tar for later analysis. Based on the results, the authors contend that not only could Neanderthals control fire but that regular birch bark tar production by Neanderthals was most likely a result of specific chaînes opératoires in order to provide the necessary control and outcomes.

---

### 337 **ARCHAEOLOGY MATTERS. THE NEED TO RE-DEFINE THE RELEVANCE OF ARCHAEOLOGY [EAA EXB]**

**Theme: 1. Archaeologists and Archaeology Here and Now**

**Organisers: Banffy, Eszter (German Archaeological Institute) - Carver, Martin (University of York) - von Rummel, Philipp (German Archaeological Institute)**

**Format: Round table**

At EAA 2021 a round table was held on the future of archaeological research in the light of ERC's Horizon Europe. A proposal to align with the UN SDGs was sympathetically discussed but without defining a clear way forward. Now we propose to discuss three more particular objectives: how can archaeology bridge STEM and SHAPE disciplines; how can archaeology best address the current climate change crisis – and how can archaeology gain more visibility and a more opinion-forming role in society?

As an area of research that deploys both STEM and SHAPE disciplines we are well placed to advance a broad agenda that can embrace many new projects suitable for funding by Horizon Europe and elsewhere.

The Round Table plans to address these questions (among others):

1. How can EAA help promote the social, political and environmental value of archaeology?
2. How can we enhance cooperation between archaeologists, scientists and heritage managers to ensure that our joint research results in beneficial social and environmental action?
3. How can we better inform and include the general public about archaeology's current contribution to the past history of the world, and how it can serve its future?
4. How can we restructure archaeology to serve these goals more clearly? The young are already sensitive to the needs of the planet. Can archaeology degree courses offer a more certain feeling of engagement in its future? Can grant giving bodies, including ERC, reflect the global needs of research in their panels, rather than representing existing single disciplines?
5. How should we promote a bold new effective and collegiate attitude to STEM/SHAPE combinations in research and teaching?

---

### 338 **POTTERY FROM POST-MEDIEVAL PERIOD IN CARPATHIAN BASIN. EVOLUTION OR REVOLUTION?**

**Theme: 3. The Carpathian Basin: Integration, Mobility and Diversity**

**Organisers: Španihel, Samuel (Museum of the Moravian Wallachia region Vsetín) - Bielich, Mário (Institute of Archaeology of the Slovak Academy of Sciences Nitra)**

**Format: Discussion session**

This session seeks to explore the changes in the ceramic production between the 16th and 19th century in Carpathian Basin and neighbouring regions. The 16th century is an era of great cultural, social and economic changes within this area. The Central Europe was impacted by new ideas originated from Western Europe influenced by expanding Reformation, Renaissance and European overseas discoveries altogether with the rise of Habsburg dynasty and 150 yearlong Ottoman Empire expansion. This unique blend of historical events transformed the whole society of the Central Europe, and also naturally changed its material culture.

Therefore, the main theme of this session is: Are the changes in ceramic production (vessels, stove tiles, smoke pipes, and building ceramics) of post-medieval period in Carpathian Basin based on local medieval ceramic traditions, or are they results of foreign influences? Or in case of mutual impact of those ideas, which was the one that became dominant or even prevailed?

**1 POTTERY OF THE 16TH AND 17TH CENTURY IN NORTHERN HUNGARY BASED ON THE EXAMPLE OF RESEARCH OF HRUŠOV CASTLE (SLOVAKIA)**

**Abstract author(s):** Bielich, Mario (Archeologický ústav SAV Slovensko)

**Abstract format:** Oral

The aim of the presentation is to present the most interesting findings from the 5 year research of Hrušov Castle. In the 16th-17th century Hrušov Castle was in the possession of the Topolčiansky and Rákoczy families. At their personal court we could see the most luxurious goods (ceramics), which appeared during this period in Hungary. Unfortunately, the castle was gradually abandoned, so the finds are mostly in a considerably fragmentary state. We will try to recreate from these fragments a mosaic of life on the castle at the turn of the 16th-17th centuries and we will focus mainly on ceramics, pipes and other small items. There are several thousand fragments of ceramics coming from our research. We divide ceramics into the ceramics of domestic production and imports. We will present the basic types that appeared in this period on the territory of northern Hungary. Among the imports, ceramics from the West. Southern imports come from the area controlled by the Ottoman Empire.

**2 SLIPWARE PRODUCTION IN POST-MEDIEVAL POLAND AS A REFLECTION OF TRANSFER OF TECHNOLOGY AND STYLISTIC TRENDS IN EUROPEAN POTTERY-MAKING**

**Abstract author(s):** Bis, Magdalena (Institute of Archaeology and Ethnology Polish Academy of Sciences, Warsaw)

**Abstract format:** Oral

My paper aims to provide an overview of archaeological finds from the sites located in today's Poland where slipware was produced between the 16th and 18th centuries. It gathers data on workshops discovered during archaeological excavations as well as on regions where this kind of pottery was potentially manufactured. The assortment of archaeological vessels and their formal and stylistic characteristics are discussed. Primarily, the main focus is put on ornamentation of the said pottery – the decorative techniques and motives being one of the main distinguishing features of this group of artefacts. Such approach enables identifying elements specific for the post-medieval slipware manufactured in the lands of present-day's Poland. This leads to evaluation of the levels of diversification and development of this branch of craftsmanship in different regions of Poland. The aforementioned data offers a solid base for considerations regarding transfer of technology in European pottery-making and tracing its geographical aspects, as well as the extent to which the local workshops were influenced by external cultural processes.

**3 ON THE BORDER OF THE OCCIDENT: STOVE TILES FROM THE NORTH-WESTERN PART OF THE HUNGARIAN KINGDOM IN THE 16-17TH CENTURY**

**Abstract author(s):** Rakonczay, Rita (Eötvös Loránd University)

**Abstract format:** Oral

The stoves of the German-speaking regions have always had a great influence on the art of stoves in the Hungarian Kingdom. The relationship between the two regions has been studied by countless researchers since the 20th century, focusing mainly on the Middle Ages. Although the influence of Western Europe in later eras, such as the 16-17th century, is also an issue that always arises, the system of the relations of these areas have been examined in far fewer cases. Compared to the 15th century, when similar motifs appeared on stoves in a particularly large area and roughly at the same time, the 16th-century stove art shows a much more colourful picture. In these cases, local influences and the impact of regional art can both be observed. In addition to local motifs, representations of the German themes appear as well. But what could be the mediums of these parallels? Engravings, books or perhaps the potters themselves?

Examining the north-western parts of the Hungarian Kingdom can help answer these questions. The stove tile research in Hungary has paid much less attention to this region, although a very special mixture of stove art can be observed here. Some local and cross-regional motifs appear in this part, as well as figural representations typical primarily for the German-speaking areas. However, the proportion of the German motifs is much higher in this region than in other areas of the Carpathian Basin. This can be partly explained by the geographical location, but is it questionable whether these stoves were the products of masters called from Germany or merely adopted the fashion of the surrounding art? Can we talk about direct effects, or were Western themes reinterpreted by potters with regional experience? Stove tiles from this region can help mapping out this complex network of connections.

## 4 LATE MEDIEVAL AND POST-MEDIEVAL PERIOD CERAMIC SET FROM ŠINTAVA

**Abstract author(s):** Nezvalová, Lucia - Vangľová, Terézia (Archaeological Institute of Slovak Academy of Sciences)

**Abstract format:** Oral

Incidental archaeological finding was discovered at the plot of land no. 395/4 in the cadastre of town Šintava (district Galanta). Numerous fragments of ceramics and tiles were found during digging of the cellar. Three features were discovered in the profiles of cellar. Animal bones and iron fragments were found too. The owner of parcel handed over to archaeologists also finds from neighbouring parcels (395/2, 5).

Ceramic set is represented by 520 vessel fragments made of 594 shards (fragmentation of set is 87.54%). 213 fragments of vessels (310 shards) are from previous dugouts. It was possible to assign on 10 of fragments found during digging of cellar to certain features from cellar profile (two fragments were from feature 1, 8 fragments were from feature 2). The weight of whole set was 18413 g. Only 22.88% were decorated.

Three fragments of lids, 21 fragments of pans, 149 rims, 51 necks, 116 bellies, 40 bottoms, 99 bases and 32 fragments of handles were found. 9 whole or almost whole vessels were found - three deep bowls, one dish, two pots, two jars and pan. One fragment of body is from storage vessel. One base with the diameter of 6 cm is probably from cup. Some shards can be identified as fragments of plates. 62 fragments were glazed mainly by brown or green-brown glaze, orange and green glaze also occurs. 19 fragments were painted. Most of the ceramic finds were dated to 16th - 17th century, some of them can be dated to 13th - 14th century.

## A. SKALKA NEAR TRENČÍN - CONTRIBUTION TO POSTMEDIAEVAL MATERIAL CULTURE FROM THE AREA OF MONASTERY

**Abstract author(s):** Jakubcinová, Miriam (Archaeological Institute of Slovak Academy of Sciences) - Čurný, Marián (-)

**Abstract format:** Poster

Skalka near Trenčín is the oldest pilgrim place in the Slovakia. It is connected with the tradition of Benedict, the pupil of saint Svorad. The monastery is in ruins currently and it is placed on the cliff in the massive of Biele Karpaty at the right bank of river Váh, in the Cadastre Opatová nad Váhom, district Trenčín. The monastery Skalka is bound to two orders, Benedictines (1224-1528) and Jesuits (1644-1773). During their presence several building phases were realized at the monastery. Last great modification of the area was done at the beginning of 18th century, when the monastery was heavily damaged by kuruc army. Monastery was under administration of royal public treasury after cancelling of Society of Jesus in Hungary and, except for smaller building modifications, gradually declined from the 19th century.

Renovation of some of the objects with the purpose of stabilizing area began after 1990. Several archaeological and architectural-historical researches were connected with it. The excavation in 2018 done by Archaeological Institute of Slovak Academy of Sciences in the room 104 (cellar) was continuation of them. Its aim was to find stratigraphically youngest levels of terrain for the needs of evaluation of architectonic and historical research. The stall under partly preserved vault in the north-western corner, which is interpreted by M. Haviarová as the middle crosspiece, was removed in connection with rebuilding of monastery in 1667-1669. Debris layers which were found contained material from 17th to 20th century. The most numerous were fragments of tiles with the fragmentally identifiable stylised floral decoration from 17th to 18th century. Shards from ceramic vessels are indistinctive and not numerous. Glass fragments suggest several vessels with angular and cylindrical body from transparent and yellowish potassium glass. Fragments of roof tiles covered with transparent dark brown glaze formed as mouldings are interesting.

---

## 339 "MORE THAN JUST BONES" - UNDERSTANDING PAST HUMAN ADAPTION AND BEHAVIOUR THROUGH THE STUDY OF HUMAN REMAINS

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** László-Mateovics, Orsolya (Hungarian National Museum) - Hajdu, Tamás (Department of Anthropology, Eötvös Loránd University) - Novak, Mario - Janković, Ivor (Centre for Applied Bioanthropology, Institute for Anthropological Research)

**Format:** Regular session

The human lifespan is fraught with environmental, physical, and psychosocial challenges that create a dynamic interaction between us and the highly variable ecologies, socioeconomic and political surroundings. Though all human beings share a genetic makeup, the different environmental cues produce a range of variations in their reaction. The response can be encoded genetically, but cultural systems can also influence the adaptation to new life strategies or the changing environment and can lead to new habits to overcome different health challenges. Consequently, we need a biocultural approach to understand that stress can initiate a series of behavioral and cultural countering responses. In this regard, ancient human remains serve as an important complement to paleoclimate, historical, and archaeological approaches understanding environmental changes which we may expect also as modern humans. This session intends to explore how socio-environmental changes manifest and shaped past health and behaviour.

The contributors intend to examine how certain bioarchaeological data (mortality, pathological traits, funerary customs) can indicate certain changes in life quality or behavioural transformations like interpersonal relations, resource use or child-rearing.

How can different scientific fields contribute to the exploration of these questions from the recovery of bones in the field to the evaluation of data produced by analytical laboratory methods?

We would welcome case studies or comparative interdisciplinary research which focus on the dead to provide insights into a past society or a historical era.

## ABSTRACTS

### 1 LATE AVAR PERIOD BURIAL GROUND OF ŠARENGRAD - KLOPARE: (BIO)ARCHAEOLOGICAL AND ISOTOPIC STUDY

**Abstract author(s):** Novak, Mario (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb) - Rimpf, Andrea (Ilok Town Museum) - Rapan-Papeša, Anita (Vinkovci Municipal Museum) - Dizdar, Marko (Institute of Archaeology, Zagreb) - Toyne, J. Marla (Department of Anthropology, University of Central Florida)

**Abstract format:** Oral

This paper presents the results of the rescue archaeological investigation of the Šarengrad - Klopare site in eastern Croatia. The elevated position of the site overlooking the Danube River indicates it served as a military outpost on the southern borders of the khaganate during the Late Avar Period. Recent excavations revealed the presence of 84 graves dated between the 7th and the 9th century CE. Most of the burials are typical Late Avar Period inhumations. However, in 2019, cremation burials associated with a Slavic population were also registered. As such, Šarengrad - Klopare is the first recorded early medieval cemetery with bi-ritual burial practices on the territory of continental Croatia. The archaeological context and radiocarbon dates strongly suggest that these two populations (the Avars and the Slavs) used this location as a burial ground simultaneously. The paper provides the information on demography, health, diet and mobility of the Avar population inhabiting Šarengrad through a comprehensive bioarchaeological and isotopic analysis of human skeletal remains. Results indicate that the studied population was characterized by relatively high subadult mortality, while a complete absence of perimortem injuries points to a low level of intentional violence with injuries primarily occurring as a result of accidents. Additionally, carbon and nitrogen isotopic data suggest a community level consistency in access to food resources. The isotopic compositions include a larger proportion of C3 and only limited C4 plant resources (<30%), including a fair amount of terrestrial animal protein. Isotopic indicators of mobility (oxygen) also demonstrate very little variation across the samples, defining a local population. The presented isotopic data suggest that the Avar community from Šarengrad was an isolated, locally based, group with limited contact or mixing with other groups.

### 2 BURY ME WHERE MY ARROW FALLS. NEW CONSIDERATIONS ON EARLY MEDIEVAL BURIALS WITH COMPOSITE BOWS EXCAVATED IN MODERN-DAY VIENNA, AUSTRIA

**Abstract author(s):** Tobias, Bendeguz (Österreichische Akademie der Wissenschaften - Institut für Mittelalterforschung) - Pany-Kucera, Doris (Naturhistorisches Museum Wien - Anthropologische Abteilung) - Klostermann, Paul (Österreichische Akademie der Wissenschaften - Institut für Mittelalterforschung; Naturhistorisches Museum Wien - Anthropologische Abteilung) - Özyurt, Jasmin (Österreichische Akademie der Wissenschaften - Institut für Mittelalterforschung) - Berner, Margit (Naturhistorisches Museum Wien - Anthropologische Abteilung)

**Abstract format:** Oral

Interpretations of the past are biased by traditional narratives. This is certainly true for the perception of armament in the early Medieval ages. Individuals buried with weapons, such as a bow and arrow, are characteristically identified as warriors. However, the presence of these objects in the funerary context could carry other or additional meanings not limited to a warrior identity. In order to explore the meaning of these grave goods we employed multiple routes of investigation on early medieval graves containing archery related objects excavated in modern day Vienna, Austria. Mortuary practices were investigated, where and how the bows were deposited in the graves. Detailed documentations of the bow parts and micro-CT examinations help to better understand the construction and material composition of the bows. Additionally, the human remains in these graves were analysed and compared to a group of individuals whose graves were devoid of archery-related object. The anthropological research explores the different expressions of enthesal change, joint disease, robusticity as well as palaeopathology and trauma between the groups. All these different results contribute to answer questions regarding the construction of composite bows, if these weapons were used, who used them and how to interpret these graves.

This study contributes to the early medieval studies in Central Europe and the study of occupation in the past through archaeological and bioarchaeological methods.

This project has received funding from the City of Vienna (MA7) and the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme (grant agreement n° 856453 ERC-2019-SyG).

### 3 HORSE-RIDING AND BONES - BIOARCHAEOLOGICAL ANALYSIS OF BURIALS FROM AVAR PERIOD AND HUNGARIAN CONQUEST PERIOD IN BODAJK (HUNGARY)

**Abstract author(s):** Líbor, Csilla (Szent István Király Museum) - Kiss, Krisztián (Department of Biological Anthropology, Eötvös Loránd University; Department of Anthropology, Hungarian Natural History Museum) - Szeniczey, Tamás (Department of Biological Anthropology, Eötvös Loránd University) - Szűcsi, Frigyes (Szent István Király Museum)

**Abstract format:** Oral

In 2016, two cemeteries were excavated near Bodajk in Hungary. From the Avar Period (6-9th c. AD) site of Bodajk – Homoki-dűlő, the skeletal remains of 40 individuals have been examined, and 14 individuals were found on the site Bodajk – Proletárföldek, from the Hungarian Conquest Period, 10th c. AD. Since only a part of the cemetery has been excavated, it was not possible to evaluate the population in sense of paleodemography, but certain trends were outlined. Pathological conditions with direct observation were identified in almost all the individuals of Proletárföldek. The majority of the observed disorders were joint alterations of the limbs and the spine which can be related to age and lifestyle and can be considered as typical alterations in these periods in the Carpathian Basin. Traumatic lesions were presented in 6 of the 14 cases (42,9%). A different ratio can be seen at the Avar Period cemetery since only 5 of the 40 (12,5%) individuals show traumatic injuries, and the occurrence of other pathological alterations was also lower.

Some human habitual activity for example horse riding can change the physical morphological characteristics of certain skeletal elements of the horse riders especially if the habitual riding started in very early years when the skeletal system is still developing thus can change morphologically. „Riding Syndrome” commonly refers to a combination of these skeletal changes.

Besides the increased number of traumatic lesions, the individuals of the 10th-century cemetery show a higher percentage of pathological changes presumably related to horse riding. This can be explained by the possibility that the newly arrived Hungarians of the 10th century were still mainly engaged in equestrian nomadic lifestyles. While the Avar age population of Bodajk may have lived a more settled way of life, especially in the Middle and Late Avar Period.

### 4 WEAVING THROUGH MEDIEVAL YPRES: DENTAL MARKERS OF ACTIVITY IN A HIGH MEDIEVAL URBAN POPULATION

**Abstract author(s):** Jackson, Veronica (Historical Research Into Urban Transformation Processes Research Unit, Vrije Universiteit Brussel; Anatomical Research and Clinical Studies, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel) - Spros, Rachèl (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel) - Veselka, Barbara (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel) - Provyn, Steven - Snoeck, Thyl (Anatomical Research and Clinical Studies, Vrije Universiteit Brussel) - Claeys, Philippe (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel) - Snoeck, Christophe (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel) - Lambert, Bart (Historical Research Into Urban Transformation Processes Research Unit, Vrije Universiteit Brussel)

**Abstract format:** Oral

The southern Low Countries were one of the earliest and most densely urbanised regions of medieval Europe. In the high Middle Ages, three Flemish cities were renowned as major cloth production centres across the European market: Ypres, Bruges, and Ghent. In the 13th century, the city of Ypres built the largest commercial building in Europe at the time, the Cloth Hall, in order to store, display, and trade Ypres cloth—a testament to the city's great economic success. Despite medieval Ypres' reputation, not much is known about the actual composition of the workforce or the division of labour within the city. Many assumptions about this workforce have been made based on extrapolations from very fragmentarily preserved and problematic historical sources. In the physical remains of the people of Ypres themselves, evidence of their labour within the cloth industry may be found in their teeth. In several stages of cloth production, teeth are habitually used as tools and repeatedly come into contact with materials such as wool and thread. This motion etches a notch or groove into the tooth surface, thus creating an identifiable characteristic. This presentation delves into the structure of the workforce of this industrial boomtown by examining these markings and the people who bore them, reporting distribution as well as correlations with certain pathological changes such as lordosis and spondylolysis.

## TOOLS AND HABITS - STUDY OF SKELETAL EVIDENCE FOR SPECIAL ACTIVITIES IN PAST POPULATIONS FROM HUNGARY

**Abstract author(s):** László-Mateovics, Orsolya (Hungarian National Museum) - Látos, Katalin (National Archaeological Institute, Hungarian National Museum) - Libor, Csilla (Szent István Király Museum) - Schilling, László (National Archaeological Institute, Hungarian National Museum)

**Abstract format:** Oral

The lifestyle and habits can bear important information about everyday life, the surrounding environment, and the potential use of its resources in the past. It is the main issue of socio-archaeological studies how certain activities, occupations appear and develop, how these can remain through generations or disappear from the cultural history of past societies. Altered environmental conditions, the exploration of new natural resources can lead to the development of new techniques and activities just as the inflow of new ethnicities, cultural customs in a certain area, just as the change of residence of a population. We can find evidence for specific activities or crafts primarily through specific objects and finds and it is also not general that we can associate these with individuals. Skeletal remains also have a limited value in this regard since different physical activities leave similar degenerative lesions on the bones, therefore specific activities cannot be determined. For this reason, we have very scarce data of the following: How many members of society did have the skills of certain crafts? Was it related to a certain segment of the society (sex, age differences)? Were these techniques and occupations attained from other cultures or it was developed within the society? Craftsmen were local or wandering? What were the long-term consequences of special activities on the skeletal system and health? How do these occupations affect funeral rites and customs in a society? To some extent, in this presentation, we intend to assume pieces of information delivered by case studies from the Neolithic, Migration, and Early Medieval periods from Hungary. The osteobiography of these individuals will provide examples for how to find more specific answers to these theoretical questions through the analyses and bioarchaeological interpretation of degenerative joint alterations to dental lesions.

## THE PATTERNS AND ETIOLOGY OF SKELETAL TRAUMA IN AVAR PERIOD COMMUNITIES

**Abstract author(s):** Djukic, Ksenija - Milovanovic, Petar - Mikasinovic, Veda - Pavlovic, Tamara - Djuric, Marija (Laboratory of Bone Biology and Bioanthropology, Faculty of Medicine, Belgrade)

**Abstract format:** Oral

Insights into etiology and patterns of skeletal trauma in archaeological assemblages give us a key source of evidence in shaping our perception of human behaviour, everyday activities and dynamics of violence. A lege artis diagnosis and comprehensive analyses of skeletal trauma yields data on injury frequencies within a population, and their pattern and distribution, and can potentially provide insights into the circumstances of death. Moreover, all this knowledge can point us to some social models and rules within the community that we might not otherwise be able to see.

In this study we will analyse patterns and etiology of skeletal trauma in two Avar period necropolises from the territory of modern-day Serbia. Both necropolises (Čik and Pionirska Ulica) are located in northern Serbia and are attributed to the Avar period. The skeletal remains of a total of 133 individuals were analysed for signs of trauma, using macroscopic examination and plain radiography. Our results suggest an extremely low incidence of skeletal trauma among the investigated communities; less than 10 per cent of skeletons showed signs of trauma, with a significant predominance of injuries of upper limbs. Additionally, there was also a significant predominance of injuries to male individuals. Skeletal traumas on juvenile skeletal remains did not noticed. The main goal of this study is the reconstruction of the biological and community aspects of the patterns and etiology of skeletal trauma in Avar period communities.

## LIFE AT THE BORDER OF VENETIAN REPUBLIC AND OTTOMAN EMPIRE - BIOARCHAEOLOGICAL ASPECTS

**Abstract author(s):** Bedic, Željka (Croatian Academy of Sciences and Arts) - Šučur, Jure (University of Zadar)

**Abstract format:** Oral

Two graveyards on the shores of Vrana Lake in Northern Dalmatia have been archaeologically investigated. Crkvina and Maksanova gomila lie in close proximity, less than 20 m away, but they are separated by the wall. Some grave characteristics show similarities, but there are also differences. On Crkvina there is a church, while on Maksanova gomila there are no buildings at all, and the tombstones are different. Crkvina also shows a longer period of use as a graveyard, at least since Early Middle Ages, while graves at Maksanova gomila are dated to the second half of 15th and the 16th century and are attributed to Vlach population.

Until current excavations on Maksanova gomila only two graves were excavated yielding together 22 skeletons.

In season 2021/2022 archaeological research was carried on, so far giving 14 new graves. Two graves contained only one skeleton – in both cases a subadult. All the other graves generally consist of one skeleton in situ – subadult or adult, and one or more skeletons buried as secondary depositions or reburials.

Previous anthropological analysis carried on skeletal remains from two graves showed high levels of interpersonal violence, evidence of heavy physical labour, and high frequency of indicators of subadult stress suggesting these individuals were probably living in poor conditions and consumed low-quality food.

Ongoing anthropological analysis on new excavated human skeletal remains will focus on demography and pathological conditions in order to complement archaeological research and historical sources to better understand the migration movements in the area of northern Dalmatia in the Late Middle Ages and Early Modern Period.

## 8 CONTINUITY AND/OR IMMIGRATION? – BIOLOGICAL CONNECTIONS OF EARLY AND MIDDLE BRONZE POPULATIONS IN THE NORTHWESTERN PART OF THE CARPATHIAN BASIN

**Abstract author(s):** Szeniczey, Tamás (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest) - Melis, Eszter - Köhler, Kitti - Kiss, Viktória (Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network, Budapest) - Major, István - Horváth, Anikó (Isotope Climatology and Environmental Research Centre, Institute for Nuclear Research, Eötvös Loránd Research Network, Debrecen) - Kiss, Krisztián (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest; Department of Anthropology, Hungarian Natural History Museum, Budapest) - Gémes, Anett (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest) - Jakab, Július (Institute of Archaeology, Slovak Academy of Sciences, Nitra) - Hajdu, Tamás (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest)

**Abstract format:** Oral

The Bronze Age in the Carpathian Basin is characterized by dynamic changes in archaeological cultures. The archaeological interpretation concerning the relationship and (dis)continuity between these cultures, is based almost exclusively on the material culture. However, material culture or identity does not reflect necessarily biological relatedness. The biodistance analysis and statistical modelling could provide a cost-efficient method to estimate the patterns of genetic affinity between different populations, applying phenotypic traits as a proxy.

Linear measurements of quantitative cranial features were selected as most of the anthropological publications are including craniometrics. Accompanied the literature data with our results, the database consists of 560 (284 males, 276 females) well-preserved skulls from 118 Early and Middle Bronze Age (EBA and MBA in terms of Hungarian chronology) archaeological sites in Central Europe (Austria, Czech Republic, Germany, Hungary, Poland, Serbia and Slovakia).

In the present study, we focused on the population history in the Northwestern part of the Carpathian Basin (Austria, Hungary, Slovakia) during the EBA and MBA. The statistical comparison revealed a strong signal for the biological continuity of the EBA population in the MBA. Moreover, ancestry may have played a significant role in shaping the MBA population structure.

This paper was supported by the Hungarian Scientific Research Fund (OTKA FK 128013) and the Momentum Mobility research project (Institute of Archaeology, Research Centre for the Humanities) granted by the Hungarian Academy of Sciences (Project Nr. LP 2015-3).

## 9 CRANIOMETRIC ANALYSIS OF THE 9-13TH CENTURY - POPULATION HISTORY OF THE DANUBE-TISZA INTERFLUVE

**Abstract author(s):** Kiss, Krisztián (Department of Biological Anthropology, Eötvös Loránd University; Department of Anthropology, Hungarian Natural History Museum) - Mészáros, Boglárka (Department of Prehistory and the Migration Period, Aquincum Museum and Archaeological Park) - Gyenesei, Katalin - Gémes, Anett (Department of Biological Anthropology, Eötvös Loránd University) - Rácz, Zsófia (Institute of Archaeological Sciences, Eötvös Loránd University) - Rácz, Tibor (Archaeological Collection, Ferenczy Museum Center) - Tóth, Zoltán (Department of Archaeology, István Dobó Castle Museum) - Révész, László (Department of Archaeology, University of Szeged; Department of Archaeology, Hungarian National Museum) - Hajdu, Tamás - Szeniczey, Tamás (Department of Biological Anthropology, Eötvös Loránd University)

**Abstract format:** Oral

The biological reconstruction of historical populations is one of the main goal for bioarchaeology. Craniometric examination is also part of this process in order to reveal biological relations between different populations. The theoretical background of this methodology says the more similar is the cranial shape of populations, the greater is the degree of genetic affinity between them. If successive communities can be seen with similar morphology then biological continuity can be assumed. We present our results of a craniometric examination involving populations from Late Avar Period (8-9th century), Hungarian Conquest Period (10th century) and Árpadian Age (11-13th century). Adult males and females were involved in our study after biological age estimation and morphological sex determination were performed according to standard methodologies. In order to characterize the cranial shape we took linear cranial measurements based on Martin and Saller (1957). Synchronic and diachronic comparisons of the communities from different temporal and spatial groups were performed in order to explore the population history, and to shed light on

the changes of population structure between the 9th and 13th centuries. This research was supported by the House of Árpád Programme (2018–2023) Scientific Subproject: V.1. Anthropological-Genetic portrayal of Hungarians in the Arpadian Age to TT and Foundation for Bolyai College.

## 10 DENTAL WEAR CHANGES IN THE PAST ~8000 YEARS

**Abstract author(s):** Godinho, Ricardo Miguel (ICArEHB, University of Algarve) - Umbelino, Cláudia (CIAS, University of Coimbra; ICArEHB, University of Algarve) - Relvado, Cláudia (ICArEHB, University of Algarve) - Garcia, Susana (ISCSP, University of Lisbon; Museum of Natural History and Science) - Gonçalves, Célia (ICArEHB, University of Algarve)

**Abstract format:** Oral

Holocene modern humans underwent two major events with profound dietary implications, the (i) transition from hunting-gathering to agro-pastoralism and (ii) industrialization of food production and pre-processing. Such transitions have been associated to increasingly softer diets and so to decreased masticatory system demands that lead to gracilization of the masticatory apparatus. Consistently, previous studies report decreased dental wear magnitudes because foodstuffs become less abrasive. Yet, to the best of our knowledge, previous dental wear studies focus on specific chronologies and/or transitions, and do not encompass such a wide diachronic span, ranging from the Mesolithic to the Late Modern Age. This limitation precludes an integrated understanding of the impact of these major transitions on dental wear. In this study, we use the ordinal scale of Smith (1984) to score the dental wear magnitude of 150 individuals of populations spanning from the Mesolithic to the Late Modern Age from present Portugal. Moreover, we also compare rates of wear across these populations by regressing wear magnitude of the first molar against wear magnitude of the second molar to provide age independent assessment of dental wear. In summary, our preliminary results show that dental wear decreases from the Mesolithic onwards, but statistically significant changes are only found between prehistoric chronologies and Modern and Late Modern populations. Rates of dental wear differ slightly between some populations, but statistically significant differences are only found between the Late Modern Age and almost all other populations (except from the Neolithic). Hence, our results suggest generally progressive and cumulative changes in dental wear that are only significant when comparing Mesolithic populations with Modern and Late Modern populations, and that the rate of dental wear is only statistically meaningfully different in the Late Modern Age (in which the speed of wear is lower).

## 11 DIETARY INFERENCES THROUGH DENTAL TOPOGRAPHY IN PREHISTORIC AND HISTORIC POPULATIONS FROM THE SOUTHEAST OF THE IBERIAN PENINSULA

**Abstract author(s):** Moya Soriano, Ester (Institute for Research in Archaeology and Historical Heritage - INAPH, University of Alicante) - Romero, Alejandro (Institute for Research in Archaeology and Historical Heritage - INAPH, University of Alicante; Department of Biotechnology, University of Alicante) - García Afénzar, Gabriel (Institute for Research in Archaeology and Historical Heritage - INAPH, University of Alicante)

**Abstract format:** Oral

Tooth wear is an age-dependent process largely determined by dietary abrasiveness. Overall, mechanical food properties differently impact on occlusal morphology as the enamel wear. Previous studies conducted on prehistoric hunter-gatherer dentitions found flat crown patterns compared to highly angled occlusal wear planes characteristic of agriculturalists. However, comparatively little is known about specific dental shape changes with wear among prehistoric and historic human groups according to documented differences in dietary regimes and modes of food preparation techniques. Using geographic information systems (GIS), here we investigate the relationship between molar topography and wear in well-dated and contextualized individuals of Bronze Age (Cabezo Redondo; between 1830 and 1450 cal. BC; n=31) and Late Roman (Tossal de les Basses; 6th–7th century CE; n=28) populations from the province of Alicante (southeast of the Iberian Peninsula). High-resolution polyurethane replicas were produced from polyvinyl siloxane-based molds of well-preserved first permanent mandibular molars (M1s) with different wear stages from juvenile and adult skeletally individuals. Meshes were generated using a structured light 3D scanner and digital elevation models (DEMs) processed to collect the steepness (slope) and height (relief) of occlusal molar surfaces using ArcGIS® and QGIS®. Analyses of covariance revealed significant between-population differences in occlusal slope and relief with wearing. The molars of Bronze Age individuals are characterized by significant reduction in cusp slopes and heights than those of Romans showing steeper slopes and relatively taller crowned teeth as wear accrues, probably associated with a substantial reduction in food toughness. Our findings denote that diet-related masticatory biomechanics largely impact on the dynamics of tooth-shape changes with wear and provide new insights about dental functional aspects among ancient populations.

## AGING CHANGES IN MAXILLARY BODY HEIGHT IN A MEDIEVAL POPULATION FROM CENTRAL EUROPE

**Abstract author(s):** Walczak, Anna - Krenz-Niedbala, Marta - Łukasik, Sylwia (Adam Mickiewicz University in Poznań, Faculty of Biology, Institute of Human Biology and Evolution)

**Abstract format:** Oral

The facial skeleton creates a support for soft tissues, and together they undergo the process of aging. The bones are subject to resorption, although the loss of tissue is differentiated, and specific to the particular elements. Maxilla is the bone most susceptible to this process.

This research was aimed at the analysis of metric characteristics of the maxillary body in the medieval sample from Cedynia, Poland. Based on historical and archaeological data, it was assumed that the biomechanical forces used during mastication were greater in the Middle Ages than in the modern times, which led to increased response of the bone tissue. Thus, it was expected to find a lower reduction of the maxillary height in increasing age categories in the medieval sample than in modern populations.

3D scans of the facial skeleton have been obtained for 140 individuals, divided into young, middle and old adults, in order to take measurements of the maxillary body height in the middle line (ML), at first premolar (FP) and first molar (FM), using Geomagic Studio 12. The metric data were statistically analyzed and compared with modern, published data. The measurements decreased with increasing age categories. The differences between young and middle age groups were 0.45 mm for ML, and in the right maxilla 1.66 mm (FP), and 0.55 mm (FM). In the left maxilla they were 1.16 mm and 0.45 mm, respectively. The differences between middle age and old age groups were 0.55 mm (ML); for the right maxilla 0.22 mm (FP), and 2.9 mm (FM), while for the left maxilla 0.21 mm (FP), and 2.66 mm (FM). The results of the study confirmed the hypothesis of the reduction in maxillary body height with age, and the lower decrease in this dimension in the Middle Ages, as compared to the modern populations.

## INSIGHT INTO SOCIAL DIFFERENTIATION OF THE BELL BEAKERS: AN EXAMPLE ON BIOARCHAEOLOGICAL DATA FROM POPŮVKY CEMETERY (CZECH REPUBLIC)

**Abstract author(s):** Tvrđý, Zdenek (Anthropos Institute, Moravian Museum, Brno) - Čerevková, Alžběta (Institute of Archaeology, Moravian Museum, Brno) - Drtikolová Kaupová, Sylva (Department of Anthropology, National Museum in Prague) - Jarošová, Ivana (Freelancer in anthropology)

**Abstract format:** Oral

The recently excavated cemetery from Popůvky (Moravia; Czech Republic) provided one of the largest collections of human skeletal remains (n=75) dated to Bell Beaker period (2500-2200 BC) in our region. Despite the not very good preservation of the skeletons, we were able to obtain valuable bioarchaeological data. The aim of this study is to assess lifeways of the individuals based on the anthropological, paleopathological and dietary analysis and connect them with funerary practices in the cemetery.

Basic demographic and metric data, along with evaluation of health condition and stress markers, provide the biological background of the population. Assessment of living conditions is complemented by dietary habits reconstruction based on the stable isotope analysis (carbon and nitrogen) of bone collagen accompanied by buccal dental microwear data. Bioarchaeological data were put it in context with grave goods at the individual level, so we could get insight into social differentiation in the Late Neolithic.

## THE SEX-SPECIFIC VARIATIONS IN THE HEALTH STATUS OF THE POPULATION FROM A SMALL LATE ROMAN ISLAND BURIAL SITE IN CROATIA

**Abstract author(s):** Zagorc, Brina (Department of Evolutionary Anthropology, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna) - Carić, Mario - Novak, Mario (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb) - Visković, Eduard (Kantharos d.o.o., Hvar) - Reich, David (Department of Human Evolutionary Biology, Harvard University; Howard Hughes Medical Institute, Harvard Medical School; Broad Institute of Harvard and MIT) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna)

**Abstract format:** Oral

The studies of subadults and their role in the past societies have been an object of interest among bioarchaeologists for decades. However, there are no published studies that would include sex-specific health variations, due to the inaccuracy of the osteological methods for sexing subadult remains. Accurate molecular sexing methods (>99.9% accuracy) can be applied to paleogenomic data as well as the detection of first, second, and third-degree of kinship, and the analysis of ancestry. By observing the latter along with sex-specific variations in the health status of the studied individuals (including subadults and adults), we can address questions about the intra-cemetery social dynamics, more specifically about upbringing, familial relationships, and preferential sex-related treatment during their life course.

This paper presents the results of ancient DNA and bioarchaeological skeletal analyses of individuals from a small burial site dated to the 4th-5th centuries CE on the Croatian Dalmatian Island of Hvar (Hvar – garden of the Radošević palace). It includes separate graves and a small tomb where several individuals, both adult and subadult, were buried together. The focus is placed on comparisons between the occurrence of physiological stress indicators and other paleopathological indicators of poor health in relation to the biological sex of the studied individuals, along with their kinship and ancestry data. These analyses enable us to better understand the nature of this burial site, sex-specific health patterns, and the social connection between them. Moreover, the role of subadults and their context within the buried population gives us a better insight into the quality of their life.

## 15 **SURVIVAL OF THE WEAKEST. A CASE OF DISABILITY IN THE LATE ROMAN CITY OF IBIDA (SLAVA RUSĂ, ROMANIA)**

**Abstract author(s): Soficaru, Andrei - Crețu, Ciprian (Institute of Anthropology, Romanian Academy)**

**Abstract format: Oral**

The skeleton (noted M 78) was discovered in 2004 in the cemetery of the ancient city of Ibida (Tulcea County) from eastern Romania. The individual was found in articulated supine position in a simple pit oriented WSW-ENE. The radiocarbon data indicate AD 321±58 and the anthropological analysis established that the remains belong to a 26 to 35.2 years old male.

The skeleton displayed unusual pathological modifications: no teeth are present on the maxillary bones, cranial sutures are closed, the 7th, 8th, and 8th thoracic vertebrae are fused, both glenoid cavities of the scapulae are deformed and show advanced degenerative changes, the humeri show bilateral shortening of the diaphyses with varus angulation and flattened and enlarged humeral heads, the left acetabular fossa is much bigger than the right one displaying enlargement of the joint and porosity, the left femoral head is very deformed with a "mushroom" shape, the right femur shows a myositis ossificans and osteochondritis dissecans, both tibiae are normal in size and proportions but the left one is longer and thinner than the right one which is shorter and thicker. This kind of transformations indicate a genetic disorder. Other pathologies include osteoarthritis of the joints, hyperostosis porotica, caries, abscesses, and some ribs with fractures.

All these conditions indicate a person with a strong impairment: he limped, he could not rise the arms above the head, he was hunchbacked. Such person could not fit to the standards of a military and masculine society as that of the Late Roman Empire. While exercising restricted agency, he was highly probable excluded from many activities performed by the local community and his identity was shaped by other people.

## 16 **THE EFFECTS OF SOCIAL INEQUALITY IN THE ZAPOTEC CHILDREN FROM MONTE ALBÁN DURING THE CLASSIC PERIOD (200-700 AD)**

**Abstract author(s): Camacho, Miriam (Physical Anthropology)**

**Abstract format: Oral**

Social inequality varies according to the type of government, in state societies such as Monte Albán, social inequality is institutionalized, the integration of classes is established on a complex and stable social system, internally differentiated and divided into social strata or classes. These classes are identified through qualitative and quantitative differences in prestige assets, residence location and size, health conditions, and funeral treatment. The most accessible way to study social classes is through the domestic unit, which reflects the social, economic and political situation of the group that inhabits it (González 2011; Winter 1974). For this reason, it is proposed to analyse the skeletal remains of children under 12 years of age (period that includes Mesoamerican childhood) buried in domestic units of Monte Albán during the Classic period (200-700 AD), through funerary customs and indicators of health like: enamel hypoplasia, periosteal reactions, cribra orbitalia and porotic hyperostosis. The explanatory framework is based mainly on the biocultural approach, which provides the necessary tools to understand the human being not only as a biological being but also as a social being that interacts with culture throughout his life (Kelso 1978; Stinson et al. 2012). The results indicate that the children buried outside the domestic unit presented more serious infectious diseases compared to children buried in tombs or inside the domestic unit. However, nutritional deficiencies such as scurvy and anaemia were found in most children regardless of their burial site. This demonstrates an unequal distribution of food in the Zapotec families regardless of their social status. Therefore, the children were vulnerable to the living conditions of the city of Monte Albán, such as the high population density, lack of hygiene and proliferation of infectious diseases caused by these first two.

- 17 SOCIAL IDENTITY OF LATE MESOLITHIC CHILDREN FROM YUZHNIY OLENIY OSTROV IN LIGHT OF NEW ANTHROPOLOGICAL APPROACHES**
- Abstract author(s):** Batanina, Olga (University of Helsinki) - Stewart, Nicolas (University of Brighton) - Murphy, Eileen (Queen's University Belfast) - Zubova, Alisa (-) - Moiseyev, Vyacheslav (-) - Mannermaa, Kristiina (University of Helsinki)
- Abstract format:** Oral
- This paper introduces new data concerning sex estimations of non-adult individuals originating from the Yuzhniy Oleniy Ostrov (Lake Onega, Russia, 6000-6200 cal BC) cemetery and places them in their broader archaeological context. The cemetery is considered to be the largest Mesolithic burial ground in North-East Europe and contains 177 burials. It includes human remains of both sexes and various age groups. While the majority of the graves are those of adults, some 13% have been identified as those of children. The life histories of the adults have been well studied but those of children have been investigated to a lesser extent. One of the reasons for this situation is the challenge of estimating the sex of immature skeletons. Peptide analysis of dental enamel has been demonstrated to be a reliable method for determining the sex of non-adult individuals and this approach was applied to children from Yuzhniy Oleniy Ostrov (n=15). In this paper we present the results of the peptide analysis and investigate the distribution of sex, age, grave goods and body positions of the children buried at Yuzhniy Oleniy Ostrov in order to understand their social identities.
- 18 SUBADULT HEALTH AND DISEASES IN THE MEDIEVAL AND EARLY MODERN PERIOD POPULATION FROM GORA, CROATIA**
- Abstract author(s):** Kokotovic, Tea (The Institute of Archaeology in Zagreb) - Bedić, Željka (Anthropological Centre, Croatian Academy of Sciences and Arts) - Sirovica, Filomena (Archaeological Museum in Zagreb) - Belaj, Juraj (The Institute of Archaeology in Zagreb)
- Abstract format:** Oral
- The Gothic Church of the Assumption of the Blessed Virgin Mary is situated in Gora (Banovina, Croatia), a well-known medieval site occupied by military orders (Knights Templars and Hospitallers). The church itself bears its beginnings sometimes earlier, in the Romanesque period, and the site was used for burials from the beginning of the 11th century, throughout the late medieval and early modern period, up to the end of the 18th century. Rescue archaeological excavations conducted from 2008 to 2011 uncovered 424 burials in the church itself and along the outer perimeter of the church walls. As about 40% of the total osteological sample consists of subadult individuals, the focus of the research is the analysis of the physiological health of the medieval and early modern period subadult population buried at this site. The mortality rates and the health status are explored through different age groups, the latter using standard subadult stress markers such as nonspecific periostitis, cribra orbitalia and linear enamel hypoplasia in permanent dentition. The specificity of the subadult sample from Gora is a high number of metabolic diseases. About 10% of the sample shows signs of vitamin C deficiency (scurvy) and about 5 % of the sample shows signs of vitamin D deficiency (rickets). Because of their well-known aetiology and characteristic markings on the dry bone, these metabolic diseases are ideal for gaining a deeper insight into the researched population's health and survival rates.
- 19 A BIOARCHAEOLOGICAL STUDY OF HOW CREMATION WAS PRACTICED ACROSS MULTIPLE CENTURIES AT A BRONZE AGE CEMETERY**
- Abstract author(s):** Ullinger, Jaime (Quinnipiac University) - Paja, László (University of Szeged) - Williamson, Kylie (University of Florida) - Danella, Erika (University of Michigan) - Cruz, Heleinna (Quinnipiac University) - Ramireddy, Pranavi (California University of Science and Medicine) - Duffy, Paul (University of Kiel) - Gibling, Julia (Quinnipiac University) - Parditka, Györgyi (University of Michigan)
- Abstract format:** Oral
- Cremations are a common mortuary practice in prehistoric Europe. However, the burned, fragmentary, and commingled nature of the skeletal elements have often precluded large-scale bioarchaeological analysis of cremation cemeteries, which inhibits our ability to understand if mortuary practices associated with cremation were conserved or changed during transitional time periods. In this paper, we present the analysis of cremated bone from a large cemetery located in the Lower Körös Basin in Eastern Hungary: Békés 103. Radiocarbon dates indicate that the cemetery was used for several hundred years, with the most active phase between 1600 and 1280 calBC, after most tells in the region had been abandoned.
- To systematically study the burials, we first microexcavated cremated bone from funerary urns in layers, under controlled laboratory conditions. We then examined all diagnostic elements, all elements over 5mm, and a 20% sample of anything smaller than 5mm to assess bone color, bone fracture patterns, and the ratio of cranial/post-cranial elements by layers. Finally, the combined weight and volume of all of the collected bone from each burial was measured and determinations of age-at-death and sex were made when diagnostic elements were recoverable. Our final data set allowed for us to look at several stages of the cremation mortuary ritual: from conditions of how the body

was burned to how much of the body was placed in the urn and whether that placement was done in a particular pattern. In this paper we explore our dataset with a particular focus on how cremation was practiced over multiple centuries at the Békés 103 cemetery. We address what practices stayed the same, what changed, and whether these patterns correlate with regional changes in the Lower Körös Basin from the Middle to Late Bronze Age.

## 20 REVISITING THE “NORTHERN IBERIANS” RITUAL PRACTICES FROM NON-INCINERATED HUMAN REMAINS IN THE NE OF THE IBERIAN PENINSULA (4TH-1ST CENTURY BC)

**Abstract author(s):** Petit-Castellví, Alba - Subirà, Maria Eulàlia (Unitat d'Antropologia Biològica, Departament de Biologia Animal, de Biologia Vegetal i d'Ecologia, Facultat de Biociències, Universitat Autònoma de Barcelona, Bellaterra, Cerdanyola del Vallés) - Agustí, Bibiana (INSITU S.C.P. Centelles, Barcelona)

**Abstract format:** Oral

The normative funeral ritual of the Iberian tribes was based on the cremation of corpses in a general way, although we know that half the population did not have access to it. Since the last century, human remains have been found isolated and not cremated in contexts other than necropolises. The most extraordinary finds are the nailed skulls that were exposed in the walls of the sites of Ullastret and Puig Castellar and Ullastret, which the classical written sources describe as trophies recovered in battles and representative of the defeated enemies.

These specific findings, with repeated patterns, have attracted the attention of researchers, although they have been little studied. Here we present a research based on an osteoarchaeological review that informs nine individuals for the first time, contributing to enlarging the northern Iberian's human remains pool.

The archaeological analysis of these shows that most of the isolated human remains from habitat contexts correspond to partial skeletal remains and show no signs of violence. Two of the skulls in this study, the female from Can Miralles-Can Modolell and the male from Turó de la Rovira, have bruises and perimortem cuts.

The existence of male, female and juvenile severed heads in both urban and productive contexts encourages us to think beyond the “warrior figure” attribution in the trophy heads phenomenon. We propose that trophy heads were also collected from raids. Moreover, since the ritual of exhibiting human remains was used by the elite as proof of their power, it was probably used as a way of coercing exterior enemies as well as local citizens. Finally, those remains with no signs of violence could be considered as burials for the lower classes who were deprived of an incineration ritual.

## 21 BIOARCHEOLOGICAL EVIDENCE OF THE STEPPE NOMAD'S PRESENCE IN BRONZE AGE MONTEORU CULTURE CEMETERIES

**Abstract author(s):** Constantinescu, Mihai (Fr. I. Rainer Institute of Anthropology; University of Bucharest) - Chicideanu, Monica (University of Bucharest)

**Abstract format:** Oral

The Middle Bronze Age Monteoru Culture had a long evolution (2250-1550 cal BC) in the hilly areas from eastern and south-eastern Carpathians. The cultural relations of the Monteoru culture with the steppe nomads were previously presumed due to the presence of specific artefacts, the catacomb like structures in some cemeteries and were often thought to have a violent component too. The cemetery from Cărlomănești placed in the vicinity of a multilayered Monteoru settlement has 143 excavated graves, most of them containing inhumated individuals. The funeral constructions are usually shallow pits, filled with river stones, with the deceased placed in lateral decubitus, with their legs crouched on the left side and the skull-oriented westwards. Most of the graves have funeral inventory consisting in ceramics, female adornments and rarely stone axes. Five graves have circular or oval-shape shafts as funeral structure, with burial niche at its base, where the skeleton is buried according to the usual local ritual. Comparing to the other graves the funeral inventory of the individuals buried in the niches is scarce or missing and some of the vessels are not typical for the Monteoru culture. Moreover, their biological characteristics (stature, bone dimensions, skeletal lesions and genetic traits) differ from the other individuals buried in the cemetery. The available bioarchaeological data suggests that individuals belonging to the steppe nomads' populations were buried in the local Bronze Age cemeteries from eastern Romania, partly using their specific ritual program while also adopting the local funerary traditions, which hints to a peaceful and common coexistence.

## 22 THE ANTHROPOLOGICAL STUDY OF HUMAN REMAINS FROM THE BURIAL CAVES OF POLLA, SALERNO (ITALY) BETWEEN THE NEOLITHIC AND ENEOLITHIC PERIOD

**Abstract author(s):** Guglielmi, Sandra - Minelli, Antonella (Università degli Studi del Molise)

**Abstract format:** Oral

We present the preliminary results of anthropological and paleopathological analysis on the human skeletal remains found in the cave of Polla, in the province of Salerno (Italy), in the Vallo di Diano area.

The cave, located in the north-eastern part of the Alburni Mountains, appears to have been used as a burial area from the Neolithic to the Bronze Age. The excavations conducted thus far provide important evidence for ritual

practices in the region, and suggest potential continuity in these practices mainly from the Neolithic to the Eneolithic period.

Osteological analyses were performed on a total of 469 human bone fragments and 48 teeth. These fragments represent a minimum (MNI) of five human subjects.

The stress pathologies observed include one case of enamel hypoplasia on the 35-45 year old male and three cases of *Cribrum cranii* associated with porotic hyperostosis.

Careful examination of the skull of the 20–24 year-old male individual revealed a case of scaphocephaly with strong thickening of the cranial vault associated with early synostosis of the sagittal suture. The sagittal suture is in fact almost completely obliterated in this individual, which is an anomaly for a person of such a young age.

The evidence collected so far allows us to reconstruct burial practices involving multiple inhumed individuals. The general absence of anatomical connection of the remains suggests that past depositions were over time deliberately manipulated to “make room” for new ones. The abundance of charcoal confirms the widespread use of fire. The ceramic materials associated with the burial deposits are characterized by their extreme fragmentation, likely a product of deliberate breakage as a part of the funeral ritual. Most ceramic fragments are not diagnostic, which suggests that commonly-used vessels were employed in these rituals.

### **OLD BONES – NEW POSSIBILITIES. HUMAN REMAINS FROM SETTLEMENT PITS AT MIDDLE BRONZE AGE TISZAFÜRED-MAJOROSHALOM (EASTERN HUNGARY) SITE**

**Abstract author(s):** Gémes, Anett (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest) - Mester, Edit (Kiss Pál Museum, Tiszafüred) - Dani, János (Déri Museum, Debrecen) - Gál, Erika (Research Centre for the Humanities, Institute of Archaeology, Budapest) - Szeniczey, Tamás (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest) - Kiss, Krisztián (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest; Department of Anthropology, Hungarian Natural History Museum, Budapest) - Szeverényi, Vajk (Déri Museum, Debrecen) - Kulcsár, Gabriella - Kiss, Viktória (Research Centre for the Humanities, Institute of Archaeology, Budapest) - Hajdu, Tamás (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest)

**Abstract format:** Oral

The origins, way of life, and general health of the Füzesabony communities that inhabited the northeastern Carpathian Basin in the Middle Bronze Age (2000/1900-1500 B.C.) are unclear, despite the publication of the anthropological results of some larger cemeteries. This can be explained by the cremation burial rites of the former autochthonous communities that had lived in the same area, which prevents comparisons with the former local populations but also does not make it easier to resolve the issue that the communities of the Füzesabony culture in different regions show a heterogeneous picture.

In the autumn of 2020 – near one of the most important Hungarian Bronze Age cemeteries – a Bronze Age mass grave was excavated in Tiszafüred-Majoroshalom, eastern Hungary. This pit is the first mass grave that belongs to the Füzesabony culture in Hungary.

In this research, we focused on the anthropological processing of the new finds, using macroscopic examination methods. The aim was to find out - as much as possible - the reason for the burial of the corpses and the living conditions of those buried here. We determined the minimum number of individuals, outlined some possible explanations for the burial in the pit, performed paleopathological examinations, and recorded craniometric data. Children and juveniles were placed in the mass grave at a higher rate than adults. There were slightly more males than females among the adults. Lesions were observed on the inner surface of the skulls of several children, which - according to the paleopathological literature - are frequently due to infection but other causes cannot be excluded.

This paper was supported by the Hungarian Scientific Research Fund (OTKA FK 128013) and the Momentum Mobility research project (Institute of Archaeology, Research Centre for the Humanities) granted by the Hungarian Academy of Sciences (Project Nr. LP 2015-3).

### **IN THE SHADOWS OF THE EMPIRE: SARMATIAN COMMUNITIES OF THE GREAT HUNGARIAN PLAIN**

**Abstract author(s):** Tica, Cristina (Clemson University) - Hajdu, Tamás (Department of Biological Anthropology, Eötvös Loránd University, Budapest) - Mateovics-László, Orsolya (Hungarian National Museum) - János, István (Institute of Environmental Science, University of Nyíregyháza)

**Abstract format:** Oral

This paper examines the health status of the Sarmatians on the Great Hungarian Plain. The written sources of classical antiquity painted these groups inhabiting the Carpathian Basin as nomadic people of the steppes between the Ural Mountains and the Don River who migrated west and settled on the Great Hungarian Plain, occupying parts of modern Hungary for over four hundred years. Consequently, the Greek and Roman authors described these populations

as skilled equestrian warriors, hostile and destructive, caught in a cycle of peace and war with the Roman Empire, when actually little is known about the biocultural challenges they had to face living in the Barbaricum. This study aims to present a border perspective not available in most of the bioarchaeological scholarship focused mainly on the Roman side of the frontier and provincial life, by looking at health and demographic profiles in the Barbaricum and on the limes, to see if life stresses were different for the two Sarmatian communities. The bioarchaeological analysis of human skeletal remains reveals an intricate picture: individuals experienced differential life stressors by sex, different stress factors also depending on where they lived in relation to the limes. No matter how close to or how far from the border one lived, nobody was spared a harsh life on the fringes of the Roman world.

## 25 FOUNDER SURVIVAL: BIOARCHAEOLOGY OF ROMAN AGE IN ANCIENT SARDINIA

**Abstract author(s):** Serra, Rita (Department of Biomedical Sciences, University of Sassari, Italy; Center for Anthropological, Paleopathological and Historical Studies of the Sardinian and Mediterranean populations, Department of Biomedical Sciences, University of Sassari) - La Fragola, Alessandra - Rovina, Daniela (Superintendence for Archaeological Heritage for the provinces of Sassari and Nuoro) - Posth, Cosimo (Max Planck Institute for the Science of Human History, Jena; Institute for Archaeological Sciences, University of Tübingen) - Mazzarello, Vittorio - Bandiera, Pasquale (Department of Biomedical Sciences, University of Sassari; Center for Anthropological, Paleopathological and Historical Studies of the Sardinian and Mediterranean populations, Department of Biomedical Sciences, University of Sassari)

**Abstract format:** Oral

Introduction

Sardinia, located in the middle of east Mediterranean Sea, along the most important trade route of the past, become a Roman province in 238 BC. Many settlements rose in this period, mainly near the coast. The Roman imperial necropolis of Monte Carru, located in the NW coast of Sardinia, seems to be related to the lost settlement of Carbia (Itinerarium provinciarum Antonini Augusti- 3rd century). This necropolis is included in a recent work (Marcus J.H. et al. 2020) that analyzed genetic Sardinia history and underline the partial survival of island's Neolithic founder population in Roman age. Previous societies' cultural heritage, in this period, is partially evident.

Materials and methods

Survival and innovation seem to be a reality in Roman Sardinia. To understand if this genetic and cultural differences can be underlined also from bio-archaeological data, anthropological results from Monte Carru were being compared with previous pre-nuragic and nuragic settlement in the same area.

Results

Anthropological analyses have underlined some differences between ages:

A different average age at death, that is higher in roman age, with a low percentage of death in subadult age (6%). Stature increases for males from nuragic (163cm) to roman age (168cm), for females it is higher in roman age (163cm). The incidence of dental pathologies (caries, tartar) is higher in roman age. Bone's pathologies, mainly arthritis, decrease from Nuragic to Roman age in both sexes. Markers of occupational stress (MOS) decrease in males, except for the tibia, which is higher in roman age; in females are fewer in nuragic, in the femur as much as in the tibia.

Conclusion

Anthropological data evidence some differences between ages, in aspects related to genetics (stature) and life conditions (pathologies and MOS) related to socio-cultural activities. More macro and microscopic analyses will be necessary to better understand these differences.

## A. HUMAN SKELETONS WITH TREPONEMATOSIS DISCOVERED IN THE NECROPOLIS OF 15TH-19TH CENTURIES AT THE ROMAN CATHOLIC CATHEDRAL OF IAȘI, ROMANIA

**Abstract author(s):** Groza, Vasilica-Monica (Romanian Academy – Iași Branch, “Olga Necrasov” Center of Anthropological Research) - Petraru, Ozana-Maria (Romanian Academy – Iași Branch, “Olga Necrasov” Center of Anthropological Research; “Alexandru Ioan Cuza” University of Iași, Faculty of Biology) - Popovici, Mariana (Romanian Academy – Iași Branch, “Olga Necrasov” Center of Anthropological Research) - Bejenaru, Luminița (Romanian Academy – Iași Branch, “Olga Necrasov” Center of Anthropological Research; “Alexandru Ioan Cuza” University of Iași, Faculty of Biology)

**Abstract format:** Poster

A sample of 89 skeletons was discovered at the “Adormirea Maicii Domnului” Roman Catholic Cathedral from Iași (Romania) (children, adolescents, adults and elders), in inhumation tombs and reburials of 15th-19th centuries. Three skeletons of this sample are suspected to be affected by treponematosis. The most known of the treponematous is the syphilis, a debilitating disease, sexually transmitted and caused by the bacterium *Treponema pallidum*. There is much debate on the syphilis origins and spreading, particularly with regard to ancient populations in preantibiotic times.

The treponematoses evidences are evaluated by macroscopic examination of the bone cortical surface and using a stereomicroscope Carl Zeiss Stemi 2000-C with a Canon Power Shot SX70 HS attached. Subsequent, selected skeletal remains were examined using medical imaging, by radiography (X-rays) and tomography (CT scans). The examined skeletons belonged to individuals of 30-35 years old (one female) and 35-40 years old (one male and one female).

Evidence of a chronic infectious disease, most likely treponematosi, exhibited destructive and proliferative processes (i.e., caries sicca) in frontal and parietal bones. Long bones also present alterations with increased osseous density and non-uniform thickening. In the analysed skeletons, the treponematosi does not appear associated with other significant pathologies.

This is a new study on the skeletal evidence of trepanematosi in archaeological populations discovered on the Romanian territory, providing data to better understand the disease in ancient times.

## **B. SKELETAL INDICATORS OF AMPUTATION PROCEDURE, LOOKING AT THE EXAMPLE OF THE CASE OF PRE-COLUMBIAN MIDDLE ANDES.**

**Abstract author(s):** Lis, Monika (University of Warsaw)

**Abstract format:** Poster

The aim of this speech is to analyse and summarize the indicators of a successful amputation procedure visible in osteological material from excavation. Evidence of this medical surgery is quite abundant in archaeological material all over the world. However, more than missing bones of the limbs is needed to identify individuals with post amputated limbs. Depending on the type of procedure, a number of indicators are distinguished. Determined by the location and period, two methods were used: disarticulation through the joint (Syme's type amputation) and direct cut through the bone. The second one requires specific tools, that were capable to do so. It usually leaves easily recognisable traces on bone. Taking into account the fact that no metal tools capable of cutting a bone were known in pre-Columbian Middle Andes, it is assumed these societies performed Syme's type amputations, accompanied by the use of available plant anaesthetics and antiseptics. This procedure usually does not leave visible cuts on the bone and requires different approaches to be identified. Possible changes might be observed in joint surfaces or musculo-skeletal stress markers analysis. Moreover, these observations may lead to conclusions about the use of crutches and prosthetics, which causes change of the body's centre of gravity, and that leads to bone's reaction to a different distribution of forces.

## **C. BIOARCHAEOLOGICAL ANALYSIS OF THE POSSIBLE SKELETAL REMAINS OF BÉLA, DUKE OF MACSÓ (12TH CENTURY AD)**

**Abstract author(s):** Hajdu, Tamas (Eötvös Loránd University) - Bernert, Zsolt (Department of Anthropology, Hungarian Natural History Museum, Budapest) - Szeniczey, Tamás (Department of Biological Anthropology, Faculty of Science, Eötvös Loránd University) - Major, István - Molnár, Mihály (Isotope Climatology and Environmental Research Centre, Institute for Nuclear Research, Debrecen) - Kelentey, Barna Árpád (Department of Operative Dentistry and Endodontics, Faculty of Dentistry, University of Debrecen) - Angyal, János (Department of Periodontology, Faculty of Dentistry, University of Debrecen) - Horváth, Anikó - Palcsu, László (Isotope Climatology and Environmental Research Centre, Institute for Nuclear Research, Debrecen) - Buzár, Ágota (Department of Anthropology, Hungarian Natural History Museum, Budapest)

**Abstract format:** Poster

Béla of Macsó (after 1243– November 1272 AD) was Duke of Macsó and of Bosnia. He governed the southern provinces of the Medieval Kingdom of Hungary. Béla's father was Duke Rostislav of Macsó (a member of the Rurik dynasty) and his mother was Anna, a daughter of King Béla IV, a member of the House of Árpád. Béla of Macsó was killed in mid-November 1272 on Margit Island.

The skeletal remains of an adult male were found beneath the floor during the excavation of a 13th-century Dominican monastery on the Margit-island, in 1914-1915 (VÁRKONYI 1915, GYARMATHI 1915, HANKÓ 2004). The body was buried head up to the altar. At a depth of 1.5 meters, the skeletal remains of two other individuals were also discovered. According to the Budapest Newsletter of 1929, the remains of Béla came from oak coffins with ornate carvings (NÉMETH 1929). After the excavation, the human remains were transported to the Institute of Anthropology of the University of Budapest (now: Department of Biological Anthropology, EötvösLoránd University) where Lajos Bartucz analyzed them. However, he did not publish the results in detail. Some of his preliminary observations were mentioned in a newspaper (NÉMETH 1929). The skeleton belonged to a 20-25-year-old male. Bartucz observed 23 perimortem cutmarks caused by sharp weapons (swords) on the bones. He thought that Béla did not die in a duel, but he was rather slain with excessive violence as his body was cut more times after he fell to the ground.

The aim of our paper is to present the results of the complex bioarchaeological analysis of the possible remains of Béla of Macsó.

This research was supported by The House of Árpád Programme (2018–2023) Scientific Subproject: V.1. Anthropological-Genetic portrayal of Hungarians in the Árpáadian Age.

## D. CHALLENGING STATUS? INTERPRETING CARE IN AN INDIVIDUAL WITH FACIAL AND LOCOMOTIVE IMPAIRMENTS

**Abstract author(s):** Robinson, Stephanie (University College Cork)

**Abstract format:** Poster

The Early Bronze Age in Ireland is traditionally interpreted as a period of socio-political change. Alongside changes in trade relations associated with the introduction of Bronze, the introduction of what is interpreted as a formalised and restricted individualised burial tradition – in comparison to the collective burial of the Late Neolithic – has often been linked to the rise of the 'ideology of the individual'. In 1935, excavations of Early Bronze Age cists at Ballybrew, Co. Wicklow, Ireland uncovered the skeleton of an adult male whose flexed remains had been inserted into a grave already containing an adolescent. A recent reanalysis of this atypical burial has identified bilateral robusticity changes to the skull and a non-union fracture of the right tibia and fibula. The identification of severe torticollis and a well-healed non-union fracture strongly suggest that this individual would have required differing short-term and long-term care throughout their life. While the Bioarchaeology of Care provides a methodology for assessing care within past populations, it also provides a framework for assessing how the provision of care can reflect upon the culture of the provider. This case study highlights the intersection of presumed high status of a cist burial, apparent reuse of the grave, atypical burial position, and an individual with highly visible facial asymmetry and lower limb injuries that can be used to explore questions not only around how status was viewed in the Irish Early Bronze Age, but also who qualified to receive care and what care entailed.

## E. RELATIONSHIP BETWEEN THE ORBIT SHAPE AND CRANIOFACIAL TRAITS IN A SAMPLE OF CONTEMPORARY HUMAN SKULLS FROM IAȘI CITY, ROMANIA

**Abstract author(s):** Groza, Vasilica-Monica (Romanian Academy – Iași Branch, "Olga Necrasov" Center of Anthropological Research) - Bejenaru, Luminița - Petraru, Ozana-Maria (Romanian Academy – Iași Branch, "Olga Necrasov" Center of Anthropological Research; "Alexandru Ioan Cuza" University of Iași, Faculty of Biology) - Popovici, Mariana (Romanian Academy – Iași Branch, "Olga Necrasov" Center of Anthropological Research)

**Abstract format:** Poster

The orbits are bilateral and symmetrical cavities in the skull, enclosing the eyeballs and its associated structures. By positioning them, below the frontal and anterior to the temporals, the orbits play an important role in the evaluation of craniofacial complex. How orbit shapes covariate with craniofacial features differs depending on the human population, geographic region, environmental or genetic factors of individuals. This is a topic of interest in many current scientific approaches.

The present study is aimed to bring new data on how the shape of the orbit varies in correlation with the craniofacial traits. The sample of this research consists of 50 skulls originated in the crypt of Mausoleum dedicated to the First World War Heroes in Iași city, Romania. This study combines geometric morphometrics with traditional morphometry to quantify the shape of the orbit and the influence of craniofacial indices upon it. The 72 landmarks quantified the shape of the orbit, while 13 craniofacial indices described the craniofacial features in the sample. Canonical discriminant function analysis and Mahalanobis' distance were used to examine the patterns of covariations which defined the clusters within sample.

The orbit shape in the studied human population fits into the pattern described in other studies on European populations, namely an inclined square or rectangle shape. Within the general pattern, it was possible to distinguish variation models correlated with the cranial index and the superior facial index. A constant signalled in the variation models is the lower margin of the orbit. This turned out to have weaker covariates in the craniofacial complex than the inner and upper margins of the orbit.

This work is one of a series of studies that will investigate the strength and direction of the relationships between orbits and cranial traits among geographically separate human groups.

## F. AN INTEGRATED THEORETICAL AND BIOARCHAEOLOGICAL APPROACH TO CATASTROPHIC COMMINGLED ASSEMBLAGES

**Abstract author(s):** Masters, Mackenzie (University of York) - Soficaru, Andrei (Francis I. Rainer Institute of Anthropology) - Alexander, Michelle (University of York) - Holst, Malin (University of York; York Osteoarchaeology Ltd.)

**Abstract format:** Poster

This research introduces a novel approach utilising a chaîne opératoire framework developed to enhance understanding of ancient mass graves by integrating archaeological data, osteological, and biomolecular methods (isotopic and aDNA analyses). Archaeological mass graves are relatively rare and understudied but, these sites provide invaluable insight into complex social interactions within and between communities in response to catastrophe.

The presented chaîne opératoire model is applied two-fold, firstly, to use archaeological data (recording stratigraphy and location of objects in the grave), burial context, and archaeoethnology (taphonomy and the burial

environment) to understand the funerary behaviour surrounding the construction of and deposition within the mass grave. Secondly, the application of osteological methods (paleodemography and paleopathology) and biomolecular analyses allows for an understanding of local and non-local identity, and socio-cultural behaviour in response to a catastrophic event.

This poster presents two historic case studies utilising this approach. Firstly, a site from 11th century CE Leicester, UK (83 individuals) comparing individual and double inhumations to mass graves- most likely created in response to an epidemic- within the same attritional cemetery. Secondly, the Late Roman/Early Byzantine site Ancient Ibida from Slava Rusă, Romania (98 individuals) comparing an attritional cemetery (4th- 6th century CE) with a mass grave (3rd-4th century CE) located outside the city walls likely a result of a violent event.

## G. INVESTIGATION OF THE GENETIC ANCESTRY OF BÉLA OF MACSÓ, AN ÁRPÁDIAN PRINCE FROM HUNGARY

**Abstract author(s):** Borbély, Noémi - Mende, Balázs Gusztáv (Institute of Archaeogenomics, Research Centre for the Humanities, ELRN, Budapest) - Pinhasi, Ron - Cheronet, Olivia (Department of Evolutionary Anthropology, University of Vienna) - Reich, David Emil (Department of Genetics, and Department of Human Evolutionary Biology, Harvard Medical School) - Takács, Ágoston (Medieval Department, Castle Museum - Budapest History Museum) - Hajdu, Tamás (Department of Biological Anthropology, Eötvös Loránd University) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, Research Centre for the Humanities, ELRN, Budapest)

**Abstract format:** Poster

We genetically investigated Béla, the duke of Macsó and Bosnia, who governed the southern provinces of the Kingdom of Hungary and lived between 1243–1272 AD. He was the son of Duke Rostislav (Rus' prince, Rurik dynasty) and Duchess Anna from the Árpád dynasty (daughter of Béla IV of Hungary) according to the historical records. His remains were excavated in the Margaret Closter on the Margaret Island of Budapest in 1915 and re-explored in 2018. His identification is based on anthropological, archaeological, and historical records on the circumstances of his murder in 1272.

In this study, we investigated his Y-chromosome and analysed the mitogenome of the ancient DNA gained from the skull attributed to Béla of Macsó. The Y-chromosomal haplogroup of Béla is N1a-M46. Further downstream subgroups can be predicted from the STR matches detected with present-day descendants of the Rurikids. Béla of Macsó most probably belonged to the haplogroup N1a1a1a1a1a1a defined by the terminal SNPs L550. We conclude that the N1a-M46 paternal lineage corresponds to his anticipated Rurikid genealogy. The maternal line of Béla belonged to the mitochondrial U3b3 subgroup of U3. No identical mtDNA haplotype to Béla's lineage was detected in the published datasets. As phylogenetic analysis reveals, similar haplotypes are nowadays characteristic in the Near East and the Caucasus. Therefore, the maternal U3b3 lineage also fits into the maternal genealogy as a rare but widespread lineage from the Caucasus to the Near East, most probably also prevalent in the Early Medieval Anatolia and the Aegean – South-Pontic world. The uniparental data, therefore, strengthens the archaeological and anthropological records in the identification of the skeleton.

## H. PALEOPATHOLOGICAL INVESTIGATION OF A POSSIBLE SURGICAL TREPHINATION FROM 11-13TH CENTURY

**Abstract author(s):** Kiss, Krisztián (Department of Biological Anthropology - Eötvös Loránd University; Department of Anthropology - Hungarian Natural History Museum) - Gémes, Anett - Gyenesei, Katalin (Department of Biological Anthropology - Eötvös Loránd University) - Karlinger, Kinga (Department of Radiology, Medical Imaging Center - Semmelweis University) - Szeniczey, Tamás - Hajdu, Tamás (Department of Biological Anthropology - Eötvös Loránd University)

**Abstract format:** Poster

The excavation of the Árpáadian Age cemetery at the site of Jászberény- Szent Pál halom (11-13th Century) took place between 1952-1954. The population buried here was under the authority of the Hungarian Kingdom. However, their ethnic representation remained uncertain as these times were characterized by both small- and large-scale immigrations of several ethnicities (e.g. Pechenegs, Cumans, hospes communities from Western Europe) toward the borders of the medieval Kingdom. Cases of trephinations are known all over Europe from the Neolithic to Arpadian Age and can be categorized based to the presumed cause of the intervention. Surgical trephination was practiced as a medical intervention while symbolic trephinations were possibly the results of religious beliefs.. In the Carpathian Basin,, most of the known trephinations are presumably of symbolic origin and related to Hungarian conquerors from 10th Century. A possible case of a surgical trephination from Arpadian Age is presented by a 45-55 years old male (inventory number: 8752). Along the coronal suture on the left, a healed lesion can be observed which characteristics resembles a surgical trephination. Another sign of a well-healed blunt force trauma is evident along the sagittal

suture. Additionally, moderate enthesopathies can be observed on both humerus, radius, pelvis and femur, as well as dental pathologies such like caries, cyst or abscess and linear enamel hypoplasia on the upper and lower teeth. In order to get a more accurate morphological description of the possible surgical trephination and reveal any other hidden lesions on the skull, computertomographic analysis is scheduled. This case may expand our knowledge of trephinations of the medieval Hungarian Kingdom.

This research was supported by the House of Árpád Programme (2018–2023) Scientific Subproject: V.1. Anthropological-Genetic portrayal of Hungarians in the Arpadian Age to TT and Foundation for Bolyai College.

## I. PALEOPATHOLOGICAL ANALYSIS OF THE LATE IRON AGE BURIALS FROM GYŐR-KÁLVÁRIA MERGED SITE

**Abstract author(s):** Gyenesei, Katalin (Department of Biological Anthropology, Eötvös Loránd University, Budapest) - Kiss, Krisztián (Department of Biological Anthropology, Eötvös Loránd University, Budapest; Department of Anthropology, Hungarian Natural History Museum, Budapest) - Szeniczey, Tamás (Department of Biological Anthropology, Eötvös Loránd University, Budapest) - Ujvári, Ferenc - Pesti, Krisztina (Rómer Flóris Museum of Art and History, Győr) - Hajdu, Tamás (Department of Biological Anthropology, Eötvös Loránd University, Budapest)

**Abstract format:** Poster

From the second half of the 5th century BC to the early 1st century BC Celts inhabited the Carpathian Basin. They populated Transdanubia and Slovakia but also had settlements in the Great Hungarian Plain and the southern part of the Carpathian Basin and Transylvania as well. From 2017 to 2019 at Győr-Kálvária merged site excavation shed light on 22 late Iron Age Celtic burials (La Tène Culture). The cemetery dates back to between the end of the 4th century BC and the 2nd century BC. The 22, mainly robbed graves contained 20 inhumated and 2 cremated remains. During the biological anthropological examination, we analyzed various pathological conditions. We detected slight and severe manifestation of a complex hormonal-metabolic disease, hyperostosis frontalis interna (HFI) on female skulls buried in graves S-30, S-69, and S-97. HFI appears on the endocranial surface of the frontal bone in form of bony deposits and mostly affects postmenopausal women. Many pathological changes affected an adultus-maturus aged man buried with several iron weapons in a larger than average grave surrounded by a ditch. We hypothesized that this individual suffered from diffuse idiopathic skeletal hyperostosis (DISH), which is mainly characterized by the ossification of the anterior ligaments of the dorsal and lumbar spine. In this case, we also observed spondylosis deformans on the cervical spine, spondylodiscitis, spondylarthrosis, Schmorl's nodes, vertebral compression fractures on the dorsal and lumbar spine. In terms of pathological changes, no significant difference between sexes or specific (cervical, dorsal or lumbar) spine regions could be found. Women were affected more likely by oral pathologies. In addition to the classical anthropological data, our results also contribute to the understanding of the pathological alterations affecting the Late Iron Age Celts of Transdanubia.

## J. INFECTIOUS DISEASE AT THE MIDDLE BRONZE AGE SETTLEMENT OF TISZAFÜRED (EASTERN HUNGARY) – A CASE STUDY

**Abstract author(s):** Gémes, Anett (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest) - Mester, Edit (Kiss Pál Museum, Tiszafüred) - Dani, János (Déri Museum, Debrecen) - Szeniczey, Tamás (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest) - Kiss, Krisztián (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest; Department of Anthropology, Hungarian Natural History Museum, Budapest) - Horváth, Anikó - Palcsu, László - Major, István (Isotope Climatology and Environmental Research Centre, Institute for Nuclear Research, Debrecen) - Kiss, Viktória (Research Centre for the Humanities, Institute of Archaeology, Budapest) - Hajdu, Tamás (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University, Budapest)

**Abstract format:** Poster

The Middle Bronze Age of the Carpathian Basin is a period spanning about half a millennium between 2000/1900-1500 BC. The first settlements of the Füzesabony-culture were also known from the beginning of the aforementioned period. The culture's first appearance took place in the valley of the Bodrog and Hernád rivers. Later their area of distribution spread across the Upper- and Middle Tisza region, as well as today's North-Northeastern-Hungary, and the Southern-Slovakia.

In the autumn of 2020, during a construction work, on the border of Tiszafüred, in Eastern Hungary a mass grave, as well as a waste pit belonging to the Middle Bronze Age, Füzesabony-culture was excavated. In the upper layers of the No. 1. pit, large amounts of animal bones (domestic and wild animals), fragments of Middle Bronze Age pottery, shells, fish scales, splinters, and a sporadic skull were found. During the demolition of the grave a large, round beehive-shaped waste pit emerged. In the pit an intact skeleton of a male was excavated in a crouched position in the submerged layer of the sporadic skull in the western half of the pit. There was an almost completely contiguous layer of shells under the body of the adult male, who was buried without any grave goods.

In our poster presentation, we focus on the anthropological analysis of this individual (age and sex estimation), supplemented with paleopathological examinations and with the results of stable isotopes (strontium and carbon/nitrogen) and radiocarbon dating.

This paper was supported by the Hungarian Scientific Research Fund (OTKA FK 128013) and the Momentum Mobility research project (Institute of Archaeology, Research Centre for the Humanities) granted by the Hungarian Academy of Sciences (Project Nr. LP 2015-3).

## **K. BIOLOGICAL ANTHROPOLOGICAL EXAMINATION OF THE LATE IRON AGE BURIALS FROM GYŐR-KÁLVÁRIA MERGED SITE**

**Abstract author(s):** Gyenesei, Katalin (Department of Biological Anthropology, Eötvös Loránd University, Budapest) - Kiss, Krisztián (Department of Biological Anthropology, Eötvös Loránd University, Budapest; Department of Anthropology, Hungarian Natural History Museum, Budapest) - Szeniczey, Tamás (Department of Biological Anthropology, Eötvös Loránd University, Budapest) - Ujvári, Ferenc - Pesti, Krisztina (Rómer Flóris Museum of Art and History, Győr) - Hajdu, Tamás (Department of Biological Anthropology, Eötvös Loránd University, Budapest)

**Abstract format:** Poster

From the second half of the 5th century BC to the early 1st century BC Celts inhabited the Carpathian Basin. They populated Transdanubia and Slovakia but also had settlements in the Great Hungarian Plain, the southern part of the Carpathian Basin and Transylvania as well. At the beginning of the era, Celts practiced inhumation as predominant burial rites however, later cremation became more dominant. The graves excavated at Győr-Kálvária merged site fit well into the Celtic burial customs of the Late Iron Age. The cemetery dates back to between the end of the 4th century BC and the 2nd century BC. The 22, mainly robbed graves contained 20 inhumated and 2 cremated remains. During the biological anthropological analysis morphological sex and age were estimated and anatomical variations were detected on the skull. Due to the fragmentation of the material, skull and long bone sizes were available in small proportions. Typical attributes of the Iron Age series such as the low number of infants and a higher ratio of females were also observed at Győr-Kálvária merged site – but it should be added, that not the entire cemetery was excavated and some of the graves could have been destroyed by construction and industrial works in the 19th and 20th century. In the case of the 2 cremated remains, only the bones of the limbs were found among the micro- and mesofragments. The two female skulls that could be measured showed the general craniometric characteristic of Transdanubian and Great Hungarian Plain Celts. As an anatomical variation bregmatic bone was also noticed on a male buried in grave S-34. In addition to the former research, our results also contribute to understanding the physical characteristic of Late Iron Age Celts of Transdanubia.

## **L. POPULATION HISTORY OF ANCIENT THESSALONIKI. A GEOMETRIC MORPHOMETRICS VIEW IN THE CONTEXT OF URBANIZATION**

**Abstract author(s):** Aidonis, Asterios (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Lyras, George (Department of Historical Geology and Palaeontology, Faculty of Geology & Geoenvironment, National and Kapodistrian University of Athens) - Protosalti, Soultana - Tzevreni, Stavroula - Vasileiadou, Stela - Konstantinidou, Krino (Ephorate of Antiquities of Thessaloniki City, Hellenic Ministry of Culture and Sports) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

**Abstract format:** Poster

Thessaloniki is a city with continuous and well-documented occupation since antiquity. The city was founded with the unification of smaller settlements in 315 BC. Its strategic position played a decisive role in its future development. After the Roman conquest of Greece (2nd c BC), it became the capital of the district of Macedonia, and later on, when the capital of the Byzantine Empire moved to Constantinople (330 AD), Thessaloniki emerged as the second largest city of the empire. During these historical transitions, the city flourished and retained its urbanity uninterruptedly. However, despite the good archaeological record, it remains unclear if there was a biological continuity among the city's inhabitants or if there were major population changes such as influxes or replacements, as expected to be due to the successive conquests. To address this question, we investigate the evolution of the craniofacial anatomy of the city's inhabitants from antiquity till the late Middle Ages. We analyze 208 individuals excavated during the construction of Thessaloniki's metropolitan subway. We applied a geometric morphometric analysis of the temporal bone, in order to reconstruct the secular patterns of population variation. We tested whether the historical and sociocultural transformations between 3rd c BC and 14th c AD are interconnected with population changes. The bones were digitized and thirteen anatomical landmarks describing temporal bone morphology were collected. Landmark measurement error was tested and a Generalized Procrustes Analysis (GPA) was conducted to extract the geometric shape from overall size. Principal components analysis (PCA) and Canonical variate analysis (CVA) were performed to examine craniofacial shape differences. Considering also the archeological data, our study examines the continuity hypothe-

sis, according to which a homogenous population pattern is expected, and the influx hypothesis, according to which morphological differentiation between chrono-cultural groups would appear.

## **M. METHODOLOGICAL CONSIDERATIONS REGARDING AN UNFINISHED CRANIAL SURGERY FROM THE 10TH-CENTURY-CE CARPATHIAN BASIN**

**Abstract author(s):** Kis, Luca (Department of Biological Anthropology, University of Szeged; Department of Archaeogenetics, Institute of Hungarian Research, Budapest) - Tihanyi, Balázs (Department of Biological Anthropology, University of Szeged; Department of Archaeogenetics, Institute of Hungarian Research, Budapest) - Király, Kitty (Department of Biological Anthropology, University of Szeged) - Spekker, Olga (Department of Biological Anthropology, University of Szeged; Institute of Archaeological Sciences, Eötvös Loránd University, Budapest) - Neparáczki, Endre (Department of Archaeogenetics, Institute of Hungarian Research, Budapest; Department of Genetics, University of Szeged) - Szabó, Árpád (Department of Forensic Medicine, University of Szeged) - Pálfi, György - Bereczki, Zsolt (Department of Biological Anthropology, University of Szeged)

**Abstract format:** Poster

The aim of this study is to describe a newly discovered surgical trepanation case that was found in the skeletal material of the 10th-century-CE cemetery of Sárrétudvari-Poroshalom. We intend to give a new insight into the indication and preparation process of trepanations, and present the implications of this particular case to the methodological problems of trepanation research. On the right parietal bone of an adult (25–30-year-old) male, a lesion complex with no sign of healing was observed. It is composed of an original sharp-force trauma surrounded by two curved, intentionally created furrows that can be interpreted as attempted but unfinished surgical trepanation, presumably performed with a U-shaped gouge. The presence of the sharp-force trauma inside the unfinished surgical trepanation supports the long-held hypothesis that curing of a primary trauma is one of the possible intentions of surgical trepanation. The significance of the presented case is given by not only the incompleteness of the surgery but the method of intervention that it allows us to investigate, as the use of a U-shaped gouge in ancient cranial surgery has not formerly been documented in the literature. This case may suggest a possible mode of tool use, and aid future reconstruction attempts concerning the hypothesized 10th-century-CE trepan from Tiszaeszlár-Bashalom. Finally, since both surgical and symbolic trepanations can be incomplete, we recommend that the term “incomplete” should not be used as synonymous with “symbolic trepanation” or “skullmark”.

## **N. CROWN DIMENSIONS OF THE M2 MOLAR: COMPARISON BETWEEN PREHISTORY AND MEDIEVAL SAMPLES FROM NORTH-EASTERN ROMANIA**

**Abstract author(s):** Bejenaru, Luminita (Faculty of Biology, “Alexandru Ioan Cuza” University of Iași; Romanian Academy Iași Branch, “Olga Necrasov” Center of Anthropological Research) - Popovici, Mariana - Groza, Vasilica-Monica (Romanian Academy Iași Branch, “Olga Necrasov” Center of Anthropological Research) - Petraru, Ozana-Maria (Faculty of Biology, “Alexandru Ioan Cuza” University of Iași; Romanian Academy Iași Branch, “Olga Necrasov” Center of Anthropological Research)

**Abstract format:** Poster

Due to their excellent preservation based on their hard tissues (i.e., enamel, dentine and cementum) teeth are a valuable source of information for studies concerning the past human populations in archaeological and forensic contexts. Several studies of dental anthropology approached the linear measurements of tooth crowns for assessing dental variations and the sexual dimorphism in both modern human populations and past ones.

The aim of this study is to assess the M2 molar crown variability in samples of archaeological human populations from Prehistory (Chalcolithic and Bronze Age, ~ 5000-1150 BCE) and Middle Ages (13th-17th centuries) discovered in sites of North-Eastern Romania. The two crown linear measurements, mesio-distal (MD) and bucco-lingual (BL) diameters, were performed using ImageJ software on occlusal digital images acquired stereo-microscopically. The crown index (CI), crown area (CA) and the sexual dimorphism index (SDI), along with the two linear measurements were subjected to the univariate and multivariate statistical analysis.

Our results show that the variation coefficient (CV) for the MD diameter of the female upper M2 molars is higher in the medieval sample than in the prehistoric one; also, a higher variability is remarked for the mandibular M2 molar in the medieval sample than in prehistoric one.

According to the bivariate analysis, the two diameters were less correlated in the maxillary M2 molar than in the mandibular M2 molar, especially in females.

In females, the MD and CA variables for mandibular M2 molars and the BL and CA for maxillary molars showed significant statistical differences between the medieval and prehistoric samples, with higher values for Middle Ages. In the male maxillary molars, the crown area (CA) variable showed significant higher values in the medieval sample than in the prehistoric one. The discriminant analysis confirmed the sexual dimorphism on the mandibular M2 crown, in the prehistoric sample.

## 340 NORTH EUROPEAN TRADING NETWORKS FOR IRON AND COPPER

**Theme: 4. Polis, Empire, League and Beyond – Living in Interconnected Societies**

**Organisers: Haggren, Georg (University of Helsinki; Muuritukimus Oy) - Karlsson, Catarina - Magnusson, Gert (Jernkontoret)**

**Format: Regular session**

Iron and copper have been traded in Europe already before the Roman era. In the North this trade involved ports of the Baltic and the North Sea. During the Middle Ages metal trade increased manifold and many ports grew into important towns, and in the 13th century the Hanseatic league became the leading actor in the metal trade. According to written sources from the 16th century dozens of ships left Stockholm every year, with osmund and bar iron as cargo. Recently maritime archaeologists have begun excavations on one of those ships that handled the Swedish iron export. This complete 16th century ship was found in the Stockholm archipelago. Ships with similar cargo have been found along the south side of the Baltic and the wrecks bear witness to the importance of metal trade.

Iron and copper were important for the social development of medieval and early modern European society. Osmund iron appear in archaeological finds since the 12th century and it was a quality product, created for large scale iron trade. Without the iron there would have been no churches, no monasteries and no impressive buildings in the towns.

In this session we will discuss the importance of metal trade in creating and developing a society as well as the technical development in shipbuilding and metal production. The focus is in the Scandinavian and Central European trading networks but we will appreciate papers related to rest of Europe too. We welcome abstracts about:

- Actors in trading and trading networks
- Demand, supply and credit
- Trading routes and trading networks
- Iron and copper findings in trade settings
- The quality of the traded metals
- Different modes of transport of metals
- Shipbuilding, cargo and the packing of goods

## ABSTRACTS

### 1 MEDIEVAL MINING PRODUCTION AND EXPORT FROM – THE ESSENTIAL OUTLANDS

**Abstract author(s): Karlsson, Catarina (Jernkontoret)**

**Abstract format: Oral**

Medieval mining and export from the Swedish outlands is one of the themes of the Atlas project. For 25 years the project has been compiling and analysing archaeological remains, historic sources, place names and maps in 23 mining districts with medieval origins. Within these mining areas there are archaeological remains from more than 750 medieval furnaces (of which 60% are for iron, 20% copper, 10% silver and 10% with undetermined smelting).

The Swedish mining area Bergslagen is situated north and west of the lake Mälaren. Stockholm, the capitol of Sweden, is located by the rapids, where the lake meets the Baltic Sea. The introduction of industrialized mining has had a crucial bearing on our medieval Scandinavian history and the urbanization of the Mälär areas. Stockholm was founded where the iron and copper was controlled before it was exported from Sweden on the Baltic Sea.

Currently seven historians and archaeologists are working on a synthesis of the results, which will give an overall picture of the medieval metal and mining industry and the mining districts effect on the landscape, economy and social transformation. The interdisciplinary approach in our project provides opportunities of further interpretations and a deeper understanding of the ancient mining landscape and the dynamic role of iron and copper in the modernization process in Sweden 1150–1350 AD.

The source material used in the project are: written documents, laws, charters, tax documents, business agreements, and archaeological remains amounting to 7 000 bloomery sites, 12 000 mines, 760 medieval smelting sites and medieval slag deposits in towns.

The work is coordinated by the historical Committee of Jernkontoret (The Swedish steel producers association) in co-operation with several county boards. The synthesis will present a new and more complex picture of medieval mining and export and its impact on Swedish and European history.

## **2 A CENTRE IN ENGLAND'S IRON TRADE? AN INTERDISCIPLINARY STUDY OF MEDIEVAL IRON PRODUCTION AND TRADE IN SOUTH EAST ENGLAND**

**Abstract author(s): Cranfield, Jack (University of Exeter)**

**Abstract format: Oral**

The Weald of Kent, Sussex and Surrey was a major centre of ironworking in Britain from the late Iron Age and into the Romano British period, by which time evidence suggests iron was produced in some localities on an industrial scale. Less is known however on the scale of this industry in the post Roman period and the extent to which iron formed a significant element of the local and wider economy of the Middle Ages. While documentary evidence is scarce for the iron industry, several important accounts imply that iron was more than just a local commodity by the 14th century, but one whose trade was connected to nobility, Royalty, and the Church. Commodities such as nails, arrows, iron bars and horseshoes were transported across England and used to repair Royal houses, castles and equip Edward III's war horses, during the Scottish wars in 1327. At times trade was controversial and in 1300 London ironmongers complained that Wealden ironworkers, were selling iron strakes for cartwheels at shorter than the normal lengths.

How do these historical accounts relate to the archaeological evidence? and to what extent do sporadically recorded trading activities reflect the typical nature of iron trade during this period? Little is known of the relationship between the exchange of iron blooms and secondary products, and the smelting and smithing sites where these products were produced. This paper uses an interdisciplinary approach to contextualise the iron industry and its trade within the Weald, considering the archaeological and documentary evidence from two important sites, Tudeley Ironworks (Kent) and Roffey Ironworks (West Sussex). Through the application of a landscape archaeological approach and a comparison to contemporary documents, it aims to identify the nature and scale of 14th century ironworking and consider the Weald's significance to both local and long-distance trade networks.

## **3 IRON IN BORGUND – OPERATIONAL CHAINS AND NETWORKS OF PRODUCTION AND TRADE**

**Abstract author(s): Hope, Brita (University Museum of Bergen)**

**Abstract format: Oral**

Borgund, a small medieval town situated on the western coast of Norway, not far from the city of Aalesund, relied its existency on a diverse economy exploiting both marine and terrestrial resources. By taking part in international as well as domestic trade and communication, Borgund grew into an important centre, flourishing in the course of the 12th and 13th centuries, holding up to possibly four churches. All together, the town must have been an attractive market for iron until its late medieval abandonment.

Several seasons of excavations in the second half of the 20th century revealed an extensive amount of iron and slag, indicating that production and trade of iron were an important factor in the town's existence. As a part of the archaeological and multidisciplinary research project on Borgund (The Borgund Kaupang Project), this Ph.D. project is studying the archaeological material related to the economy of iron.

Central questions the Ph.D. project encounters are what iron production processes were carried out within the town, and what economic, cultural, and social networks of production and trade the people of Borgund were entangled in. The project aims to see the economy of iron as a whole, following the enchainments of the economy from consumption and demand, to production and supply, linked by aspects of networks and trade. This paper will be angled towards the latter.

## **4 RECTANGULAR IRON BLOOMS – A NEW AND NUMEROUS ARTEFACT GROUP FROM ESTONIA**

**Abstract author(s): Saage, Ragnar - Jegorov, Sander (University of Tartu)**

**Abstract format: Oral**

The rise in popularity of the metal detectors in Estonia have given us thousands of new finds. Among them are the iron blooms – a suspected product of the local iron smelting industry, which took place between the 1st and 15th centuries AD. The blooms are usually hammered into a rectangular shape, but not folded nor stretched out. Now, these blooms are appearing as hoards, put into the ground in times of trouble or other reasons.

This paper investigates this new phenomenon. The blooms were sampled to be investigated metallographically. This gives information about their composition and enables the selection for areas suited for radiocarbon dating. Finally, the blooms were localized using SEM-EDS for the bulk chemical composition of slag and LA-ICP-MS analysis for trace elements. The samples originating from local iron smelting sites were compared with the slag from the blooms. This enables a thorough discussion of the local iron smelting and regional iron trade.

## 5 IRON TRADE IN THE BALTIC AND NORTH SEA IN EARLY MEDIEVAL TIMES

**Abstract author(s):** Magnusson, Gert (Stockholm University; Jernkontoret)

**Abstract format:** Oral

Iron and copper were important for the economic and social development of medieval European society. Osmund iron appears in archaeological finds already in the 12th century. It was a quality product, created for large scale trade of iron and steel. At this point in time iron production was in a stage of technical development. In the mining areas the blast furnace was invented and at Tvååker on the Swedish west coast, one of the earliest water powered iron forges known in Europe was developed. The forge was mentioned in the will of the Danish Bishop Absalon in 1197. It was situated ca 6 km from the nearest port of trade Gamle köpstad (Old port) by the coast. Two wrecks of cargo ships from the 12th century were found in the port in the 1920s. This is a model site of the connection between high developed iron production and regional trading ports for a larger market.

In a similar fashion, ports of trade at close distance to the iron production sites are common in the Baltic. For a long time, iron was traded in small ports as well as major ports. It was traded in local markets along the coasts and in the greater European market organized by merchants in important towns. The finds mirror the scale of the trade. Without iron no churches, no monasteries and no impressive buildings in the medieval towns would have been erected during the "long" 13th century.

## 6 METALLURGICAL ANALYSIS OF IRON BARS FROM THE POLISH 15TH C. COPPER WRECK

**Abstract author(s):** Wärmländer, Sebastian (Department of Archaeology and Classical Studies, Stockholm University)

**Abstract format:** Oral

Iron and steel have been major trade commodities in the Baltic region during the last thousand years. There are however many things that we still do not know about iron manufacturing in ancient times, and about the quality and composition of the iron and steel that was traded. Iron bars in the cargo of ship wrecks are an important source for understanding such aspects of iron production and iron trade. The Baltic Sea provides excellent preservation conditions for such materials, as the brackish water prevents the wrecks from being degraded by ship worm, and corrosion of the iron bars is slow due to the cold and almost oxygen-free conditions at the Baltic Sea bottom. Here, we present the analysis of different types of iron, including bar iron and possible osmund iron, from the so-called "Copper Wreck" that sank outside the harbour of Gdańsk in Poland around AD 1400. In the medieval period, Gdańsk was an important center for iron trade, where raw iron was imported from Sweden and refined in the Polish water-powered iron hammers. The investigation of the composition and manufacturing steps of these bars adds important understanding to Polish 15th c. iron working and iron trade.

## 7 A UNIQUE SHIP WRECK FOUND WITH A UNIQUE CARGO

**Abstract author(s):** Hansson, Jim (Swedish National Maritime and Transport Museums)

**Abstract format:** Oral

The wreck is unusually well preserved for a ship built with clinker technique. It also has its cargo still in place. There are a little over 30 barrels visible, mostly containing so called osmund iron. No similar wreck has ever before been found in Swedish waters. The wreck is dated to 1540's and has been repaired in the 1550's.

The wreck has three masts (the main mast still standing in its original place) and all its rigging seems to be intact at the site.

In October 2022 an excavation was conducted. The aim was to find out how big the cargo was and what content it had. The result was that 20 really well preserved barrels was found and most of them with Osmund iron. The results also showed that that ship contains about 80-100 barrels. When the barrels was documented it was clear that the barrels with Osmund iron had a different construction. The construction might have to do with the custom in Stockholm where you had to show the whole content before export. The excavation gave some stunning result that gave a lot more information.

Iron exports was then, and still is, one of Sweden's most important exports but the knowledge of historic cargo ships, the trade routes and the quality of the iron is almost unknown. This ship is one of the most important finds to date and can tell us much more about how the iron was transported, how export was organized and what kind of ships were constructed.

Based on the archaeological surveys this paper discusses the ship wreck, its construction, export, the rigging, the cargo and the possibilities for further study of the history of the Swedish iron industry through a ship wreck still fully equipped and comparable to a time capsule from 1550.

**Abstract author(s):** Haggren, Georg (University of Helsinki; Muuritutkimus Oy)

**Abstract format:** Oral

Historical archaeology is always multidisciplinary. Historians use written sources in their research, while archaeologists analyze physical remains. When researching the Middle Ages historians often face the lack of well preserved series of sources while in the early modern era the number of written record grows remarkably. This is also the case when researching merchant shipping in the Baltic Sea. The famous Danish Sound Dues were introduced in the 15th century, and beginning from the middle of the 16th century large series of customs records from coastal towns in Sweden (including Finland) have survived.

Historical research has its focus on time and chronology while analyzing the material record and focusing on sites and objects archaeologists have usually to be content with rather inaccurate datings. While historians are used to discuss about single years or precise dates, archaeologist are happy when being able to limit their stratigraphy or time scale to decades or even centuries. Wrecks and especially early modern wrecks offer rare luxury. They are time capsules that scholars are often able to date exactly, and in best cases it is also possible to identify a sunken ship.

The aim of this paper is to show the potential of the 16th century Swedish customs records while analyzing the iron trade. The middle of the 16th century was a crucial period when bar iron began to shake traditional osmund iron's position as Sweden's most important export article. The idea is to discuss here about the possibilities to put together the written sources and the maritime material record in the context of iron trade.

## OVERSEA AND INLAND – CULTURE CONTACT DYNAMICS IN THE MEDITERRANEAN DURING THE 1ST MILLENNIUM BCE

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Gerling, Claudia (University of Basel) - Gigante, Melania (University of Padua) - Billo-Imbach, Marta (University of Basel) - Salfini Semerari, Giulia (University of Michigan)

**Format:** Regular session

The 9th to 7th centuries BCE coincide with a period of increased circulation of objects and ideas (via trade, exchange and human mobility) throughout the Mediterranean. The arrival of Aegean and Phoenician settlers along the Mediterranean coasts was a further catalyst for the intensification of culture contact dynamics with local communities. This process had deep repercussions on the latter's economic and political organization, likely also impacting their earlier interactions with neighbouring communities. This aspect in particular has been under-investigated, yet it is instrumental in understanding local communities' economies and resilience at this turning point in Mediterranean history. Within this historical framework, the recent expansion of bioarchaeological (physical anthropological, isotopic, aDNA analyses etc.) studies has allowed archaeologists and bioarchaeologist to engage in multidisciplinary studies that have the potential to better reconstruct these interconnected processes of mobility, contact and social change. Specifically, material cultural analyses focused on shifts in production and consumption practices and domestic, funerary and ritual traditions can illuminate continuity and discontinuity in local organizations and constructed identities, while bioarchaeological analyses allow us to tackle the demographic changes underpinning these processes. Yet the integration of these two datasets is not devoid of problems, and requires active engagement by experts in both fields to resolve issues of scale, chronology, and theoretical and methodological mismatches.

We would like contributors to focus on how to integrate archaeological (material cultural) datasets with bioarchaeological analyses in order to illuminate (1) regional networks of contact and exchange and (2) interactions between non-local settlers and local populations. Starting point for our session is the early 1st Millennium BCE in southern Italy, but we also welcome presentations focusing on other contemporary Mediterranean regions by combining archaeological and bioarchaeological analyses.

## ABSTRACTS

### SOCIO-CULTURAL EXCHANGE IN THE SIBARITIDE, CALABRIA (ITALY)

**Abstract author(s):** Billo-Imbach, Marta (University of Basel, Department of Ancient Civilizations) - Gerling, Claudia (University of Basel, Department of Environmental Sciences) - Guggisberg, Martin (University of Basel, Department of Ancient Civilizations) - Zaugg, Céline (University of Basel, Department of Environmental Sciences)

**Abstract format:** Oral

Archaeological excavations of the Macchiabate necropolis at Francavilla Marittima (Early Iron Age) led to the discovery of several burials with grave goods of non-local origin. Amber and glass beads as well as various types of bronze and ceramic vessels testify to long-distance contacts with the Baltics, Greece and Phoenicia, while other categories of objects, such as fibulae, indicate interactions with Etruria, Campania and the surrounding region. The prox-

imity to Sybaris, a Greek colony foundation, can explain some of the oversea contacts, while others rather imply intra-Italian connections. Through the application of strontium and oxygen isotope analysis to human skeletal remains, we try to answer whether it is more likely that human individuals or their ideas moved, both oversea and inland, and whether foreign objects are correlated to foreign people. Or are the archaeological indicators of "foreign identity" misleading and archaeological objects that are interpreted as non-local belong to individuals who grew up on site? In this contribution we present the results of our project and discuss difficulties connected to our research question.

## 2 SAME, SAME BUT DIFFERENT? – THE 6TH CENTURY BC BURIAL CUSTOMS IN THE SIBARITIDE

**Abstract author(s):** Gullo, Ilaria (University of Basel)

**Abstract format:** Oral

The arrival of Greek settlers and the foundation of their apoikia Sybaris around 720 BC on the northeast coast of Calabria had a deep impact on the local communities of the surrounding region. The site of Francavilla Marittima – only 10 km away – holds rich archaeological evidence dating back from the 8th to the 6th century BC that bear witness to the changing social dynamics. The 6th century burial customs in the Macchiabate necropolis differ from those dating back from the time before the Greek presence. What is especially noticeable in this case, would be the introduction of numerous new ceramic forms of Greek tradition connected to new funerary practices. In this paper, my aim is to focus on these perceptible changes in the 6th century BC burials of the Macchiabate Necropolis. Whilst comparing them to the other known contemporary necropolis of Amendolara, I will explore to what extent a same but different collective identity might be expressed through new and old traditions.

## 3 OVERSEA AND INLAND – CULTURE CONTACT DYNAMICS IN THE MEDITERRANEAN DURING THE 1ST MILLENNIUM BCE

**Abstract author(s):** Salfini Semerari, Giulia (University of Michigan)

**Abstract format:** Oral

This presentation will consider the case study of Basilicata in the early 1st millennium BC as a starting point to develop further reflections on the methodological challenges presented by studying mobility in the Mediterranean through bioarchaeological and archaeological datasets. Coastal Basilicata was one area where the so-called Greek colonization had a major impact on local developments, though there is still no consensus concerning the details of this process. Specifically, questions regarding the nature of the Greek colonial enterprise and their relations to local communities have seen diametrically opposed interpretations, from organized, centralized conquest by uniform groups coming from the Aegean to piecemeal, gradual migration which saw a deep involvement of the local population. In the hope of testing the validity of these two contrasting hypotheses I conducted a series of bioarchaeological analyses on well-documented indigenous and colonial cemeteries spanning the Greek colonization. The results highlight not only the potential of this approach, but also potential challenges. Some of these are specific to the context of the Mediterranean, which is unique in its long-term history of connectivity – something that should be considered when undertaking such studies.

## 4 WITHIN THE PILLARS OF HERCULES. MOBILITY AND INTERCONNECTIVITY IN THE FIRST MILLENNIUM BCE WESTERN MEDITERRANEAN: AN ARCHAEOLOGICAL AND BIOARCHAEOLOGICAL PERSPECTIVE

**Abstract author(s):** Gigante, Melania - Mazzariol, Alessandro (University of Padua)

**Abstract format:** Oral

The history of the Mediterranean basin is a history of human mobility and cross-cultural interactions. Since prehistory, this region has been a crossroads for people with different origins and cultures. They were purveyors of raw materials and artefacts, as well as idioms and customs, technologies and ideas which have enhanced the biological, linguistic and cultural heritage of local groups.

However, only since the first millennium BCE was there a shift towards more complex mobility dynamics, encouraged by the establishment of permanent outposts along maritime and land trade routes. Particularly, the movement of Eastern people in the West is tied to two fundamental events in the Iron Age Mediterranean, namely the so-called Phoenician diaspora and the eighth century-Greek colonisation. Looking at the Italian coasts, evidence of these encounters has been brought to light in several archaeological sites across southern Italy, Sicily, and Sardinia, pointing out a long-lasting debate on the nature of the often-unclear relationships and cross-cultural interactions between natives and foreigners.

Recently, the use of multi-isotopes analyses (e.g., Sr, O, Pb) on ancient human mineralised tissues has proven to be a useful tool to identify isotopically local and non-local people in melting-pot societies, opening to new and unexplored ways to address the mode and tempo of residential mobility in the past.

Coupling state-of-art archaeological theories and bioarchaeological techniques, this paper builds on the two case studies of Nora (Cagliari, Sardinia) and Pithekoussai (Ischia Island, Gulf of Naples), which respectively represent the first Phoenician emporium and the first Greek outpost in the West. This paper illustrates how merging material culture, osteology, and Sr-isotopes ratio ( $87\text{Sr}/86\text{Sr}$ ) data at both key-sites, it is possible to provide a better insight into mobility and interconnectivity in the first millennium BCE Western Mediterranean.

## 5 RECONSIDERING THE VILLANOVAN PHENOMENON OF PRE-ROMAN ITALY THROUGH AN ISOTOPE-BASED PERSPECTIVE: THE CASE STUDY OF FERMO (9TH-5TH CENTURY BCE, MARCHE)

**Abstract author(s):** Esposito, Carmen (Cardiff University; Queen's University Belfast) - Gigante, Melania (University of Padua) - Miranda, Pasquale (University of Naples Federico II) - Stoddart, Simon (University of Cambridge) - Pacciarelli, Marco (University of Naples Federico II) - Reimer, Paula - Malone, Caroline (Queen's University Belfast) - Bondioli, Luca (University of Padua; University of Bologna) - Müller, Wolfgang (Goethe University Frankfurt)

**Abstract format:** Oral

The Italian Early Iron Age (end of the 10th to the 8th century BCE) was a period characterised by significant population dynamics associated with the increase of exchange networks and expressed by profound social-cultural and structural changes. Diverse local communities represented by unique material culture and funerary rituals – arguably related to specific ethnic entities (e.g., Latial culture= Latins, Atestina culture= Veneti, Golasecca culture= Leponti) – emerged regionally in the archaeological record. Meanwhile, Greek people and Phoenicians settled along the Italian Peninsula, Sardinia and coastal Sicily. The human groups linked to the so-called Villanovan material culture stood out as a result of the organisation of the territory, geographical expansion across the Peninsula, and leading roles in the interaction with foreign and local groups. The main concentration of Villanovan sites was in Etruria in the central Tyrrhenian region. In addition, other sites, such as Bologna, Verucchio, Pontecagnano, Capua, Sala Consilina, and Fermo were scattered across the Peninsula. Some scholars have interpreted these sites as the outcome of the Villanovan expansion, while others have preferred a local formation. Here, we have combined archaeological, osteological, multi-isotope analysis ( $\delta^{13}\text{C}$  &  $\delta^{15}\text{N}$ ,  $n=25$  human samples;  $87\text{Sr}/86\text{Sr}$ ,  $n=54$  human samples,  $n=11$  baseline samples) to investigate human mobility at the site of Fermo (9th-5th century BCE, Marche). The combination of data sources from the Fermo funerary record confirmed the presence of a significant number (24%) of allochthonous individuals, contributing to the knowledge of community connectivity dynamics at this frontier site.

## 6 UNBURNT BODIES AMONGST CREMATED PEOPLE. FIRST ELEMENTS TO DEFINE THE IDENTITY OF THE INHUMED INDIVIDUALS FROM THE NECROPOLIS CUS-PIOVEGO, PADUA

**Abstract author(s):** Capasso, Giusy (Department of Cultural Heritage, University of Padua) - Beck de Lotto, Micheal (Department of Cardio-Thoraco-Vascular Sciences and Public Health, University of Padua) - Lugli, Federico (Department of Cultural Heritage, University of Bologna) - Sperduti, Alessandra (Bioarchaeology Service, Museum of Civilizations, Rome) - Bondioli, Luca (Department of Cultural Heritage, University of Padua) - Cupitò, Michele - Vidale, Massimo (Department of Cultural Heritage, University of Padua)

**Abstract format:** Oral

The pre-Roman necropolis of CUS-Piovego (second half of the 6th-beginning of 4th century BCE, Padua, Northern Italy) is crucial for understanding the transition of the proto-urban Padua in a urban settlement. The graveyard returned more than 132 cremations, 24 inhumations, 6 horse burials, and a double grave of a human with a horse.

As well as for the contemporary graveyards from Veneto, the coexistence of cremations – prevailing, in association with more or less wealthy grave goods – and a few inhumations – usually without grave goods – is recorded at the site.

To date, the reasons for the funerary inhomogeneity are still unclear. The interpretation is divided between two – non-mutually exclusive – hypotheses according to which the inhumed individuals might have been foreigners or belonging of a lower social rank.

In particular, the latter hypothesis seems to be supported by the poverty of the grave goods associated to the inhumed individuals and by the evidence of 'anomalous burials' that suggest violent deaths for some of them. A striking example is the double burial of a man with a horse found in association with a cremation, interpreted as a case of double sacrifice of a stableman and a horse for their rich owner, cremated; moreover, evidence of rope bonding was observed on the upper and lower limbs – held behind the back – in a female individual.

Therefore, in addition to the archaeological data and the recent anthropological analysis, which allowed to assess through the morphometric method the sex for 47 of 59 cremated adults (24 MM and 23 FF), strontium isotopes ratio ( $87\text{Sr}/86\text{Sr}$ ) of dental enamel and sex estimation through amelogenin proteomic analyses of inhumed samples contribute to understand the identity of these individuals and the bio-cultural encounters existing between Padua and other areas during Middle Iron Age.

A.

## CONTINUITY OR DISCONTINUITY? SOCIAL AND BIO-CULTURAL IDENTITIES AT THE LA CONA CEMETERY (9TH CENT. BCE–1ST CENT. CE, TERAMO, ITALY)

**Abstract author(s):** Gigante, Melania - Peripoli, Beatrice - Trevisan, Martina (University of Padua) - Torrieri, Vincenzo (Minister of Culture) - Vidale, Massimo (University of Padua)

**Abstract format:** Poster

The ancient funeral and sacral area of La Cona is located three kilometres SW of Teramo (Abruzzo, Italy). The use of this area as a burial site is attested throughout the Iron Age (9th cent–6th BCE century) by a proto-Villanovan cremation and approximately 41 inhumations. Evidence suggests that La Cona was also regularly frequented during the Republican and Imperial Roman period (1st cent BCE–1st cent CE), when not only 26 cremations took place but also a temple was built. This latter sanctioned the sacral function of La Cona's district. Interestingly, the later cremations were placed between Iron Age inhumations without overlapping or damaging them. According to scholars, this evidence might indicate a possible continuity of frequentation at the graveyard by people with common ancestry, whilst a cultural connection between different human groups who have come and gone at the site cannot be excluded.

Bioarchaeological analysis on skeletal and dental remains from La Cona has been conducted in both the Iron Age and Roman period funerary contexts. At present, morphological and morphometric analyses allowed us to characterise the biological profile of people buried at the site, recognising 43 individuals from Iron Age graves and 28 individuals from the Roman ones. In addition, the strontium ratio analysis ( $^{87}\text{Sr}/^{86}\text{Sr}$ ) in tooth and bone human mineralised tissues will be applied to diachronically quantifying local and non-local individuals at La Cona.

This paper will present the preliminary results of a multi-analytic study, merging archaeological evidence with osteological and isotopic data from the La Cona cemetery. The aim is to characterise the population dynamics in the Abruzzo region during the Iron Age until the Imperial Roman period, pointing out if mobility trends have had a role in the continuity or discontinuity of local organisation and socio-cultural identities.

## WHAT DO ARCHAEOLOGISTS WANT FROM A DISTRIBUTED SCIENCE INFRASTRUCTURE? INTRODUCING IPERION HS AND E-RIHS

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Campbell, Gillian (Historic England) - Çakırlar, Canan (Groningen Institute of Archaeology)

**Format:** Workshop

As part of introducing two projects, IPERION HS and E-RIHS, this workshop will aim to ensure that future science infrastructure works for archaeologists, whether researchers or practitioners. It will seek the views of archaeologists participating in the workshop on the challenges and opportunities connected with developing an effective European heritage science infrastructure. Is the current infrastructure fit for purpose? Does it provide the tools and the expertise archaeologists need to answer important questions about past lives, livelihoods and landscapes? Are there gaps in provision and how can we fill those gaps? What barriers currently exist in fostering collaboration and how can they be overcome?

Integrating Platforms for the European Research Infrastructure ON Heritage Science (IPERION HS, <http://www.iperionhs.eu/>) is a new initiative funded by the European Commission as part of the Horizon 2020 programme building on the success of the previous IPERION CH project. It seeks to develop a pan-European distributed and connected infrastructure made up of research facilities situated across Europe and beyond. It brings together researchers in humanities and sciences fostering a culture of exchange and cooperation. The core activity of IPERION HS is to provide access to researchers from different disciplines, including heritage and conservation sciences, archaeology, palaeo-anthropology, to scientific instruments, data, tools and expert knowledge outside of their core area of expertise so that they can develop their competence and advance the understanding and conservation of cultural heritage from artefacts to archaeological sites and landscapes.

The future European Research Infrastructure for Heritage Science (E-RIHS; <http://www.e-rihs.eu>) will capitalize on the developments of IPERION HS and its predecessor projects pursuing the integration of European world-class facilities to create a cohesive entity playing a connecting role in the global community of heritage science.

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Saage, Ragnar (University of Tartu) - Wärmländer, Sebastian (Stockholm University) - Neiß, Michael (Uppsala University) - Kurisoo, Tuuli (Tallinn University)

**Format:** Regular session

Archaeometallurgy is a multidisciplinary field where researchers from different fields, and different traditions, come together to answer a range of different questions related to ancient metalworking. In this session we welcome full-length papers on various aspects of archaeometallurgy, with a focus on metals and metalworking in the borderlands. This focus particularly relates to two of the main themes for the 2022 EAA meeting, i.e. "The Carpathian Basin: Integration, Mobility and Diversity" and "Polis, Empire, League and Beyond – Living in Interconnected Societies". In this context, the term "the borderlands" is to be widely interpreted. It can mean the border between a central power, such as the Roman Empire, and its hinterlands or neighbours. But it can also mean the border region between different cultures, such as the Christian and the Islamic world, or the borders between different technological traditions. There may be other ways to interpret the term "borderlands", and to encourage people to come up with their own interpretations, the papers in this session are not limited to a particular time period or culture. Furthermore, we especially welcome contributions from young researchers.

## ABSTRACTS

### 1 METALS AND SOCIETY - THE INFLUENCE OF NEW MATERIALS ON SETTLEMENT STRUCTURE IN MARGINAL ZONES

**Abstract author(s):** Mino, Martin - Fratričová, Monika (Monument Board of Slovak Republic) - Zachar, Tomáš (Archäologisches Museum Frankfurt)

**Abstract format:** Oral

Central Slovakian mountains have always been a border - a geomorphologic border of the Carpathian basin, an ecological border and a north-west cultural border. Yet these mountains are the source of all of the main raw materials in prehistory – lithic, copper and iron. The copper mines at Špania Dolina became one of the most important of Europe's copper sources which provided not only for the Carpathian basin but as far as Scandinavia. Recent field activities in the mining areas and the landscape around it shed some light on the early days of the ore retrieving process and the way it affected the lifestyle, distribution and mobility of the communities of the early copper age. These activities were the basis for the transformation from lithic to metallic age. In many ways similar, yet different situations occurred with the push of the southeastern urnfield cultural complex into the same mountains. With the arrival of the systematic aerial scanning of the landscape and the following survey occurred a strange border zone. While the copper sources were controlled by the Lusatian groups in their borderlands, surrounded by a vast amount of hillforts the people of Kyjatice Culture have established a line of spacious hillforts in the previously unsettled wilderness on the border of the Lusatian domain. This line correlates with the important iron-ore resources. Among them is the Železník Mountain, which supplied the society with iron ore from Middle Ages up to the 20th century. An 11-hectare Kyjatice-Culture hillfort was detected on the top of the ore-bearing mountain. Traces of primitive iron metallurgy were discovered here. This observation could be the features of pioneering activities joined with the transition from copper metallurgy to iron production.

### 2 MULTIMETALITY BEYOND THE IRON AGE CENTRAL-PLACE CRAFT MILIEUS – METAL USE IN THE BORDERLANDS

**Abstract author(s):** Svensson, Andreas (Lund University)

**Abstract format:** Oral

Complex metalworking, i.e. metalworking utilizing several metals within object manufacture, has traditionally been seen as intimately linked to the centralized crafts milieus in a Scandinavian Iron Age setting, as well as in many other prehistoric and historic societies. The notion of the exclusively central character of complex metalworking goes as far as to encompass all aspects of metal use involving both ferrous and non-ferrous metals – multimetallicity.

However, one of the case studies within the project 'From the Crucible and at the Anvil' has clearly shown that the spatiality of complex metal use stretched far beyond the central places and their areas of immediate control. Following this, hypotheses can be forwarded concerning both the reach of multimetallicity emanating from the central metalworking milieus, as well as the utilization of borderlands or peripheral resource areas within the networks of metal production, trade and use.

The results from the project 'From the Crucible and at the Anvil' have in this sense revised previous general interpretative models concerning the spatial dynamics of both ferrous and non-ferrous metal use and their overarching

socio-economic frameworks. In order to facilitate an in-depth understanding of these aspects of metal use, the dichotomy between iron production placed in the periphery and non-ferrous metalworking connected to the central milieus needs to be thoroughly scrutinized.

This paper aims to critically discuss and evaluate the spatial dynamics of metal production, trade and networks, highlighting differences and similarities between ferrous and non-ferrous metal use as well as the utilization of both central and peripheral areas. Results from the project 'From the Crucible and at the Anvil' will be used to drive this critical discussion, specifically elucidating metal use and multimetallicity in the borderlands.

### 3 IRON FOR THE KNIGHTS – THE TEUTONIC ORDER CASTLE SMITHY IN TARVASTU

**Abstract author(s): Saage, Ragnar - Oks, Kristo (University of Tartu)**

**Abstract format: Oral**

The Teutonic Order had an important role as the main military force in medieval Livonia. In the borderlands of the Catholic world, the Order took part in numerous conflicts with its neighbours. A network of castles was an essential part of its defences and the castle of Tarvastu lies in the heartland of the Order. The recent excavations at the castle gave light to numerous weapon finds, which is unsurprising given its function. However, we were also able to locate the smithy site.

In the paper, we will give an example how methodical soil sampling and metallographical analysis enables a thorough characterisation of the production activities. Hammerscale, collected with a magnet from the soil, is a direct indicator of forging. Its abundance, when mapped, can give a clear indication of where the smithing took place. Other finds like slag, animal bones and iron artefacts help to define the layout of the smithy. We will also discuss the provenance of iron bars as it answers a critical question - where did the Order get its iron?

### 4 WHAT IS IT ABOUT METAL OBJECTS? IRON AND COPPER ALLOYS IN THE LATE MEDIEVAL CASTLE OF LORCA (SPAIN)

**Abstract author(s): Molina-Campuzano, María Isabel (University of Murcia)**

**Abstract format: Oral**

The castle of Lorca (Murcia, Spain) is located in the south-east of the Iberian Peninsula and it was a defensive, residential and symbolic place for power during the Middle Ages. This castle, combined with a smaller system of fortresses, occupied a defensive role as an active border zone between the Christian and the Islamic areas of influence (Castilian kingdom and Nasrid Kingdom of Granada).

In addition to its border context, the castle of Lorca is characterised by the discovery of a Jewish Quarter inside its walls (14th and 15th centuries). Since 2009, an interdisciplinary team from the University of Murcia has been leading a research project, in order to define the particularities of the Jewish presence in Lorca from a strictly material perspective. Within the framework of interdisciplinary, this research includes an archaeological study of metal objects (iron and copper alloys) recovered from the domestic area of the Jewish community. The aim is to identify if there were changes in metallurgy after the conquest process of the castle; whether it is possible to determine any differences between quotidian and symbolic objects used by Christian and Jewish communities during the late Middle Ages, and, finally, to understand the production process, the distribution and the "life-cycle" of metal in a borderland.

To conclude, this paper presents the aims, the methodology, the first results and also future approaches (archaeometallurgy and chemical analyses) of this research, which is part of the PhD (3rd year) I am currently working on "metal and medieval metallurgy in the medieval kingdom of Murcia (Spain)" at the University of Murcia.

### 5 A PRE-VIKING AGE IRON PLATE FOR WIRE-DRAWING FROM A WORKSHOP IN OLD UPPSALA, SWEDEN

**Abstract author(s): Wärmländer, Sebastian (Department of Archaeology and Classical Studies, Stockholm University; UCLA/Getty Conservation Programme, Cotsen Institute of Archaeology, UCLA)**

**Abstract format: Oral**

Metal wire is ubiquitously used in modern society, and routinely manufactured by drawing a metal rod through a die with holes of given shapes and sizes. The origin of this wire-drawing technique is however unclear. The earliest wire-drawing tools as well as literary mentions of the wire-drawing technique have been encountered in Mediaeval Europe, but the technology itself could be much older. Before wire-drawing was invented various techniques were used to create metal wires, such as hammering, block-twisting, strip-twisting, and twist-drawing. Here, we report the finding of an iron draw-plate excavated in a pre-Viking Age workshop in Old Uppsala, Sweden. Traces of metal residue show it had been used to draw silver wire. This is one of the oldest draw-plates so far encountered in the archaeological record. In addition to shedding light on the origin of the wire-drawing technology, this find indicates that the local Scandinavian gold-and silversmiths had access to the technology required to craft the exquisite gold and silver jewelry previously known to exist in pre-Viking Age Scandinavia.

## 6 ABI'EL COINS – LOCAL VARIATIONS ON A SUPRA-REGIONAL TRADITION

**Abstract author(s):** Van Ham-Meert, Alicia (Earth and Environmental Sciences, KU Leuven) - Overlaet, Bruno (Royal Museum for Art and History, Brussels) - Yousif, Eisa - Jasim, Sabah (Sharjah Archaeology Authority)

**Abstract format:** Oral

Coins are motors and means of trade, but also objects of power and display. Abi'el coins are found in the Gulf region and especially in the Oman peninsula. Their typology is largely borrowed from Seleucid coins (in the earliest examples the name of Alexander still appears), but over time local types appear, including some that bear the name Abi'el. In the summer of 2021 the largest hoard of Abi'el coins ever uncovered was found at Mleiha, Sharjah, United Arab Emirates. In a pilgrim's flask over 400 silver coins were found with various obverse and reverse iconography. The complete study of these coins is underway by the Sharjah Archaeology Authorities.

This paper presents pXRF analysis of all the coins in the hoard as well as the lead isotopic composition of 10% of the assemblage. The aim is to see whether there are changes in chemical or isotopic composition associated to chronology or typology. Are some of the coins heavily debased with e.g. lead or copper? Since silver is not readily available on the Oman Peninsula the question of provenance is also important for these coins. Is there a single provenance, are there compositional groups present? How similar are those findings with what we know of Seleucid coinage or other pre-Islamic coins from the gulf-region? These are some of the questions we want to tackle in this paper.

Dr S. Jasim and E. Yousif will integrate this information into the study of the chronology and typology of the Abi'el coinage and the upcoming full publication of the Mleiha coin hoard.

## 7 METAL HORSE TACKS FROM THE HUNNIC-PERIOD CARPATHIAN BASIN AND THEIR CLASSIFICATION BY MEANS OF ARCHAEOMETRIC ANALYSES

**Abstract author(s):** Piros, Réka (Department of Archaeology, University of Szeged) - Mozgai, Viktória - Bajnóczi, Bernadett (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, Eötvös Loránd Research Network - ELKH)

**Abstract format:** Oral

The characteristic assemblages of the Late Hunnic period (5th century AD, 420/430) are the objects manufactured from pressed gold, gilded silver or copper alloy sheets. In this present study, horse tacks from several archaeological sites in the Carpathian Basin (Árpás, Budapest–Zugló, Debrecen–Agrár park, Léva, Nyíregyháza–Oros, Pannonhalma, Pécsüszög and Szeged–Nagyszéksós) were analysed non-destructively by using a handheld X-ray fluorescence spectrometer (hXRF) and a scanning electron microscope equipped with an energy dispersive spectrometer (SEM-EDX). The main aims were to determine the chemical (elemental) composition of the objects, to characterise the used gilding technique, to determine the provenance of the garnet inlays, as well as to make an attempt to prove whether the groups within an assemblage are from the same set. The results of the chemical analysis give us the opportunity to confirm whether the damaged or presumably lost objects of an assemblage were replaced or repaired.

The hXRF results indicate that the objects were manufactured from gold, gilded silver or gilded unalloyed copper or bronze sheets. Later replacements can be distinguished based on their different chemical composition and quality of manufacture. Two types of gilding were observed: fire gilding with the presence of mercury and leaf gilding. The assemblage from Pécsüszög contains three stone-inlaid bridle mounts. The white and red inlays are microcrystalline quartz and almandine garnets, the latter originate from Sri Lanka.

Upon close observation of the finds and their ornamentation (Pressblechtechnik, punch decoration, stone inlays), some objects presumably show close connection with ethnic groups originating from the Iranian territories (Alans) and Central Asia. However, some new pattern of the decorations (e.g., Pécsüszög) are so far unique in the Carpathian Basin.

## 8 PRECIOUS METALWORK IN THE BORDERLANDS OF THE AVAR EMPIRE (LATE 6TH-EARLY 9TH CENTURY AD): PRODUCTION, DISTRIBUTION AND CULTURAL-HISTORICAL INTERPRETATION

**Abstract author(s):** Bühler, Birgit (Vienna Institute for Archaeological Science - VIAS, University of Vienna)

**Abstract format:** Oral

The material culture of the Avar Empire (late 6th-early 9th century AD) in the Carpathian Basin is a mixture of diverse cultural influences, which reflect the heterogeneous, multi-cultural population of the Avar realm. In particular, there is substantial evidence for a close connection between 'Avar' and 'Byzantine' or 'Italo-Byzantine' material culture. Although the mechanisms and exact pathways of cultural and technological transfer are still subject to debate, it seems that border regions with adjacent cultural regions must have played a key role in facilitating such transfer processes. Archaeometallurgical research can be essential for identifying cultural traditions in archaeological contexts. In many cases, within the framework of technological necessities for creating a particular effect in metalworking, the individual metalworker had a number of choices: The technical decisions taken in each case will have depended on the craftsman's skills, personal preferences and background, on smaller-scale 'workshop traditions', on larger-scale

'cultural traditions', as well as on the demands of the customer regarding motifs, style, material and technique in the finished product. The aim of this paper is to demonstrate, with the help of case studies from border regions of the Avar Empire, how a combination of archaeological and archaeometallurgical criteria may contribute to resolving issues of cultural and technological transfer.

## 9 PRODUCTION AND DISTRIBUTION OF RELIGIOUS AMULETS IN DENMARK AROUND 1100. THE CHURCH AS INITIATOR AND KEY AGENT?

**Abstract author(s):** Søvsø, Mette (Museum of Southwest Jutland)

**Abstract format:** Oral

Finds of small brooches from the period c. 1050-1150 are rising steadily all over Denmark as a result of metal detecting and the Danish treasure trove act. The uniform Urnes-style brooches display motives firmly rooted in Christian symbolism.

Two workshops excavated in Ribe and Aalborg (Jutland) represent key breakthroughs in terms of placing the large number of detector finds in a wider context and to understand the background to their distribution. Both workshops were placed next to churches and their similar range of products suggest that this business was urban, organized and targeted rather than haphazard or scattered. The wide range in the quality of the finished products at both sites suggest they must have been aimed at a relatively broad market.

The production and distribution of these brooches are manifestations of the spread of Christianity. Like the imported, cross bearing brooches from the Late Viking period, the local Urnes brooches can be seen as baptismal tokens. The production was large-scale, they are common finds in almost every village and must have been accessible to most people. The location of workshops adjacent to and perhaps run by the church adorned the products with inherent holy power. A kind of thinking normally associated with the Late Medieval boom in pilgrim badges and souvenirs.

## 10 SCANDINAVIAN BRACTEATES AND ROMAN BORDERLANDS: EMBRACING AND ADAPTING FOREIGN TECHNIQUES

**Abstract author(s):** Wicker, Nancy (University of Mississippi)

**Abstract format:** Oral

Small gold pendants called bracteates, which date to the Migration Period of the fifth and sixth centuries CE, have been considered a specifically Scandinavian phenomenon. More than 1,000 examples of this jewelry have been found, mostly in Scandinavia but also in England, France, Germany, Czechia, Hungary, the Netherlands, and Poland. In this paper I will examine how the idea of these small golden disks harkens back to fourth-century Roman gold coins and medallions, although the technology of northern bracteates differs substantially from the Roman models.

Bracteates most likely were conceived along the borderlands of the Roman provinces, where northern soldiers who had served as auxiliaries in the Empire were paid in coinage, which they may have taken home to the North after they completed their service. Scandinavians adopted the idea of the coin object, but in their non-monetary economy, they adapted it by blending Roman and northern techniques. Whereas Romans minted two-sided coinage with different images on obverse and reverse, Scandinavian goldsmiths made one-sided, stamped disks. This technique is a significant simplification of the Roman numismatic technique, using a method that already was known in Scandinavia. Suspension loops occasionally were added to Roman medallions—perhaps by Romans in the provinces—so that the objects could be worn as pendants, but bracteates were looped during the production process in Scandinavia. Northern goldsmiths expended a great effort to embellish these loops with elaborate filigree and granulation, techniques learned from Roman jewelry.

That some Roman techniques were embraced (filigree and granulation), some modified (casting dies with figural images), and some rejected (two-sided minting) in Scandinavia reflects a careful weighing of which techniques were considered worthwhile. Ultimately, bracteates reflected a cultural border between different technological traditions that were blended in the development of a new hybrid type.

## 11 A PILOT STUDY OF THE WORKSHOP AREAS IN ESTONIA

**Abstract author(s):** Kurisoo, Tuuli (Tallinn University) - Saage, Ragnar (University of Tartu)

**Abstract format:** Oral

The geographical location of Estonia between Eastern and Western cultures has shaped the nature of local archaeological record markedly. These influences are well traceable in the styles of local ornaments and dress accessories, especially in the 9th–13th centuries material culture. Traditionally, the origin of objects (import or local) is determined by typological comparison and only little attention has been paid to intrinsic questions of production techniques and manufacturing locations of non-ferrous ornaments. Moreover, there is only a little discussion about production sites and production series of local jewellery. It is argued that identical or similar forms of artefacts point to one production series and distribution patterns of these series signal the locations of workshop areas.

This paper introduces the first results of a pilot study that specifically targets these questions in Estonia. Firstly, potential production series that can be distinguished on the basis of stylistic analysis and mapping are presented. Secondly, the chemical compositions of selected series are discussed. Lastly, it is hoped that this study will stimulate further research and discussion on local production of artefacts.

## 12 RE-WRITING ANCIENT NARRATIVES THROUGH USE-WEAR ANALYSIS - A CASE STUDY FROM A VIKING AGE BOAT GRAVE

**Abstract author(s):** Neiß, Michael (Uppsala University, Department of Archaeology & Ancient History)

**Abstract format:** Oral

Material culture is the cardinal source of archaeology and needs to be recognised as a natural starting point for theorizing research. A continuous re-evaluation of old finds is therefore essential. Archaeological artefacts carry genuine testimonies with a potential to support or to challenge established narratives within in our discipline. The Viking Age was a dynamic era during which many old constants became obsolete. It is a fair assumption that this development left marks on the material culture. Our challenge is to detect and interpret these marks. A suitable tool for this purpose is an archaeological 'autopsy' that reveals how objects were made and used, damaged and repaired and how they fared after their final deposition. Implementing object-autopsies, provides archaeologists with a genuine chance to reconstruct the biographies of specific objects and restore their historical voices. During the 1972 rescue excavation prior to a motorway construction project in the Swedish region of Södermanland, a previously unknown Viking Age burial ground was found near the farmstead of Årby in Turinge parish. The find included some early Christian graves as well as a boat grave that resembled a pre-Christian burial of a wealthy lady of the late Birka period. However, the results a recent use-wear analysis of the metal objects and beads from the Turinge grave challenge this narrative. As a result, the boat grave seems to date from a much later period than previously assumed. Boat graves and the oval-brooch fashion both belong to a pre-Christian tradition. And yet, there is much to suggest that the Turinge lady was buried sometime well into the 11th century – which is supposedly a Christian era. But why, all of a sudden, revive ancient burial rites? Was it an attempt by the people of Turinge to re-connect with a lost world?

## 13 BEYOND BORDERS: MARGINS IN EARLY IRON AGE SOCIETY

**Abstract author(s):** Murray, Matthew (University of Mississippi)

**Abstract format:** Oral

This paper will examine the idea of marginality (borders and boundaries of interaction) and interconnectivity through an exploration of the results of the excavation of two largely intact early Iron Age (720-400 BC) burial monuments near the Heuneburg in southwest Germany. Mortuary practices at the Speckhau mound group included the use of metal objects, such as weapons and personal adornment, and revealed connections that crossed many different geographic and cultural margins.

My approach in this paper is multi-scalar, revealing connectedness in the 7th to 5th centuries BC that extended from regional cultural boundaries to the continental margins of Europe. At the regional level, female burial costume in the Heuneburg mounds shows a strong connection to an adjacent cultural region in the Black Forest, from which women migrated, likely through exogamous marriage practices. Although they became part of the Heuneburg community, these women were buried in the complex bronze and textile belt assemblages and bronze hair/headdresses of their geographic origins. Metal work in graves also reveals a border-bending connectedness to the margins of continental Europe, culminating in the identification of an individual who was outfitted in the military style of northern Iberia (over 1,000 kilometers from the Heuneburg) with a short single-edge slashing sword and a leather helmet with iron plume clamp adorned with feathers. Other burials yielded additional evidence of connectedness specifically to the northern margins of continental Europe, including amber from the Baltic Sea and shale from the southern British Isles. While detailing the scalar connectedness of the Heuneburg mortuary community, I will also touch upon intriguing information about the construction of liminal spaces, forms of boundaries, in the early Iron Age mounds. These acts were intended to distinguish and highlight processes important in the community's engagement with the mounds.

- 14 THE MINES OF DACIA – ENVIRONMENTAL EVIDENCE OF METAL SMELTING ACTIVITIES BEFORE, DURING, AND POST ROMAN PERIOD**
- Abstract author(s):** Veres, Daniel (Romanian Academy, Institute of Speleology) - Tamas, Calin (Faculty of Biology and Geology, University Babeş Bolyai; Romanian Academy, Institute of Speleology) - Haliuc, Arifina (Romanian Academy, Institute of Speleology) - Longman, Jack (Marine Isotope Geochemistry, Institute for Chemistry and Biology of the Marine Environment - ICBM, University of Oldenburg; Romanian Academy, Institute of Speleology) - Develle, Anne-Lise (Université Savoie Mont Blanc, CNRS, EDYTEM) - Gogaltan, Florin (Institutul de Arheologie al Academiei, Cluj-Napoca; Romanian Academy, Institute of Speleology)
- Abstract format:** Oral
- Mining activities in the Carpathians reached maximum intensity during the Roman rule, with Roman Dacia (106-275 AD) hosting some of the largest underground mining operations in Europe during Late Antiquity. It is very likely that massive mining during the Roman and Medieval periods removed earlier field traces but here we discuss peat geochemical data that can verify the extent of metal processing before - during - after the Roman period. Indeed, the impressive amounts of gold and silver stated in ancient sources as war trophy from the Dacian Wars (101-106 AD) imply significant pre-Roman mining in Dacia. Chance discoveries of mining tools within deep-seated mines, and especially radiocarbon dating of timber remains at Rosia Montana produced some verifiable evidence of pre-Roman mining. Using high-resolution geochemical analyses of several peat profiles from the Apuseni Mountains, including two records from within the Rosia Montana area, we provide a detailed chronology of human activities and mining in one of Europe's oldest mining fields. The Pb isotopes on bulk peat suggest that by 300 BCE exploitation of the Neogene Au-Ag ores within the Apuseni produced a strong environmental pollution signal. Interestingly, the Pb curve as well as the Pb isotopes data suggest that mining activities at Rosia Montana did not cease following the Roman withdrawal from the area, despite that fact that Late Roman times in SE Europe have been marked by significant movements of peoples that triggered severe socio-economic disruptions. Instead, our data indicates that the Pb curve closely match a significant drop following the collapse of Roman authority north of Danube, but then diminished progressively with Pb data still indicating the Apuseni ore fields contributed for several centuries. By 700 CE however, the Pb isotope suggest that the pollution budget reflects only long-distance input of atmospheric metals originating from the Balkans.
- 15 AZOTOS PARALIOS, A LATE ANTIQUITY CITY, ITS STRUCTURES AND PEOPLE – THROUGH A METAL LENS**
- Abstract author(s):** Mazis, Matasha (Technical University Darmstadt) - Fantalkin, Alexander (Tel Aviv University)
- Abstract format:** Oral
- Located in the southern Levant, the Late Antiquity city of Azotos Paralios was important enough to be depicted in the famous 6th century Madaba Mosaic. Today, the city lies buried beneath coastal dunes and remains largely unexplored. Recent rescue excavations have revealed a large basilica church founded in the late 4th century, making it one of the earliest-known Christian compounds. The church represents the periphery of Byzantium but it also existed at the 'border of time' between the Eastern Roman Empire and the Islamic conquest of the Levant. Destroyed by fire in the early 7th century, its collapsed roof not only helped preserve historically significant mosaic floors, but also metal fixtures, fasteners, and tools, as well as functional church equipment. Investigating the metal finds in terms of distribution, morphology, and technology is helping answer questions about Late Antiquity religious architecture, construction, and ritual operations. The latter includes human intra-mural burials, and circumstances involving iron objects that were found injected into skulls. Archaeometric examination of these finds is contributing to forensic anthropological investigations. In this paper, the focus is on archaeology and metallurgy in concert as a means to explore associations between people, places, and objects.
- 16 GERMANIC VERSUS ROMAN COPPER ALLOYS BEYOND THE DANUBIAN LIMES – ELEMENTAL COMPOSITION OF SELECTED SMALL FINDS OF THE ROMAN PERIOD**
- Abstract author(s):** Komoróczy, Balázs - Kmošek, Matěj - Vlach, Marek - Kmošková, Michaela (Institute of Archaeology of the Czech Academy of Sciences, Brno)
- Abstract format:** Oral
- The long-term influx of the metal artefacts from the region of South Moravia (Czech Republic), resulting predominantly from the proactive approach towards the hobby metal detecting, has gradually generated a considerable assemblage of specific type archaeological information, presently counting over 10 thousand database items. Within the long-term institutional, methodological approaches in parallel, there were also collected metallography data from all documented finds. Among others, an extensive set of Germanic and Roman-provincial brooches were examined by elemental composition pXRF analysis of artefacts surface and metal cores, and construction-technological analysis done by radiographic and microscopical survey. In the case of some brooches, more details were observed either by Germanic and Roman variants or by the elemental composition of selected parts of objects. The general results

indicate that Roman and Germanic metalworkers used a similar variety of copper alloys, but they used them differently, yet still following awareness of properties of respective materials. Germanic wrought and even cast brooches were frequently made from copper alloys with high zinc content (brass and gunmetal), which could be considered a specific form of influence between two distinctive spheres of metalworking. On the contrary, Roman-provincial fibulae were usually made using lead-tin bronze with high lead content. It reflects the population's different technological, supplying, and probably even aesthetical attitudes on both sides of the middle Danubian Limes.

## 17 A METALWORKER'S BURIAL FROM THE MIDDLE BRONZE AGE, KAJÁSZÓ, HUNGARY

**Abstract author(s):** Kovács, Ágnes (King St. Stephen Museum, Székesfehérvár)

**Abstract format:** Oral

In the summer of 2021 we were excavating a part of a Middle Bronze Age cemetery at the edge of the village of Kajászó (Fejér County, Middle Hungary). The graves were the characteristic burials of the late phase of the Vátya Culture: cremations in urn graves. The ashes were put in big urns, which were covered with big bowls. There was usually a small bowl in the mouth of the urns, and a small one-handed cup.

One of the graves was exceptional: the western side of the tomb was lined with stones. There were eight polished stone molds among the stones, a clay melting container, pieces of broken stone axes, big pebbles, and polished pieces of stone.

The unique artifact assemblage can be analyzed at several levels. The tool kit of a Bronze Age metalworker is very interesting in itself. The placement of the stones, as part of the burial rite is also remarkable.

Finally we can investigate the place of the burial within the Vátya world. The cemetery of Kajászó belonged to a fortified settlement over the Váli stream. It was a fairly big village, however smaller than the big Vátya centres, the thriving centres of trade and crafts along River Danube. In comparison with them, the settlement of Kajászó, 16km from the Danube was only hinterland. Perhaps this explains why there was no successor to the metalworker and his tools were buried with him.

## 18 METALLURGY WITHOUT A METALLURGIST. THE BIOGRAPHY OF AN ARROWHEAD FROM NE POLAND

**Abstract author(s):** Maciejewski, Marcin (Institute of Archaeology Maria Curie-Skłodowska University) - Szczepański, Łukasz (Ostróda Museum) - Tracz, Michał (Medical University of Lublin) - Fejfer, Mariusz (Biskupin Archaeological Museum) - Osipowicz, Grzegorz (Institute of Archaeology Nicolaus Copernicus University) - Gan, Paweł (Institute of Archaeology and Ethnology, Polish Academy of Sciences)

**Abstract format:** Oral

Is it possible that an inconspicuous object made of copper alloy and discovered by an amateur while searching with a metal detector can enrich the body of knowledge on the metallurgy in the Bronze Age?

The (presumable) eponymous arrowhead was discovered in 2021 in the wetlands near Ostróda and handed to the Museum in Ostróda. What drew our attention first was the preserved piece of the arrow shaft, which offered significant analytical possibilities itself. The form of the metal object is equally interesting; there is nothing corresponding thereto in the Bronze Age artefacts from Central Europe. Thus, we may pinpoint a highly complicated biography of this object. It was hypothesised that the arrowhead had been made from a bigger arrow of a javelin/spear, which was possibly damaged; however, it was not recast but underwent solely mechanical working.

In the Bronze Age the most common way of recycling the object made of copper alloys was recasting it into a different object. However, in this case, there are some evidence that indicate different scenario. The question that should be posed is: is this evidence enough to prove it? Secondly, it is necessary to discuss the reasons for which it occurred. In the Late Bronze Age, NE Poland was a peripheral area in regard to the centres of Lusatian Urnfield culture (e.g. Silesia or Greater Poland). Communities living in these areas were dynamically developing only in the Early Iron Age, which is evidenced by the stabilisation of the settlement network, the rapid development of metallurgy, and the peculiar cultural inventory. Does the presented artefact fit in this scheme? Will the results of the analyses, especially the carbon-14 dating, confirm this? These are the issues we would like to address.

## 19 ON THE BORDER OF THE EARLY METAL WORLD? ENEOLITHIC METALLURGY IN THE MIDDLE WARTA BASIN

**Abstract author(s):** Strózyk, Mateusz (Archaeological Museum in Poznań) - Żurkiewicz, Danuła - Szmyt, Marzena (Adam Mickiewicz University in Poznań; Archaeological Museum in Poznań) - Silska, Patrycja (Archaeological Museum in Poznań) - Garbacz-Klempk, Aldona (AGH University of Science and Technology in Cracow)

**Abstract format:** Oral

The hoard from Bytyń is one of the best known Eneolithic metal deposits in Poland. From the beginning, the debate on this unique find was dominated by the question of the origin of the oxen figurines. In the opinion of most researchers,

they were imported from developed metallurgical centres located in the Middle East or the Carpathian regions. The discussion on the provenance overshadowed the study on manufacturing technology and the relation of the figurines to other metal objects known from Greater Poland. However, based on thorough analyses carried out in recent years, previous assumptions have been questioned, giving rise to new hypotheses.

The paper aims to provide better insight into the issue of raw material and technology of the oxen from Bytyń and to set them in the local context, including both the evidence for the use of metal objects and indications suggesting the knowledge of metallurgy among the Lowland communities in the period between 4000-2500 BC.

The application of modern analytical methods to the study of metal artefacts and other objects associated with early copper and bronze metallurgy, retrieved from a well-recognized settlement context, contributes significantly to the considerations outlined above.

## 20 METALLURGY AT A CULTURAL CROSSROAD: RE-INVESTIGATING SIGNS OF USE AND PRODUCTION OF METALS IN THE LATE BRONZE LEVELS OF TARSUS-GÖZLÜKULE

**Abstract author(s):** Koumari, Marfa (Bogazici University)

**Abstract format:** Oral

The Cilician plain (Kilikia Pedias, Cilicia Campestris) in which the site of Tarsus-Gözlükule lies is situated at the historical junction of central Anatolia and North Syria. Aptly, the decision to excavate the mound of Tarsus-Gözlükule was in anticipation of cultural connections between Anatolia, Syria and the Aegean. As the decision was made, the metal artifacts from Tarsus-Gözlükule were assiduously excavated, examined and published by Hetty Goldman and her team from early to mid-twentieth century. The results of this excavation project galvanized Anatolian archaeology yet also followed the methodological conventions of the time where context was peripheral to the study of artifacts. The re-investigation of metal artifacts resumed within a new phase of archaeological research during the early twenty-first century, yet these focused more so on material composition through chemical analysis. This paper re-investigates the use and production of metals at Tarsus-Gözlükule based on an examination of the excavated artifacts and available excavation records (e.g. unpublished field notebooks, documents and final reports) of the Late Bronze Age levels by the Goldman team. While new evidence on metalworking on site points to continuity in metallurgical practices hitherto unnoticed, the latest comparanda presented for the artifacts reinforces cultural contacts with central Anatolia and the Near East.

## 21 METALLURGY IN THE LUSATIAN URNFIELD CULTURE. THE INFLUENCE OF WATERCOURSES

**Abstract author(s):** Nowak, Kamil (Institute of Archaeology Nicolaus Copernicus University in Toruń)

**Abstract format:** Oral

The presentation will discuss the characteristics of metallurgy in the border areas in the Late Bronze Age and the Early Iron Age in Central Europe. The aim of the research was to check whether in the so-called Lusatian urnfield culture territorial differences are visible in metallurgical production, and whether the natural boundaries - rivers - influenced the development of metallurgy, the repertoire of manufactured items, and used casting tools. The territory covered by the research includes the area of today's eastern Germany and the territory of Poland. The main borders are the rivers Odra and Nysa Łużycka in the west and the Vistula river in the east.

The main determinants of metallurgical activity were investigated: casting moulds, crucibles and tuyeres. Such issues as the presence of hoards with casting moulds and the so-called metallurgist' graves were also studied. The research allows to notice the differences and similarities in a large area of occurrence of the Lusatian Urnfield Culture.

The research was funded by National Science Centre Poland, project no. 2021/40/C/HS3/00097.

## A. MARZABOTTO ON ITS OWN? ARCHAOMETALLURGICAL INVESTIGATION OF COPPER BASED FINDS FROM ETRUSCAN TOWN OF MARZABOTTO (IT)

**Abstract author(s):** Kmosek, Matej - Kysela, Jan (Institute of Classical Archaeology, Faculty of Arts, Charles University in Prague) - Gaucchi, Andrea (Etruscology and Italic antiquities, Department of History and Cultures, University of Bologna)

**Abstract format:** Poster

The paper presents results of archaeometallurgical investigation of copper based finds from Etruscan town of Marzabotto (ancient Kainua). The research focus on finds from different stages of the chaîne opératoire of copper based metallurgy of supposed Etruscan and Celtic origin (slags, raw material, production waste, finished artefacts) found on site and its surroundings. The investigation is done through material analysis (XRF, metallography, ICP-MS) compared with find context, typology and chronology of finds. The use of copper with specific composition in form of "Fahlerzkupfer" (high amounts of As, Sb, and also Ag, Bi) was identified. This specific material is connected mainly with supposed locally produced copper based artefacts unlike alleged imported finds. Appearance and significance of

this specific material was investigated during the Iron Age. For this reason, possibilities of use of local ores for local production are investigated. It seems, that Marzabotto stood somehow on its own in the Apennines.

## **B. PRECIOUS METALS FROM AUGUSTA RAURICA - ARCHAEOLOGICAL AND ARCHAEOMETRICAL INVESTIGATIONS USING NON-INVASIVE X-RAYS**

**Abstract author(s):** Megatli-Niebel, Isabel (Universität zu Köln; Augusta Raurica)

**Abstract format:** Poster

This poster presents the PhD thesis by the author, that was started last year at the University of Cologne. It works on precious metal in the former Roman colonial town of Augusta Raurica. Within this research project the round about 300 objects made of precious metal are planned to be discussed comprehensively and analysed variably. Next to a comprehensive research in the material culture, the metal finds are examined both macro- and microscopically. Furthermore, the interdisciplinary research project "DEEPμ: A non-destructive and depth-resolved element analysis technique using elementary particles – development and applications" in cooperation with the Laboratory for Muon Spin Spectroscopy at the Paul Scherrer Institut (Villigen, CH) provides a truly non-destructive and depth-profiling measurement to analyse the elemental and isotopic composition of archaeological objects. This is achieved by the use of high-energy muonic X-rays. The measurement can go as deep as 1 cm, depending on the material's density. Also, the technique is not only sensitive to all the elements, but moreover, it is possible to determine different isotopes. Within this fundamental research a convolute of archaeological objects will be analysed according to their elemental composition deep beneath the often falsified surface.

---

## **344 INTEGRATING NEANDERTAL LEGACY: NEW OPPORTUNITIES FOR COOPERATION [PAM]**

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Mihelic, Sanjin (Archaeological Museum in Zagreb) - Leskovar, Tamara (Faculty of Arts, University of Ljubljana, Slovenia)

**Format:** Regular session

As a direct beneficiary of a century and a half's research on Neandertals, our present-day scholarly community has at its disposal a vast amount of data pertaining to an incredibly diverse spectrum of facets of this long-lost relative and predecessor of ours. However, during this long period, scientific methods, technological and methodological aspects, theory and practices have developed at different paces—and sometimes followed several trajectories—in different countries. As such, it can often be difficult to evaluate and compare various datasets dealing with Neanderthal legacy, whether biological, cultural or other. Likewise, for numerous reasons, problems exist in relation to access to data and information for various sites and finds. In addition, the research questions asked by different groups and scholars from not only separate disciplines, but sometimes from the same disciplines but following diverse traditions, as well as from a variety of countries, are often difficult to compare, even if their goal is the same.

These overall shortcomings in Neanderthal research and in the general management of Neanderthal heritage have recently been addressed by an international initiative—a COST programme Action entitled 'Integrating Neanderthal Legacy: From Past to Present'—which aims to collate a long-term network of scientists with the goal of creating a usable and inclusive, inter- and multidisciplinary database and data sharing platform for all those interested in Neandertals.

As a follow up to the last year's EAA conference in Kiel, we would once again like to invite all those interested in different aspects of Neandertals and their legacy to join us with their presentations thereby contributing to bridging the geographic, linguistic, disciplinary-and-data specific gaps, as well as the issues created by the diverse traditions of different disciplines operating in various European countries. We especially welcome contributions that offer proactive, realistic and feasible solutions that could lead to synergistic effects in research, management and valorisation of Neanderthal heritage.

## **ABSTRACTS**

### **1 NEANDERTAL AND GRAVETTIAN DIETS: A CONTINUUM OR A REVOLUTION?**

**Abstract author(s):** Jankovic, Ivor (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb) - Voisin, Jean-Luc - Vauzelle, Alexandra - Conde mi, Silvana (CNRS, EFS, ADES, Aix-Marseille Université)

**Abstract format:** Oral

Recently, a number of stones from Gravettian contexts (ca 31 000 to 23 000 years BP) at archaeological sites have been recognized as grinding stones bearing traces of starch. This led to a proposal that the Gravettian people used wild grain flour, suggesting a change in diet (carbohydrate consumption) compared to earlier populations (Neandertals). If so, this would also be reflected in dental pathologies between these two human groups. Testing of this

hypothesis is one of the main goals of the ANR\* grant entitled "Starch4Sapiens" led by one of us (SC). The aim of this presentation is to present the oral health status of late Neandertal and Gravettian peoples. Results of the preliminary study show that teeth pathologies are present in both populations but have different etiologies. In Neandertals, hypoplastic defects are much more common than in Gravettian people, where periodontal diseases are prevailing. Interestingly, caries is very rarely seen in either group. Hypoplasia reflect stresses during dental growth, such as malnutrition, infection or fever. Low incidence of hypoplasia in Gravettian people could be interpreted as a more regular food intake compared to Neandertals, which is in accordance with the use of flour grain. Grains can be stored easily and thus allowed a more regular supply of food. However, the etiology of periodontal diseases need further study, as planned by this grant. Comparative work on Gravettian is supported by the Croatian Science Foundation Grant IP-04-2019. This work is in accordance and supports the goals of the COST Action CA 19141.

## 2 INTERACTIONS AMONG NEANDERTHALS, HERBIVORES AND CARNIVORES: DIET AND ECOLOGICAL RELATIONSHIPS IN THE MIDDLE AND LATE PLEISTOCENE

**Abstract author(s):** Rivals, Florent (ICREA, Barcelona, Spain; Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA, Tarragona; Universitat Rovira i Virgili, Tarragona) - Bocherens, Hervé (Department of Geosciences, Biogeology, University of Tübingen; Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen) - Camarós, Edgard (McDonald Institute for Archaeological Research, University of Cambridge) - Rosell, Jordi (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA, Tarragona; Universitat Rovira i Virgili, Tarragona)

**Abstract format:** Oral

Neanderthal ecology was strongly driven by the climatic and environmental context that occurred during the Middle and Late Pleistocene in Western Eurasia. They were living under widely fluctuating conditions which affected Neanderthal ecology, including subsistence, land-use patterns, social interactions and interactions with other organisms and with the environment. This presentation will focus on the latter aspect. Biological interactions are the relationships existing between organisms in a community within an ecosystem. Dietary traits of individuals and populations of both Neanderthals and animals, are essential for the reconstruction of biotic interactions among species. These kinds of dynamic relationships with other living species in a shared environment can be seen as a major influence in evolution and ecology, and the timing and type of interaction could have driven many aspects of Neanderthal behaviour. This presentation is aimed at combining the different approaches to studying interactions between organisms or populations: dietary food webs of plants-animals (stable isotopes and tooth wear), animals-humans (stable isotopes) and more complex interactions between humans and other animals, mainly carnivores (based on taphonomy and zooarchaeology). The main types of interactions that can be recorded in archaeological assemblages will be presented and discussed: competition and interaction between resources and consumers, including predation. Studies on the interaction between Neanderthals and animals are suggesting an important plasticity of Neanderthal behaviour in all the territories occupied and, therefore, a broad-spectrum ecological niche characterised by important relationships with a multitude of animals of a very diverse nature. Therefore, the question that must be addressed in the future is how to assess the degree of importance of the relationships determined by the over-representation of each species in the environment and the degree of interactions determined by specific Neanderthal cultural criteria (or similar).

## 3 THE ROLE OF NEANDERTALS IN SHAPING HOMO SAPIENS BEHAVIOR AND CULTURE 50-40KA; EXTENDED WORKSHOP(S) FOR SYNTHESIZING TRANSCONTINENTAL RESEARCH

**Abstract author(s):** Soressi, Marie - Carmignani, Leonardo - Chu, Wei - Djakovic, Igor (Leiden University)

**Abstract format:** Oral

How frequent were interactions between incoming Homo sapiens and Neandertals in Eurasia 50-40,000 years ago? Only a theoretically well-informed investigation of material culture, combined with the identification of its makers and detailed analysis of site formation processes, can elucidate how past knowledge and ideas were exchanged. Here, Archaeologists have much to contribute; however, they face several problems. The analysis of material culture corresponding to the Middle to Upper Paleolithic transition in Europe has been published in many different languages, and meaningful interpersonal opportunities to synthesize diverse, regionally segmented research have been rare.

Here, we propose the organization of a synthesis workshop(s) to bring together the latest research, data, and perspectives on the final stage of Neandertals as a population in Europe, with the aim of paving the way to uncover evidence (or lack thereof) of Neanderthal/Homo sapiens cultural interactions. In our minds, such a workshop(s) would last one week, be located in a major European city, and gather researchers from across Europe. There will be time for reflection on the latest relevant findings, to discuss the quality and integrity of their geological context and their dating, and to evaluate their implications for our understanding of this timeframe. The broad goal is to identify if and how interactions between the different groups identified in Europe between 50 and 40,000 years ago were manifest. There will also be space to display artifacts and examine representative collection samples. Such workshop(s) could

lead to the realization of a publication (for example an atlas) co-authored by the participants, and 3D scans of collections could be produced on the spot or offered in-house.

#### 4 **MASTERING OF UNDERGROUND AREAS BY NEANDERTHALS REVEALED BY SPELEOTHEMS**

**Abstract author(s):** Verheyden, Sophie (Royal Belgian Institute of Natural Sciences) - Jaubert, Jacques (PACEA- University of Bordeaux) - Marinova, Elena (State Office for Cultural Heritage Baden-Wuerttemberg, Laboratory for Archaeobotany) - Gurova, Maria (National Institute of Archaeology, Bulgarian Academy of Sciences)

**Abstract format:** Oral

Speleothems (stalagmites, stalactites, etc.) are one of the best datable terrestrial environmental archives. Currently routinely used in palaeoclimatic studies, the potential of these deposits in an archaeological context is however still poorly explored. Speleothems provide not only a precise (<0.5%) chronology for sedimentary deposits, including incorporated archaeological material, but also give some clues to the overall human behavior patterns in the cave environment. To illustrate this we present two case studies from the Mishin Kamik cave (Bulgaria) and Bruniquel cave (France).

Flowstones of the Mishin Kamik cave, Bulgaria, allowed to date the cave deposits containing archaeological material to the period before 135 ka (Early Middle Paleolithic / EMP). This was achieved through the correlation of the sedimentary units covered by flow stone with the detailed profile of a nearby stalagmite. Additionally The speleothem offered a reliable chronological framework and context for reconstructing the time-span of an intriguing and unique bear skull accumulation of between 250 and 220 ka (MIS 7). In the Bruniquel cave, France, a careful selection and dating of stalagmites covering broken stalagmite-bases provide information on the time of breakage and on the possible nearby origin of the stalagmites used in the 176 ka-old-early Neanderthal construction in the cave. The construction only contains stalagmites, while surrounding speleothems consist of broken stalagmites, stalactites and flowstones, some of them defined as 'speleofacts', i.e. broken and displaced speleothem pieces. A distinct geochemical signature of speleothems from different parts of the cave may bring additional information on the origin of the stalagmites and the extend of Neanderthal activities in this, a priori, hostile environment that before the dating of the Bruniquel structures was thought to be the exclusive playground of modern humans.

#### 5 **NEANDERTHAL BURIAL PRACTICES IN WESTERN ASIA**

**Abstract author(s):** Been, Ella (Ono Academic College) - Barzilai, Omry (Israel Antiquities Authority)

**Abstract format:** Oral

The Middle Paleolithic of western Asia is one of the more complicated periods in human evolution as it hosts at least two hominin species– the archaic Homo sapiens and the Neanderthals. Anthropological and genetic studies indicate these populations arrived at the region in various dispersal events. The archaic Homo sapiens arrived from Africa during MIS 7 and MIS 5 whereas Neanderthals from Europe during MIS 4. These populations exploited similar resources in the same geographical niches and, in some cases, even inhabited the same caves.

As such, the arrival of new populations to the Levant must have had an impact on territoriality. One of the most convincing expressions for land ownership in prehistory are the burials which were common for both populations.

This paper aims to review all published Neanderthal burials in western Asia. Emphasis will be made on incorporating Neanderthal anthropological and archaeological data which is carried under the framework of the COST Action program entitled 'Integrating Neanderthal Legacy: From Past to Present'.

The anthropological data will include the number of buried individuals at each location, body position (supine, side-lying, etc.), gender, age at death, and estimated height and weight for each specimen. The presence of a burial pit, any burial offerings/goods, and special positional remarks (such as - head resting on a square limestone) will also be included. The archaeological data will include characterization of the material cultural remains that were found in burial contexts (i.e., lithic assemblages, faunal remains, shells, ochre, etc.).

The presented material will be synthesized to form a coherent picture of the Neanderthal burial practices in western Asia which could be compared to the burial practices of archaic Homo sapiens. This work is expected to highlight similarities and differences between the two populations who shared western Asia during the Middle Paleolithic period.

#### 6 **NEW ZOOARCHAEOLOGICAL DATA FROM LA ADAM CAVE PALAEO LITHIC SITE (DOBROGEA, SE ROMANIA)**

**Abstract author(s):** Vasile, Stefan (University of Bucharest, Faculty of Geology and Geophysics; Romanian Academy) - Dumitraşcu, Valentin (Romanian Academy, "Vasile Pârvan" Institute of Archaeology)

**Abstract format:** Oral

Accumulated between 151 and 55 ky BP, the cultural layer excavated in La Adam cave (SE Romania) yielded rare lithics, but numerous faunal remains. This study analysed the vertebrate faunal remains unearthed in recent exca-

variations, aiming to assess their taxonomy, taphonomic, and anthropic modifications of the bones. The vertebrate remains were highly fragmented, only allowing taxonomic assessment for a relatively small fraction of specimens. Taphonomic modifications of the bones are very frequent, including signs of chemical corrosion and carnivore bite marks, as well as possible trampling, bone gnawing, and fungal activity. The cave appears to have been a shelter for carnivores, with cave bear remains dominating numerically. Other large carnivores, such as cave hyenas, most probably contributed to bone accumulation as well, with large and middle-sized ruminants being their most common prey. Human activity, most probably related to Neandertals, albeit scarce, is supported by the cut marks seen on several bones, and by the presence of a bone percursor/retoucher.

Work supported by EEA grant 126/2018, contract no. 3/2019 - KARSTHIVES2 and by CNCS – UEFISCDI project number PN-III-P4-ID-PCE-2020-2282, within PNCDI III (both Ș.V.); and project PATCULT#RO (PN-III-P1-1.2-PCCDI-2017-0686 – V.D.).

## 7 PALEOTEJO, A NETWORK FOR NEANDERTHAL AND PRE-NEANDERTHAL INVESTIGATION AND HERITAGE

**Abstract author(s):** Pereira, Telmo (Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar, Portugal; Centro de Geociências da Universidade de Coimbra; UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Raposo, Luís (Museu Nacional de Arqueologia; ICOM - International Council of Museums) - Figueiredo, Silvério (Instituto Politécnico de Tomar; Centro de Geociências da Universidade de Coimbra; CPGP - Centro Português de Geo-história e Pré-história) - Salvador, Margarida - Sousa, Fernanda (CPGP - Centro Português de Geo-história e Pré-história) - Cunha, Pedro Proença (Universidade de Coimbra, Lisboa; MARE - Centro de Ciências do Mar e do Ambiente) - Martins, António (Universidade de Évora; ICT - Instituto de Ciências da Terra) - Cunha-Ribeiro, João Pedro (Universidade de Lisboa, Portugal; UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Ferreira, Carlos (UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Pirata, Vânia (Universidade Autónoma de Lisboa)

**Abstract format:** Oral

Since the 19th century, the Lower Tejo River (western Iberia) provide extensive evidence of Neanderthal occupation. However, due to the absence of long-term, well-funded projects and of fully-equipped research facilities, we still do not have a clear framework for the Neanderthal occupation of this crucial territory. Nowadays, probably more than ever, the increasing impact of urbanization and intensive agriculture potentiates the loss of already known and also the yet to find Paleolithic sites.

Recently, grounded on the extensive work performed by Prof. Luís Raposo for 50 years, and also of decades of work from other colleagues, it was possible to put in place a network project that will integrate previous and new data on the first human communities in Portugal, both pre-Neanderthal and Neanderthal.

In this contribution, we present the PaleoTejo project, highlighting the network of researchers and institutions, but also the strategy, goals and what has been achieved so far.

## 8 PALAEOOLITHIC BIASES: SOME REFLECTIONS ON WHAT IS LIMITING PALAEOOLITHIC ARCHAEOLOGY IN ACADEMIA AND ARCHAEOLOGICAL MUSEUMS. A SPANISH PERSPECTIVE

**Abstract author(s):** Romagnoli, Francesca (UAM - Universidad Autónoma de Madrid)

**Abstract format:** Oral

Paradigmatic biases in Palaeolithic Archaeology go back decades and have their roots in the conception of archaeology as anthropology or history, the debate about objectivity in humanities, and the discussion if archaeology is science. In Spain, where Archaeology is mainly included in Bachelor programmes in History and university departments are called 'Prehistory and Archaeology', these debates are still current. The way in which Palaeolithic has been taught and passed on, significantly affect the perception that large portions of students, academic colleagues, and the society have of ancient Prehistory. It is often seen as a long time in which everything -e.g. technology, cognition, and social dynamics- is extremely simple, and a time for which we cannot gain a proper knowledge because of little archaeological evidence and lack of written sources. It is astonishing to hear today these arguments in academia, and detecting the belief of many students that the knowledge of Prehistory has nothing to do with the understanding of the present, as though Palaeolithic archaeologists do not investigate how and why humans interact with other individuals, the environment and the objects. Furthermore, other issues affect the current idea of Palaeolithic people and life styles. On the one hand, there is a persistent bias in the way in which western societies approach 'diversity'. This generate a weird narrative by opposing 'us' Homo sapiens with 'the others' hominins, and 'primitive' hunter-gatherers with 'modern' producers. On the other hand, Prehistory is biased by the one-side focus that usually makes invisible all the diversity of gender as it is mediated by age, ethnicity, and sexuality. In this presentation, examples related to direct working experience will be presented discussing some thoughts that would stimulate a needed collective reflection on what is today the responsibility of Palaeolithic archaeologists to train (better) archaeologists, citizens and human beings.

## NEANDERTHAL MORPHOLOGY AND THE FRONTAL BONE FROM HAHNÖFERSAND, GERMANY

**Abstract author(s):** Röding, Carolin (Paleoanthropology, Senckenberg Centre for Human Evolution and Palaeoenvironment, Eberhard Karls University of Tübingen) - Profico, Antonio (DFG Centre of Advanced Studies 'Words, Bones, Genes, Tools', Eberhard Karls University of Tübingen; Catalan Institute of Human Paleoecology and Social Evolution IPHES, Tarragona) - Merkel, Michael (Archäologisches Museum Hamburg und Stadtmuseum Harburg) - Harvati, Katerina (Paleoanthropology, Senckenberg Centre for Human Evolution and Palaeoenvironment, Eberhard Karls University of Tübingen; DFG Centre of Advanced Studies 'Words, Bones, Genes, Tools', Eberhard Karls University of Tübingen; Museum of Anthropology, Medical School, National and Kapodistrian University of Athens)

**Abstract format:** Oral

In 1973 the sediments of the river Elbe near Hahnöfersand, Germany, yielded an enigmatic human frontal bone. This well-preserved frontal bone exhibits a rather prominent supraorbital region and a flat frontal squama, whose metric analyses showed affinities to Neanderthals (Bräuer, 1980). In contrast, other features are typical of *Homo sapiens*, like the supraorbital torus divided into lateral and medial portions. The frontal bone was interpreted as showing signs of hybridization between Neanderthals and modern humans due to this mix of features in combination with an initial dating to ca. 36 ka (e.g., Bräuer, 1980). However, later re-dating of the bone produced Mesolithic ages around 7500 B.P. and thereby, rendered previous interpretations implausible (Terberger, Street & Bräuer, 2001).

Here, we aim to objectively analyze the entire preserved ectocranial morphology of the frontal bone from Hahnöfersand in order to explore its affinities to Neanderthals and different modern human populations. Therefore, we employ the novel 3D shape comparative analysis based on surface registration. In this approach surface registration is coupled with an elastic iterative closest point algorithm to create a dataset of meshes with an identical number of corresponding vertices. Multivariate statistics are applied to Procrustes superimposed coordinates derived from the vertices of this dataset. This described method has a great potential for the study of hominin fossils as it allows to analyze the entire preserved morphology of isolated and fragmented remains based on a minimal number of homologous points.

This research was supported by the European Research Council (ERC CoG no. 724703) and the German Research Foundation (DFG FOR 2237).

## IS EVERYTHING LOST? RE-EXCAVATION POTENTIAL OF OLD CAVE EXCAVATION DEPOSITS

**Abstract author(s):** Škrdla, Petr (Institute of Archaeology of the CAS, Brno) - Nejman, Ladislav - Wright, Duncan (School of Archaeology and Anthropology, The Australian National University) - Králík, Miroslav (Department of Anthropology, Masaryk University, Brno) - Mlejnek, Ondřej (Archeologické centrum Olomouc) - Bartík, Jaroslav (Institute of Archaeology of the CAS, Brno)

**Abstract format:** Oral

Most caves, including caves most suitable for human occupation, were excavated in Moravia as early as late 19th century and the first half of 20th century. Recently, we [1, 2] tested the re-excavation potential of discarded sediments from a spoil heap deposited near the entrance of Švédův stůl cave in Moravian Karst – a well-known site where a Neanderthal jaw was found [3]. B. Klíma removed all of the sediments (450 m<sup>3</sup> in total) from the cave during several excavation seasons in the 1950s [4]. The current re-excavation of the spoil heap outside of Švédův stůl cave is aimed at finding lithic artefacts, human skeletal remains, personal ornaments, and other small finds lost during previous excavations as well as monitoring the stratigraphy for potential contexts [2]. In an age in which archaeologists are increasingly attempting to balance their roles as cultural heritage educators and destroyers, and with respect to our volumetric capabilities, we were able to transport and wet-sieve only a small amount of sediments as we believe in more precise methodological attempts in the future [2].

## NEW METHODS TO EXPLORE OLD DATA: APPLYING MODERN TECHNIQUES FROM DATA SCIENCE TO COMPARE NEANDERTHAL BEHAVIOR BETWEEN MIS6 AND MIS5E

**Abstract author(s):** Kandel, Andrew - Bolus, Michael - Bruch, Angela - Groth, Claudia - Hertler, Christine - Heß, Julia - Kanaeva, Zara - Malina, Maria - Sommer, Christian - Haidle, Miriam (Heidelberg Academy of Sciences and Humanities)

**Abstract format:** Oral

Here we present the results of a study that integrates information stored in the ROCEEH Out of Africa Database (ROAD). We examine whether climatic changes observed in Europe between the cooler period of MIS6 and the warmer conditions of MIS5e affected Neanderthal behavior. To address this question, we first examined which sites fit within the periods of interest. Next, we evaluated these sites to establish which ones provide well-dated contexts that lend themselves to such a study. Then, we processed the data and extracted information about stone artifacts and other cultural materials, faunal and botanical remains as well as indications about the climate.

Finally, we used the extracted datasets to test whether the fundamental environmental change between MIS6 and MIS 5e is reflected in Neanderthal behavior through variations in mobility behavior, changes in preference for certain artifacts, or the overall composition of the assemblages. We assessed these questions by applying and validating established archaeological indicators for mobility (e.g. tool diversity, specialization index, tool-flake-core ratio, artifact density, prey diversity), performing statistical analyses (e.g. independence, correlation, Multiple Correspondence Analysis) and borrowing sensitive tools for data discovery from machine learning (e.g. Frequent Pattern Analysis). Our preliminary results indicate an overall stability in the archaeological record with only nuances of technological change during these climatic phases. In sum, we conclude that the Neanderthal tool kit was versatile and offered its users the flexibility to sustain themselves in a changing environment without the need for substantial technological adaptation.

## RAPTORS CLAWS, A NEANDERTHAL BRAND: A DISCUSSION AROUND SHARED PRACTICES ACROSS HUMAN COMMUNITIES IN SOUTHERN EUROPE

**Abstract author(s):** Peresani, Marco (University of Ferrara, Department of Humanities, Prehistoric and Anthropological Sciences Unit Department of Humanities; National Research Council, Institute of Environmental Geology and Geoen지니어ing)

**Abstract format:** Oral

Neanderthals' attention to the aesthetic or uniqueness of certain materials of biological nature is also attested by the use of raptors pedal phalanges, despite the ephemeral occurrence with which these items are discovered in the archaeological deposits across Western Eurasia. The most well-known findings are isolated, cut-marked pedal phalanges of golden eagle, white-tailed eagle, cinereous vulture, other birds of prey, as well as swan found in France, Italy and Croatia in contexts covering a time interval of 100 to 45 ka BP. All these posterior phalanges bear disarticulation striations showing the successful removal of the claw from the toe using lithic tools to cut into the thick skin, the stratum corneum and severing the strong ligaments and tendons. Because claws are not directly compatible with human consumption, they may have served in a limited range of actions, likely symbolically oriented. Furthermore, the presence of diagnostic wear, in addition to the remnants of a string and of traces of ochre has been observed on the Krapina items.

An attractive hypothesis is a Neanderthals' ornamental use thanks to their length and curvature, and possibly their suspension in different ways, a feature for such elements observed in the present-day ethnographic records like tinkling pendants, suspended in isolation or still connected to the entire foot. This interpretation of pedal phalanges' use has also been supported from the over-representation of raptor feet bones bearing comparable traces ascribable to their deliberate removal, recorded for more recent periods of the Upper Palaeolithic in Europe and the Near-East. As striking case, the recent discovery of notched or unnotched eagle pedal phalanges in Initial Upper Palaeolithic contexts sheds light and fuels discussion on the occurrence of shared traditional practices between the late Pleistocene Neanderthals and early modern humans in Southern Europe and the Mediterranean rim.

### DISENTANGLING MIDDLE PALAEOLITHIC TECHNO-COMPLEXES WITHOUT USING LABELS

**Abstract author(s):** Marciani, Giulia (Università di Bologna, Dipartimento di Beni Culturali; Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, U. R. Preistoria e Antropologia, Università di Siena) - Leplongeon, Alice (Department of Archaeology, KU Leuven, Geo-Institute; UMR 7194 HNHP, Muséum national d'Histoire naturelle – CNRS – UPVD, Institut de Paléontologie Humaine) - Bortolini, Eugenio (HUMANE - Human Ecology and Archaeology Dept. Archaeology and Anthropology Institutió Milà i Fontanals de Investigació en Humanidades Consejo Superior de Investigaciones Científicas) - Kandel, Andrew W. (The Role of Culture in Early Expansions of Humans, Heidelberg Academy of Sciences and Humanities) - Negrino, Fabio (Dipartimento di Antichità, Filosofia, Storia, Università degli Studi di Genova) - Ronchitelli, Annamaria (Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, U. R. Preistoria e Antropologia, Università di Siena) - Riel-Salvatore, Julien (Département d'anthropologie, Université de Montréal) - Moroni, Adriana (Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, U. R. Preistoria e Antropologia, Università di Siena) - Benazzi, Stefano (Università di Bologna, Dipartimento di Beni Culturali)

**Abstract format:** Oral

Evaluating and comparing various datasets is a pressing issue in Palaeolithic archaeology. These processes become even more problematic when observations are recorded across a wide spatio-temporal transect, with differential research intensities and research goals, as in the case of research on the Middle Palaeolithic of Eurasia. Different approaches arose from a variety of epistemological backgrounds. These generated marginally comparable – if not irreconcilable – outputs in terms of documentation and questions. Nonetheless, the data collected over the past century, offer a remarkable opportunity for exploring and trying to explain the development and demise of Neanderthal groups across Europe and Asia.

Our current work aims to address questions concerning the development of an integrated approach to comparatively study this considerable amount of empirical evidence at a broad spatial and temporal scale of observation, while controlling for problems arising from: a) different epistemological perspectives; and b) different labels or “NASTIES” (named stone tool industries) characterising published datasets. Here we present a study comprising 67 layers from 29 different sites dating to the end of the Middle Palaeolithic of Europe and the Near East. Preliminary results show that our approach makes it possible to effectively compare contexts through different descriptive systems, as well as new and published data, and to use the proposed systematics to present novel insights on the European Middle Palaeolithic.

### NEANDERTHALS AND “US”: HOW THE GOLDEN AGE OF NEANDERTHAL RESEARCH CHALLENGES HUMAN SELF-UNDERSTANDING

**Abstract author(s):** Peeters, Susan (Erasmus School of Philosophy - ESPhil, Erasmus University Rotterdam; Institute for Science in Society - ISIS, Radboud University Nijmegen) - Zwart, Hub (Erasmus School of Philosophy - ESPhil, Erasmus University Rotterdam)

**Abstract format:** Oral

Our image of Neanderthals is changing rapidly, and this affects long-standing views about ourselves. Neanderthals (our most proximate other) serve as a mirror to reconsider who we are. They are more like us than other early humans, but the guiding conviction was that they were different. Precisely this (genetic, behavioural, cultural) difference allegedly confirmed our exceptionality. The overall trend was to frame humans as favoured evolutionary “winners”, whose alleged “superiority” led to the demise of Neanderthals. Research is rapidly questioning this. Allegedly unique markers of humanness are redefined and it becomes increasingly difficult to single out specific human characteristics as decisive. In the face of the current global environmental crisis, this triggers us to reconsider the story of our evolutionary narrative. Although the scientific image of Neanderthals has dramatically shifted, research still tends to focus on anatomical, genetic, psychic and cultural differences between “them” (*Homo neanderthalensis*) and “us” (*Homo sapiens*). Our interdisciplinary project combines insights from palaeolithic archaeology, philosophy, and post-colonial gender studies to analyse how transitions in Neanderthal research challenge our self-understanding, reopening the question: what makes us human?

### TAKE A WALK ON THE VIRTUAL SIDE OF NEANDERTHALS. EXHIBITIVE SOLUTIONS TO TRAVEL INSIDE POGGETTI VECCHI (CENTRAL ITALY)

**Abstract author(s):** Florindi, Silvia (Istituto Italiano di Preistoria e Protostoria; Cyprus Institute - STARC) - Aranguren, Biancamaria (Soprintendenza Archeologia Belle Arti e Paesaggio per le province di Siena, Grosseto, Arezzo - retired) - Puzio, Daniela - Revedin, Anna (Istituto Italiano di Preistoria e Protostoria)

**Abstract format:** Oral

Poggetti Vecchi (Grosseto, central Italy) is a Middle Pleistocene site dated to around 170 ka, with remains of *Palaeoloxodon antiquus* and artefacts referred to early Neanderthals, comprising the extraordinary wooden tools. The site is also an exceptional case study for the reconstruction of a peculiar thermal ecosystem at the beginning of MIS6.

The site was entirely excavated during a preventive archaeology campaign in 2012. The materials found - faunal bones, as well as lithic, bone, and wooden tools – are still waiting for a permanent exhibit venue.

The variety of the archaeological, paleontological, and palaeobotanical remains, together with the specific environmental context, is particularly suitable to communicate different topics to the general public. To make aware a wide audience of these topics, it is fundamental to adapt them in a modern perspective, focusing on the man-environment relation during climate crisis, the complexity of the prehistoric research, and on specific issues on restoration and conservation of heritage.

In the frame of the research project of the Istituto Italiano di Preistoria e Protostoria (IIPP), we present the virtual exhibition "170,000 years ago at Poggetti Vecchi. Neanderthal and elephants in the Tuscan Maremma, the climate challenge".

The virtual tour aims to engage the public in the climate change topic through human history, by means of innovative scientific methods and the artistic suggestions given by Tom Björklund's illustrations.

Since the physical space is becoming less and less available, while digital technologies became of common use in everyday life, we substitute the real space with a digital one, to enhance the visitors' experience and the valorisation of this extraordinary heritage.

## 16 NEANDERTALS AS STAKEHOLDERS IN CULTURAL TOURISM: THE STORY SO FAR

**Abstract author(s):** Mihelic, Sanjin (Archaeological Museum in Zagreb)

**Abstract format:** Oral

One of the salient features of the recent COST programme initiative—or Action—entitled Integrating Neanderthal Legacy: From Past to Present (abbreviated as iNEAL) is the wish to fully appraise the wide spectrum of present-day perspectives on Neanderthals, from the public appreciation of their role as long-gone partial ancestors of modern Eurasian populations to the valorisation of their legacy in broader cultural terms, including for instance the cultural tourism angle.

Within the iNEAL special attention is awarded to potential positive impacts different aspects of Neanderthal heritage, like museum displays or archaeological sites may have on the socio-economic development of a given community through mediation of tourism. This perspective underscores the public and touristic attractiveness of tangible and intangible aspects of the Neanderthal story, while exhibits and heritage sites are considered as tourist resources. Consequently, their management and valorisation for purposes of tourism enter the domain of destination management, as a continuous process in which tourism industry, administration at various levels, and other stakeholders develop a destination with a view to fulfil a shared vision of its future.

In addition to this, the Action seeks to develop a package of informational, educational and didactic tools to be used for communicating topics relating to various facets of Neanderthal legacy. The package will be designed to cater for different publics, from general public, schools, civil society and local communities, tourism sector, heritage institutions, small and medium enterprises, and all others interested in these topics. This paper aims to present and discuss the philosophy behind this key feature of the iNEAL Action, as well as the work done so far.

---

## 345 LET IT BURN! EXPERIMENTAL AND ETHNOARCHAEOLOGICAL APPROACHES IN PYROARCHAEOLOGY

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Stahlschmidt, Mareike (Department of Human Evolution, Max Planck Institut für Evolutionäre Anthropologie, Leipzig) - Mallol, Carolina (Departamento de Geografía e Historia, Campus de Guajara, Universidad de La Laguna, Tenerife; Archaeological Micromorphology and Biomarkers - AMBI Lab, Instituto Universitario de Bio-Orgánica Antonio González, La Laguna, Tenerife) - Miller, Christopher (Institute for Archaeological Sciences, University of Tübingen) - O'Neill, Brendan (School of Archaeology, Centre for Experimental Archaeology and Material Culture - CEAMC, University College Dublin)

**Format:** Regular session

The reconstruction of fire use behaviours can provide valuable insights into technologies, subsistence strategies and domestic activities of the past. For the interpretation of specific behaviours and the preservation of their evidence in the archaeological record, experimental and ethnographic studies present a helpful interpretative framework. In this session, we welcome presentations from experimental archaeology or ethnoarchaeological research on pyroarchaeology topics from hunter-gather contexts to complex urban societies. Such pyroarchaeology topics may include, but are not limited to:

- Taphonomy and preservation of fire residues
- Wildfire signatures and impacts on human behaviour, environments and the archaeological record
- Identification of burnt materials and their characterization
- Early fire use behaviours

- Fuel use and management strategies
- Cooking technologies and constructions
- Pyrotechnology
- Fire use for landscape-management
- New approaches, methodologies and techniques in pyroarchaeology

We invite researchers from all disciplines of the archaeological sciences to contribute to this session with talks or posters including short elevator pitches.

## ABSTRACTS

### 1 EXPERIMENTAL BIRCH TAR MAKING ALLOWS TO IDENTIFY ANCIENT PRODUCTION METHODS

**Abstract author(s):** Schmidt, Patrick (Department of Early Prehistory and Quaternary Ecology, Eberhard Karls University of Tübingen; Applied Mineralogy, Department of Geosciences, Eberhard Karls University of Tübingen) - Koch, Tabea (CEPAM, Université Côte d'Azur, CNRS, Nice)

**Abstract format:** Oral

Birch tar was the first adhesive produced by early humans. Its study has important consequences for our understanding of human evolution and, in later periods, the development of specialised craftsmanship. Little archaeological data on the way birch tar was made are known and it remains unknown what techniques were used for tar making in the Palaeolithic. Here, we present the results of an experimental programme aiming at producing birch tar with different techniques that could have been used in the Stone Age. We found that several methods allow to produce birch tar, some being more time and resource efficient than others. The resulting reference collection of experimental tar was used to recognise proxies of specific methods. We found that infrared spectroscopy allows separating the spectral signatures of different techniques. The implications of our findings are that it is possible to investigate which techniques were used to make birch tar in the Palaeolithic. This makes it possible to work on aspects like technical complexity, difficulty or the dynamics of invention of ancient birch tar.

### 2 EXTRAS PROGRAM NEW RESULTS: UNRAVELLING TEMPERATURE FROM FUEL INFLUENCE ON RAMAN SIGNAL

**Abstract author(s):** Vandeveld, Ségolène (Laboratory of Climate and Environment Sciences - LSCE UMR8212) - Delicque, Damien (Laboratoire de Géologie de l'ENS)

**Abstract format:** Oral

First part of the ExTraS program (an Experimentation program on Traces of Soot) was conducted in order to better understand the processes of fixation, recording and preservation of combustion products in speleothems and thin parietal carbonated crusts that form at cave entrances and on rock-shelters walls and vault.

Among the numerous results, we found that soot has different properties depending on the fuels used and the combustion temperature. We wanted to better define the source of these differences (in color, texture, etc.). Therefore we designed a new step of the ExTraS program, in the laboratory, to produce soot in a controlled environment.

We will present here the protocol used to unravel the two factors that can modify the soot structure (documented in Raman microspectroscopy): the combustion temperature and the fuel used. We will also present the results of this new experimental phase, which contributes to a better understanding of what the soot Raman signal indicates.

### 3 LESSONS FROM A LONG TERM WOOD FIRE EXPERIMENT

**Abstract author(s):** Karkanas, Panagiotis (Malcolm H. Wiener Laboratory for Archaeological Science, ASCSA)

**Abstract format:** Oral

More than 30 years of experimental studies of wood fire have produced a large body of knowledge about the formation of ash and its preservation. However, the unrelenting interest on fire experiments shows that there is still lack of critical information on this complex phenomenon. Recently, an 8-year experimental study involving hundreds of open wood fires and laboratory experiments has enriched our understanding of ash formation, its physical and chemical alteration, and preservation in the archaeological record. In addition to the implications for the emergence and use of fire in the Pleistocene and the interpretation of ash remains in later periods, some important lessons have been learned from this study about the experimental strategy, plan, and execution of wood fires. The traditional approach of defining accurately the problem, designing the experiment carefully, and precisely recording the variables works fine when the material under study is relatively well known and only certain aspects of its behavior are unknown. Contrary to what is believed, making a fire is not a simple task, and its behavior and relation to the environment is complex and depends on many variables. Therefore, a fundamental step is to understand the material aspect of wood ash as best as possible, particularly its physical and chemical characteristics. Moreover, long term experimental fires with several rounds of investigation of certain variables are required in order to reveal trends with time. Contrary to the

common belief, experimental procedures have to be revised continuously as new observations prompt additional measurements. Investigations in other fields unrelated to archaeology (e.g., combustion industry and forest science), are highly relevant. Finally, in addition to rigorous scientific inductive judgment, intuition, and luck are not to be dismissed and their positive effect increases with repetition of the same experiments.

#### 4 **RE-LIGHT MY FIRE: THE POTENTIAL OF MAGNETIC SUSCEPTIBILITY AS A PROXY FOR IDENTIFYING RELIGHTING EVENTS IN PREHISTORIC COMBUSTION FEATURES**

**Abstract author(s):** Hoare, Sally (Dept. Archaeology, Classics and Egyptology, University of Liverpool) - Albert, Rosa (ERAAUB, Department of History and Archaeology, University of Barcelona; ICREA) - Gowlett, John (Dept. Archaeology, Classics and Egyptology, University of Liverpool) - Halsall, Karen (Liverpool Hope University) - Stahlschmidt, Mareike (Department of Human Evolution, Max Planck Institutur for Evolutionary Anthropology, Leipzig) - Ian, Stanistreet (Department of Earth, Ocean and Ecological Sciences, University of Liverpool; Stone Age Institute, Bloomington)

**Abstract format:** Oral

The Lower Palaeolithic site of Beeches Pit (Suffolk, UK), dated to MIS11, is well-known for evidence of fire in the form of heated flints, heated bone, calcined shell, charcoal and seeming combustion patches. It has been interpreted to preserve some of the oldest evidence for human use and control of fire in northern Europe, including the presence of hearths. As the latter can be disputed it is necessary to approach the issues with a range of new techniques as previously, the presence of human hearths was determined based on macroscopic observations. While a first micro-contextual analysis of these sediments is on-going. We report on data from mineral magnetic studies of the affected sediments. Results show that while some of the sedimentary properties have arisen through heating others are, in fact, the results of natural redox processes. We further investigated the sedimentary properties of the heat affected sediments to investigate whether Magnetic Susceptibility (MS) can be used to determine re-lighting events in the archaeological record. Our experimental approach demonstrates that increases in MS are determined by the temperature of heating, total Fe content of the sediments, and composition of the parent material. Furthermore, our data shows that similar MS values can be achieved by successive episodes of heating or heating for longer periods. Our data also demonstrate that under some circumstances changes in MS values can be used as a proxy for re-lighting events in the archaeological record, when compared to an experimentally heated assemblage of the same substrate, and when other influences, such as duration of heating are also accounted for.

#### 5 **HOW ABOVE GROUND HEAT ALTERS MATERIAL UNDERGROUND: A HIGHLY CONTROLLED HEATING EXPERIMENT FOR BONE BURIED IN SEDIMENT**

**Abstract author(s):** Gallo, Giulia (UC Davis Anthpology) - Aldeias, Vera (Interdisciplinary Center for Archaeology and the Evolution of Human Behavior - ICArEHB) - Stahlschmidt, Mareike (Max Planck Institute for Evolutionary Anthropology)

**Abstract format:** Oral

The ability to clearly identify heated bones and reconstruct the conditions under which they were heated is crucial in investigating fire use practices. Most prior research has focused on the thermal alteration to bone with direct heating, and there is not currently a consensus on the degree to which indirect heating conditions can impact and transform buried bone. Recent studies have shown that the heat of a fire event can penetrate into underlying sediments, potentially altering buried archaeological materials. We investigate here the degree and nature of the heating of buried bones in an effort to differentiate heating during and after use.

The present study introduces the results of a controlled experiment utilizing a fire simulator setting following Aldeias et al. (2016). An indirect heating source was placed above fresh modern bones buried at -2, -6, and -10 cm in two substrates with differing pore spaces (dry gravel, and dry gravel with fine sand). An additional reference set of bones were burned sitting on crucibles of identical substrate utilizing a Nabertherm Muffle Furnace exposed to air, all trials burnt to 950° C for a period of 6 hours in addition to an extended cooling period. Subsequent to burning, bones were analyzed utilizing Fourier-transform Infrared Spectroscopy (FTIR) with an Attenuated Total Reflectance (ATR) attachment and x-Ray Diffraction (XRD) to provide information on bioapatite crystallinity and organic loss, as well as monitor structural changes.

Preliminary results indicate that bone buried in both substrates did have access to oxygen atmosphere with calcination seen at -2cm. Overall, heat penetration and alteration of bones was greater than expected, including bones buried at -10 cm having clear indications of burning . Our study shows that post-depositional heating can alter previously deposited materials underground and needs to be considered as a contributing factor to burnt bone assemblages.

## 6 LIVING IN DESERT ZONES, FORMATION PROCESSES OF ARCHAEOLOGICAL FIRE SIGNATURES IN THE ATACAMA DESERT SOILS FORMATIONS

**Abstract author(s):** March, Ramiro (CNRS – SCTD – UMR 6566 – CD0941) - Bastos, Galaad (CNRS UMR 6566) - Santoro Vargas, Calogero (Universidad de Tarapaca)

**Abstract format:** Oral

Human adaptation in extreme arid desert zones has been a recurrent strategy of human being around different parts of the world in different prehistoric periods. Nevertheless experimental studies of formation processes of fire structures formations in these contexts are rarely. This paper present the recent experimental studies carried out on the desert formations of the Atacama Desert and the different processes of formation and transformation of the mineral and organic components of soils and combustion residues from a realistic and laboratory experimental approach and the application of various analytical techniques (FX-DRX GC- GC-MS et GC-C-IRMS) aimed to characterize and understand the transformation processes of these soils under the effect of heat and combustion episodes of anthropogenic origin and the formation processes of fire structures signatures to facilitate the study of the human relation with thermal energy and the signification of the data that could be obtained from these archaeological structures in these kind of particular ecological environment.

## 7 MAMMOTH DUNG AS A FUEL RESOURCE IN PLEISTOCENE EURASIA? AN EXPERIMENTAL APPROACH

**Abstract author(s):** Miller, Christopher (University of Tübingen; Senckenberg Center for Human Evolution and Palaeoenvironment; SFF Centre for Early Sapiens Behaviour - SapienCE, University of Bergen) - Haidle, Miriam (The Role of Culture in Early Expansions of Humans - ROCEEH, Heidelberg Academy of Sciences and Humanities, Senckenberg Forschungsinstitut und Naturmuseum)

**Abstract format:** Oral

Mammoth extensively shaped the environment of the northern latitudes of Eurasia during the last glacial period and were a key species targeted for hunting by both Neanderthals and modern humans. Beyond the meat provided by these large proboscideans, mammoth also provided a wealth of other secondary products, including their bones for building structures and the ivory from their tusks for producing sculpture, personal ornaments, and musical instruments. A number of researchers have suggested that the large volumes of dung produced by mammoth would have potentially provided a significant source of fuel in the largely treeless steppes of Ice Age Eurasia. Here we present the results of experimental fires that use modern elephant dung as a proxy for Mammoth dung, exploring the firing and burning properties of this material. We use the results to investigate the energetics of burning and collecting dung, relying on ethnographic analogy, and examine methods for identifying burnt proboscidean dung in the archaeological record.

## 8 EXPERIMENTAL FUMIER DEPOSITS: A MICROMORPHOLOGICAL APPROACH TO FORMATION PROCESS

**Abstract author(s):** Polo-Diaz, Ana (University of the Basque Country UPV/EHU; University of Sheffield) - Burguet-Coca, Aitor - Allué, Ethel - Expósito, Isabel - Vergès, Josep (IPHES Institut Catala de Paleoecologia Humana i Evolució Social; URV e Area de Prehistoria, Facultat de Lletres, Universitat Rovira i Virgili)

**Abstract format:** Oral

Since the 1980s, high-resolution geoarchaeology has lead the investigation of early animal herding in caves and rock-shelters of the Mediterranean region. Micromorphological analysis in particular, has proved its suitability for the characterization of the sedimentary deposits so-called fumiers resulting from livestock practices of agropastoral groups since the Neolithic. In the Iberian Peninsula these studies have provided much relevant data, enabling the contextualization of artefact, bone and archaeobotanical assemblages and the construction of theoretical models on animal management, natural resource exploitation and territorial organization of early farmers. Given the relevance of archaeological interpretations of fumier deposits research hypotheses need to be tested to ensure accurate reconstruction of the dynamics involved in the accumulation and alteration of the sedimentary record. To address this issue an experimental and ethnoarchaeological interdisciplinary programme has been conducted at the rock-shelter of Mas del Pepet (Northeast Iberia) since 2014. The works have involved replication of prehistoric fumier activities consisting of seasonal herding of ovicaprids and recurrent burning of residues.

This presentation introduces the first results of the micromorphological analysis of the sediments from the experimental works conducted at the site of Mas del Pepet. The samples studied show a range of fumier stratigraphies which layering and composition allow us to improve our understanding of the impact of fire on plant and animal materials, deposit formation and taphonomy.

## FROM FUEL TO EMBERS: EXPERIMENTING ON IRON AGE COMBUSTION STRUCTURES IN THE WESTERN MEDITERRANEAN

**Abstract author(s):** Belarte, Maria Carme (ICREA - Catalan Institution for Research and Advanced Studies; ICAC - Catalan Institute of Classical Archaeology) - Portillo, Marta (Department of Archaeology and Anthropology, Institució Milà i Fontanals - IMF, Spanish National Research Council - CSIC) - Mateu, Marta - Saorin, Carme (GRAP - Grup de Recerca en Arqueologia Protohistòrica, Institut d'Arqueologia de la Universitat de Barcelona - IAUB) - Pastor, María (ICAC - Catalan Institute of Classical Archaeology) - Pou, Josep (Calafell Town Council) - Morer, Jordi (GRACPE, Institut d'Arqueologia de la Universitat de Barcelona - IAUB) - Castells, Georgina (Calafell Town Council) - Vila, Sílvia (Universitat de Lleida) - Pescini, Valentina (ICAC - Catalan Institute of Classical Archaeology)

**Abstract format:** Oral

The study of fuels related to the use of domestic combustion features in Iron Age contexts in the Western Mediterranean region is commonly based on wood charcoal remains found within the firing installations or within secondary deposits. Although macrobotanical records are common in the study areas, direct microscopic evidence from phytoliths and thin-section micromorphology is still limited.

Further, macroscopic combustion remains on hearths and ovens or on the floors around them are commonly scarce in the contexts here analysed, as these structures were cleaned after use, and pavements were also regularly swept. Interdisciplinary analyses such as those above-mentioned are needed in order to obtain more information on the fuels used and, also, to distinguish the components related to that purpose from those that were part of the constructions themselves. Experimental archaeology may provide valuable records that can be used as comparative data in order to identify the combustible materials used as well as the taphonomical processes related to them.

This study integrates macro and microscopic records from both archaeological and experimental firing installations in order to better understand fuel use in the Iron Age.

## NEOLITHIC OVEN BUILDING TECHNIQUES: EXCAVATION OF THE OVEN FROM THE SITE OF VINČA – BELO BRDO AND ITS EXPERIMENTAL RECONSTRUCTION

**Abstract author(s):** Đuricic, Ana (Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade)

**Abstract format:** Oral

Even though ovens are often found at the Vinča culture sites, they are frequently preserved only at the floor level (firebed), while parts of the upper structure are almost always missing. At the beginning of the XX century, at the site of Vinča – Belo Brdo, several fully preserved ovens were found. These ovens were extremely valuable for the reconstruction of the shape of these fire installations, as they were the only fully preserved Vinča culture examples. On the other hand, their building techniques were not documented, so we could only guess which techniques were used by the members of this Late Neolithic community. Usually, ethnographic examples were used to bridge this gap. Luckily, in the year 2006, at the site of Vinča – Belo Brdo, a fully preserved oven was found in the house 01/06. In order to gather data about the oven building techniques, this oven was partly excavated in the spring of 2015. Dome fragments were carefully removed and examined so that breaking patterns can be determined. The inner surface of the dome was closely observed to determine the presence or absence of a wooden frame. By not cutting through it, but removing dome fragments piece by piece, we were able to determine the exact building techniques, previously not taken into consideration by other authors. In order to test these techniques, two experimental ovens were constructed. Later on, one of the experimental ovens was taken apart. The experimental wall fragments had the exact breaking patterns and shapes as the original oven, confirming the supposed building technique. The aim of this presentation is to show, previously not considered, Late Neolithic Vinča culture oven building techniques.

## THE PROXEMICS OF FIRE IN CERAMIC TECHNOLOGY. THE CASE OF THE UP-DRAUGHT KILN

**Abstract author(s):** Gheorghiu, Dragos (National University of Arts - Bucharest; ITM Macao)

**Abstract format:** Oral

Up-draft kilns with perforated platforms represent the final phase of the evolution of the design of a machine for the serial production of ceramic objects, avoiding all the deficiencies of the previous combustion methods. In the form of a (hot) black box, the up-draft kiln can be controlled by visually connecting the in-put and out-put processes generated by combustion. These can then be perceived simultaneously by the operator, thus acting similarly to a contemporary machine.

Experimental archeology has so far studied only the physicochemical processes that occur during the combustion inside the furnace. Due to the operator's proxemic relationship with this type of machine, s/he can follow the (hot) black box process with the help of sight. Data from archaeological experiments, combined with ethnographic data, has led to a new image of the proxemic relationship between the operator and the machine, highlighting the use of all the senses in the technological process. The paper will discuss various proxemic issues that arise when using Chalcolithic and Roman replicas of up-draft kilns.

## TRACKING SEAWEED FUEL IN THE ARCHAEOLOGICAL RECORD THROUGH RAMAN SPECTROSCOPY OF CHARRED PARTICLES

**Abstract author(s):** Sitzia, Luca (Universidad de Tarapacá - Departamento de Antropología) - Power, Ximena (Instituto de Arqueología y Antropología - IIA, Universidad Católica del Norte) - Carcamo, José (Investigador Externo Dirección de Investigación, Postgrado y Transferencia Tecnológica - DIPTT, Universidad de Tarapacá) - Maalouf, Jean-Paul (Independent researcher) - Zurro, Débora (HUMANE Research Group. Institució Milà i Fontanals de Investigación en Humanidades IMF-CSIC) - Salazar, Diego (Departamento de Antropología, Facultad de Ciencias Sociales - FACSO, Universidad de Chile) - Ibacache, Sebastian (Independent researcher) - Silva, Claudia (Museo de Historia Natural de Concepción) - Borie, Cesar (Instituto de Arqueología y Antropología - IIA, Universidad Católica del Norte) - Roa, Constanza (División Arqueología Museo de La Plata - Laboratorio 129, Facultad de Ciencias Naturales y Museo, Universidad Nacional de la Plata)

**Abstract format:** Oral

The use of seaweed as fuel has been mentioned in ethnographic and historical sources in different coastal regions, including the North and South Pacific of America, North Atlantic, and Australia. In contrast, the archaeological record of seaweed burning is limited to contexts where preservation is exceptional and macroscopic discrimination of charred remains is possible. Among the known sites, those of the North Atlantic and the Atacama Desert coast stand out. In this work, we evaluate the effectiveness of Raman spectroscopy in the discrimination of algal vs. wood charcoals. First, we created an experimental dataset with current macroalgae and plants from the Atacama Desert (Northern Chile), burned under controlled temperature conditions (550°C) to obtain charcoals. Forty-four carbons (25 algae - 19 wood) were analyzed, and the spectra obtained were processed to identify valuable parameters. Parameters were fed into a Random Forest classification model to predict carbon class, and the model resulted in an out-of-bag accuracy of 86.3%. The model was then used to predict carbon class for 37 Raman spectra of charred particles identified in sediment and micromorphological thin sections from two archaeological sites on the Atacama Desert coast. All the charcoals were classified as algal charcoals, consistent with the working hypothesis. We suggest that Raman spectrometry is a valuable tool for discriminating algal and wood charcoals in the archaeological record, allowing future discussion of their use as fuel in past societies in this desert and other coastal environments around the globe.

## THE USE OF FIRE IN A METALLURGICAL SITE FROM THE INCA PERIOD (1450-1536 DC) IN THE ATACAMA DESERT, NORTHERN CHILE

**Abstract author(s):** Grimberg, Daniela (Independent researcher) - Cifuentes, Ariadna (Antropología UCN-UTA, Universidad Católica del Norte) - Figueroa, Valentina (Instituto de Investigaciones Arqueológicas y Museo R.P. Gustavo Le Paige, Universidad Católica del Norte)

**Abstract format:** Oral

The development of archeology in the Atacama Desert has had important advances in the understanding of the different areas of their daily lives of the past societies that occupied this challenging territory. Subsistence, domestic and economic activities have been approached by different proxies by national researchers, providing new results from the application of archaeometry. However, the study of fire has not been incorporated into the lists of topics of interest in local archeological research, even though this element constitutes one of the key resources for the daily activity of human communities, including metallurgical production.

Ethnographic works indicate that wood to be used as firewood or charcoal must go through a selection process, focused mainly on its heating properties, and then be subjected to drying or carbonization treatments, depending on the object of its subsequent use (Grimberg et al. 2021). Also, it is frequent the combination of woody elements from a tree or bush (branches, trunks, leaves) of similar or different species to get fire and, in this way, achieve the desired temperature in response to the need to be covered (Arre et al. 2015, Miller Alva 2017). In this sense, the combustion structures were designed to maintain a controlled environment (Rodríguez 2018), where domestic, economic, productive, or ritual activities could be carried out. The foregoing shows that for the generation of fire it is necessary to follow a series of steps that are not capricious, being the result of a thorough knowledge of vegetable fuel.

The present work is a first approach to the use of fire in the prehistory of the Atacama Desert, from the study of woody fuel and a combustion structure, oriented to metallurgical production of cooper from the Inca period (1450-1536 AD).

## DEATH AND FIRE.THE IDENTIFICATION AND CHARACTERIZATION OF PYRE GOODS AND THEIR USE IN CREMATION BASED ON EXPERIMENTAL AND ARCHAEOLOGICAL OBSERVATIONS

**Abstract author(s): Fülöp, Kristóf (Institute of Archaeology Research Centre for the Humanities)**

**Abstract format: Oral**

In addition to many parts of life, fire is an essential element of the concept of death to this day. Regardless of time or culture, the ritual of cremation is at the centre of many burial processes. Its special role derives from the purifying and transforming power of fire.

The most obvious form of this meaningful role is the transformation of the corpse into ashes, which has long been the subject of funerary and experimental archaeology. At the same time, however, we often forget that the objects and accessories placed on the funeral pyre are an equally important elements of the complex event of cremation. Therefore, this presentation focuses on the burning and transformation of pyre goods.

In order to thoroughly document the entire process of transformation of ceramic vessels and bronze artefacts and to understand the characteristics and conditions of burning, I performed two cremation experiments.

Then I examined more than 300 cremation burials of two Late Bronze Age cemeteries in Hungary. The experimental observations made it possible to divide the objects into two categories: grave goods and pyre goods. At the same time, it enabled me to outline the special circumstances and certain rules of cremation rite based on the type, condition and burning characteristics of the pyre goods.

The relationship between man and fire in this way appears in the unique context of death through the various use and deliberate manipulation of objects.

## LODOVICO BRUNETTI'S EXPERIMENTAL STUDIES FOR THE CONSTRUCTION OF A CREMATORIUM IN THE LATE 19TH CENTURY

**Abstract author(s): Magno, Giovanni (University Museums Centre CAM, University of Padua) - Zanatta, Alberto (Department of Cardiac, Thoracic, Vascular Sciences and Public Health - University of Padua)**

**Abstract format: Oral**

Cremation practices has been documented since prehistoric times and it was a common funerary custom until the advent of Catholicism. After a long hiatus, new movements arose during XVII-XVIII century to bring cremation back with modern criteria, mainly due to hygienic reasons and overcrowding of cemeteries.

Lodovico Brunetti, professor of Pathological Anatomy at the University of Padua (Italy) in 1855, was one of the first to investigate ancient roman cremains and started to carry out a crematory experimental research to improve the ancient open-air pyre practice. His studies and experiments led him to prototype a new crematory oven and become formally the father of modern cremation.

To evaluate the validity of Brunetti's crematorium, it was provided a comparison with modern experiences of experimental pyroarcheology. Furthermore, the social and theological dimensions of Brunetti's innovations demonstrated how the use of fire has aided the development of new tools and technology, as well as the evolution of cultural context, thus allowing cremation to be once again accepted as an alternative to inhumation.

## THE EXPERIMENTAL BURNING DOWN OF A LATE NEOLITHIC HOUSE RECONSTRUCTION

**Abstract author(s): van Gijn, Annelou (Faculty of Archaeology, Leiden University) - Pomstra, Diederik (Leiden University)**

**Abstract format: Poster**

From 2012 to 2019 a reconstruction of a Late Neolithic house could be found in the woods of one of Holland's polders. It was the result of a collaboration between the State Forest Service and archaeologists. For the first it served as a base to show the public how life close to nature could have taken place, whereas the archaeologists carried out all sorts of experiments. The construction was carried out with stone age tools only and the amount of building materials, labour input and duration of use of the various tools was quantified. The house was however never occupied on a regular basis and although several repairs took place, after seven years the roof was in need of substantial upkeep. Money was lacking and it was therefore decided to burn the house down and excavate it at a later stage. From the start the approach of the project was a biographical one: we wanted to document all stages of the life of the house, how it was built and used, which repairs took place and ultimately how it "died". Before setting the house to fire, we furnished it, adding items of daily life like wooden stools, skins, pottery, basketry, various foodstuffs and tools. The actual fire was filmed and temperatures were recorded by pyrometers. Immediately after burning the area was documented photographically and by 3D scan and three months later it was excavated. We will show what was left of both the house and its contents, comparing the situation before and after the fire and discuss the taphonomical processes that affected the house during its life and death.

## B. EXPERIMENTAL CREMATIONS AND THE EFFECTS ON BONE MICROSTRUCTURES

**Abstract author(s):** Bantavanou, Panagiota (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Trantalidou, Aikaterini (Hellenic Ministry of Culture & Sports, Independent Department of Press, Communication and Promotion, Athens) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

**Abstract format:** Poster

Osteological analysis of burnt animal and human bones, is a challenging task due to the severe modification of the skeletal elements after cremation. At high temperatures (<300o C), bones are severely damaged, and standard methods (i.e. age and sex estimation) do not perform efficiently. However, analysis of cremated skeletal remains is essential for anthropological, zooarchaeological and even forensic studies.

Up to date, most studies of experimental cremations concentrate on superficial alterations of the burned bones, like discoloration, warping and fragmentation. Few studies extend the research to the microlevel, analyzing the effects of high temperatures on the bone microstructures. Preliminary results studies indicate that specific patterns on firing process (i.e. temperature) can be identified. Experimental cremations, therefore, can offer valuable insights reconstructing cremation practices in ancient times.

In this study in order to observe and determine the effects of high temperatures on bones, at macro- an microscopical level, and to understand the cremation as a burial practice, we performed open field experimental cremations using animal bones. We created two different open field cremations that fired with different wood fuel (yew and beech), to examine the effects of wood on the bones at histological level. The experiment included lower limbs of domesticated pigs (*Sus scrofa domestica*) (n=10), and sheep (*Ovis aries*) (n=5) that was burned in different Celsius degrees (500, 600, 700, 800, 900). We retained two unburned bones as a reference sample.

We sampled femur cross-sections and proceeded to histological analysis. For the histological analysis we developed two protocols for sample preparation of the cremated and unburned bones. The microscopical analysis included the observation of: a) the discoloration, microfractures, and carbon concentrations on the cross-sections, b) the histological deformations of the microstructures, c) the differences of the wood fuel and d) the way that cremation was possibly performed in ancient times.

Acknowledgment: This research has been co-financed by the European Regional Development Fund of the European Union and Greek national funds through the Operational Program Competitiveness, Entrepreneurship and Innovation, under the call RESEARCH – CREATE – INNOVATE (project title: ECHOES-Development of a methodology for the digital reconstruction of ancient human biographies through the study of archaeo-anthropological material, project code:T2EDK-00152).

## BRINGING ROMAN COARSE WARE TO THE POINT: THE CHALLENGE OF A COMMON APPROACH

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Venditti, Caterina - Taloni, Maria (Ministry of Culture Italy) - Froehlich, Thomas (German Archaeological Institute) - Polito, Eugenio (University of Casinum and Southern Latium)

**Format:** Regular session

Material culture impacts the world in which people live, their interactions with each other and the social structure they build and coarse wares, with their enormous informative potential for the reconstruction of social-economic changes, are among the most interesting indicators. Despite being the most attested class in excavations of every regional and temporal horizon, they still represent a challenge, especially because of the preponderance of the local productions, that are prevalent in the contexts.

Nevertheless, researches carried out in the Mediterranean area show that the morphological repertoire is also composed of forms that can be traced back to a craft tradition of medium to wide range, in a horizon that goes beyond the chronological and territorial barriers and is based on strictly functional characteristics, linked to usages.

An integrated approach includes morphological classification, distinction of mixtures, selection for analysis and the recognition of production areas with a distinction between local and external production centers. Each step implies criticalities and the amount of potential data is enormous. The time is ripe for a management based on automatic systems of recognition that exploit complex algorithms, so far developed to recognize similar shapes and therefore very well applicable to highly standardized productions.

The new technologies and the collaborative work approach impose a reflection and sharing of best practices, guiding principles, lexicons, structures.

The aim of this session is to create a moment of dialogue in which the traditional typological approach can find a synthesis with the modern technologies of AI and the new frontiers opened by Social Network Analysis.

Expected papers may include but are not limited to:

- Presentation of excavations and findings.

- Analysis of traditional typological classifications.
- Use of AI in Roman coarse wares classifications.
- The contribution of Social Network Analysis to the study of Roman coarse wares.

## ABSTRACTS

### 1 ROMAN COARSE WARES IN FABRATERIA NOVA. AN ATTEMPT OF CLASSIFICATION

**Abstract author(s):** Venditti, Caterina Paola - Taloni, Maria (Ministry of culture - Directorate general for Education, research and cultural institutes)

**Abstract format:** Oral

15 years after the beginning of the scientific research in the roman city of Fabrateria Nova (southern Lazio, Italy), significant data are coming to light, thanks also to the study of finds, which is helping us to better define chronologies, external networks, consumptions and life-style. In the grand scheme, the most interesting data for the knowledge of the relationships between city-suburbs-production centers and in general the system of relations between Fabrateria Nova and the neighboring and contemporary centers of the territory are expected from the common ceramics. Quantitatively preponderant in every context, only recently they have been the subject of a classification work, with in a system based on a traditional formal / typological approach.

The purpose of this paper is to present the classification, underlining the metodological difficulties encountered in drafting the typology: the absence of parameters for comparison - there are no in fact, for the area and for these ceramic classes, extensive classifications of reference; the uncertainty of the nomenclature - for different chronological ranges and the various ceramic classes, different terms are used to indicate the same case; the difficulty in identifying the correct hierarchy and in deciding whether to favor the formal / typological or functional criterion.

In a scenario that has recently seen a flourishing of similar research in the sub-regional context, the prospect is to be able to compare our data with those of urban contexts and of similar chronology.

The aim is also to re-open a discussion on these issues and to understand how the automatic recognition softwares of ceramic forms, based on AI, can be effective with common wares and how social network analysis can help the typological classification, which is decisive not only in the chronological characterization of an excavation, but also and above all for historical reconstruction.

### 2 ROMAN COARSE WARE FROM AN ARCHEOLOGICAL AREA NEAR MILVIO BRIDGE. VIA CAPOPRATI (ROME)

**Abstract author(s):** Ciarrocchi, Barbara (MiC)

**Abstract format:** Oral

In October 2017, preventive archeology interventions of the Soprintendenza Speciale di Roma were carried out in a suburban area near the Milvio Bridge, in via Capoprati. The excavation continued in 2018 with an activity that lasted several months bringing to light an important archaeological area, where an important 5th century AD funerary complex was unearthed which is imposed on commercial structures of the I-III century AD. C. An abundant quantity of roman coarse ware was recovered, in particular from the 5th-6th century AD. C. which allowed the framing of the burial evidence of the late imperial age showing a chronological and typological sequence with types that circulated in the western and eastern Mediterranean in those centuries.

This archaeological area it's very important because is in the suburban area of the City not very known about roman coarse wares.

### 3 THE USE OF DEEP LEARNING ALGORITHMS FOR THE STUDY OF ROMAN POTTERY FABRICS (FABRICAI)

**Abstract author(s):** Willems, Sonja (Royal museums of Art and History, Brussels/Université Catholique de Louvain) - Chaidron, Cyrille (Université de Picardie Jules Verne; Artéka; Arkéocéra) - Borgers, Barbara (Universität Wien)

**Abstract format:** Oral

Building upon extensive Roman pottery reference collections, French and Belgium researchers have classified correlations for locally produced ceramics distributed in the North of Gaul. This methodic approach to fabric variants by macroscopical comparison has resulted in the defining of production zones, enabling analysis of transport routes and economic exchanges, or wider reflections on e.g. Romanization processes, consumption site status, cultural identities...

Since 2014, a multi-analytical approach to the study of production waste permits to answer questions on technology and knowledge transfer. Nevertheless, much more work is needed before all regional production sites are compositionally characterized. Furthermore, the excavation of consumption sites brings about quantities of fragments difficult

to identify at the macroscopic level, certainly when reference material lacks. Moreover, the identification process remains cumbersome, demanding extensive experience.

In 2021, Arteka and the design department Arkeocera developed an analytical programme, using image recognition with a Deep Learning algorithm, which permits to tackle precisely these identification issues. This approach, undoubtedly a major step forward, joins other recent projects where AI is applied to archaeological data (e.g. Archaïde). The outset is the implementation of a database of scientifically identified fabrics, which will then lead to the development of an application providing time gain during post-excavation, the education of specialists and extensive distribution mapping. The first results, using local pottery, confirms the utility of artificial intelligence, permitting the attribution by probability to known groups, or the creation of new fabric groups and their attribution to reference zones. In the future, the principle can also be extended to other data, such as decoration forms on archaeological objects, permitting easier identification and conservation for museum purposes.

#### **4 COARSE AND ROUGH AND IRRITATING: COARSE WARE OF DOLENJSKA**

**Abstract author(s):** Stemberger Flegar, Kaja (PJP d.o.o.) - Kovačič, Ana (Independent researcher)

**Abstract format:** Oral

In 2019, Roman pottery waste including various table ware and coarse ware items was unearthed at Drnovo (Slovenia). In Roman times, the settlement was known as Municipium Flavium Latobicorum Neviodunum. Beginning already in the 15th century, excavations have been conducted at Neviodunum. During various pre-modern excavations, the discovery of several cemeteries, an aqueduct, a couple of metalworking shops and at least five pottery kilns was documented, but most artefacts were published without a context. It is therefore impossible to know for example which finds come from the settlement and which from the cemeteries, and also what type of pottery was produced at the site, with exceptions such as bricks and water pipes that are known to have been exported from Neviodunum as far as modern Belgrade. The latter imply large a pottery production, of which we knew next to nothing until a 2019 find shed some light on the issue.

No comprehensive study of the coarse ware from Dolenjska has yet been published. This paper aims to present the preliminary results of the first comparative Dolenjska coarse ware analysis focussing on spatial distribution across both settlements and cemeteries (including newly excavated nearby sites at Trebnje, Medvedjek, Draga, and Ribnica), typo-chronology, and fabric analysis.

#### **5 POTTERY TRADITION IN THE NORTHWEST OF THE IBERIAN PENINSULA. TIMES OF CHANGE DURING THE ROMAN EMPIRE**

**Abstract author(s):** Hernández-Tórtoles, Alicia - Romero-Perona, Damian (Spanish National Research Council)

**Abstract format:** Oral

Pottery material culture is inherent to practically all human groups from the end of Prehistory to the present day. It has to be studied within its spatial-temporal frame, and it must be understood in the context of the society that produced it. We present a new state of the issues regarding pottery manufactures and their archaeological contexts in the Northwest area Iberian Peninsula (between the end of the 1st century B.C. and early 1st century AD). It includes the north of Portugal, the provinces of Galicia, the north of León and the western part of Asturias. The conquest and domination of this region during the Augustus' government were characterized, among other aspects, by an intense gold mining exploitation in the Early Roman Empire period.

Ancient gold mining has dramatically shaped the landscape. The "fossilized" remains have left an extremely rich geo-historical heritage. These are the so-called "mining landscapes", due to the variety of mining techniques, infrastructures and the diverse ancient settlement documented at these mining areas. The archaeological record shows up tributary peasant communities under the rule of Rome, as well as evidences of hierarchical relationships.

Some pottery productions maintain technical and typological local traditions, dating back to the Early Iron Age. However, the quantity and the variety ceramic artifacts increases with the emergence of new techniques from abroad and the arrival of objects produced out of these regions (Roman pottery, Mediterranean imports, and other Hispanic productions). Our aim is to assess the impact of the Roman imperial economy on local economies in order to see how and how much it transformed production, distribution and consumption of pottery in several archaeological sites in which the research group carries out research.

(\*This study belongs to LOKI Project, within the "Social Structure and Territory. Landscape Archaeology" Group (from Spanish National Research Council).

## 6 COARSE WARE'S STRATIGRAFICAL EVOLUTION IN THE WESTERN ATLANTIC SHORE OF HISPANIA (V-VI C. AD): THE CASE OF ALMOÍNHAS (LOURES, LISBON)

**Abstract author(s):** Quaresma, José Carlos - Lopes, Marfim (Universidade Nova de Lisboa)

**Abstract format:** Oral

This work follows the most recent studies and developments regarding the stratigraphy of the site of Almoíñas, that has over forty contexts between the V and VI centuries AD with a good quantity of material evidence and statistical quality.

This study is of importance for the study of the coarse ware in the western Atlantic shore of Hispania, especially in the territory associated with Olisipo, given that until recently the available stratigraphical data on coarse ware for the region was very scarce. Thus far, it aims the broadening of the knowledge related to these ceramic productions in a chronological period that is usually of complex analysis.

The contexts here presented are associated with the last phases of occupation of the site, namely the last habitational evidences, with marks of squatting, and the phase of abandonment of the two main buildings that have certainly collapsed in the first half of the VI century AD.

## A. INVESTIGATING ROMAN COARSE WARES IN NORTHERN ITALY: METHODS AND FIRST RESULTS FROM THE CASE STUDY OF AQUILEIA

**Abstract author(s):** Riccato, Anna (Università degli Studi di Padova)

**Abstract format:** Poster

Recent research carried out by the University of Padua in the Roman town of Aquileia (Northern Italy) brought to light a few thousand coarse ware shards, dating back to the period comprised between the 2nd c. BC and the 6th c. AD. The vessels displayed different characteristics in terms of morphology and technical features, which were hypothetically reconducted to both the chronological evolution of the ceramic technology and the presence of imported products. To address these research topics, a multidisciplinary approach was adopted. Some well-established methods were applied (i.e. typology, distributional analysis, thin section analysis), in association with others less frequently used in the study of Roman coarse ware (digital image analysis, in-depth study of the forming techniques). The systematic application of these methods made it possible to recognize the main morphological and technological features of the pottery of local/regional production and to trace the evolutionary trajectory of the manufactures regarding raw materials supply, fabrics "recipes", skills and economic resources involved in the productive process, and possible location of the workshops. Moreover, the presence of vases imported from other regions of Northern Italy was confirmed, thus allowing the reconstruction of the exchange network which connected Aquileia with the neighbouring territories. In conclusion, the study has highlighted the role of the coarse ware as a preeminent source of information to reconstruct local economies and productive systems, as well as short- and medium-distance market dynamics.

---

## 347 NATURAL RESOURCES OF HIGHLANDS AND HINTERLANDS IN THE MEDITERRANEAN

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** de Neef, Wieke (Ghent University) - Attema, Peter - Maurer, Arnoud (University of Groningen)

**Format:** Regular session

This session explores the environmental and economic entanglement between lowland and highland zones in Mediterranean landscapes. Although highland zones remain generally underrepresented in archaeological landscape research, their economic importance to past societies has long been acknowledged on account of the availability of a wide range of resources. These include primary materials such as metals, stone, salt, timber, game etc., but also pastures. Transit routes through upland areas are crucial to their availability and thus a major factor in the economic entanglement between lowlands and highlands.

Information on the long-term human impact related to the exploitation of these resources is, apart from archaeological studies, increasingly becoming available through environmental research. For instance, palynological studies indicate that Neolithic communities in various parts of the Italian peninsula systematically deforested woodland areas to expand their pastures.

Our aim is to integrate the ephemeral archaeology of resource extraction and human impact on highland areas into models of settled lowland areas, and to explore the means and infrastructure through which diverse landscape zones were connected in past land use. Our session covers three broad themes:

- The archaeology of natural resources in highland areas: methodological issues including detection and dating of past extraction practices;
- Environmental impact of highland exploitation: approaches to reconstruct the human footprint on fragile upland zones;

- Infrastructure and connections in highland economies: route networks and practical aspects of transport.

We invite contributions with case studies from around the Mediterranean and from all archaeological periods, including the recent ethnographic past.

## ABSTRACTS

### 1 INTRODUCTION: REFLECTIONS ON SOCIO-ECONOMIC, ENVIRONMENTAL, AND SPATIAL LINKS BETWEEN LOWLANDS AND HIGHLANDS

**Abstract author(s):** de Neef, Wieke (Ghent University) - Attema, Peter - Maurer, Arnoud (University of Groningen)

**Abstract format:** Oral

In the introduction to this session the organizers will discuss the importance of the study of highland exploitation and human impact on upland zones in reconstructions of past socio-economic systems in the Mediterranean. In recent years the archaeology of mountain areas has taken up speed, with exciting new research offering new perspectives on the long-term entanglement between lowlands and highlands. This includes not only new primary archaeological data, but also environmental studies highlighting the impact of resource extraction strategies on sensitive upland ecologies, and spatial approaches to the connections between various landscape zones.

The study of vertical landscapes poses several methodological challenges related to the ephemeral character and low visibility of archaeological traces, the dynamic nature of landscape processes, and the varied resolutions of archaeological, environmental, historical, and ethnographic sources. In this introduction we draw attention to established practices as well as recent theoretical and methodological advances in the study of upland areas and their integration into long-term regional occupation models. Our expectation is that the cases presented in this session will help explore a broad range of configurations in settlement and land use systems between lowlands and mountains.

### 2 THE HISTORICAL RELEVANCE OF MARGINAL AREAS IN THE AEGEAN: A CASE-STUDY OF THE DIKTE MTS, CRETE

**Abstract author(s):** Kalantzopoulou, Tina (NKUA - National and Kapodistrian University of Athens)

**Abstract format:** Oral

The aim of this paper is to explore the ways in which Bronze Age polities on the island of Crete organised their countryside and its ensuing production. Mountainous areas as peripheral zones are studied regarding the extent of sustenance they provided the palatial system necessary for its survival or, on the other hand, regarding the possibilities they offered for alternative modes of political and economic organization. Essentially, we examine the level of integration of remote and seemingly marginal areas into the palatial political and economic system and territory from the bottom-up. The study wishes to explore the clusters of labour and production in peripheral zones and to approach the political and economic organisation of the Bronze Age starting with areas that were as remote as possible from the centralised manifestations of power concentrated in the monumental and palatial complexes. Our goal is to offer a fresh perspective to the debate concerning the functional character of Minoan polities, one that contrasts the usual top-down interpretations. As a case-study we have elected two separate but comparable mountain regions on the massifs of east Crete. The research focuses on architectural remains belonging to both habitation and exploitation infrastructure (terraces, enclosures, pens, wells etc) and on movable finds in their immediate surroundings.

### 3 HIGH ALTITUDE EXPLOITATION SYSTEMS OVER TIME: THE CASE OF THE WESTERN VENETIAN PREALPS

**Abstract author(s):** Migliavacca, Mara (Dipartimento di Culture e Civiltà università di Verona)

**Abstract format:** Oral

Surface researches, followed by excavations, have been carried out for years in the high altitude areas (1200-1600 m asl) of the western Venetian Pre-Alps, specifically in the Lessini and Piccole Dolomiti zones. Several methods have been employed: field-walking survey, analysis of aerial photos, ethnographic and archival research, GIS-based landscape analysis and predictive modelling, and LiDAR data for feature detection in wooded areas. These researches have brought to light the traces left by the human frequentation, necessarily seasonal but attested starting from the farthest phases of the prehistory, to reach the protohistory, the Roman age, the Middle Ages up to the great wars of the last century. We are thus discovering systems of exploitation of the resources of the high altitudes that are diversified from period to period, but always necessarily interrelated to the economy and systems present at lower altitudes. In this contribution I shall illustrate the case of the pastures of Malga Campodavanti (Recoaro Terme, Vicenza), where a medieval-modern exploitation system and a protohistoric one have been recognized. In both ages pastoralism and exchange/working of metals seem to be connected and refer to the wider economic system of the region.

#### 4 SALT, SHEPHERDS, SMUGGLERS IN N-E ITALY FROM THE PRESENT BACKWARDS TO PREHISTORY

**Abstract author(s):** Montagnari Kokelj, Manuela (University of Trieste) - Boscarol, Chiara (Divulgando srl, Trieste)

**Abstract format:** Oral

The idea that salt might have played an important role already in Late Prehistory in settlement strategies of Karst and Istria, regions bordering the N-E Adriatic, emerged on the basis of direct and indirect indicators. As to direct indicators: saline had been active in the area of Trieste and its surroundings at least from the Middle Ages till 1830, in Istria even later, but salt production/trade were attested already in Roman times - one of the tradesmen operating until Dacia (ca. N-E Balkans and Carpathian basin) was registered as conductor pasculi, salinarius. Abundant remains of briquetage found at Elleri, a hillfort close to the coast, would indicate the production of salt by using fire even earlier, in the Bronze Age. Before hillforts were built, Karst caves were used by human groups, in some cases by shepherds with flocks of sheep and goats, as demonstrated by sedimentological and soil-micromorphological analyses. The connection between pastoralism/transhumance and salt is an accepted fact, and the high number of exotic materials – pottery, flaked/polished stones first identified on typological grounds, then confirmed by archaeometric analyses – would strengthen it.

If the N-E Adriatic coastal areas were attractive already in Prehistory for the possibility of collecting sea salt produced by natural elements, the study of geomorphological features of hilly and mountain areas more or less distant and potentially complementary for pastoral movements, of the origin of raw materials and artefacts, of the distribution of contemporary sites in the territory so delimited could help to reconstruct the routes from the coast to the hinterland. Studies of paths used in different historical periods – including the present, by using an ethnographic approach – by transhumant shepherds, but also by salt smugglers or migrants, can help too.

All the preceding topics will be discussed at the EAA 2022 meeting.

#### 5 COMMUNICATION AND RESOURCE USE OF SOUTHERN VELEBIT COMMUNITIES

**Abstract author(s):** Serventi, Zrinka (University of Zadar, Department of History) - Vuković, Morana (Archaeological Museum Zadar)

**Abstract format:** Oral

Velebit, a large mountain range spanning parallel to the Eastern Adriatic coast, has always been a place of communication and separation, being in most instances insurmountable with just a few mountain passes of great strategic importance. Among its territories, Southern Velebit is more hospitable and as such it played an important role in communication between lowland and highland zones (e.g. territories of Bukovica and Ravni kotari with Lika and deeper hinterland), particularly in Iron Age but in later periods as well. This territory throughout centuries has been used by mobile cattle-breeders that laid down the first trails over the mountain and used important trade hubs and settlements established on higher zones of Velebit. These communities, however, had to acquire many resources from far away areas, creating a culture with distinct identity, opened to foreign influences. Unfortunately, this territory has been poorly researched and only few studies have been conducted on the settlements of this area. Among such sites is the Iron Age hill-fort Kneževići (situated near one of the mountain passes and the still inhabited hamlet), which has been recently excavated by the Archaeological Museum Zadar and it has given good insights into the life of people in this territory, their trade, use of materials and resources as well as burial rituals.

Therefore, in this paper we shall present the Iron Age communities living in the area of Southern Velebit, with primary focus on the hill-fort Kneževići. Apart from the recent finds, we intend to analyse the most important routes leading to said hill-fort as well as other nearby settlements and discuss possible goods that were both produced in the area and acquired from other territories. In the end we shall also consider the continuities of transport, trade and production in Southern Velebit from Iron Age to present days.

#### 6 NORTHERN PARALLELS: WAS NORWEGIAN OUTLAND RESOURCE EXPLOITATION JUST A SERIES OF SIDE HUSTLES?

**Abstract author(s):** Hill, David (NIKU - Norwegian Institute for Cultural Heritage Research)

**Abstract format:** Oral

The Norwegian landscape sets absolute limits for rural settlement, 95% of Norway is non-cultivable. Annual seasonality sets further harsh limits for agrarian / pastoral strategies – May to September is the growing season. When winter comes producers have to be ready to meet it. The outland economy has therefore played a strong and necessary economic role in times of expansion and crisis. The strategies that Nordic society developed to build a sustainable economy were varied, complex and closely linked to a duality of infield and outland exploitation. The range of outland activities practiced in Norway was strikingly varied. Was the outland economy just a series of 'side hustles' to make ends meet? Or do the economic dividends within production variability provide a perfect toolbox for creating a robust and economically sustainable economy? Was outland surplus production less easy to tax and control by elites? Does this result in attractive flexibility for primary producers? A case study from the north.

7

## NATURAL RESOURCES OF HIGHLAND IN SICILY: FROM THE ARCHAEOLOGICAL SURFACE SURVEY TO A CHEMICAL CHARACTERIZATION OF ORGANIC RESIDUES

**Abstract author(s):** Forgia, Vincenza (Dipartimento Culture e Società, Università di Palermo) - Vallejo, Asier (Department of Analytical Chemistry, University of the Basque Country - UPV/EHU, Faculty of Pharmacy; Bioaraba, Metabólomica Biosanitaria, Alimentaria y Medioambiental) - Ollé, Andreu (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Vergès, Josep Maria (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art)

**Abstract format:** Oral

Archaeological landscape research on the uplands of Sicily has shown the economic importance of highlands and the central role they played within raw material exploitation, exchange and transit networks.

Our research is focused on the Madonie mountain range, on the northern part of the island. We started with the surface survey of sample areas, then with the excavation of a key-site and test-pitting of specific places. Our results inform about a "persistent place-making" of a mountain territory since ~ 10 ka BP. The early peopling of the highlands has to be ascribed to the interest for wild species seasonally migrating to the uplands and coincide with an open landscape, while the repeated phases of intentional burning of vegetation cover, during the several following millennia, correspond to the "domestication" of the place by pastoral groups. At the Vallone Inferno rock-shelter (800 m a.s.l.), these groups based a persistent pastoral refuge seasonally occupied from the middle Neolithic (mid 6th millennium BC) onward. At 1400 m a.s.l., at Fonte Castellaro we opened a test pit (1x2 meters), inside a recently abandoned pastoral pen, which yielded archaeological traces spanning from the Upper Paleolithic to the Middle Ages. Here, the use of the same place for millennia can be explained by the presence of a spring water source (the "Fonte" of the place name) and the abundant chert nodules embedded in the local geological formation. To prove the presence of herds, so the use of highlands pasture along the millennia, we are testing organic residues in sediments. These organic residues are fecal biomarkers with which the biogenic origin of the sediment can be determine and hormones, such as progesterone, with which herding practices can be determine as the separation of the pregnant females or the recent lamb ewes and their lambs from the herd.

8

## TRACING NEOLITHIC AND MEDIEVAL LIVESTOCK FARMING IN THE EASTERN PYRENEES: THE COMBINED ARCHAEOLOGICAL AND PALAEOENVIRONMENTAL STUDY OF MOLLERES II (PUIGPEDRÓS-MASSIF)

**Abstract author(s):** Carbonell, Arnau - Colominas, Lúdia - Pescini, Valentina (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - ICAC-GIAP) - Mayoral, Alfredo (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - ICAC-GIAP; GEOLAB, UMR 6042 UCA-CNRS) - Egúez, Natalia (Archaeological Micromorphology and Biomarkers - AMBI, Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Gallego-Valle, Abel - Martínez, Jesús - Palef, Josep Maria (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - ICAC-GIAP)

**Abstract format:** Oral

The reconstruction of livestock practices in high mountain areas is of crucial importance for understanding the integration of these spaces into the economy of ancient societies. However, it is often challenging to characterize this activity due to the poor preservation of archaeological remains in these extreme and sensitive environments. Over the last years, interdisciplinary landscape archaeology combining archaeological and palaeoenvironmental analyses allowed documenting both the long-term occupation and landscape impact of ancient pastoral societies in the eastern Pyrenees. Here, we present the study case of Mollerés II, a site located at 2.424m a.s.l. We have applied an archaeological and palaeoenvironmental approach, focused on test pit digging of archaeological structures and on the analysis of wood charcoal and other botanical microremains, micromorphological analysis of soils, and lipid biomarkers and their stable isotope signatures (carbon and deuterium). This combined approach has allowed us to document the presence of several enclosures of about 20m<sup>2</sup> with a high-intensity mountain livestock farming activity. Radiocarbon dating has shown that these enclosures were built during the Neolithic (the end of the 4th millennium–the start of the 3rd millennium BC), and also reused during Medieval times (13th-14th c. AD). This early pastoral activity is exceptional and forces us to rethink the use of these high mountain spaces and their complementarity with the lowlands.

9

## THE CONNECTED HIGHLANDS: MULTIDISCIPLINARY INVESTIGATIONS OF RESOURCE EXPLOITATION IN THE POLLINO RANGE (SOUTHERN ITALY)

**Abstract author(s):** de Neef, Wieke (Ghent University) - Attema, Peter - Maurer, Arnoud (University of Groningen)

**Abstract format:** Oral

In this paper we discuss the results and perspectives of three fieldwork campaigns by the Pollino Archaeological Landscape Project (PALP), a collaboration between the Universities of Groningen and Ghent and the Gruppo Spe-

leologico 'Sparviere'. The PALP seeks to understand highland exploitation of the Pollino mountains (southern Italy) within the context of changing upland and lowland socio-economic and cultural relationships, from prehistory up to the present. We apply a multidisciplinary approach combining landscape archaeological, environmental, historical and ethnographical sources to understand past land use practices and their ecological impact.

We highlight the various natural resources available in the Pollino range and the extent to which they were relevant in various phases of past occupation: wildlife; timber; flint, chert and quartzites; pastures; water and snow; edible plants. The results of our studies so far have brought to light previously unknown traces of human occupation which we can in various extents link to these resources, ranging from a Palaeolithic hunting camp at an important mountain pass to 20th century charcoal burning platforms. We connect these newly discovered sites to the archaeology of the much more intensively studied coastal lowlands, drawing attention to the deep past of path networks, location preferences, and the availability of resources such as salt for upland pastoral systems. The diachronic perspective of our work is reinforced by botanical and pedological studies which provide a long-term environmental framework of this dynamic mountain landscape, and the way it was affected by human impact.

10

## **TASKSCAPING THE CHALCOLITHIC LANDSCAPE OF SOUTH-EASTERN IBERIAN: MOBILITY AND RESOURCE EXTRACTION IN THE GUADIX-BAZA-HUÉSCAR HINTERLANDS (GRANADA)**

**Abstract author(s):** Pinillos de la Granja, Paula - Barruezo Vaquero, Pablo (Universidad de Granada)

**Abstract format:** Oral

Since its coinage in 1991 by T. Ingold, the concept of 'taskscape' has been widely used in archaeological narratives. The concept is useful for understanding the landscape from the point of view of its cultural transformations due to socio-economic patterns (e.g., working, mobility, etc.). Moreover, the concept also adds new layers of epistemological complexification from the point of view of humans/non-humans interrelationships. This paper addresses this concept applied to the Guadix-Baza-Hués-car hinterlands (Granada, Spain) to understand the mobility patterns associated with extracting and allocating raw materials. Furthermore, such an analysis helps better analyse social explanations associated with pottery production during the Chalcolithic (III Millennium BC).

To deploy this study, the paper aims at analysing the connectivity between two Chalcolithic sites: Cerro de la Virgen and El Malagón. Recent archaeometrical analyses have shown that the pottery production of Cerro de la Virgen contains a quantity of schist—which is somewhat surprising, given that the immediate environs of the settlement lack this geological component (as per the geological map IGME 951). For its part, the pottery production of El Malagón presents an important quantity of schist. Contrary to Cerro de la Virgen, though, the environs of El Malagón do have natural metamorphic rock -schist- resources (as per IGME 973). Considering this context, we argue the existence of a connection between both sites, at least regarding pottery production and landscape exploitation. Yet, no previous study has considered such a hypothesis. This paper thus follows this argument and tests it through multivariate analyses based on Least Cost Path (LCP). The results from these analyses are then integrated within the concept of taskscape, which serves for understanding the landscape from the point of view of social interactions between communities in the hinterlands of this Mediterranean area.

## **DARK HORSE – ARCHAEOLOGIES OF HORSES AND HORSE CULTURE IN THE MIDDLE AGES**

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Benkert, Helene (University of Exeter) - Orlando, Ludovic (Centre for Anthropobiology & Genomics of Toulouse - CAGT; CNRS UMR 5288, Université Paul Sabatier) - Creighton, Oliver - Outram, Alan (University of Exeter) - Liddiard, Robert (University of East Anglia)

**Format:** Regular session

The warhorse was the most iconic animal of the Middle Ages. As distinctive symbols of status, horses were central to the aristocratic image and closely bound up with concepts of knighthood and chivalry across a wide geographic area. As weapons of war, bred for strength and stamina, warhorses contributed crucially to the rise and fall of empires. But while the development and military use of the warhorse has been intensively studied by historians, the archaeological evidence is too often dispersed, overlooked or undervalued. However, to fully understand the cultural significance and functional role of the medieval warhorse, a systematic study of the full range of archaeological evidence for warhorses (and horses more generally) from medieval sites across Europe and beyond is necessary. More importantly, it is crucial to integrate the various disciplines and lines of evidence to comprehend the multifaceted socio-economic value of medieval (war)horses.

Similarly, this session aims to bring together researchers from a variety of disciplines to explore this important species, its material culture and impact on human history. We will present findings from the UK Arts and Humanities Research Council-funded Warhorse Project as well as the European Research Council-funded Pegasus Project, looking at zooarchaeological and genetic evidence as well as equestrian equipment and breeding landscapes. While our focus is on the European experience, we would like to invite papers from around the world to complement our re-

search. We especially welcome contributions that highlight the impact of horses as active agents. The horse in the medieval (or equivalent) period and its role in military and society stands at the centre of this session, without disciplinary restrictions.

## ABSTRACTS

### 1 INTRODUCTION. THE MEDIEVAL WARHORSE PROJECT: INTERDISCIPLINARITY AND INTEGRATION

**Abstract author(s):** Creighton, Oliver (University of Exeter)

**Abstract format:** Oral

This opening paper for the session introduces the current UK-based research project, Warhorse: The Archaeology of a Medieval Revolution? (<https://medievalwarhorse.exeter.ac.uk/>) as a case study of the potential of genuinely interdisciplinary, integrated research. The project, which is based at the Universities of Exeter and East Anglia and is funded by the Arts and Humanities Research Council, UK, is engaging with material evidence for horses in medieval England at a wide variety of scales — from zooarchaeological samples for genetic and isotopic analysis and individual artefacts through to excavated assemblages and landscape-wide datasets — dating between the late Saxon and Tudor period (c. AD 800–1600), all contextualised by new historical research. This paper stresses how these different lines of evidence, from cutting-edge archaeological science through to re-analysis of primary documentary sources, interact with and complement one another to create the potential to create new understandings about the medieval horse and its social context.

### 2 'TO WORK FOR THE KING': EQUINE NETWORKS IN 14TH-CENTURY ENGLAND

**Abstract author(s):** Liddiard, Robert (University of East Anglia)

**Abstract format:** Oral

This paper examines the physical and administrative frameworks in which royal warhorses were bred, trained and kept during the first half of the 14th century. Contemporary documentary records associated with the management of royal equines are exceptionally rich and permit the identification of a series of overlapping 'networks' within which high-status animals lived and worked. One such network comprised studs – chiefly at royal castles and palaces – in which horses were born and kept until they reached the threshold of adulthood. Those destined for military use were subsequently drawn off into a larger network of the king's 'great horses', characterised by its own pattern of stabling and itineration, where they were trained for war. It was this 'pool' of elite beasts that provided the households of successive English monarchs with significant numbers of warhorses during their military campaigns.

The detail of the evidence is such that it permits the locations of studs, stabling, supply chains and physical infrastructure to be mapped with great accuracy as well quantifying the number of horses involved and, in some cases, providing evidence for the life course of individual animals. This paper therefore aims to give a spatial dimension to one aspect of the military organisation that underpinned England's war effort in the Hundred Years War, a conflict in which its kings achieved hitherto unparalleled military success. In so doing it provides an historical and geographical context alongside which the archaeological evidence for equestrianism can be evaluated.

### 3 HIGH HORSE: THE IDEAL CONFORMATION FOR WARHORSES IN THE FRENCH TRANSLATIONS OF JORDANUS RUFUS'S DE MEDICINA EQUORUM

**Abstract author(s):** Vo Van Qui, Camille (University of Exeter, Centre for Medieval Studies)

**Abstract format:** Oral

The conformation of medieval warhorses is still the subject of intense debate among historians and archaeologists, with new evidence on their size and morphology regularly coming to light. Information about the physical appearance of medieval warhorses can be found in textual sources, for instance in one of the chapters of Jordanus Rufus's veterinary treatise, the *De medicina equorum* (c. 1250). The way the text is reinterpreted in its vernacular French translations (dating from the 13th to the 16th centuries) can give interesting information on the ideal morphology for a warhorse, and to what extent the criteria were of an aesthetic or practical nature. Some physical aspects can also be linked to specific horse types and complement zooarchaeological findings, either confirming them or contrasting with them. This paper will explore how the ideal (war)horse is described in those texts and how this can be linked back to specific horse types, or potentially breeds. It will also analyse whether this theoretical morphology would have had any effects on the horses' performance and explore the reasons behind the favouring of certain physical traits over others.

## 4 SIZE AND CONFORMATION OF MEDIEVAL HORSES OF NORTHWESTERN EUROPE BASED ON OSTEOARCHAEOLOGICAL EVIDENCE

**Abstract author(s):** Niskanen, Markku (University of Oulu)

**Abstract format:** Oral

As reconstructed from published osteometric dimensions, medieval Northwest European horses were generally similar in size and conformation with large Gotland Russ ponies and small Icelandic horses. Warhorses likely averaged somewhat larger because they had to be strong enough to carry heavy rider weights with adequate agility in mounted combat. For example, early medieval Merovingian horses from Childeric's tomb in Tournai, Belgium, were similar in size and robusticity with current Icelandic horses. Although average size of horses remained stable until Modern Period, later medieval warhorses likely included larger horses because heavier armor required the development of the destrier (the 'great horse'). Only about five percent of Medieval warhorses were destriers and their identification is difficult in medieval horse bone assemblages. Some archaeological horses are potentially destriers due to their large size, but size was hardly the only criteria. None of these potential destriers were even remotely similar with modern heavy draft horses. Instead, their size and build ranged between large Norwegian Fjord horses and modern light riding horses of medium size. Medieval artistic representations indicate that destriers were generally similar with small and sturdy warmblood riding horses. Biomechanical reconstructions suggest that destriers should have weighed at least 400 kg to be able to carry heavy rider weights (both the rider and the horse in full armor) with adequate agility in mounted combat.

## 5 ALL HORSES GREAT AND SMALL – HORSE STATURE AND MORPHOLOGY IN MEDIEVAL EUROPE

**Abstract author(s):** Benkert, Helene (University of Exeter)

**Abstract format:** Oral

Despite its importance for the medieval world, archaeological research has so far generally neglected the horse. Though usually only found in relatively small numbers, horse remains are present on the vast majority of medieval sites in Europe and present a valuable tool to study past human-animal relationships as well as many other aspects of human society, such as warfare, status and identity.

This paper presents the findings from my PhD project. Using traditional zooarchaeological techniques, it examines the available biometrical data of horse remains from European sites, covering the time between the 8th and 16th centuries, and explores morphometric changes through time and space. A special focus is on the question whether it is possible to detect different morphological types, and warhorses in particular, in the faunal record. Drawing on other lines of evidence, studied as part of the Warhorse Project, it discusses what horses looked like in the Middle Ages and how they were likely used. Such insights can be used to better understand the impact of horses on society in the medieval period and beyond.

## 6 WOUNDED WARHORSES: USE, PATHOLOGY, AND INJURY IN MEDIEVAL HORSES FROM ENGLAND

**Abstract author(s):** Kanne, Katherine (University of Exeter; Northwestern University)

**Abstract format:** Oral

Medieval horses worked hard in a variety of roles, from 'Great Horse' to cart horse, and often have pathologies and injuries that testify to how they were used and treated. The study of use, pathology, and injury in archaeological horses has had a somewhat contentious history which has been hampered by the lack of large comparative datasets. This paper presents the results of pathologies and injuries recorded from the largest sample of horses compiled from the late Saxon to Tudor period (c. AD 800–1600) in England. This data is used to detail types and rates of injury by body part, site, and period, and subsequently to infer use (ridden, draught, or mixed), and to identify individuals as likely warhorses. With this interdisciplinary study, the injuries can be contextualized by genetics and metrics (traditional and geometric morphometrics), stable isotope analyses, as well as medieval textual and iconographic evidence for veterinary care. The results then are compared to other known instances of use, injury, and care of horses in the archaeological record, providing examples how this robust dataset that can be utilized in additional studies.

## 7 HORSES IN THE BATTLE FOR EVERYDAY LIFE.

**Abstract author(s):** Klontza-Jaklova, Vera - Tengeriová, Romilda - Smíšek, Michal (Department of Archaeology and Museology, Faculty of Arts, Masaryk University) - Sedláčková, Lenka - Kolařík, Václav - Zúbek, Antonín (Archaeia Brno)

**Abstract format:** Oral

The horse was the essential means of transport and production for the medieval communities. Their value and price were always high. Although the horse had to do hard work, whether in the army, transport, agriculture, or as a moving and driving force, it was not possible to treat it too insensitively so as not to degrade its work potential rapidly. Therefore, we welcomed the opportunity to explore a set of several dozen horses and cattle buried south of medieval Brno

(CR). The skeletons were discovered in suburban villages south of Brno during rescue excavation, supplying the urban agglomeration with vegetables.

All studied individuals were young (exceptionally more than ten years). All skeletons bore significant signs of human treatment (bit wear, deformity of the occipital bone, punctured thoracic vertebrae, hoof bones deformed by careless horseshoeing); signs of severe physical exertion (outgrowths on the long bones, vertebrae, in spinal canal, and vertebral adhesions). The pathology of the examined individuals was also very pronounced: deformed orbits and neoplasms on the bones indicate severe inflammatory diseases. Inverted rib fractures were noted in one individual.

The size of horses, which corresponds to the European average (140 - 150 cm), was also examined. The massiveness of the bones indicates a wide variety of body types. Strontium analyzes were performed on the skeletons and compared with cattle buried in the same region. The dating of all skeletons was confirmed by the radiocarbon method. All individuals were buried in the habited area, in the houses' backyards. Neither shows signs of consumption. Horses were apparently used for both riding and work.

## 8 HORSE IN EVERYDAY LIFE, MAGIC AND RELIGION OF THE SLAVS OF THE POLISH LANDS (8TH-13TH CENTURIES) - AN ARCHAEOZOOLOGICAL APPROACH

**Abstract author(s):** Makowiecki, Daniel - Chudziak, Wojciech - Szczepanik, Paweł (Institute of Archaeology, Nicolaus Copernicus University in Torun) - Pasicka, Edyta (Department of Biostructure and Animal Physiology, Wrocław University of Environmental and Life Sciences) - Janeczka, Maciej (Department of Biostructure and Animal Physiology, Wrocław University of Environmental and Life Sciences) - Wiejacka, Martyna (Institute of Archaeology, Nicolaus Copernicus University in Torun)

**Abstract format:** Oral

The importance of the horse in everyday life of Slavs and their mythological and religious systems in the territory of Poland was quite often a subject of archaeological considerations. They were based mainly on very limited written records and archaeozoological data. One must also admit that the archaeozoological data has never been the subject of a deeper analysis, so those used by archaeologists were highly fragmented. In this paper, thanks to the project\* aimed at collecting scattered archaeozoological information, the issues listed in the title of the paper will be discussed. Thanks to archaeozoological analyzes and anthropological reflection, the aims of the project went beyond the problems familiar in archaeology, indicating manifestations of utilitarian or non-utilitarian activities of Slavs interpreted on the basis of horse bones found among faunal collections. By analyzing archaeological contexts of horse remains, and such archaeozoological data as anatomical composition, sex, age, taphonomy, bone measurements and pathological changes, a number of issues were addressed, such as horse consumption, military and prestige value of horses, their biological condition and diversity of forms. Thanks to the analysis of skulls and skeletons, the existing issues of the importance of the horse in magic and religion have been reinterpreted. In this case, an important topic was the inclusion of objects with an image of a horse, as well as miniature figurines of these animals found more and more often during excavations. Taphonomic studies allowed to take up not only the issue of horse meat consumption by the Slavs but also a different genesis of depositing horses' heads and bodies in sacral sites and living spaces.

\*) The research is a part of the project "Horse in Poland in the Early Piasts and Internal Fragmentation" (2017/25/B/H3/01248) financed by the National Science Centre, Poland.

## 9 MULTIPROXY ANALYSIS OF EARLY MEDIEVAL PRUSSIAN HUMAN/HORSE GRAVES: A REAPPRAISAL OF OLD ASSUMPTIONS

**Abstract author(s):** Shiroukhov, Roman (Centre for Baltic and Scandinavian Archaeology - ZBSA) - French, Katherine (School of History, Archaeology and Religion Cardiff University) - Madgwick, Richard (Cardiff University, ATTN: BONEZ Project) - Meadows, John (Centre for Baltic and Scandinavian Archaeology - ZBSA) - Skvortsov, Konstantin (-)

**Abstract format:** Oral

The Sambian peninsula (Kaliningrad Oblast, Russia) is well-known for a distinctive burial rite – cremation graves accompanied with horse burials/sacrifices. The rite is introduced in the early first millennium AD, increases through the Migration period, and represents 80-90% of Sambian Prussian cemeteries by the Early Medieval period. Of greatest interest are the so-called double-layer burials, represented by the equestrian cremation in the upper layer and the remains of a horse in the lower one. These complex deposits contain cremated and unburnt bone and other preserved organic materials like charcoal, wood, and fabric. The cremated individual(s) and underlying horse have been assumed to be contemporary, with the burials generally interpreted as a male horseman buried with his personal steed (though the gender interpretation can be different).

In order to test these assumptions, horse bone and teeth were sampled from three cemeteries (Alejka-3, Berezovka and Kholmny) for 14C dating, dietary stable isotope analysis ( $\delta^{13}C$ ,  $\delta^{15}N$ ,  $\delta^{34}S$ ), and 87Sr/86Sr analysis. The integrated results of these analyses establish the chronological relationship between the human and horse burials, reconstruct the diet of selected remains, and determine whether the human and the horses buried together were local or non-lo-

cal to the Sambian peninsula. The results of our multiproxy study, which are presented to the public for the first time, will be discussed in relation to the most recent studies of archaeological horse remains from modern Lithuania and Poland.

## 10 GENETIC CHARACTERIZATION OF THE HORSES IN THE EARLY MEDIEVAL POLAND

**Abstract author(s):** Popovic, Danijela - Baca, Mateusz (Centre of New Technologies, University of Warsaw) - Makowiecki, Daniel - Wiejacka, Martyna - Chudziak, Wojciech (Institute of Archaeology, Faculty of History, Nicolaus Copernicus University, Torun)

**Abstract format:** Oral

During the formation of the Polish state in the Early Middle Ages horses had very important meaning in social, economic and military life. The rich archaeological and archaeozoological evidence of subfossil horse remains emphasize the importance of this species in the Medieval societies. Biometric data showed great diversity of horse subfossil remains excavated on the territory of the present-day Poland especially in the estimated wither height. To deeper investigate this morphometric diversity, we combine ancient DNA analyses with macroscopic and biometric methods applied in archaeozoology. We performed target enrichment and high throughput sequencing of 5,000 genomic SNPs which covered polymorphisms associated with coat colour, genetic disorders and functional traits as well as SNPs which are not under selection. We found that Polish medieval horses grouped with other ancient and modern domestic horses without significant differentiation between separate populations. The chestnut coat colour was dominant. We found strong sex bias with ca. 80% specimens genetically identified as males. This corroborated with morphological sex determination performed on the larger set of samples.

The research is part of the project "Horse in Poland in the Early Piasts and Internal Fragmentation" (2017/25/B/HS3/01248) financed by the National Science Centre, Poland.

## 11 BREEDING A WEAPON. MORPHOLOGICAL DIVERSITY OF HORSES IN MEDIEVAL ENGLAND

**Abstract author(s):** Ameen, Carly - Benkert, Helene - Rapp, Karina - Townend, Tess - Kanne, Katherine - Outram, Alan (University of Exeter)

**Abstract format:** Oral

Popular culture presents a deep-rooted perception of medieval warhorses as massive and powerful mounts, but identifying real warhorses from the zooarchaeological record is challenging. This is due to both a paucity of horse remains relative to other domesticates, as well as the tendency of researchers to focus almost exclusively on osteological size, making it difficult to reconstruct in-life usage and activity related changes. This paper presents our work on the largest zooarchaeological dataset of English horse bones from a wide range of contexts dating between AD 300 and 1650. Consisting of both traditional metric analysis and novel 3D geometric morphometric approaches, we examine trends in osteological size and shape to explore the diversity of equid skeletal conformation, reflecting different domestic, elite and military roles. In particular, we investigate a chronology of changing horse morphology, in an attempt to detect conformations specifically associated with military activities. Results highlight the importance of accurately exploring the morphological characteristics of skeletal elements and in-life activity-related remodeling to aid our understanding of these animals' lives. Contextualised by both the historical record and a modern comparative dataset, this paper explores the complex biological factors contributing to the development of this iconic medieval animal.

## 12 WHAT CAN BE DETERMINED ABOUT THE SIZE AND SHAPE OF MEDIEVAL HORSES FROM METRICAL ANALYSES OF HORSE ARMOUR AND HORSESHOES?

**Abstract author(s):** Outram, Alan (Department of Archaeology, University of Exeter) - Creighton, Oliver - Benkert, Helene - Rapp, Karina - Townend, Tess (University of Exeter)

**Abstract format:** Oral

Metrical analysis of horse bones, when sufficiently complete, allows zooarchaeologists to approximate horse wither heights and create indices of robusticity. Such analyses rely on a series of 'factors' that approximate the relationship between elements of the skeleton and the dimensions of a live horse. However, to what extent is it possible to model in the opposite direction, from a horse's artificial exoskeleton, such as its armour and shoes? Such artefacts have the advantage of being quite closely dateable. Furthermore, armour tells us specifically about horses used by the nobility in warfare or jousting, something that it is hard to ascribe to bones definitively. This presentation considers the methodological challenge of relating such material culture to the size and shape of horses. These challenges include different object designs and whether identifiable anatomical landmarks have a clear relationship to stature. The paper also presents preliminary data from our analysis of shaffrons (head defences) and horseshoes from major collections and databases.

**Abstract author(s):** Webley, Robert (University of Exeter)

**Abstract format:** Oral

Taphonomy has not been kind to the examination of the medieval warhorse through its equipment, with the leatherwork, fabric caparisons and iron mail armour depicted in manuscript illustrations all but vanished. This paper therefore focuses on the underlying metal elements that have survived, such as bridle bits and stirrup components, to provide a new perspective – one that offers the kind of technical detail that iconographic evidence lacks. It draws upon the collated evidence of a large corpus of historic excavated objects and brings to bear newly recorded metal-detected finds; this second data source has now captured significant numbers of objects lost while traversing the landscape. Stirrups are often acknowledged as one of the most understudied elements of horse equipment, due to vagaries of survival outside burial or settlement contexts. This presentation outlines work undertaken for the Warhorse project to provide a new analytical framework for medieval stirrups, before focusing in on the 11th century. Using the new framework, excavated and metal-detected data will be brought together to locate changes in stirrup form and size. This will be compared with evidence from bridle bits to reconsider the impact on horse equipment of the Normans in England, the archetypal mounted warriors.

#### A. THE DIVERSITY OF LATE ANTIQUE PERIOD AND EARLY MEDIEVAL HORSES IN THE CARPATHIAN BASIN: INTRODUCTION TO AN INTEGRATIVE RESEARCH PROJECT

**Abstract author(s):** Szecsenyi-Nagy, Anna (Institute of Archaeogenomics, Research Centre for the Humanities) - Koncz, István - Csippán, Péter (Institute of Archeological Sciences, Eötvös Loránd University) - Bollók, Ádám (Institute of Archaeology, Research Centre for the Humanities) - Bárány, Annamária (Hungarian National Museum) - Gerber, Dániel - Mende, Balázs (Institute of Archaeogenomics, Research Centre for the Humanities)

**Abstract format:** Poster

Human societies have used and valued horses since prehistoric times, and their presence was closely linked to people's lifestyles and social status. Our research focuses on the Carpathian Basin, where we mostly find horses in burials during the Roman as well as Early Medieval (Migration) periods. While their importance and role might have changed, suggested by their frequency and associated burial customs, their presence in human communities is continuous on both sides of the Danube throughout the 4-9th centuries.

The aim of the project is to study the relationships between horses and humans, with a special focus on the Avar Period (late 6th-9th century AD). Horses were buried alone or with humans, who were most probably members of the elite in this era. Horses served as companions for afterlife or as prestige goods representing the social status of the deceased. Yet the possibly diverse relations between humans and animals have not been explored from interdisciplinary angles. Through joint historical, archaeological, archaeozoological and paleogenomic studies of ca. 150 horses, we aim to get further answers about the way and role of the horses in the life of late Roman, early medieval communities, both in Pannonia and east of the Danube.

For detailed observations, we pay special attention not only to cemeteries but also to horse remains from settlements to see whether there are differences in breeds, genetic markers and morphology between horses used and probably also kept differently.

This poster presents the concept of our research along with some preliminary results.

#### [RE]INTEGRATING A DISPERSED AGENDA: ADVANCING ARCHAEOLOGICAL RESEARCH IN CENTRAL EURASIA

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Rouse, Lynne (German Archaeological Institute, Eurasia Dept; Washington University in St. Louis) - Dupuy, Paula (Nazarbayev University)

**Format:** Discussion session

As with our peers worldwide, archaeologists with a research focus on central Eurasia have had to deal over the past two years with lapses in fieldwork and funding, lost opportunities for professional networking, and to various degrees, stagnation in overall research development. Notably, these setbacks have come at a pivotal time in the evolution of the region's archaeology, as emerging highly specialized laboratory and bioarchaeological analyses are entangling with deeply-rooted methodological and epistemological approaches to studying the past. Our discussion session is intended to set the foundation for (re)integrating the scholarly community of central Eurasian archaeologists by (re) opening dialogue across the fissures brought on by two years of fragmented, punctuated research. Focusing on the pre-Silk Roads periods in an area spanning the Caspian Sea to Xinjiang in far western China, we bring together archaeologists with expertise in a particular research method/ methodology, geographical area, and/or intellectual approach – with the goal to (re)integrate colleagues and their various strands of data and knowledge within a ho-

listic, regional perspective. Our open discussion will be anchored in the public abstracts of fifteen participants who will address the current state of – and next steps for – archaeology in the region, and interrogate the mutual interests driving forward our shared research agendas. Ultimately, our aim is to provide a forum to communicate insights that stem from specialist knowledge in our field, as well as a backdrop for constructive ongoing dialogue as the discipline of archaeology in central Eurasia continues to unfold in the 21st century.

## ABSTRACTS

### 1 HISTORIOGRAPHY AND TERMINOLOGY: TOWARDS A MORE INCLUSIVE PAST

**Abstract author(s):** Kidd, Fiona (New York University Abu Dhabi)

**Abstract format:** Oral

Inclusivity plays out variously in academia: the literature we read, the ideas we are exposed to, the conversations we have and with whom, depends on our language knowledge; where we live and the institutions we work in impact access to funding. Terminology, too, plays a critical role in discussions of inclusivity. Words used to frame our conversations about the past can subconsciously include or exclude certain communities. The term 'Silk Roads' is increasingly challenged. Yet terms like urbanism, nomad, and sedentary can entrench divisions less pronounced in the past. 'Nomad', for example, rarely appears in vernacular sources. In the earliest 2nd century CE Sogdian sources, as well as later Persian and other vernacular sources into the 18th century, mobile populations are referred to as 'people of the tent' or as steppe dwellers. Words documenting Turkmen groups in the 19th century, such as chovra and chomur reference pastoral and farming communities respectively. But contemporary observations indicate that such categorisations were more fluid. Chronological terms are similarly exclusionary: 'antiquity', Achaemenid, and Hellenistic, for example, anchor top down perspectives, often Eurocentric. Critically, many of these terms deny the place of Central Asia, rendering it a transitional zone rather than an area of study in its own right.

Of course, many of these terms are undeniably useful because they provide a chronological or historical shorthand. Yet they simultaneously frame the standard narratives of centre/periphery, nomad/sedentary, urban/rural etc. that we challenge. How can we think more productively about the terminology we use to frame our discussions? How do we scaffold our research with terminology that accurately reflects the diversity of Central Asian communities and lifestyles, temporally and spatially? How do we move away from the tropes that have continued a Eurocentric narrative, to share a more inclusive narrative of the past?

### 2 ARCHAEOLOGY OF CENTRAL ASIA THROUGH THE HISTORICAL PRISM

**Abstract author(s):** Shnaider, Svetlana (L.N. Gumilyov Eurasian National University)

**Abstract format:** Oral

Beginning in the early 20th century, the research on Prehistory in Central Asia can be divided in three major historical phases marked by different dynamics of research.

1. Building of scientific knowledge (1930s-1950s).

Led by scholars from the major institutes of the Soviet Union (Moscow, Leningrad), the story of Prehistory started with the systematic research of new sites in order to build a regional sequence of the archaeological events in the Union.

2. Mass studies (1950s-1990s).

The post-war period was marked by the development in Central Asia of infrastructure and large-scale irrigation constructions, resulting in intensive site discoveries led by Soviet scientists, active publishing of results, and building of the main hypothesis on the Prehistory of Central Asia territories.

3. International projects (1991-present).

Due to the disintegration of the USSR, few scholars were trained during the 90s and a generation of scientists is missing. The renewal of the archaeological research is now notably driven by a new generation of archaeologists from the republics under the influence of European and American scientific centers.

One of the important problems in the archaeology of Central Asia that I note is the linguistic barrier. The Iron Curtain was not only geopolitical, but also linguistic, and much of the previous research published in Russian is still sadly ignored by Western colleagues, and major scientific works and actors are being forgotten. Thus, some modern international projects present their results as worldwide discoveries, although these ideas have been discussed in Central Asian and Russian-language literature for decades.

Accordingly, in frame of our round table I would like to propose the preparation of a series of summaries that would encapsulate the history of the study of the region, and the main discoveries and hypotheses proposed by Soviet archaeologists.

### 3 RE-INTEGRATING ARCHAEOLOGICAL RESEARCH IN CENTRAL AND EASTERN EURASIA: RE-VISITING REGIONAL ARCHAEOLOGIES

**Abstract author(s):** Wright, Joshua (University of Aberdeen)

**Abstract format:** Oral

Looking at the growing number of researchers, growing breadth of research fields, and increasingly complex international collaborations across central Eurasia there are great opportunities for future years. Areas of recent Eurasia archaeology that can reintegrate archaeological research include, firstly short range interaction and local patterns. The increasing density of all types of data available to us in many regions of Eurasia means that large scale narratives are becoming less compelling and that our ability to create resilient and detailed local narratives is increasing. With regionally focused research projects come developing models of adaptation and socio-political activity centered on human scaled regions. We will be able to look at a Eurasian cultural landscape in which local adaptations are engines of change and the contrast, comparability and interaction of regions is the main avenue of study of past societies in Eurasia. This could have some interesting effects in terms of how we understand relative mobilities, knowledge exchange and learning, the ways that general proxies are used to understand past practices (e.g. monuments for people, dairying for mobile pastoralism) and the resilience of our models and interpretations in the face of networks of technological and biological diffusion that can be reorganised with the addition of only a few data points. The second area that could use some critical attention is typological structures. The underlying principles of typology of material culture in Eurasia go back to the deep roots of modern archaeology. Now these essentially 19th century structures are no longer just play things for the ceramic or architectural specialists, but key foundations for the biomolecular research of the 21st century. We are at a moment when those typologies can be critically examined, both in terms of how they are constructed by archaeologists and what they represent in terms of forms, practices and identities.

### 4 (RE)INTEGRATING THE ARCHAEOLOGY OF THE STEPPES THROUGH ARCHAOMETALLURGICAL RESEARCH

**Abstract author(s):** Radivojevic, Miljana (UCL Institute of Archaeology)

**Abstract format:** Oral

Recent debates in central Eurasia have focused on identifying genetic markers of migrating Bronze Age steppe populations into Europe, the scale of the bubonic plague pandemic or the transmission of domesticated crops and animals. However, the ample scale of the genetic and domesticate models being presented is frequently underpinned by smaller sample sizes due to their scarcity. Equally, the low spatial and temporal resolution of these datasets makes the assessment of environmental impact in relation to technological change and/or increased connectedness fraught with difficulties. The mostly anglophone orientation of key project investigators, as well as the limitations of their professional networks, add yet another layer of bias to the available datasets. This low level of resolution can contribute to interpretations of the Eurasian Steppe communities as relatively homogenous and mobile societies who mainly carry objects, ideas, languages, diseases or genes between settled worlds at their boundaries. Archaeometallurgical studies, on the other hand, are not deficient in robust evidence, of which metal production debris proves to be particularly resistant to post-depositional processes due to the very nature of high-temperature inorganic materials.

New archaeometallurgical research in the steppes shows varied extents of involvement of pastoralist communities in metal production, from small scale to specialised metallurgical communities, including the estimates of environmental impact of these activities. It also demonstrates the power of regional communities connected through chains of metal and ore supplies, the size of which varies across the steppes and the Inner Asian Mountain Corridor. As such they demonstrate the potential of materials science research in the area as well as complexities of networks of connectedness that led to the formation of Silk Roads as we know them.

### 5 [RE]INTEGRATING RAW MATERIALS AND TECHNOLOGIES IN CONTEXTS OF SOCIAL AND SPATIAL MOBILITY IN CENTRAL EURASIAN BRONZE AGE

**Abstract author(s):** Luneau, Elise (Deutsches Archäologisches Institut, Eurasien-Abteilung)

**Abstract format:** Oral

Within the session "[Re]Integrating a Dispersed Agenda: Advancing archaeological research in central Eurasia", I would like to address the potentials and progress gained from the archaeology of materials in Bronze Age central Eurasia, especially ceramic material. The use of archaeometric methods on archaeological objects enables archaeologists to examine production, circulation and use of the material culture. Investigating raw materials is particularly important for better understanding technological processes sometimes forgotten behind the decorative/stylistic aspects of the material culture, and which are highly indicative of social identities of communities. The approach also enables to trace circulation of raw materials and/or objects. Studies on the movement of peoples, animals and plants recently brought crucial knowledge on the spatial and temporal dynamics of connections between major

cultural entities in central Eurasia. Combined with isotopic and genetic data, the analysis of raw materials and technology makes it possible to understand links between mobility and material culture, bringing new evidence for inter-regional connections and diffusion of the material culture. Understanding the evolution, dispersal, practices related to the material culture requires accurate and further identification of raw materials and technology of production. This analysis also raises questions on cultural contacts at the level of individual interaction and on processes of technostylistic transmission in contexts of social and spatial mobility. Further developments in the study of interactions can be addressed through the lens of technological and compositional studies of archaeological objects: how raw materials and technology reflect interactions in Central Eurasian Bronze Age, and which role do the mobility play in the person-to-person (or group) contacts?

## 6 FRUITS, CEREALS, AND SPICES ALONG THE SILK ROAD: CONNECTING PLANTS REMAINS AND PEOPLE'S DISPERSAL

**Abstract author(s): Dal Martello, Rita - Spengler, Rob (Max Planck Institute for the Science of Human History)**

**Abstract format: Oral**

In the past decade archaeobotanical sampling has been increasingly incorporated in archaeological excavations across Central Asia. The new data generated by this effort has not only contributed in expanding our understanding of plant use by past Central Asian populations, but it has especially helped unveil the great diversity of subsistence practices that people living in this vast area in late prehistoric and early historic times engaged in. This has led to a shift in the narrative to a more nuanced and diversified view of past Central Asian lifeways and economies that more accurately depict past social complexity, encompassing both mobile and sedentary, pastoral and agricultural populations.

Continuous efforts in this direction are being undertaken particularly by researchers attached to the "Fruits of Eurasia, domestication and dispersal" project. The results obtained through active collaborations in Uzbekistan, Turkmenistan and Kyrgyzstan, among others, allow us to incorporate systematically collected ancient plant remains in the Central Asian archaeology discourse and discuss the valuable contribution archaeobotany can make toward reconstructing a more well-rounded understanding of the human past. Beyond fundamental questions, such as what were people eating and producing, more complex questions can now start to be asked. These include how linked was agriculture to the flourishing movement of goods, ideas, and people across the region, when did plants originating elsewhere, such as rice, reach Central Asia, and how did these exotic plants change the cuisine traditions? When and how were important Central Asian fruits, such as peaches, plums and apricots domesticated and how did they spread through the Silk Road? Since the production of food is among the most essential aspects for human life, integrating plant remains with other archaeological evidence, such as animal rearing, goods manufacturing and trade, can help better reconstruct past societies and understand the development of these up until today.

## 7 THE RESULTS AND PERSPECTIVES OF COMPLEX RESEARCH ON THE TERRITORY OF KYRGYZSTAN

**Abstract author(s): Tabaldyev, Kubatbek (Kyrgyz-Turkish Manas University)**

**Abstract format: Oral**

Relying on the results of archeological research with a greater degree of certainty

the following conclusions should be drawn:

- collapse of the Soviet Union, the scientific works of Europe and America on antiquities of Central Asia were revealed to the scientists of the newly independent states
- after the establishment of scientific ties organized joint archeological research;
- complex studies of archeological objects began to be organized more and more, we are talking about joint studies of specialists in various fields;

At times, differences are noticed in the consecration of research results between early local researchers and researchers who arrived from scientific organizations far abroad. There are many practical useful directions that you can learn from each other.

Often, when studying the culture of the population of the intermountain valleys of the Tien Shan, excavations of barrows were carried out selectively. Purposeful searches and studies of settlements were carried out very rarely. The presence of agriculture was determined by the discovery of bronze and iron sickles, hand mills, grain graters.

The experience of a specialized new project led by Associate Professor of Vilnius University Giedre Motuzaitė Matuzėviciute provided qualitative and quantitative evidence for the reconstruction of the appearance of the settled part of seasonal pastoralists (nomads). Field research was carried out as part of the detachment directly by field specialists in zooarchaeology and ceramics. With the help of an aircraft (drone), important information was obtained for characterizing the landscape, activities, and the nature of the development of the foothill zone in various historical eras.

In Soviet times, the tangible contributions of the works of physical anthropologists were noticed. Their conclusions, made on the basis of a statistical study of bone, craniological material, still retain their significance

One of the important problems is the preservation of archeological sites.

## 8 A STEPPE IN A NEW DIRECTION: CAPACITY BUILDING IN CENTRAL AND INNER ASIAN ARCHAEOLOGY

**Abstract author(s):** Hermes, Taylor (Max Planck Institute for Evolutionary Anthropology)

**Abstract format:** Oral

A large increase in foreign-run research projects in Central and Inner Asia arguably reflects the great importance that this region bears for understanding critical social processes of the past across the wider expanse of Eurasia. However, scientific equitability and capability in state-of-the-art methods for local researchers remain out of reach. Here, I argue that the most ethical and optimal way to integrate "dispersed agendas" in the archaeology of central Eurasia is to invest in capacity building in the archaeological methods that foreign teams employ, so local scientists can also better engage with the rapidly moving "global" scientific community. The granting of co-authorship or field collaborations should no longer be an acceptable voucher to access the rich archaeological record of Central and Inner Asia as part of an effectively extractive system of research that garners great scientific merit. Instead, foreign research teams should always involve local archaeologists and researchers from allied fields in bottom-up project design, work to train collaborators in cutting-edge methods, and help develop new scientific infrastructure. Only through a balanced system of collaboration and research independence for local archaeologists will there be a true global representation of the cultural heritage originating from the great Eurasian steppe landscapes.

## 9 SCIENTIFIC STAGNATION AND PARADIGM SHIFT IN KYRGYZSTAN

**Abstract author(s):** Abdykanova, Aida (American University of Central Asia)

**Abstract format:** Oral

Since collapse of Soviet Union, the archaeological science in Kyrgyzstan faced many challenges such as lack of research funding and training of professional archaeologists, inconsistency of legal basis, misunderstanding or lack of collaboration between organizations, absence of local journals for publications, weak dissemination of research results among wider public audience. As a result, today active archaeological works in the country is represented mostly by research of international teams, and course of works in sphere of archaeological expertise lead by the Ministry of Culture. The latter is developing rapidly and cover broad issues of protection and use of cultural heritage objects.

Among many internal issues raised due to systematic lack of funding thus lack of research, I would like to focus on issues of scientific stagnation and the level of theoretical background of that research in Kyrgyzstan.

Archaeology as a discipline is actively changed in the light of the development and implementation of new theoretical approaches. The requirements to qualified research are also changed. Traditional site reports and monographs are not enough, interdisciplinary research and publications in peer-reviewed journals became an indicator of success. Majority of local archaeologists trapped by mindset of traditional views of conducting research.

Interesting that the facing these challenges Kyrgyz archaeology has quite favorable position. Our cultural heritage still waiting for its discoveries and proper research. And I do hope that Kyrgyz archaeology still has a time to broadening of collegial networks, getting a new experience, thinking and rethinking on contemporary approaches and practices to mold specific sets and use them in the field.

## 10 WHAT ARE THE "POST-ISMS" OF CENTRAL ASIAN ARCHAEOLOGY IN THE 21ST CENTURY?

**Abstract author(s):** Brite, Elizabeth (Purdue University)

**Abstract format:** Oral

Contemporary experiences of profound social change often raise questions about what is rebuilt from a dismantled past. In scholarship since the 1980's, these questions have been encapsulated by a variety of "post-isms" that explore the implications of such changes for theory and practice in the humanistic disciplines. In archaeology, "post-isms" have brought us a range of new practices – most recently, decolonizing methodologies, archaeologies of the contemporary past, and new approaches to socionature, among others. These are predominant concerns in some regional archaeologies today, but only rarely do they appear in Central Asia specifically. Why is this the case, and what might be the appropriate "post-isms" for Central Asian archaeology going forward in the 21st century?

Post-processualism was an outgrowth of broader movements related to postmodernism and post-colonialism and had profound implications for theory and practice in archaeology. Its more muted appearance in Central Asian archaeology might be explained by the presence of other, contending "post-isms" specific to our region – post-communism and post-Sovietism – which chart a different path and sometimes present challenges for contending with the region's imperial and colonial past. For example, are decolonizing agendas for archaeology suited to such spaces, which were built upon an exceptional history of ethnos development, with ongoing implications for identity politics in

the region today? Is post-Sovietism a more relevant and equally useful category that we should employ, and does it necessarily entail an abandonment of archaeological theory with connections to reworkings of Marxism? Lastly, the triumphalism implicit in the post-Soviet concept raises yet other "post-isms" to consider – post-humanism and a post-Silk Road – which engage and challenge the prioritization of geographic space over modern history as guiding analytical frameworks, a feature that may typify archaeological constructions of ancient Central Asia in the 21st century.

## 11 THE SCIENTIFIC REVOLUTION IN CENTRAL EURASIA

**Abstract author(s):** Ventresca Miller, Alicia (University of Michigan)

**Abstract format:** Oral

It has been over a decade since the publication of Hanks (2010), which focused on the Archaeology of the Eurasian Steppes and Mongolia. This work highlighted the key developments in this broad region, from the peopling of northern Eurasia to horse domestication, and eventually the rise of the Xiongnu polity. However, over the past five years, the utilization of new scientific methods in archaeology have led to dramatic changes in the timing of these key developments. This new evidence has altered our understanding of societies, economies, and politics in prehistoric and historic periods. This is especially pertinent to research on human population flow and the introduction of domesticates. As we begin to resolve the timing of the influx of people and transmission of domesticates, we need to focus on how these changes impacted societies. While in some cases these led to immediate changes, there were also slower transformations unfolding on centennial or longer timescales. Thus, the challenge is to reconsider broad questions that led to these key developments, in an effort to advance archaeological research in central Eurasia.

---

## 351 ROUTED ARCHAEOLOGY III – GETTING AROUND

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Mele, Marko (Universalmuseum Joanneum) - Fábíán, Szilvia (Hungarian National Museum) - Mihelić, Sanjin (Arheological Museum Zagreb)

**Format:** Regular session

Following on the previous Routed Archaeology sessions organized at the last two EAA Annual Meetings in this session we continue to explore different aspects pertaining to the functioning and management of archaeological routes. This time our primary focus is placed on one of the essential features of all cultural routes – i.e. mobility, naturally, with the underlying rationale of promoting travel and stimulating people to move along the routes.

The topic itself is approached from a variety of angles. The first angle tackled by the session is how to make a route as a touristic product more visible among the many offers in the leisure market. Since the usefulness of the work invested in the management and organization of the network is ultimately measured by the response of the public/tourists, an indivisible question we wish to raise is that of the marketing of cultural routes.

Once the attention and the interest have been raised many questions concerning logistics of movement from one place to another within the route network emerge. Starting from individual travellers acting on the spur of the moment with preference for designing their own on-the-fly itineraries at one end of the scale, and ending with minutely organized general or bespoke tours for overseas groups on the other, well-organized routes are expected to entertain a plethora of options catering for different travelling tastes and habits.

This subject logically segues into that of the different modes of transport that can be employed on the route, among which we would specifically like to encourage contributions promoting al fresco travelling styles such as hiking, cycling, horseback riding, kayaking and other outdoor activities. Furthermore, as routes may widely differ in terms of scale, we invite contributions discussing local, regional, national and transnational networks with case studies detailing different responses to mobility.

## ABSTRACTS

### 1 SITES AND ROUTES OF ARCHAEOLOGY AND THE CULTURAL IDENTITIES

**Abstract author(s):** Varga, Benedek (Hungarian National Museum / Magyar Nemzeti Múzeum)

**Abstract format:** Oral

Ever since modern archaeology appeared during the early modern period in Europe it has always been a recurring problem how we can present (besides the beauty or rarity of some artefacts) the views and perception of archaeology to the general public. How can we make it comprehensible, relevant, and interesting to various groups of laic spectators? How can we attract enough attention from the public which may produce serious numbers of visitors? If we take apart the most common motivation of visitors, which, I presume, is based on remembrance of national and/or cultural identity and pride, all other historical era which archaeological sites may represent, fell short of interest.

To solve these questions, however, we usually apply various technical solutions in order to increase public awareness. Modern methods of disseminating and representing knowledge are widely used, and to a certain extent they are successful, indeed. We produce properly designed packages for leisure activities and tourism, and provide, the public with various forms of on-line and on-site accessibilities.

These are all essential tools to build up our presence in cultural life, but probably they still miss the point, and as a consequence, are in short of accumulating public interest any nearer to those we see in respect of archaeological sites of the ancient Mediterranean, or of national remembrance in each country.

How can we form the presentation of the remote past of other regions of Europe to a comparable attraction? I suggest the answer lies, at the first place, not in the technicalities applied, but in understanding the representation of the structure of European cultural identities. The core question is, perhaps, how can we reach behind routine interpretations and present a renewed and more sophisticated conception of the cultural history of Europe through many millennia.

## 2 ACCESSIBILITY, VISIBILITY AND INFRASTRUCTURE OF IRON AGE SITES IN THE DANUBE REGION – THEORY AND PRACTICE

**Abstract author(s): Mele, Marko (Universalmuseum Joanneum) - Štuhec, Seta (Austrian Academy of Sciences, Austrian Centre for Digital Humanities and Cultural Heritage) - Fera, Martin (University of Vienna, Institute of Prehistoric and Historical Archaeology)**

**Abstract format: Oral**

Over the past few decades, European archaeological heritage gained major attention by connecting prominent archaeological sites to wider transnational networks, which have become a popular tool for their protection, promotion and tourist use. The Iron-Age-Danube project focused on monumental archaeological landscapes of the Early Iron Age.

The Iron-Age-Danube project ran between 1st January 2017 and 30th of September 2019. In 2017 and 2018 eleven project partners and nine associated partners from Austria, Croatia, Hungary, Slovakia and Slovenia conducted research and established common strategies for research, protection and sustainable touristic use of archaeological heritage in the Danube area.

As a tool for the implementation of the strategies a database was created in collaboration with the Austrian Centre for Digital Humanities and Cultural Heritage (ACDH-CH) / Austrian Academy of Sciences. The database was used to evaluate and understand the research activities, status of monument protection and potential for touristic use of Iron Age heritage in Austria, Slovenia, continental Croatia and Transdanubian Hungary. In total 1046 Iron Age archaeological sites with multiple entities were entered, of which 3 sites extend over 2 countries. The collected data are accessible to researchers and the general public (<https://iron-age-danube.eu/>). In our lecture we will present the results of the data evaluation from the perspective of accessibility, visibility and infrastructure of Iron Age sites in the mentioned area. We see these elements as a key points for development of mobility plans and touristic strategies for future locations.

## 3 DEVELOPMENT OF ARCHAEOLOGICAL SITES IN OUR MOUNTAINS FOR TOURISM PURPOSES

**Abstract author(s): Czifra, Szabolcs (Hungarian National Museum) - Deminger, Csilla (Kuny Domokos Museum) - Pálinkás, Adrienn - Fábíán, Szilvia (Hungarian National Museum)**

**Abstract format: Oral**

The pandemic period has brought a lot of new habits to people's everyday lives around the world. One of these was the explosion-like increase in forest visits as a result of which a large number of tourism developments began in the Hungarian mountainous areas.

Archaeological sites in these regions could also be integrated into this type of tourism development. Experience shows that the vast majority of hikers are unfamiliar with the archaeological sites along the routes they visit. A shocking example is that in the Pilisi Parkerdő - where there is about 1,000 km of marked hiking trails - no signpost leads to the Árpádvár site, from where a significant late Bronze Age and a medieval fortress are known. It is especially interesting because this site is located between the Rám-szakadék and Dobogókő, which are among the most popular tourist destinations in Hungary (60,000 people/year).

In this presentation, we will look for the answers to the above-mentioned problems. We will examine the forest visiting and hiking habits of the population. How could the archaeological heritage be incorporated into outdoor activities? How much need is there to get to know these places better? How could these archaeological sites be used for educational purposes and protected in cooperation with forestry, municipalities and local communities? How could the surviving archaeological sites in our National Parks be presented? How could we achieve positive economic and social changes with these developments (on a local or regional level), from which further research and developments could be implemented?

## 4 ARCHAEOLOGICAL ROUTE MANAGEMENT: A LOOK BEHIND THE SCENES

**Abstract author(s): Mihelic, Sanjin (Archaeological Museum in Zagreb)**

**Abstract format: Oral**

From a cultural-tourist perspective, cultural routes are well-organized and highly dynamic networks connecting different locations and points of interest – in other words, tourist attractions. Ideally, tourists are presented with a variety of options to pick from, starting from a list of sites, to different modes of transport and a range of accommodation choices, to organized guided tours of various durations. Add to this general and/or site-specific products and services and you arrive at a first-class tourist experience: just the way things should be.

However, things may take a different turn once you start approaching the subject from a diametrically opposite perspective, namely, that of the organizer and manager. This comes particularly to the fore when we discuss the topic from the archaeological professional standpoint. As archaeologists, we are seldom equipped with knowledge and skills, let alone the means and resources that are the preserve of the tourism sector – yet many of us are still willing to invest time and effort into first developing, and then also maintaining cultural routes, because we believe that by opening up and working with the tourism sector and other key stakeholders in cultural tourism we may at the same time pave the way for a better protection, preservation and appreciation of our archaeological heritage.

The aim of this paper is to take you behind the scenes of the archaeological route management, with a specific emphasis on topics pertaining to marketing, as well as on those regarding the mobility and transport along the routes.

## 5 CULTURAL ROUTES AND HERITAGE TOURISM

**Abstract author(s): Wollak, Katalin (Independent researcher; Hungarian Ass. of Archaeology and Art History; Archaeolingua Foundation) - Jerem, Erzsébet (Archaeolingua Foundation)**

**Abstract format: Oral**

In the paper we gave last year, we provided an overview of how Iron Age archaeological monuments in West Hungary—especially around Lake Fertő, Sopron and its wider surroundings—can be integrated into the network of cultural tourism. This year, we would like to give an update on the implemented projects and discuss new possibilities and the attitude of stakeholders. Our study area includes two counties along the Hungarian-Austrian border (Vas and Győr-Moson-Sopron counties), with the Iron Age fortified settlements and tumuli of Velem and Sopron as key points, in addition to other Iron Age landscape features.

In this paper we present the initiatives launched so far, the NGOs and professional organisations that have supported these, and suggest further possible cross-border connections. The Baedeker (Prehistoric Monuments and Collections in Hungary - Itinerarium Hungaricum), published 10 years ago, divided the country into seven regions from a practical, touristic point of view. The two counties under study in the north-western part of Transdanubia formed the second region in this classification, from which 14 locations were included in the thematic guide, most of which offer attractions classified in the highest category. We also aim to explore how these authentic sites can be linked to the increasingly popular slow tourism industry by taking advantage of the regional opportunities for hiking and biking. Taking into consideration that the recent and future development of biking routes around Lake Fertő will affect a number of Iron Age sites, it is definitely worthwhile to build on existing local attractions and explore the further potentials this region has for heritage tourism.

## 6 IRON AGE DANUBE ROUTE IN THE POŽEGA VALLEY REGION

**Abstract author(s): Rakvin, Marta - Balen, Jacqueline (Archaeological Museum in Zagreb)**

**Abstract format: Oral**

The fact that most of the Iron Age sites are located in more or less remote areas holds a number of advantages. It allows visitors to experience archaeology in a new kind of way – out of the museums and immersed in the landscape. In addition, it opens up a wide array of possibilities for joining the Iron Age sites with the al fresco travelling styles and adventure tourism. However, this approach is not without challenges.

In recent years, in the scope of the Interreg Iron Age Danube and the Danube's Archaeological eLandscapes projects, Archaeological Museum in Zagreb initiated and played a vital part in novel ways of site presentation in Kaptol. As one of the Iron Age Danube Route founding members, it commenced the revitalization processes in the region by introducing new approaches to cultural heritage presentation and developing tools for future sustainable management.

In this paper, we would like to explore and share the challenges and offer possible solutions focusing on the network of the Iron Age Danube Route members and stakeholders in the Požega Valley, which are centered around the archaeological site Kaptol.

## CLAUSTRA ON THE ROAD

**Abstract author(s):** Zanier, Katharina (Department of Archaeology, Faculty of Arts, University of Ljubljana)

**Abstract format:** Oral

The paper presents the route, developed in the CLAUSTRA+ project, with special attention to different transportation methods tested in several pilot tours. The main goal of the project was to establish a cross-border destination of cultural and green tourism based on the archaeological remains of the Late Roman defence system *Claustra Alpium Iuliarum*. The defence system protected the passages to the heart of the Roman Empire and is the largest architectural feature that the Romans built on the territory of today's Slovenia. Archaeological remains of the system span in segments from Rijeka in Croatia to the Posočje region in Slovenia. *Claustra* represents an outstanding example of integration of architecture within the natural environment: the archaeological remains are mainly located in wooded areas that often overlap with protected natural and woodland areas, therefore its experience is closely connected to the experience of nature.

During the project we carried out several activities for the development of an "archaeological tourism product", preparing guidelines for its sustainable development and a general interpretation plan, as well as a promotion plan and a rich and diverse range of itineraries. We systematically worked on the product promotion and established appropriate multilingual tools such as a mobile app and printed guidebook for different target groups in order to improve the accessibility of the sites. We have also developed a rich program for visitors with an emphasis on living Roman history: we have carried out several thematic cycling, hiking and riding tours, tours for blind persons, diverse outdoor culinary and cultural events, including a pilot accommodation facility in the form of a Roman camp.

## MATRICA (SZÁZHALOMBATTA) WITHIN THE HOLISTIC APPROACH OF LIVING DANUBE LIMES PROJECT

**Abstract author(s):** Kovács, Gergo - Vukosavljević, Zorán - Kiss, Zsuzsanna (Budapest University of Technology and Economics)

**Abstract format:** Oral

The EU-funded Interreg project "Living Danube Limes" focuses on the historical and touristic values of the former Roman frontiers and routes as well as innovative concepts for the development of historic sites along the river through the international cooperation of 10 countries along the Danube with the Lead Partner Danube University Krems. The holistic approach of the project stands on four pillars that are archaeology and history, formation of museum clusters, protection and green tourism and reconstruction of a historical Roman *lusoria* vessel. During the project, each country with a connection to the Danube has identified a pilot site that will be the main focus point for the implementation of this holistic approach. Activities at the sites include archaeological geoprospection, VR reconstructions, sustainable tourism strategy development, facilitating cooperation between museums and visitor centres and various reenactment events. As a Hungarian project partner, the Department of History of Architecture and Monument Preservation of the Budapest University of Technology and Economics is actively involved in several aspects of the project, by education, research or organisation of events with the aim to involve potential Hungarian experts in the field of Roman architectural heritage research. The presentation focuses on the historical values and contemporary development potential of the Hungarian pilot site of the auxiliary *castellum* of *Matrica* through the results of the scientific research and the virtual reconstruction provided by international and multidisciplinary cooperation and the network of the connecting cruise according to the project's holistic approach.

## ARCHEOLOGICAL SURVEYING WITH UAV LIDAR

**Abstract author(s):** Látos, Tamás (Hungarian National Museum / Magyar Nemzeti Múzeum)

**Abstract format:** Poster

Nowadays LiDAR (Light Detection And Ranging) is one of the most exciting modern tool in archeological research. There are many of archeological sites covered with forests, vegetation (agricultural plants), soil, debris etc. Using LiDAR we can reveal the secrets of these places, furthermore we can explore new, previously unknown sites also.

LiDAR is one of the most important non-destructive method in archeology in addition and in complement with the geophysics surveys. A LiDAR survey with UAV is cheap, fast, can be covers large area. During the data processing we can remove the disturbing objects from the surface: trees, bushes, buildings, landmarks etc., and the final result is the bare ground surface. The visible topographical differences can show us the surface-shaping activities of people who previously lived on this places: ruins of cities, temples, castles, forms of burials etc.

We can use this results to plan an excavation or to replace it and analysis the sites without destruction. An another important possibility to use this results is the presentation for the public. This very impressive pictures and 3D models made from the LiDAR data can make the hidden archeological sites attractive for the public.

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Hausmair, Barbara (University of Innsbruck/Department of Archaeologies) - Theune, Claudia (University of Vienna/Department of Prehistory and Historical Archaeology) - Moshenska, Gabriel (University College London/Institute of Archaeology)

**Format:** Regular session

In recent years, the importance of ethics has been increasingly debated in many subfields of archaeology. In this session we aim to advance discussions that concern ethics in regard to the study of 20th- and 21st-century violence, injustices and repression. There have been innumerable episodes of conflict worldwide, ranging from wars to state-led terror and dictatorship. These conflicts have been characterised by physical, structural and symbolic violence against individuals, as well as acts of violence directed against the identity and livelihoods of groups. Their tactics have included the targeted destruction of material possessions, homes, entire settlements, agricultural land, and cultural heritage perceived as constitutive of particular groups' identities.

Studying the material dimensions of violence, repression and persecution opens up ways to trace the production of injustices and immoral actions in the recent past and present. However, the practice of such research also presents distinctive ethical challenges. For example, at the intersections of archaeological work and contested heritage and memory discourses, scholars may encounter resistance, rejection, or even violent opposition to their work. In many places worldwide the heritage of conflicts, their scholarship, representations and commemorations are themselves platforms for contemporary divisions and violent contestation. We welcome papers that either discuss interpretative approaches towards material remains of 20th- and 21st-century violence and/or engage with the ethical dimensions of archaeological practice, e.g. dissonant heritage, handling of human remains, contesting and contested narratives, and varying attitudes towards the material remains of recent conflict.

## ABSTRACTS

### 1 DEALING WITH THE LEGACIES OF CONFLICT AND VIOLENCE IN DREŽNICA, CROATIA.

**Abstract author(s):** Simões, Sara (UNIARQ - Center for Archaeology, University of Lisbon) - Stojević, Iva (Institute of East Asian Studies, École Normale Supérieure de Lyon) - Grgurinović, Ivona (Department of Ethnology and Cultural Anthropology, Faculty of Humanities and Social Sciences, University of Zagreb) - Parežanin, Lujo (Department of Comparative Literature, Faculty of Humanities and Social Sciences, University of Zagreb) - Gomes Coelho, Rui (Department of Archaeology, Durham University; UNIARQ - Centre for Archaeology, University of Lisbon) - Horvatinčić, Sanja (Institute of Art History, Zagreb) - Gligora, Valerija (Valdir - obrt za istraživanje i usluge, Zagreb)

**Abstract format:** Oral

Heritage from Below / Drežnica: Traces and Memories is an interdisciplinary heritage project focused on the region of Drežnica and its recent past. Located in central Croatia, this area was an important stage for the partisan struggle during the Second World War, but also a stage for conflicts during the dissolution of Yugoslavia, multi-ethnic encounters, and successive migrations over recent historical periods. These historical events shaped new social and political frameworks, which were materialized in the landscape, objects and personal dwellings. Those traces have been mobilized in conflictive ways, in new discourses and narratives about the past, experiences of violence, and resistance.

Within the context of this project, archaeology is a tool to mobilize the local community and its political allies in their effort to uncover and explore the past, reexamining historical events and old narratives, engaging in broader discussions on redress and social justice through present times. In a region like Drežnica's, where the legacies of recent conflicts continue to shape the present, our team is confronted by ethical challenges posed by community-based work. Our presence contributes to the construction of new narratives, new meanings, and the development of new landscapes of memory, which necessarily lead us to constantly question our positioning as researchers.

We aim to explore how Drežnica's community has been responding to different political, cultural and socio-economic events from the past 80 years through the analysis of public and private spaces, community boundaries, as well as personal objects. We will look at how they were used, re-used, and resignified in daily life. We will examine how archaeology has been affecting Drežnicans relationship with recent conflict, to discuss what we have been learning with the local community, encouraging reflection and organization against the obscure political forces that again emerge all over the continent.

## 2 DYNAMICS OF CONTESTED HERITAGE

**Abstract author(s):** Igljic, Sara - Kulenović, Igor - Vrkić, Šime - Kulenović, Neda (University of Zadar)

**Abstract format:** Oral

Throughout the past year, in Obrovac, a small town in northern Dalmatia, a field survey of an Italian military complex from the Second World War has been conducted. The goal was to document all the military infrastructure that was built during the Italian, and later German occupation. The complex consists of several fortified military positions along both sides of the river Zrmanja canyon. In Croatia, there is still no significant interest in the archaeological research of the material remains of modern conflicts. That being said, the time of the occupation has left a mark on the local communities. There is a reluctance to discuss their shared history and to even acknowledge it (visible in the destruction of several bunkers and falsely defining bunkers as viewpoints without mentioning their military purpose and history). There is a great need to completely erase a part of the history in accordance with the historical revisionism visible in Croatia and also, globally. As the surveyed military infrastructure presents material evidence of oppression and fascism, the community chose to represent the history and values that are to be remembered and implied the ones that are meant to be forgotten - the contested heritage. How do modern conflicts affect heritage and remembrance and is history truly written just by winners? What are the dynamics between unwanted parts of history and heritage? The relationship between the social and material will be examined in this local example.

## 3 THE DEFENSIVE SYSTEM OF PLOIEȘTI (ROMANIA) DURING THE SECOND WORLD WAR (1939-1945)

**Abstract author(s):** Banica, Costina - Jané, Oscar (Autonomous University of Barcelona)

**Abstract format:** Oral

Ploiești is a city located in the south of Romania and an important site during the Second World War, thanks to its strategic position and, above all, thanks to its abundant oil production, which aroused great interest in the area of the great European powers of the time.

Despite playing a key role during this war and having the largest defensive system after Berlin, Vienna and the Ruhr region, studies about Ploiești have been scarce compared with other European cities.

The main aim of this work is to gather and identify all the elements that formed the defensive system of this place and to analyse their importance during the period 1939-1945. This research is based on the oral memory of the citizens of the area, bibliographical and archival studies and, finally, an archaeological investigation of the territory and classification of the defensive structures of the city. Finally, the study also aims to analyze the current memory of the conflict and the impact it has on today's society.

## 4 MAKING CONFLICT ARCHAEOLOGY USEFUL: LINKAGES WITH CRITICAL MILITARY STUDIES

**Abstract author(s):** Carman, John - Carman, Patricia (University of Birmingham)

**Abstract format:** Oral

The emergent field of Critical Military Studies addresses and challenges the standard tropes of military discourse. It examines modern military practice and discourse from a critical perspective, to reveal the underlying discourses that provide a moral justification for the use of mass violence. In particular it turns attention away from a concern with the actions and responses of the military in situations of conflict, to the consequences for others of military activity. Its concerns – especially with issues of the categorisations of agents as combatants and non-combatants and 'human [rather than state] security', with the gendered construction of conflict, and with geographies of conflict – are shared by those in archaeology also concerned with issues of conflict. To date, however, efforts to directly connect Conflict Archaeology to Critical Military Studies are very rare.

This paper, drawing upon recently published work of the Bloody Meadows Project and focusing on 20th century conflicts and commemoration, will present an outline of those themes and topics where archaeology can usefully contribute to the development of Critical Military Studies. It will also outline how the concerns of Critical Military studies can inform and help develop the field of modern Conflict Archaeology.

## 5 WAR AT THE END OF THE WORLDS? CONFLICT HERITAGE, ETHICS AND THE PLURIVERSE IN ARCHAEOLOGY

**Abstract author(s):** Breithoff, Esther (Birkbeck, University of London)

**Abstract format:** Oral

Conflicts are inherently partisan, invoking not only ideological disjunctions but also ontological clashes. A truly ethical approach to the archaeology of conflict must thus take a pluriversal approach (Escobar 2012; Blaser and de la Cadena 2018) to engage with the multiple ontologies and worlding practices which stand at the centre of modern conflicts. This paper is an exploration of modern industrialised war, and its material and discursive legacies, as both

world-making and unmaking processes that acknowledge the ways in which these worldings are multiple, co-existent, contrasting and often conflicting. Using the material culture and landscapes of the Chaco War between Paraguay and Bolivia (1932-1935) as a case study, it argues for a multi-world perspective on conflict heritage as a way to reorient archaeology as a discipline that no longer allows for one dominant world to absorb all other potential worlds but that takes seriously “worlds and knowledges otherwise” (Blaser 2010, 17).

## 6 “LEFT, RIGHT, LEFT, RIGHT” POLITICAL INTERPRETATIONS OF HERITAGE OF FINNISH WARS AND READINGS IN MATERIAL CULTURE

**Abstract author(s):** Kauhanen, Riku (University of Turku)

**Abstract format:** Oral

On 20th Century Finland went through two bloody periods: The Civil War of 1918 and World War II. All these wars have been interpreted many times and in specific political discourses, which follow and produce political readings of Finnish history. This is also reflected on material culture, such as memorials and statues as well as certain aspects of public memory, that must be considered when working with archaeological research and heritage of these times.

After the Civil War, during the so-called Finland's First Republic (1919–1944) memory culture was dominated by the winning side, the Whites, who suppressed remembrance of the losing Red side. This was especially seen in the treatment of statues and memorials, which were erected on graves of fallen or executed Reds.

During the Second Republic (1944–1994) the leftist history saw upheaval. Interestingly the Finnish communist resistance during Continuation War (1941–1944) was strongly connected to new leftist interpretation of history among with memories of the Civil War. This change also was reflected on new and old memorials.

After the collapse of Soviet Union new interpretations of the wars have risen, but still with certain political aspects. Also, with the rising interest towards conflict archaeology the Civil War sites are examined, and in some cases, excavated. This research has been publicly debated, especially when mass graves of Reds are examined, or memorial services have been held. These interpretations are both local and nationwide and raise ethical questions of handling of heritage and memories surrounding these times.

This representation studies several cases from each period to show politically charged interpretations, with ethical questions about ownership of heritage and with it, “right” to make research and conclusions about history. Examples come from different aspects of material culture, such as memorials, museum objects and archaeological excavations.

## 7 ARCHAEOLOGY, HUMAN REMAINS AND CONTESTED NARRATIVES: INTERPRETING THE MATERIAL REMAINS OF THE LITHUANIAN PARTISAN WAR

**Abstract author(s):** Petrauskas, Gediminas (Klaipėda University, Institute of Baltic Region History and Archaeology)

**Abstract format:** Oral

The Lithuanian Partisan War (1944–1953) occupies a significant place in the history of 20th-century Lithuania. The relatives and comrades of freedom fighters killed during the ten years of anti-Soviet armed resistance sought an honourable burial of the partisan remains. However, the Soviet power structures, in order to intimidate the people, to suppress the resistance and support for the partisans, as well as to identify the killed partisans and to find their relatives, publicly displayed the desecrated remains of the dead in central town squares. Many of the remains of freedom fighters were buried in unmarked and disrespectful places, such as gravel pits, rubbish dumps, latrine pits, etc.

Since 1988, mass grave exhumations of killed partisans have been carried out by family members of partisan war victims. In 1992, the procedure and rules for the exhumation and transfer of partisan remains to cemeteries were adopted at the state level. Nevertheless, the excavation of partisan remains continued to be carried out in a haphazard manner, and the calls by state authorities and heritage specialists to follow the exhumation procedure were often controversial in society, as were seen as a hindrance to honouring the memory of the dead. Today, targeted searches and investigations of the burial sites of freedom fighters are being carried out in Lithuania, and the remains of the main leaders of resistance have been found and identified. However, decades of Soviet propaganda and information warfare have still tended to criminalise the partisan war and its participants at the level of personal histories, and archaeological discoveries of partisan remains in the public sphere are often the subject of tumultuous clashes between different narratives. This paper examines the phenomenon of the treatment, valuation and commemoration of the remains of Lithuanian partisans, analysing the relationship between conflict archaeology, oral history and memory.

## THE DNA IDENTIFICATION OF HUMAN REMAINS FROM WORLD WAR II: THE ETHICAL CHALLENGES OF RACIALISED IDENTITIES AND NATIONALIST NARRATIVES

**Abstract author(s):** Renshaw, Layla (Kingston University London) - Dziuban, Zuzanna (Institute of Culture Studies and Theatre History, Austrian Academy of Sciences)

**Abstract format:** Oral

DNA testing is being used with increasing frequency to identify war dead. Scientific advances enable the technique to be applied to older remains, bringing more historic conflicts into the scope of genetic testing. The identification of war dead can offer certainty and closure to relatives and survivors. On a societal level, the recovery and identification of war dead may inform new historical accounts and commemorative acts.

However, genetic testing is not a value-neutral tool. It is historically embedded in the detection of difference, the determination of group membership, and racialised identities. DNA testing may be used to establish the unique individual identity of a set of human remains, or it may be used to determine the likely ancestral population that the individual is descended from. These two different applications of genetic testing create disparities in the way categories of dead are conceptualised and constructed. This triggers further disparities in the kind of mourning and commemoration that follows identification. Genetic testing of war dead runs the risk of inscribing (or re-inscribing) ethnic and national identities upon the dead. Especially when they are commissioned by the state, the scientific analyses of the dead can be deployed to support nationalist representations of past conflicts.

This paper contends that genetic identification of war dead unsettles the prevailing modes of memory and commemoration in important ways that have not yet been adequately interrogated or theorized. It will have long-lasting political and ethical ramifications. This paper will focus on the DNA testing of World War II dead in Poland. It will discuss the recent analysis of skeletons recovered from Sobibór and the ethical problems with biologically delineating Jewish and non-Jewish Polish identity in this particular historical and commemorative context.

## 'HIDDEN HILLFORTS'. THE IMPORTANCE OF ARCHIVAL SOURCES FOR THE FUTURE STUDY OF FORTIFICATIONS [COMFORT]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Ibsen, Timo (Centre for Baltic and Scandinavian Archaeology Schleswig) - Podėnas, Vytenis (Lithuanian Institute of History, Vilnius) - Schneeweiβ, Jens (Centre for Baltic and Scandinavian Archaeology Schleswig; ROOTS Cluster of Excellence, University of Kiel)

**Format:** Regular session

Since the inception of European archaeology hillforts, strongholds, enclosures, and other types of fortifications have been a persistent leitmotif of research. This enduring presence in archaeological research has left a paradoxical patchwork of limited research. This is in part due to a diversity of approaches to excavation inside and outside these monuments, as well as their size and their complex systems of ramparts, ditches, and walls. For this reason, a large portion of the original excavation reports and find materials remain unpublished in institutional archives. Rarely have the results of excavations been published in full and then only within frameworks of the contemporary prevailing theories. This gap in the catalogue of available literature has discouraged critical reassessment of foundational research.

The main obstacle to critical analysis is the inaccessibility of preliminary reports and grey literature spread across a broad number of archives and institutions. This is made more apparent by instances of renewed examination of archival sources challenging previous interpretations. Still, the bulk of archival resources need recuperation. Current research on fortification requires clear strategies to refine primary sources of old excavations for inclusion into modern archaeological science.

This session invites presenters to unshroud hillfort research that has been hidden or forgotten in various archives. Presentations will demonstrate not only practical aspects of incorporating archival sources and grey literature, but also how archival work and new investigations of previously studied sites can alter previously accepted interpretations and their broader implications on modern research. These two perspectives should demonstrate how early research impacts modern studies and whether archival sources, finds, and samples provide fresh contributions to current discussions on fortification. Papers focusing on national heritage institutes and archival repositories are particularly welcome in order to develop strategies to encourage the study of old excavations and to reassess old results.

## 1 A CENTURY OF DATING BACK AND FORTH. THE TORNOW-KLENICA AFFAIR IN THE CONTEXT OF GERMAN-POLISH ARCHAEOLOGY AND POLITICS

**Abstract author(s):** Reichenbach, Karin (Leibniz-Institute for the History and Culture of Eastern Europe - GWZO)

**Abstract format:** Oral

The paper seeks to follow the story of the changing chronology of Tornow-Klenica type strongholds and pottery throughout the 20th century. Based on the study of archival and published material it will trace the origins of the early-dating paradigm back to its roots in Silesian archaeology of the 1920s and 1930s and explore how and why it was taken up in Eastern German and Polish post-war archaeology until its eventual refutation in the light of dendrochronological data in the 1990s. It will discuss how the early dating of Tornow-Klenica type sites and finds was connected to ethnic interpretation which in itself was informed by respective German and Polish history politics. The strongholds thus served as key elements in the creation of grand narratives told from a national(ist) history perspective, which apparently could only be finally overcome after the end of the Cold War and by cutting deep sections into those monuments to obtain timbers for dendrochronology. The case of the dating history of Tornow-Klenica therefore raises the question of whether the study of archival documents as part of a critical approach to understanding and contextualising long-established research paradigms could offer a non-invasive corrective to challenging and overcoming them.

## 2 HOW VERIFICATION LEADS TO DISCOVERY – FOUR NEW EARLY IRON AGE HILLFORTS IN DYLEWO HILLS LANDSCAPE PARK (NORTH-EAST POLAND)

**Abstract author(s):** Solecki, Rafal - Welc, Fabian - Rabiega, Kamil (Cardinal Stefan Wyszyński University in Warsaw)

**Abstract format:** Oral

In 1908 Emil Hollack has published a map of East Prussia with marked location of prehistoric archaeological sites (Hollack 1908). One of these sites - a barrow cemetery - was located in the area of Dylewo Hills, near Peterswalde village. It was later, in 1930s, excavated by Carl Engel, who established its chronology to Early Iron Age (Engel 1935). In 1980s this site was verified by Wiesław Skrobot (Hoffmann 1999: 122), who has found two hitherto unknown hillforts in the vicinities of the cemetery (Skrobot 2015: 123, 142). Fabian Welc and Rafał Solecki conducted a further verification in 2010s, which resulted in discovery of another two hillforts. All four hillforts were excavated in 2018-2020 and their main phase of habitation can be dated to Early Iron Age and associated with the West Balt Barrow culture. In this way, a verification of already excavated barrow cemetery has allowed to discover a significant concentration of hillforts, which were probably a regional centre at that time.

## 3 WHEN THERE'S NOTHING ELSE: SPATIAL ANALYSIS OF ĶĪVUTKALNS HILLFORT INHABITATION THROUGH EXCAVATION JOURNALS

**Abstract author(s):** Visocka, Vanda (University of Latvia)

**Abstract format:** Oral

Ķivutkalns is one of the best known Bronze and Pre-Roman Iron (1100-1 BC) Age site in the eastern Baltic. Although it has been researched thoroughly, especially in questions regarding chronology and assemblages of the hillfort, there are little research related to spatial analysis of the site. This is due to the fact that only information traces of spatial distribution left are in the journals, made during the excavations. This will be the first attempt to analyse inhabitation and everyday life in the Ķivutkalns hillfort in order to determine the main tendencies of living and crafting during the Late Bronze and Pre-Roman Iron Age eastern Baltic.

In this paper excavation journals will be critically analysed, the information about possibilities and problematics regarding their analysis will also be presented. In this study the archaeological assemblages will be analysed and put into the context related to structures such as houses and hearths of the hillfort.

#### 4 HILL FORTS OR NOT? SITES WITH TOPONYMIC OR FOLKLORIC BUT MISSING ARCHAEOLOGICAL EVIDENCE

**Abstract author(s):** Valk, Heiki - Vindi, Andres (University of Tartu)

**Abstract format:** Oral

Hill forts can be defined as archaeological sites with cultural layers and/or with visible traces of fortifications. Many of these sites have been known as archaeological monuments for a long time, but toponyms on historical maps, as well as oral lore recorded in archives can serve as a basis for discovering new, formerly unknown strongholds.

In addition to „real“ hill forts there are, however, sites without definite archaeological features but with folkloric evidence referring to a former fortified place. There exist place names characteristic of hill forts, as well as legends of stronghold or „town“ sunken into the hill. Toponyms may also indirectly refer to the vicinity of an unknown hill fort (e.g. „hill fort lake“, „hill fort swamp“ etc.).

Due to the lack of archaeological evidence these sites without archaeological features have traditionally not been regarded as hill forts. However, toponyms may hold memories of very short-time or temporarily used strongholds or reflect cases in which weak cultural layers have been eroded to the slopes due to long-term ploughing. The presentation discusses the topic on the basis of source materials from Estonia.

#### 5 THE POTENTIAL AND CHALLENGES OF SPATIAL ANALYSIS BASED ON ARCHIVAL SOURCES: BRONZE AGE - ROMAN PERIOD HILLFORTS IN LITHUANIA

**Abstract author(s):** Podenas, Vytenis (Lithuanian Institute of History)

**Abstract format:** Oral

New investigation methods have allowed archaeologists to extract more information from less excavated areas as well as fill in the gaps on various lacking knowledge on past populations' behaviour, economy, spatial organization, defensive strategies, and everyday life. Even though, some questions might be addressed with the help of non-destructive methods, the tendency of lessening excavated areas inevitably provides new interpretational problems where large quantities of artefactual spatial data are required. In turn, a potential of bridging an emergent data gap could be addressed with old excavation reports that documented vast excavated areas in the hillforts. However, the documentation tendencies differed based on the timeline of the excavations, archaeologists' readiness, and a level of taken precautions to ensure report data association with the artefacts that after all were stored in the museums.

The Paper reviews available spatial information in the old excavation reports from XX century Lithuania that dealt with hillforts from the Bronze Age up to the Roman period. It also aims to discuss the development of documentation tendencies and answer the question: have the good examples provided the impetus for other researchers to improve their own reports or were they isolated cases? Lastly, the paper discusses thoroughly the case of Narkūnai hillfort that was excavated in 1976–1978. The primary spatial analysis objective was the identification of formation processes of the archaeological record, however, several significant observations from the secondary analysis of archival sources also emerged. Based on comparative analysis of report data and artefacts stored in the museum, a fragment of a I-II cent. AD paleorelief was reconstructed as well as quick abandonment of the Northern building during the Late Bronze Age was identified.

#### 6 APUOLĖ HILLFORT COMPLEX: POSSIBILITIES OF RE-EVALUATION OF RESEARCH DATA

**Abstract author(s):** Zabiela, Gintautas (Association of Lithuanian Archaeology)

**Abstract format:** Oral

According to the written sources, in 853, castle Apulia was attacked by the vikings. It was connected with the hillfort of Apuolė in 1887. Today, the entire Apuolė archeological complex (Western Lithuania) is known, consisting of at least six parts: the hillfort, cemetery, foot settlement, sanctuary, forecourt, and individual homesteads. The complex has been excavated two times by seven different researchers, and surveyed eight times. The focus was always on the hillfort. It was excavated in 1928–1932 and 2018–2019. A total of 1,855 m<sup>2</sup> has been excavated within the complex, including 1,609 m<sup>2</sup> of the hillfort. A significant part of the pre-war research material was collected and sorted in 1992 and published in 2009. In the past 30 years, drafts of plans and a film have been found in museums and archives. New excavations were carried out aiming to study the environment of the hillfort and to adapt the site for visitation. During this period, a separate discipline of archeology, known as archival archeology, emerged and developed its methods. All this enables us to re-evaluate our knowledge of Apuolė.

The ultimate goal of such assessment is a new level of understanding of the Apuolė complex without the use of destructive research methods (such as excavations). This should be done through an analysis of all known research material in the form of a separate study (preferably, a publication). The main principles of such work are a full publication of the available primary sources with appropriate comments, as well as a spatial - chronological analysis of all known material using the achievements of modern archeology. In the case of Apuolė, the objective of archival

archaeology would be to record all research material, which, unfortunately, could not be performed by the author of this paper.

## 7 HILLFORTS REVISITED: INTEGRATING LEGACY DATA INTO A MODERN ARCHAEOBOTANICAL RESEARCH

**Abstract author(s):** Minkevicius, Karolis (Vilnius University Department of Archaeology)

**Abstract format:** Oral

The beginning of the 20th c. witnessed a growing interest in Lithuanian hillfort studies. This included several key Iron Age sites, most notably – Apuolė and Senoji Iplitis. These excavations also uncovered some of the richest assemblages of charred plant remains which facilitated pioneering archaeobotanical studies in Lithuania. However, the start of the Second World War and the following geopolitical turmoil ceased the development of this field. The surviving collections and research data were not organized systematically, and the existing information was gradually forgotten. Eventually, this has resulted in a modern notion that archaeobotanical studies in Lithuania were almost non-existent up until the end of the 20th c. This has often caused either insufficient or excessive criticism of legacy excavations. In worst cases, the data was being ignored altogether.

However, a recent inspection of museum collections highlighted the need to re-evaluate such viewpoint. Many of the pre-WWII finds alongside the original excavation reports have survived in museum storages. Even though both the quality of excavation and the overall condition of museum collections are varied, the surviving field documentation presents an opportunity for re-examination and modern analysis of the legacy material. Also, the results of this study revealed the necessity to re-assess the state of botanical studies in Lithuanian archaeology. Many of the recent advancements in the field were a direct result of the research efforts made in 20s and 30s. Recognizing this enables a meaningful integration of the legacy data into a modern research framework.

## 8 THE HILLFORT OF CAPOTE (EXTREMADURA, SW SPAIN). A MISUNDERSTOOD FORTRESS AMONG THE CELTIBERIANS OF THE IRON AGE

**Abstract author(s):** Berrocal-Rangel, Luis (Department of Prehistory and Archaeology, Autonomous University of Madrid) - Ruano, Lucía (University Complutense of Madrid) - Paniego, Pablo (Consejo Superior de Investigaciones Científicas - Instituto de Arqueología de Mérida) - Sánchez de Oro, Pablo (Universidad Autónoma de Madrid)

**Abstract format:** Oral

In 1985, as a result of several surveys conducted by the Autonomous University of Madrid, one of the authors of this contribution identified an archaeological site at El Castrejón de Capote (Extremadura, SW Spain). Here, an important funerary slab, with a Tartessian inscription dated to the 6th century BC, was found. Archaeologists observed a series of buried structures, first interpreted as burial mounds but which, after a series of excavations between 1987 and 1996, were revealed to be the bastions and ramparts of a Late Iron Age settlement. As a result, the competent authorities bought the site and prepared it for visitors, but did not organise a proper programme of systematic excavations. Since then, the settlement has not been further dug.

Although between 1988 and 2003, archaeologists partially published the site, more than thirty houses and two hundred metres of walls, ditches, and defensive elements remain unpublished, buried again in the preliminary excavation reports. A single isolated exploration in 2007 revealed that Capote hillfort occupied a central place in the geographical structure of the region and that this place is well hidden in the landscape. Would this central position justify its location despite its scant natural defences, limited to the steep slopes of a shallow ravine? If not, how can the enormous defensive structures be explained? As this question could not be previously answered, our aim is to try to answer it by unearthing the grey literature produced as well as the excavation reports. From an updated theoretical and methodological perspective, we believe that applying new technologies to the large areas of the site excavated and to be excavated (GIS analysis coordinated with LiDAR data, analyses of raw materials and photogrammetric reconstructions) could finally reveal the hitherto incomprehensible function of a fortress located in a site of impossible defence.

## 9 REVEALING FORGOTTEN HILLFORTS - ARCHIVAL SOURCES OF EASTERN PRUSSIA'S GERMAN RESEARCH HISTORY ON PREHISTORIC FORTIFICATIONS

**Abstract author(s):** Ibsen, Timo (Zentrum für Baltische und Skandinavische Archäologie)

**Abstract format:** Oral

Hillfort research in former German Eastern Prussia, today divided into a Lithuanian, Polish and Russian part, goes back to the 1830s. Until 1945 mainly German archaeologists registered a total of approximately 500 monuments of this type. Nevertheless hillfort research right before the second world war was still at the very beginnings. Only a few hillforts experienced a more detailed investigation, with a varying quality and extent. But beside a few preliminary reports in archaeological journals of the time and newspaper articles these results remained mainly unknown to the wider

scientific community. The reports and documents related to the pre-war excavations were kept in the Prussia-Museum in Königsberg, but its collection and archive was lost for half a century during the post-war period. Only after 1990 big parts of the archive were rediscovered, re-sorted and can now systematically be filtered for hillfort related information.

This paper sheds light on the different archival sources related to hillfort research in former Eastern Prussia and gives examples, how rich the material in the archives sometimes is. As a best practice example, relevant archival material of excavations at the hillfort Kraxteppelin (today Jantarnij, Russia) will be presented to demonstrate, how original documentations can add to the understanding of modern hillfort research. Kraxteppelin was the only hillfort completely excavated in the German research period. Based on the archival sources it is possible to reconstruct the main phases of this hillfort, used between pre-Roman Iron Age and the medieval period. Furthermore adjacent settlements have been discovered by in the vicinity, making the hillfort Kraxteppelin one of the best investigated settlement chambers of the region. It was hidden in the archives so far, but can now be revealed.

## 10 BUDEČ STRONGHOLD: THE POTENTIAL OF ARCHIVAL SOURCES FOR THE FUTURE STUDY OF A “WELL-KNOWN” ARCHEOLOGICAL SITE

**Abstract author(s):** Tomanova, Pavla (Institute of Archaeology of the CAS)

**Abstract format:** Oral

Budeč is an early medieval stronghold (ca. 9th-12th cent.) located about 20 km northwest of Prague (Czech Republic). The site's name appeared in written sources as early as the 10th century. Therefore the site has always attracted the attention of historians and archeologists. The most extensive archeological excavations took place in the 70s' and 80s' and brought a vast mass of archeological sources. On the other hand, the excavation results have been published only in several sub-papers and two (more or less) science popularization monographs. In these publications, the site is interpreted as a temporary residence of the princely Přemyslid family and a significant administrative center of the nascent Přemyslid state. The site is considered one of the best investigated archeological sites in the Czech Republic.

However, a significant part of the archeological sources from the excavations at Budeč have remained unprocessed or deserve revisions. Therefore, a revision of selected archival sources became part of my PhD research. Besides critically reading the archival documentation, I have processed spatial data in GIS and applied modern geodetic surveys. The revision shifted the general interpretation of Budeč as, primarily, a Christianization center of the early medieval Přemyslid state.

In addition, the aforementioned revision has shown more gaps in the research of the site. At the same time, the chances of conducting modern excavations in situ are currently quite low. Thus, future research at Budeč is limited to further processing archival sources and applying non-destructive research methods. Both will be included in the proposal of a new research project I am working on at the moment.

This paper will present the results of my PhD research, as well as the proposal for the new research project.

## 11 EARLY AND HIGH MEDIEVAL FORTIFICATIONS IN THE HANNOVER AREA

**Abstract author(s):** Messal, Sebastian (Lower Saxony Heritage Agency)

**Abstract format:** Oral

Numerous early and high medieval castles are known from the area around Hannover. Some of these fortifications have been scientifically investigated to some extent, while little is known about other fortifications in scientific research. However, a closer look into the archives of the responsible heritage agency in Hannover reveals that there is often much more information available on these sites, ranging from surface surveys to unpublished excavation reports. The extent to which this knowledge improves the state of research on the fortifications in the Hannover area is difficult to say at present, as a reappraisal of the extensive source material is still pending. However, the lecture will present the potential of these hidden archival materials and discuss a future strategy for using this data. In addition, the project "Denkmalviewer Niedersachsen" (Lower Saxony Monument Viewer), an online viewer listing Lower Saxony's cultural monuments, including fortifications, will be briefly presented and discussed.

## 12 THE “LATVIJAS PILSKALNI” PROJECT AND E. BRASTIŅŠ LEGACY. ON THE WAY TO THE OPEN-ACCESS DATABASE OF THE BALTIC REGION HILLFORTS

**Abstract author(s):** Shiroukhov, Roman (Centre for Baltic and Scandinavian Archaeology - ZBSA) - Kalniņš, Gatis (Latvijas Pilskalni / Latvian Hillforts)

**Abstract format:** Oral

The paper covers a number open-access databases of the hillforts of the East Baltic region, including Estonia, Latvia, Lithuania, Kaliningrad region of Russia and Poland. A short overview of the pre-existing databases of hillforts of the region is given with special attention to the “Latvijas pilskalni” project, its structure, methods and philosophy.

"Latvijas pilskalni" was launched in August 2017 with the aim to provide free access to information on Iron Age hillforts in Latvia. The first step was to give online access to the content of four pre-war books on Latvian Hillforts by E. Brastiņš, barely known outside Latvia, as well as to create a hillfort map integrating Brastiņš' work with unpublished data from the Latvian state archives. These data were later supplemented by J. Urtans and recent relevant publications. In the course of the work, the locations of the hillforts were updated using the Latvian Geospatial Information Agency's (LGIA) Place Names Database. The next stage was to refine the coordinates using the digital terrain model layer in the map browser of the same Agency. In August 2019, the planlauf/Terrain software was purchased to create 3D models of the hillforts using LiDAR and orthophoto data freely available on the LGIA website. 3D models and videos of Latvian and Estonian hillforts were created and uploaded to Sketchfab.com and YouTube. The source codes of the models and other related information are freely available at <https://opendata.latvijas-pilskalni.lv>. As a result, in January 2020, the project received the Latvian Open Technology Association's Private Sector Award of the Year.

The Latvian hillforts project is a prime example of unifying different geospatial and archival sources on the way to the ambitious development of the broader European Hillforts open-access database.

## RE-VISITING THE GLOBAL/LOCAL CONTINUUM IN ARCHAEOLOGICAL HERITAGE PRACTICE: CONTRASTING HISTORIES, PERSPECTIVES, AND EXPERIENCES WITHIN AND BEYOND EUROPE

**Theme: 1. Archaeologists and Archaeology Here and Now**

**Organisers:** Lazzari, Marisa (Department of Archaeology, University of Exeter) - Lilley, Ian (Faculteit Archeologie, University of Leiden; School of Social Science, University of Queensland in Australia) - Orlandi Barbano, Francesco (Department of Archaeology, University of Exeter)

**Format:** Discussion session

Worldwide, communities at the frontier of global resource extraction experience issues affecting their cultural and natural reservoirs of knowledge, memory, and lifeways. Despite their highly variable experiences, they share a preoccupation with the eroding power of global flows of capital—particularly as it often presents itself as a road to development and a better future—and a pressing need for alternative pathways towards sustainable futures. New global and continent-wide programs (e.g. UNESCO SD goals; Horizon Europe 2021-24) promote myriad initiatives, foreground the need for multilateral collaboration, and stress European-based research's role both inside and beyond its borders. Global agendas mobilise cultural, educational, social, and political capital under the banner of sustainable development through multiple pathways, often converging on cultural heritage as a vortex of action. Yet what 'sustainability' means in relation to locally meaningful cultural landscapes should be explored rather than a priori assumed.

Transnational flows of capital, resources, and discourses require matching transnational research efforts that are also able to establish fruitful dialogues across disciplinary and geographical borders. Taking the global-local in heritage research and practice as a continuum rather than as a dichotomy, this session seeks to explore the distinct processes, practices, discourses and materialities that each of these realms involve, as well as their overlapping, intersecting, contradictory and/or mutually re-enforcing dynamics with dedicated and detailed attention.

The session invites papers with a critical stance towards archaeology's possibilities, responsibilities, and shortcomings when supporting communities' heritage practice to envision and develop inclusive futures. Topics may include (but are not limited to) the following: community/indigenous heritage and resource extraction; ex-mining regions facing waning investment while coping with the ecological aftermath of extraction; post-conflict regions seeking global tourism markets amidst cultural and ecological devastation legacies; mobile/transient/diasporic heritages. Papers with a global and/or European focus are welcomed.

### ABSTRACTS

1

#### TRANS ADRIATIC PIPELINE IN SOUTHERN ITALY: THE STORY OF A COMPLEX RELATIONSHIP BETWEEN HERITAGE, COMMUNITY AND LARGE-SCALE DEVELOPMENT

**Abstract author(s):** Iacono, Francesco - Faccio, Vittoria (Dipartimento di Storia Culture Civiltà, University of Bologna)

**Abstract format:** Oral

After several years of protests, oppositions and intense social conflict, in 2016 the Trans Adriatic Pipeline (TAP) joint venture company landed on the Adriatic coast of Apulia, in Southern Italy. The facility transports Azerbaijani gas to Europe, and the start of its construction marked a turning point for inhabitants of the small town of Melendugno, mostly devoted to agriculture and tourism. The top-down imposition of the pipeline, from both National and International actors, resembled an actual invasion to the eyes of the numerous members of the community. Locals were mainly concerned with the consequences the pipeline would have had on the landscape. Particularly olive trees, of great symbolic significance for Apulia, were protected, and campaigners did not hesitate to stand against excavators. Regardless of mitigation attempts, the fragile balance of the territory has been perceived as threatened by the presence of the infrastructure, as the portion of land crossed by TAP is representative of an extremely rich cultural

landscape, and the general area has been inhabited from early prehistoric times to present (an archaeological survey qualified the area as of high archaeological risk).

This paper will explore the presence of the pipeline in Salento from a range of different perspectives, with the purpose of assessing the complex relationship existent between heritage, community, and large-scale development. It will discuss the ethical stance of local archaeologists, addressing at the same time the overarching issue of environmental justice in a highly contested territory.

## 2 UNARCHIVED STORIES AND ALTERNATIVE PERCEPTIONS OF SULTANAHMET ARCHAEOLOGICAL PARK, A UNESCO WHS

**Abstract author(s):** Yalman, Nurcan (Nisantasi University Istanbul Dept of History) - Cana, Sinan (Nişantaşı University Dept of Tourist Guiding)

**Abstract format:** Oral

Sultanahmet Archaeology Park is a UNESCO World Heritage Site since 1985 and one of the most visited tourist destinations in Turkey. The primary importance of this area is that it was the administrative center of the capital of both the Byzantine and Ottoman Empires which has made it one of the focal points of socio-global attention. While this place never loses its central characteristics, it also preserves its feature of being a stage where political statements are reflected. Therefore, the place contains significant cultural stratification.

Over the last 35 years, it has increasingly become a tourist destination. Thus, the region has continued its evolution due to the tourism economy, its physical shape, availability of the facilities that have changed and developed, such as new hotels, hostels, restaurants, bars, and souvenir shops.

In this paper, we would like to present the preliminary results of our research which has focused on the local communities whose lives are associated with Sultanahmet Archeological Park. Our research aim is to explore, what other histories exist in the memory of the society living today that is overshadowed by those iconic and ostentatious historical buildings of the region such as Hagia Sophia, Blue Mosque, and Topkapı Palace. The diversity of individual and communal stories that have been overshadowed by those will be presented.

## 3 CHANGING POLITICAL PERCEPTIONS OF THE SULTANAHMET ARCHAEOLOGICAL PARK, A UNESCO WHS

**Abstract author(s):** Cana, Sinan - Yalman, Nurcan (Nişantaşı University)

**Abstract format:** Oral

While the Sultanahmet Square is a tourism hotspot of today, it served as a political foci for millenias. Due to this the square as it is known today was changed numerous times according to the political climate or the ruling regime, be it an empire or a political party. The heritage and the culture of the square changed accordingly, and the people followed suite. The square itself houses the ancient (now ruined) Roman Palace and the Topkapı Palace which where the ruling seats of the former empires, both Byzantine and the Ottoman Empires respectively

This research focuses on the changing political importance of the square and its cultural effects on the people living in and around Sultanahmet Archeological Site. Their shared stories and the written history will be analysed using interviews. Tumultuous changes in the political climate of the region opens up many questions relating to the history and heritage of the region.

## 358 CAN YOU SEE ME? PUTTING THE 'HUMAN' BACK INTO 'HUMAN-PLANT INTERACTIONS' [ARCHWILD]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Martin Seijo, María (Universidad de Cantabria) - Mooney, Dawn Elise (University of Stavanger) - Berihuete Azorín, Marian (IPHES-Catalan Institute for Human Palaeoecology and Social Evolution) - Ciampagna, María Laura (CONICET-Universidad Nacional de la Plata)

**Format:** Regular session

Environmental archaeology has undergone significant development and consolidation in recent decades, integrating a growing variety of proxies. Our knowledge about past landscapes and plant exploitation has greatly expanded. It is time now to go further and reintegrate humans as research subjects in archaeological and archaeobotanical studies of human-environment or human-plant interactions. Archaeological discussions generally acknowledge the traces left by humans on the landscape, and their botanical knowledge, skills, and technological know-how – but the agency of individuals and communities is often poorly integrated in these narratives. Although we acknowledge the difficulties inherent in this approach when studying plant remains from the archaeological record, it is crucial at this point to reflect on the human dimension of people-plant interactions. In this sense, the main aim of this session is to present works that combine studies of plant exploitation with more human perspectives, in order to open a discussion

on the possibilities and limitations of this approach and explore the current state of the art. We welcome contributions on practical and theoretical approaches from archaeobotany, anthropology, ethnoarchaeology and experimental archaeology dealing with this topic.

## ABSTRACTS

### 1 PERCEPTIONS AND PRACTICES, AN OVERALL STUDY OF THE HUNTER-GATHERERS FROM PATAGONIA ARGENTINA AND PLANT INTERACTION

**Abstract author(s):** Ciampagna, María (CONICET-Facultad de Ciencias Naturales. Universidad Nacional de La Plata)

**Abstract format:** Oral

The main aim of this presentation is to elucidate the practices of gathering and postharvest processing wild plants that performed hunter-gatherers on the north coast of Santa Cruz, Patagonia, Argentina, in the late Holocene. An overall study of archeobotany remains, ethnohistorical sources, ethnobotanical interviews and experimental replications were proposed. The methodological analyses are specific for each field. The analyses of plant macro and microremains recovered from various archaeological sites, pot fragments and grinding tools were made following these protocols (Capparelli et al. 2015a, Ciampagna et al. 2021, Mercader et al. 2017, Piqué et al. 2021). Ethnohistorical sources from XVII to XIX centuries were performed behind a critical view. An ethnographic qualitative methodology with flexible design was adopted; and experimental studies were executed to reproduce the patterns which were inferred in the last sources. Due to the integrity of these results, categories like sensory perceptions and foodways are put in dialogue with field work, theory and reflexivity. This exercise would improve our analytical and theoretical tools to look for native categories and comprehend the "ways of inhabiting" of these hunter-gatherer societies.

### 2 FROM THE ARCHIPELAGO TO THE STEPPE IN CENTRAL-WEST PATAGONIA: PLANTS AND HUNTER-GATHERERS IN THE AISÉN REGION, CHILE

**Abstract author(s):** Belmar, Carolina (University of Chile) - Méndez, César - Nuevo-Delaunay, Amalia (CIEP) - Reyes, Omar (Univeristy of Magallanes; CIEP) - Farias, Ivonne - Gómez Díaz-Tendero, Macarena - Gutiérrez, Valentina (Fondecyt 11180388)

**Abstract format:** Oral

The study of the plant/human interactions in the steppe, forest, and channels of Central-West Patagonia (Aisén Region) provides an important perspective for achieving a better understanding of behaviors developed by the hunter-gatherer groups who inhabited these environments in the past. Introducing an archaeobotanical view contributes and enhances the discussions related to the use of plants since it considers their multiple properties, various usable parts, and seasonal cycles, all of which implies recognizing the profound knowledge of plants by their users. Hence, we can study various aspects of the hunter-gatherer way of life such as: a) characteristics of the procurement behaviors of plants, b) identifying seasonality of occupations, and c) recognizing the technology involved in obtaining and/or processing plants.

In this contribution, we present a synthesis of the archaeobotanical analyzes of macro and micro remains from sixteen archaeological sites distributed along six Andean valleys located in steppe and forest environments, and from eleven sites from the Chonos archipelago of the Pacific coast, all in the Aisén Region. These samples cover a time range from the Pleistocene-Holocene transition to the end of the Holocene. Addressing the environmental and temporal variability is fundamental in studying the trajectories of plant use by these groups. We integrate the study of plant macro and micro remains to obtain a comprehensive view of the use of plants. On the one hand, recognizing plants in their primary contexts -such as residues in lithic artifacts, in human dental calculus, or in sedimentary features (i.e., hearths)- links plants to the technology and activity areas within the sites. On the other hand, the scattered material is indicative of the discard behaviors within the inhabited contexts.

ANID FONDECYT 11180388, ANID FONDECYT 1180306, ANID FONDECYT 1210042, ANID FONDECYT 1210045, ANID Regional R20F0002.

### 3 WOOD FOR WEAPONS: CAN WE SEE CHILDREN IN SCALED ORGANIC HUNTING TOOLS?

**Abstract author(s):** Milks, Annemieke (University of Reading, Department of Archaeology) - Lew-Levy, Sheina (Max Planck Institute for Evolutionary Anthropology)

**Abstract format:** Oral

As the name suggests, the Stone Age archaeological record is dominated by stone, and to a lesser extent bone technologies. In contrast, wood is rare (but there!). The Palaeolithic in particular suffers from what April Nowell calls 'the tyranny of the tangible'. Organic evidence of Palaeolithic children comes in the form of personal ornaments such as shell beads, possible toys in the form of figurines, and functional tools and toys including weapons. This presentation will review the tentative evidence that hunter-gatherer children of the deep past, possibly as early as the Middle Pleis-

tocene, made and/or used scaled weapons that were manufactured either entirely from organics or with significant organic components, including wood. Although the question of whether children's toys and tools were made more often from wood than adult material culture is poorly understood, ethnographic evidence does support the suggestion that early learning of hunting technologies may have involved the use of expedient toy weapons and functional scaled-down wooden hunting tools. Weapons therefore provide a lens through which to 'see' human engagement with wood as a raw material in the deep past.

#### 4 **LATE MESOLITHIC BIRCH BARK LAYERS FROM OSTEEL, GERMANY - A PLACE TO 'SIT AND WATCH' OR TO 'STORE AND HIDE'?**

**Abstract author(s):** Mahstedt, Svea - Siegmüller, Annette - Wolters, Steffen (Lower Saxony Institute for Historical Coastal Research -NIhK)

**Abstract format:** Oral

A birch bark layer on the edge of a shallow sandy ridge that projects far into a vast wetland seems to belong to late Mesolithic traces of human activities. It was found close to the site of Osteel in the coastal zone of Northwestern Germany, which was known from a rescue excavation in the 1990ies and characterized by a pit structure that was radiocarbon dated to the 6th millennium calBC by charcoal remains. Covered by mid-Holocene bog peat and clay from a Medieval marine transgression the birch bark was protected from decomposition and agricultural disturbance. For the bark finds the radiocarbon dating led to an age from the early 5th millennium calBC. They seem to have been laid out on a sandy soil that was already influenced by a rising ground water level. In this presentation the birch bark finds are integrated into the reconstruction of the surrounding landscape and put into relation to other potential traces of human activities in the landscape as the mentioned pit structure and a layer of burnt shrubs. An interpretation as bark floor or as a storage for later use in a wet milieu is discussed.

#### 5 **SEEDS FROM DIFFERENT PERSPECTIVES: INTERPRETING PLANT REMAINS FOUND IN SPECIAL CONTEXT FROM LATE NEOLITHIC HUNGARY**

**Abstract author(s):** Mervel, Máté (Eötvös Loránd University, Institute of Archaeological Sciences, Budapest)

**Abstract format:** Oral

Szegvár-Tűzköves is located in the southern part of the Great Hungarian Plain, and it represents one of the most significant Late Neolithic archaeological sites of the country. Due to the clay anthropomorphic figurines found here, the site is also well known to the general public in Hungary. The aim of this paper is to present and interpret the results of the archaeobotanical analysis carried out on two macrobotanical samples from Szegvár-Tűzköves. These samples were collected from two intact vessels that were found on the floor of a burned down house. The vast majority of the carpological remains are cereal grains. Among cereals, the most dominant crop is naked wheat, followed by barley and emmer. A small amount of blackberry seeds was also identified. This assemblage of cereals is rather unusual in the Late Neolithic of the region, and the context of the samples also imply to consider that their deposition did not result from everyday actions. Therefore, the plant remains do not reflect solely on their production and consumption, but also on a special use of plants and the ideas that were associated with these cultural practices. This paper will interpret the results of the archaeobotanical analysis beyond the economic significance of plants and try to explore the possibilities of an interpretation that takes into consideration other cultural factors in order to determine why these specific, less prevalent species were selected to be exposed in such a peculiar context.

#### 6 **CORDAGE EXPERIMENTAL PRODUCTION. EARLY NEOLITHIC (5324-4977 CAL BC) RAW MATERIALS AND TECHNIQUES USED IN LA DRAGA (GIRONA, SPAIN)**

**Abstract author(s):** Herrero-Otal, María - Romero-Brugués, Susagna - Piqué Huerta, Raquel (Autonomous University of Barcelona) - Homs, Anna (Independent researcher) - Palomo, Antoni (Museu d'Arqueologia de Catalunya)

**Abstract format:** Oral

Cordage is related to daily life purposes and have played an important role in all societies. Due to the lack of preservation in the most of archaeological contexts, the knowledge of these technologies is limited. One of the main questions is how raw material determine the type and production processes. Moreover, raw materials properties may also have to do with the properties of the final ropes.

To test the raw materials used in the Early Neolithic, the cordage assemblage from La Draga (Girona, Spain; 5324-4977 cal BC) have been systematically studied to infer if the raw materials may influence in the variability of manufacturing processes and cords typology.

The Early Neolithic site of La Draga is a dwelling settlement located in the north-eastern part of the Iberian Peninsula. It has provided one of the oldest sets of vegetal fibres-based objects from southern Europe preserved in waterlogged conditions, which have been systematically studied. A wide variety of manufacturing techniques were identified, and monocots and dicots families were determined as raw materials in fibre-based productions. The plant availability

probably was an important factor for taxa selection but the use of specific families with particular mechanical and physical properties may bear on the technique used in production.

In this work, we present the results of an experimental reproduction of the cords recovered in La Draga, considering both their manufacturing processes as well as the raw material used and their properties.

## 7 ASSESSING THE ROLE OF WOODEN VESSELS, BASKETRY, AND POTTERY AT THE EARLY NEOLITHIC SITE OF LA DRAGA (BANYOLES, SPAIN)

**Abstract author(s):** Bertin, Ingrid (Departament de Prehistòria - Universitat Autònoma de Barcelona; CEPAM - Université Côte d'Azur; ESR ChemArch Network) - Romero-Brugués, Susagna - Tzerpou, Evdoxia - Morera, Núria - Piqué, Raquel (Departament de Prehistòria - Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The receptacles made of wood or plant fibres are rarely preserved in the archaeological context. As a result, the work involved in their production and their functions remains invisible with respect to other receptacles commonly better represented, as it is the case of pottery. The early Neolithic site of La Draga (5300-4900 cal BC), located at the shore of the Lake Banyoles (Spain) has provided several receptacles made of wood and plant fibres besides a significant amount of ceramic remains. The goal of this presentation is to provide an overview of the receptacles of La Draga site in order to assess the importance of organic receptacles in a context where pottery technology is well known and employed for several functions. The importance of the different types of vessels and receptacles in the context of this farming society is assessed through the analysis of the number of remains, their sizes and shapes, as well as with their spatial distribution. Moreover, the process of production of the different types of vessels is analysed in order to highlight the technologies involved and the organization of work. The good preservation of the organic receptacles allows focusing on their comparison in order to generate hypothesis of their function.

## 8 FINDING HUMAN AGENCY IN THE 0.5MM ARCHAEOBOTANICAL FRACTION

**Abstract author(s):** von Baeyer, Madelynn (Max Planck Institute for the Science of Human History)

**Abstract format:** Oral

Beginning in 2022, the Çadır Höyük Excavations in central Anatolia will incorporate an ethnographic component to the archaeological excavations. After almost 30 years of research at Çadır Höyük, this expansion of research is notable. This methodological broadening can be traced to a number of factors, not the least of which is my dissertation research on the Late Chalcolithic archaeobotanical record at Çadır Höyük. My research was able to identify a specific shift in animal provisioning that I believe is linked to climate change risk management strategies during the second half of the 4th millennium BCE (ca. 3600–2900 BCE). The ability of archaeobotanical research to highlight how humans in the past mediated climate change led to the adoption of a new research goal: to integrate past and present agricultural data to identify successful solutions for mediating climate change in central Anatolia that current farmers can follow.

My oral presentation will discuss the elements of my dissertation research that allowed me to emphasize human behaviors and how that small emphasis led to this shift in the overall approach to research at Çadır Höyük. I will also discuss outside influences that support this methodological shift and perceived difficulties in applying this approach to other research projects.

## 9 HANDS, TOOLS, AND SKILLS: INTERPRETING ARCHAEOLOGICAL PLANT-BASED CRAFTS FROM THE PERSPECTIVE OF ARTISANS

**Abstract author(s):** Martin Seijo, Maria (Universidad de Cantabria)

**Abstract format:** Oral

Plants provided essential raw materials for crafting, such as wood, bark, fibres, vines, saps, and resins amongst others. This presentation summarises recent research on archaeological plant-based crafts from northern Iberia recovered from contexts dated between Bronze to Iron Age by reclaiming crafters experience as a framework for interpreting this evidence. Hands, tools, skills, raw materials, and plants meet and interact in plant crafting. Ethnobotanical and ethnographic research has attested that crafting plant materials requires long and repetitive processes which involve from practices of tending and managing plants to obtain adequate raw materials, to shaping, and crafting wood and fibres. The analysis of plant-based material culture preserved by charring, mineral replacement and waterlogging by combining archaeobotany and morpho-technological analysis, and the compilation of ethnobotanical and ethnographic evidence has provided new insights in the botanical knowledge, technological know-how and specific skills of ancient artisans, and about the complex entanglements that were established between woodlands, scrublands, orchards, plants, and humans.

## HUMAN-ENVIRONMENTAL INTERACTIONS IN THE MIDDLE SURA RIVER REGION (RUSSIA) IN THE EARLY IRON AGE AND THE EARLY MIDDLE AGES

**Abstract author(s):** Salova, Julia (-) - Vyazov, Leonid (-) - Ponomarenko, Elena (University of Ottawa) - Ershova, Ekaterina (-) - Utiagulova, Rimma (-) - Myasnikov, Nikolai (-)

**Abstract format:** Oral

Multidisciplinary studies in the Middle Sura region aimed to analyze land-use dynamics in a floodplain area at the former confluence of the Sura and the Malaya Sarka rivers. The stratigraphic analysis of the alluvial sediments and buried soils revealed a series of climatic cycles dated to the first millennium BCE and the first millennium CE, when the floodplain was periodically available for various types of economic development, as revealed by the macrofossil and pollen analyses. The earliest buried soil is dated to the Early Iron Age (~700 BCE - 200 CE) and associated with the pine and oak forests used as forest pastures. There are no markers of permanent occupation of the floodplains during this period; the population developed high floodplain terraces and adjacent riverbanks. On the contrary, after ~200 CE the floodplains, covered by broadleaf forest, became the most favorable area for settlement. The territory was partially cleared for slash-and-burn agriculture, as evidenced by the soil stratigraphy and mud-coated charcoal. That resulted in a gradual deforestation; areas of grasslands appeared here not later than 300 CE. The local population cultivated cereals (barley, wheat, and millet) and practiced fishing. After 450 CE floods drastically intensified following the increase in runoff. The sites post-dating that time relocated onto high river terraces and the pine and oak forest recovered in the floodplain. The new stage of low flooding dates to the Medieval time (after 750 CE), the soils of this period are of a grassland type and have traces of subsequent tillage in permanent plow fields. The traced dynamics of the water fluctuations in the Sura floodplain are asynchronous with the data from the other studied regions of the Russian Plain, which raises the question of a relationship between the availability of floodplains for economic development and migration processes.

## HUMAN AGENCY FOR WOOD FUELING THROUGH THE ANDALUSIAN WRITTEN SOURCES AND ARCHAEOBIOLOGY

**Abstract author(s):** Celma Martínez, Mireia - Hernández Robles, Alicia - Eiroa Rodríguez, Jorge A. (University of Murcia)

**Abstract format:** Oral

There is a need to revise gendered human agency implied in the wood fueling cycle –acquisition, transformation, transport, and trade, as the basis for the socio-economic analysis in the Andalusian chronological phases. The public dimension of this economic activity most affects transport and trade and was regulated in the hisba treaties – Yahyà ibn 'Umar, Muhammad Ibn al-Munasif, Ibn 'Abd al-Ra'ūf, al-Saqāṭī al-Mālaqī, and Ibn 'Abdūn.

There was a particular prohibition of carrying fuelwood on narrow roads. Trading this raw material was only permitted in the habilitated areas like wide squares, the riverside, and outside the city walls, and banned the wood wandering trade in the streets and the zocos in the cities. All these are constants regulations that were unchanged despite geopolitical changes. We have not found direct information on acquisition territories, coal and firewood production particularities, nor which gender was associated with the different fuelwood and charcoal production stages, distribution, and trade in the written sources.

We hypothesize the essential part of the fuelwood's cycle production, distribution, and trade was an invisible activity for the citizens or undervalued. The real important thing was the raw material and its continuous supply to the cities but not the human agency that develops the activity and makes it happen. Considering the demanding work conditions and minimal reference in the sources of this activity, it could be involved as a part of the immersed household economy because fueling is only the means to achieve actual artisanal and maintenance purposes.

The supply of charcoal and firewood to the cities would require a long chain of work and implied hundreds of people in each territory. However, much of this organization have must be interpreted exclusively from archeobiological sources. Here we present an input-output proposal from the gendered human agency interpretation.

## WOOD UTILISATION STRATEGIES IN THE NORTH ATLANTIC (870-1500 AD)

**Abstract author(s):** Guðmundsdóttir, Lísabet (Institute of Archaeology Iceland; University of Iceland)

**Abstract format:** Oral

Wood was a vital raw material for the Norse in the North Atlantic. However the availability of this material varied due to geographical position and different environmental conditions. While large parts of Western Norway were forested and could sustain all timber need of the Norwegians. The inhabitants of Iceland and Greenland had to substitute the native wood resource by import and driftwood. Recent studies indicate that driftwood was the main substitute. Acquiring this basic raw material, however was problematic due to unpredictable quantities and long distances journeys needed secure it. Hence acquiring timber as and when needed was not always an option. The more widely available Norwegian wood resources were, on the other hand, often found locally and thus a commodity more

readily available at predictable quantities and of higher species diversity. Iceland and Greenland shared a material culture very similar to that of Norway even though wood procurement strategies were profoundly different.

In this talk I will compare contemporary wood assemblages from Norse Greenland, Iceland and Western Norway (870-1500AD). I will discuss if qualities and the shape of the raw material effected how it was shaped and utilised. Furthermore, I will address how these societies seem to have dealt with varying degrees of predictability connected to their wood sourcing and wood utilisation strategies.

### 13 **CHOOSE YOUR OWN ADVENTURE: USING MICROBOTANICAL ASSEMBLAGES TO INTERPRET HUMAN-PLANT RELATIONSHIPS AND CHOICES IN PICTLAND**

**Abstract author(s): Prado, Shalen (McMaster University)**

**Abstract format: Oral**

Archaeobotanical data allows us to examine how past human communities, and individuals within these communities moved through and experienced their world. Often this data is used for reconstructing past landscapes to interpret climate, environmental cycles, and resource availability. While such investigations and reconstructions are valuable, aspects of being a human within these environments are often sidelined. Indeed, it is challenging to apply archaeobotanical data to discussions centred on human agency; however, such applications are far from impossible as evidenced through several recent studies (e.g., Delhon et al. 2020; Krath Helweg 2020). In this paper, I discuss the application of phytoliths, starch grains, and other microscopic biological residues to interpret human choices and human-plant relationships. Using data from my doctoral research I address human movement, seasonality and decision making through microbotanical and microalgal residues recovered from early medieval archaeological sites in north eastern Scotland. I will discuss how microbotanical residues (e.g., phytoliths) contribute to our understanding of movement, seasonality, architectural choices and animal care from several prominent archaeological sites (e.g., Burghead, Mither Tap). I argue that human-plant relationships at the regional (inter-site) and community (intra-site) scales can be teased out using these microscopic plant proxies and can reflect the choices and experiences of past human communities. Overall, this paper will present the opportunities afforded by microbotanical data to reflect the human aspects of human-plant interactions beyond the purposes of resource exploitation, with an emphasis on northern communities. Lastly, I examine the taphonomic and diagnostic limitations of using microbotanical residues to assess human-plant relationships.

### 14 **ENVIRONMENTAL RESOURCES MANAGEMENT AND COMMONS: CRITICAL CONSIDERATIONS ON THE FIRST RESULTS OF ARCHAEOBOTANICAL INVESTIGATIONS AT PORT DE ROUET (LLO, FRANCE)**

**Abstract author(s): Santeramo, Riccardo - Menozzi, Bruna (Università degli Studi di Genova) - Rendu, Christine (FRAMESPA Université Toulouse Jean Jaurès) - Moneta, Valentina - Molinari, Chiara - Stagno, Anna - Bizzarri, Giulia (Università degli Studi di Genova)**

**Abstract format: Oral**

The paper aims to critically discuss the first results of the archaeobotanical study of the site of Llo (Cerdagne, French Pyrenees), which include excavations, landscape archaeological investigation as well as anthracological and palynological analyses. Investigations were carried out in the framework of a research devoted to the reconstruction of environmental resources management practices as tools to understand ownership, possession, jurisdiction and their changes through time. Research benefited of previous rescue archaeological investigations in the same area (now occupied by a thermo-solar power plant), which allowed to deepen the understanding of changes in practices in the long term. While landscape archaeology allowed to reconstruct the changes in space organisation, and in particular the presence of lynchets and possible temporary cultivation sites inside an historical wooded meadow pasture. Palynological investigation in two soil sequences showed a correlation between the arboreal vegetation dynamics and the changes in the percentages of the micro charcoals, possibly indicating changes in landscape management, especially in terms of woodland clearance strategies. The study of the charcoals retrieved during the excavations in three hearts and three pit fills also allowed to gain some initial insights into the past management of the local resources, especially with regards to the selection and use of wood. Moreover, the observation of some taphonomic and dendrological features (tangential resin-duct rows) reveals the possibility to identify practices related to the use of controlled fires, that could be related to cycle of the activation and management of environmental resources.

The final aim of the paper is to discuss the meaning of the environmental archaeological evidence, not only in term of environmental resources management, but also in their meaning of social occupation of the space.

## MILLENNIAL TREES AND DECIDUOUS HUMANS. DIFFERENT ECO-GEOGRAPHIES BUT SAME STORIES: A COMPARISON BETWEEN ARBOREAL BIOCULTURAL HERITAGE IN SICILY AND MOZAMBIQUE

**Abstract author(s):** Ferrara, Vincenza (Department of Archaeology and Ancient History, Uppsala University; Department of Human Geography, Stockholm University) - Gota, Pascoal (Department of Archaeology and Ancient History, Uppsala University)

**Abstract format:** Oral

Humans and plant communities have been entangled for millennia. Accumulated knowledge, practices and experiences related to the ecology of plants have allowed us to adapt to local environments, and to re-adapt such body of knowledge to new physical contexts, customary norms and different land use practices.

A quite unique case of these entanglements is the biocultural heritage emerging from the relationship between long-living millennial trees and deciduous humans. A relationship entirely based on the extreme resilience capacity of these plants and the human intentional ecological management within a temporal perspective projected over the long term.

Bringing together results from ongoing work on different eco-geographies united by same dynamics, in this paper we tell the stories of living ancient trees and local communities, with a special focus on olive agroforestry systems on the island of Sicily and culturally protected forests in Mozambique.

Within the overall framework of historical ecology, we adopt a transdisciplinary approach that combines ecological memory from oral histories and eco-geography reconstructions in selected case study areas, with the overall scope to better understand key features of arboreal biocultural heritage and the processes behind its endless formation. The results obtained allow us to look at human-trees entanglements with new eyes, while arguing on the function of residents and communities as designers and stewards of local biodiversity, as well as on their central role in building more integrated approaches to biocultural heritage conservation.

### A. PLANTS IN BURIALS: THE ROMAN IRON AGE ĪLES MEŽS BARROW CEMETERY (SOUTHERN LATVIA)

**Abstract author(s):** Guscika, Elina - Stivrins, Normunds (University of Latvia, Institute of Latvian History)

**Abstract format:** Poster

Palaeobotanical evidence in the context of burials in the Eastern Baltic region is an understudied topic, raising question about the use of plants in burial practices. The Roman Iron Age barrow cemetery of Īles mežs provides some insight into this question.

Īles mežs cemetery in southern Latvia, with 27 barrows, was discovered in 1938. Archaeological excavation was carried out in 1940 by Pēteris Stepiņš and in 2014 by Elina Guščika and Andrejs Vasks. In total, eight barrows have been excavated, which were of various size (5–8 m diameter, 0.3–1 m height). The barrows contained one or two inhumations within a stone circle created on the subsoil. According to the type of burial and artefact typology as well as radiocarbon (AMS) dating, the excavated barrows are from the first part of the Roman Iron Age (1st–3rd century AD).

During the recent excavations, two partially undisturbed burials were discovered in one of the barrows. Sediment samples were taken from different layers of the barrow and from undisturbed areas close to the burials for palaeobotanical analyses (pollen and non-pollen palynomorph analysis by Normunds Stivrīņš). This revealed a wide range of human-related pollen (*Secale cereale* [rye], *Triticum* [wheat], *Rumex acetosa* [herb sorrel], *Cannabis sativa* [hemp] and *Filipendula* [meadowsweet]) specifically under the skull remains of burial 1. The recorded pollen composition tentatively suggests the use of specific plants in Roman Iron Age burial practices in the Eastern Baltic region.

The presentation and abstract were prepared within the frame of the Fundamental and Applied Research Project funded by the Latvian Council of Science No. lzp-2021/1-0163 "Burial practices in the landscape: present-day Latvia in the Iron Age (AD 1–1200)".

## BORDERLANDS, INTERACTION ZONES, AND BOUNDED SPACES IN THE PREHISTORIC EASTERN MEDITERRANEAN: INTERDISCIPLINARY STUDIES IN THE RECONSTRUCTION OF CONNECTIVITY

**Theme:** 2. [Re]integration

**Organisers:** Menelaou, Sergios (Archaeological Research Unit, University of Cyprus) - Oğuzhanoğlu, Umay (Department of Archaeology, Pamukkale University) - Kouka, Ourania (Archaeological Research Unit, University of Cyprus)

**Format:** Regular session

In recent years the global challenges in mobility dynamics and permeability of modern nation state borders, particularly obvious in the eastern Mediterranean, have revived archaeological discussions on the reconstruction of connectivity, mobility patterns, and the definition of material culture transformations along marginal zones, borderzones, or simply bounded spaces. However, these terms are often used interchangeably and under biased interpretations to denote complex phenomena and socio-cultural or political circumstances that go beyond simply the natural and

physical conditions of geographical limits. In particular, there is a gap in archaeological knowledge between developing regional and interregional patterns in the examination of large-scale circulation of artefacts and the identification of such 'in-between' areas, where phenomena of hybridisation and creativity take place in the expression of ethnic and cultural identity. Such transformations are especially complex and require multi-level, interdisciplinary approaches in islandscapes and coastscapes, where technological and ideological/conceptual innovations are explained under the influence of core-periphery models.

This session aims to bring together contributions from various geographical contexts in the eastern Mediterranean, presenting multiscalar and theoretically informed projects, with a special emphasis in the Aegean basin, to tackle:

- the definition of cultural borders;
- patterns of bilateral interaction and integration of 'foreign' materials;
- the transmission and transfer of goods and ideas and identity negotiation;
- the past mobility of people during the later prehistory.

We particularly invite papers developing theoretical frameworks with specific case studies, addressing the impact of modern geopolitical borders and biases in our definitions of archaeological frontiers particularly in regions with long-term or ongoing conflicts, and the fluidity of such concepts and application of bottom-up micro-scale approaches in understanding shifting traditions and relevant effects in shaping interaction borderzones.

## ABSTRACTS

### 1 RETHINKING PREHISTORIC BORDERS, CHALLENGING MODERN NARRATIVES: ISLANDNESS, SENSE OF PLACE, AND CONNECTIVITY IN THE EAST AEGEAN INTERFACE

**Abstract author(s):** Menelaou, Sergios (University of Cyprus)

**Abstract format:** Oral

The geo-cultural region of the eastern Aegean, including the off-shore Greek islands and the western Anatolian (Turkish) coastline, is of crucial significance for the investigation of theoretical issues related to connectivity, the transmission of knowledge, mobility of people, and how these are expressed in the material culture. The East Aegean 'archipelago', with islands lying in strategic locations and being central to seaborne communication, has been characterised as a borderland, frontier, or in recent literature as contact zone between the central Aegean and inland western Anatolia. Various terms are often used interchangeably in such in-between areas with socio-politically and geographically complex historical trajectories, which often bear negative connotations. However, archaeological borders are neither simply natural conditions nor geographical zones of structured spaces. Instead, they should be perceived in archaeological narratives as dynamic, where identity negotiation, technological transformations, and cultural influences are constantly redefined.

This paper explores how the micro-region(s) of the East Aegean islands, with emphasis on Lemnos, Lesbos, Chios, and Samos, formed and transformed separate maritime small worlds with their opposite Anatolian perai, using pottery as proxy to reconstructing connectivity patterns during the Early Bronze Age. Building on previous and current analysis, this endeavour takes into consideration how shifts in archaeological narratives are also affected by biases in modern political borders and changes in intellectual trends. It is argued that the islands had multiple spatial, cultural, and temporal dimensions in the context of economic activities or social negotiation and held a strong visual meaning as part of the cognitive horizon for the opposite mainland. The East Aegean islands are, then, examined as gateway hubs of interaction, encompassing various meanings established through social memory and knowledge of existing terrestrial and maritime routes, where the sea acts as a unifying medium.

### 2 RINGS OF THE SAME CHAIN? RECONSTRUCTING CULTURAL IDENTITIES IN THE MARITIME LANDSCAPES OF THE EAST AEGEAN ISLANDS AND WESTERN ANATOLIA

**Abstract author(s):** Kouka, Ourania (University of Cyprus)

**Abstract format:** Oral

The East Aegean islands and the littoral of Western Anatolia represent a geographical borderzone between Europe and Asia. The proximity of the East Aegean islands with the Western Anatolian coast resulted their colonization during the 6th millennium BCE by human groups deriving from the Anatolian peninsula. Archaeological fieldwork since the late 19th c. on Western Anatolia and since the early 20th century on big and small islands of the East Aegean resulted a more intensive habitation in the Chalcolithic and the Early Bronze Age, that turned this area to one of the most interesting maritime landscapes of the Prehistoric Aegean. Despite the bilinguality in the nomenclature of chronological terminology, modern approaches to old evidence and recent scientific analysis of archaeological and palaeoenvironmental materials immensely enrich discussions on cultural aspects of the Aegean and the Western Anatolian Prehistory, such as insularity, materiality, identity, diversity, mobility, trade, connectivity, technology (e.g. ceramic, metal, textile), social practices, ranking, early urbanism, etc. This paper aims to discuss the aforementioned aspects based primarily on the evidence from extensively excavated and published sites on big and smaller East Aegean

islands and at the coast of Western Anatolia for reconstructing cultural identities, pinpointing diversities, and tracing dynamics and patterns of regional and interregional interaction in this Aegean landscape.

### 3 **A NODE BETWEEN THE MEDITERRANEAN AND THE AEGEAN: SOUTHWEST ANATOLIA IN EARLY AND MIDDLE BRONZE AGES**

**Abstract author(s):** Oguzhanoglu, Umay (Pamukkale University)

**Abstract format:** Oral

The Southwest Anatolian coast has usually attracted the interest of researchers focusing on the Cycladic and Minoan Bronze Age and their impact over the Aegean, especially due to the former's influences in the 3rd millennium and the latter's influences in the following phase. The majority of these researches have emphasized the circulation patterns and transmission of Cycladic and subsequently Minoan-influenced artifacts, technologies, and ideas to Anatolia or vice versa. In archaeological projections of the World Systems Theory to the Bronze Age, Sherratt and Sherratt (1998) stated that a new Near Eastern consumption pattern reached the West, especially following the Mediterranean coast of Anatolia. The elite's desire to access luxurious resources was a major motive of this process. Accordingly, Southwest Anatolia, which forms the westernmost part of the north Mediterranean route, is expected to have received an eastern influence before, or at least at the same time with, the Cycladic and Minoan. However, the discovery of the Early Cycladic cemetery in Iasos or the whole Minoan Bronze Age set (pottery from Crete, local wares in Minoan style, loom weights, Linear A inscriptions, frescoes, etc.) in Miletos turned the attention of researchers to the western connections. The ethnicity of the rulers, the political and social management, the craftsmanship, and the role of craftsmen in Southwest Anatolia have been discussed over the same "imported" Cycladic and Minoan package. But what were the immanent characteristics and dynamics of the Bronze Age communities of Southwest Anatolia? What were their motives for involvement in the long- and short-distance networks? This presentation aims to evaluate the pre-Late Bronze Age dynamics of Southwest Anatolia from a micro-scale perspective, followed by a discussion of the region's role not only in the Aegean but also in the entire Mediterranean, taking into account the latest archaeological research.

### 4 **AEGEAN-ANATOLIAN CULTURAL FUSION: DYNAMIC PATTERNS OF CONNECTIVITY, TECHNOLOGY TRANSFER AND APPROPRIATION AT ÇEŞME – BAĞLARARASI DURING THE MBA/ LBA TRANSITION**

**Abstract author(s):** Sahoglu, Vasif (Ankara University) - Kiriati, Evangelia (British School at Athens) - Goodmann-Tchernov, Beverly (University of Haifa) - Çayır, Ümit (Sivas Cumhuriyet University) - Gündoğan, Ümit (Batman University) - Velters, Melissa (University of Salzburg) - Choleva, Maria (British School at Athens) - Maltas, Tom (University of Oxford) - İncirli, Mustafa (Ankara University)

**Abstract format:** Oral

Çeşme – Bağlararası, an ancient coastal settlement located at the westernmost tip of Urla Peninsula (Izmir, Turkey) within view of Chios Island, was excavated between the years 2002-2005 and 2009-2019 by the Izmir Region Excavations and Research Project (IRERP-Ankara University). Here, we present results from this interdisciplinary research that aims to shed light on the site's transformation during the first half of the second millennium BC from a local settlement into a regional borderline hub connecting the Aegean and Anatolia. The combined results of a series of material culture studies from the site have begun to reveal important changes between levels CB 2 and CB 1 (contemporary with MMIII and LMIA, respectively). These changes include new cultural practices and technologies associated with pottery, but also textile manufacture and crop cultivation. The transfer of new technologies, as well as imported types of material culture, mark the appearance of new traditions and new life styles that echo strong connections with both Cretan fashions and Anatolian traditions. These transformations seem to reflect intensified human mobility, crossing and negotiation of borders and identities. Recent investigations revealed that end of activity at this international hub coincided with the arrival of a series of devastating tsunamis generated by the eruption of Thera. The new evidence will be discussed both in the context of the site's history but also in relation to its changing role in regional networks and connections with neighbouring and distant areas.

### 5 **WESTERN ANATOLIA DURING THE LATE BRONZE AGE: A CULTURAL LANDSCAPE ON THE SEARCH FOR IDENTITY**

**Abstract author(s):** Pieniazek, Magda (Universität Tübingen, Institut UFG)

**Abstract format:** Oral

Western Anatolia during the Late Bronze Age was a borderland landscape, balanced between central Anatolia and the Aegean, but also exposed to influences coming from the eastern Mediterranean by sea. This surely partly resulted from its geographic location but was also related to the political situation – western Anatolian polities developed between two powers: the Hittite empire in the east and Mycenaean states in the west. Until recently, an understanding

of western Anatolia was hindered by the state of research, but thanks to recent excavations and publications, the situation has begun to change.

However, the crucial question is: how did local people deal with this borderland situation? Hittite conquest, as known from written sources, as well as undeniable influences from the Aegean are one side of the story, but homegrown traditions and local creativity, resulting in regional diversity, is another side.

One of the most characteristic features of Late Bronze Age culture in western Anatolia is the entanglement of indigenous traditions and foreign impacts, visible in architecture, burial rituals, pottery production, glyptic, weaponry or even in the religious sphere of life. Simultaneously, we observe at various levels a dedication to local achievements and styles. Was this combination of indigenous trends and foreign influences, as known from such Late Bronze Age western Anatolian sites as Troy, Panaztepe, Liman Tepe or Miletus, simply typical intercultural coastal mixture, or was it rather an outcome of the specific geopolitical situation between Anatolia, the eastern Mediterranean and Aegean in the second half of the 2nd Mill. BC? How and why was it different from the situation in the same area during the Early and Middle Bronze Age? And finally – what can we consequently say about western Anatolian identity, or rather identities, during the Late Bronze Age?

## **6 COASTAL AND INLAND WESTERN ANATOLIA DURING THE LATE BRONZE AGE: BORDERED OR CONNECTED?**

**Abstract author(s):** Köknar, Nuray Nisan (University of Cyprus-Mediterranean Archaeology)

**Abstract format:** Oral

This paper presents a preliminary discussion on geographical, economic, and political dynamics which shaped the Western Anatolian cultural borders in the coastal and inland regions. The coastal region of Western Anatolia, due to its island-like geographical character, strong bonds with and relations through the Aegean Sea, exemplifies a hybrid culture. The mountainous coastal area isolated the region from certain dangers and risks. However, its safe natural harbours made it attractive for outsiders not only for a safe break in the sea but access to Anatolian resources as well. In the Late Helladic III, the exchange of exotic goods started showing increased variance and the density of imported and imitated mundane Mycenaean style artifacts in coastal settlements and cemeteries noticeably rise. As suggested by Hittite documents, this period corresponds to a time characterized by conflict and formalization between the Hittites and people in Western Anatolia. Although coastal sites have had better accessibility to maritime networks, inland sites developed around valleys and rivers that provided them access towards the coast. Therefore, inland sites of the region became both a border and buffer zone between Western and Central Anatolia. These conditions also affected the political and militaristic conflicts in the region mentioned in Hittite documents. Understanding, exploring, and contextualizing these dynamics are crucial in efforts of mapping such borders in the region of interest.

## **7 GRAVE NEW WORLD – COMPETITION, STATUS NEGOTIATION AND CONTROL IN THE LATE BRONZE AGE EAST AEGEAN-WEST ANATOLIAN BURIAL PRACTICES**

**Abstract author(s):** Frankovic, Filip (Institute for Prehistory, Protohistory and Near Eastern Archaeology, Heidelberg)

**Abstract format:** Oral

The 14th and 13th century BCE (LH IIIA-LH IIIB periods) East Aegean-West Anatolian region has previously been perceived as a contact zone between Central Anatolia and the West Aegean. The substantial presence of Mycenaean-type material culture in these two centuries has commonly been interpreted as a sign of colonization, presence of immigrants, political influence, hybrid culture or conscious absorption of the West Aegean socio-cultural structure by the local populations. Funerary data sets were often used to support such interpretative narratives. However, most of such interpretations focused on "Mycenaean" cemeteries and grave types, while neglecting the "local" (or "non-Mycenaean") ones, which resulted in an incomplete understanding of burial practices in the region.

Contrary to the popular narratives about the strong "Mycenaean" influence on burial practices in West Anatolia that dominate the Aegean scholarship, most of the region developed a strong indigenous tradition of burial practices. Essentially, since the beginning of the 2nd millennium BCE the entire area was dominated by the so-called mixed-type cemeteries. A novelty of the 14th and 13th century BCE at the largest coastal cemeteries is the introduction of architecturally elaborate stone-built chamber tombs, which can be connected to a higher level of social stratification in the period of the transformation of the West Anatolian political units into pre-state or early state polities. This paper presents several smaller case studies which show how burial practices were employed as means of competitive status negotiation among different social groups in the East Aegean-West Anatolian region. Moreover, the paper examines how burial practices were employed by the elite as a strategy of control, used to prevent the questioning of their status by other social groups.

**Abstract author(s):** Denel, Elif (American Research Institute in Turkey)

**Abstract format:** Oral

The emergence of Syro-Anatolian principalities, or city-states, with diversified economies had set the stage for intense Assyrian interest through the growth of culturally, socially, politically and economically diverse systems of the Empire in the first millennium BCE. The management of these systems paved the way for new routes of communication while reinforcing pre-existing ones across contact zones, or rather, particular nodes of contact in the geographically controlled regions and beyond, but within a framework of imperial ideology that needed constant maintaining and reinforcement. It is within this historical context that unique objects originally from the Near East, namely from the Syro-Anatolian and Assyrian realms, that were dedicated at such religious centers in the Aegean as the Heraion at Samos or the Sanctuary of Apollo Daphnephoros at Eretria in Euboea, reflect an impact of a wider overarching and an extended period of development. These objects seem originally produced for elite consumption, though their essential transportation into the Aegean realm, most probably about two hundred years later, cannot be attributed entirely to elite acts of dedication. As such, these objects clearly reflect that their function and value evolved through time and across routes of communication. Clearly loaded with social value and associated ideology, how did the function and value of such objects changed as they were moved across the Syro-Anatolian realm, through the Assyrian Empire, across Anatolia and the Mediterranean, finally reaching the Aegean world? This paper will examine the actors and systems that relied on the social value of specific kinds of objects for establishing status and ideology in a dynamic and culturally vibrant period of the first millennium BCE.

**Abstract author(s):** Boyd, Michael (University of Cambridge, McDonald Institute for Archaeological Research; Science and Technology in Archaeology and Culture Research Center, The Cyprus Institute) - Renfrew, Colin (McDonald Institute for Archaeological Research, University of Cambridge) - Legaki, Irini (Ephorate of Antiquities of Cyclades) - Margaritis, Evi (Science and Technology in Archaeology and Culture Research Center, The Cyprus Institute) - Gavalas, Giorgos (Ephorate of Antiquities of Cyclades) - Moutafi, Ioanna (Malcolm H. **Abstract format:** Oral

The third millennium in Europe is marked by expanding horizons, the increasing importance of information, and by new identities forged in connectivity. In the Aegean, these changes are manifest in a series of creative social experiments that ultimately lead toward the large-scale, complex societies of the second millennium.

The island of Keros is located south of Naxos in the central Cyclades. Previously a backwater, on the side lanes of connectivity, suddenly around 2750 BCE it became a central haven. Waves of visitors brought with them choice material destined for deposition in the now well-documented cult area at Kavos. But over a 500-year period of often intense activity visitors were also attracted to the adjacent islet of Dhaskalio. Here a monumental and planned architectural complex housed skilled metalworkers and the imported material and agricultural produce of other islands. Understanding the role of Dhaskalio, and its place in island networks, has been the goal of the Keros-Naxos Seaways Project since 2015.

This paper outlines our initial thinking on what drove the early stages of proto-urbanisation at Dhaskalio. The parameters that enabled the creation, manifestation, and negotiation of identity were connectivity and information transmission; creativity in material production and in the physical reimagination of space; the direction and process of communal acts of labour; and the organisation at a distance of landscape and agricultural resource manipulation and exploitation. The added parameters of time and space allow us to envisage the drawing in of people and materials to the site, and their subsequent onward journeys: the people transformed by their experience, and the materials transformed in the workshops of the site.

The creative cultural nexus of Keros is the prism through which we can begin to understand how identity creation in the mid-third millennium became rooted in place, in space, and in community action.

## BEYOND TECHNOLOGICAL TRANSFER AND LOCAL IDENTITY: ARCHITECTURAL, PROTO-URBAN, AND SOCIAL INNOVATION AT THE EARLY BRONZE AGE SETTLEMENT OF DHASKALIO (CYCLADES).

**Abstract author(s):** Floquet, Marie (Centre Camille Jullian; Aix-Marseille Université) - Boyd, Michael (McDonald Institute for Archaeological Research; University of Cambridge) - Renfrew, Colin (McDonald Institute for Archaeological Research; University of Cambridge) - Herbst, James (American School of Classical Studies at Athens)

**Abstract format:** Oral

Recent excavations undertaken at the site of Dhaskalio have revealed an impressive proto-urban centre in the middle of the Aegean characterized by the development of directed urban planning and advanced architectural engineering. These characteristics, while drawing to an extent upon widely evidenced architectural knowledge, embody an innovation and creativity evident in scale and organisation as well as in specific features.

This paper seeks to examine the contribution of both background knowledge and local innovation to the construction of Dhaskalio and thereby understand aspects of the social organisation manifest there. Although some of these architectural and proto-urban features may indeed be recognised elsewhere in the Aegean, the architecture of Dhaskalio shows more than a selection of features found elsewhere and demonstrates in particular the maturation of an endogenous inventiveness.

The built environment of Dhaskalio embodies a creative hybridity of existing knowledge and local innovation on a scale hitherto unseen. The architecture of the settlement solves complex engineering problems, and involves a complex supply chain of materials - including the transportation of tons of marble from Naxos -, labour and sustenance. In completely transforming Dhaskalio its builders were also transforming the boundaries of what was possible for island societies, their lives and identities.

This paper aims, by untangling local ingenuity and technological transfer in the innovative process visible through the Dhaskalio architecture, to contribute to the redefining of connectivity, local identity, and cultural borders in the Early Bronze Age Aegean.

## CERAMIC EVIDENCE FOR AN INTERCONNECTED WORLD: THE KASTRI ASSEMBLAGE FROM THE NEW EXCAVATIONS AT DHASKALIO

**Abstract author(s):** Dimitriou, Vasiliki (Department of Antiquities, University of Rome I) - Krijnen, Ayla (Vrije Universiteit Amsterdam, Department of Art and Culture, History and Antiquity) - Boyd, Michael (McDonald Institute for Archaeological Research, University of Cambridge; Science and Technology in Archaeology and Culture Research Center, The Cyprus Institute) - Renfrew, Colin (McDonald Institute for Archaeological Research, University of Cambridge)

**Abstract format:** Oral

The Kastri assemblage provides evidence for one of the earliest substantial interregional contacts between Asia Minor and the Aegean. This distinct set of ceramic vessels, originating on the coast of Asia Minor, makes its first appearance at a limited number of sites in the Aegean during EBA II Late. The quantity and shape repertoire of Kastri pottery varies at each of these sites, thereby highlighting how local communities chose to participate differently in the adoption of new, foreign consumption practices. As such, the appearance of Kastri pottery emphasises the significance of interregional interactions and the transformations of cultural traditions during the emergence of proto-urban life in the Aegean.

The recent, large-scale excavations on Dhaskalio (2016-18), located off the coast of Keros in the central Cyclades, offer exceptional research potential to shed new light on this ceramic phenomenon. Large quantities of Kastri pottery were found in the EC II Late and EC III levels at a site where, unusually, almost all materials were imported. Interestingly, the Kastri pottery at Dhaskalio includes both canonical Kastri vessels and hybrids, with Kastri shapes noted in different surface treatments and fabrics. This challenges our traditional ideas about the role of material culture circulation in long-distance interaction networks and evokes questions about the way that new cultural customs were adopted within Cycladic communities.

This paper will present the preliminary results of the analysis of the Kastri pottery from Dhaskalio, whereby focus is turned to the functional, technological and contextual characteristics of the assemblage. This study will thereby evaluate the role of Kastri pottery in the shaping and forming of emergent social identities in the highly mobile and strongly interconnected community of Dhaskalio.

## 12 A NORTHERN POWERHOUSE: CERAMIC EVIDENCE FOR TECHNOLOGICAL AND SOCIAL TRANSFORMATION IN EARLY BRONZE AGE ATTICA, GREECE

**Abstract author(s):** Tsai, Che-Hsien (Department of Archaeology, University of Sheffield) - Kaza-Papageorgiou, Konstantina (Hellenic Ministry of Culture) - Hein, Anno (Institute of Nanoscience and Nanotechnology, N.C.S.R. "Demokritos", Athens) - Madrid i Fernández, Marisol (Cultura Material i Arqueometria UB - ARQUB, GRACPE, Departament d'Història i Arqueologia, Universitat de Barcelona) - Day, Peter (Department of Archaeology, University of Sheffield; Institute of Nanoscience and Nanotechnology, N.C.S.R. "Demokritos", Athens)

**Abstract format:** Oral

In 1972, Renfrew singled out the Early Bronze II period in the Aegean as a watershed in technological innovation and craft specialisation, accompanied by regional inter-connectivity he dubbed "The International Spirit". This picture of social and economic transformation centred on the Cyclades and nearby pre-Palatial Crete, treating Attica as rather peripheral.

Much of the last fifty years has been devoted to demonstrating that such key developments happened earlier than EB II. Metallurgy, a driving force of technical innovation, was clearly important from the Final Neolithic, while some ceramic exchange through the islands is now accepted to be widespread at least from the EB I period. It has been common to argue that specialisation in ceramic production goes back to the seventh millennium BCE.

Analyses of EB I and II pottery deposits (early third millennium BCE) from the site of Kontopigado, Attica, are presented here. With extensive evidence for metallurgy, as well as obsidian working, Kontopigado was a pottery production centre in EB II and most probably in EB I. The ceramics of the two phases show stark contrasts, those of EB I dominated by red slipped vessels, while EB II is characterised by thin walled pottery which skeuomorphs metal drinking and pouring vessels, with white/grey and yellow slips imitating precious metals.

Petrography, SEM and XRD testify to a new selection of non-calcareous clays and change from open firing to the use of kilns with close control of firing temperature and atmosphere. Transformations in large scale, standardised production at Kontopigado are presented, as well as tracing the exchange of its products across the Aegean to Crete. The implications of these findings re-focus our attention to EB II as a time of radical change in the Aegean in terms of production and inter-regional consumption, with Attica as a power-house of craft innovation.

## 13 AT THE CROSS-ROAD BETWEEN MINOANS AND MYCENAEANS: THE RCT TABLETS FROM KNOSSOS AS A MODEL OF CULTURAL INTERACTION

**Abstract author(s):** Pierini, Rachele (University of Copenhagen)

**Abstract format:** Oral

Minoans and Mycenaeans inhabited the island of Crete during the Bronze Age. Specifically, there is evidence for both societies inhabiting Knossos in 1400 BCE. The palace of Knossos has yielded Linear A and Linear B tablets, the written sources from this era. Linear A (1800-1400 BCE) encodes the yet to be deciphered Minoan language, whereas Linear B (1400-1200 BCE) is the only deciphered script of the epoch and encodes the earliest written evidence of the Greek language (Mycenaean). Within the Linear B corpus, the Knossos tablets from the Room of the Chariot Tablets (RCT) present truly unique characteristics due to their chronology (1400 BCE versus 1200 BCE of most of the Linear B tablets), palaeographical features (the closest similarities with Linear A tablets from a palaeographic, epigraphic, artefactual, textual perspective), elements of the script and the language (e.g. the use of logograms and composite signs, words that do not appear any longer on tablets from later deposits, variant spellings, archaisms).

This paper focuses on the Knossos Linear B tablets from the RCT as a model of linguistic interaction to define transculturation between Minoan and Mycenaean, and between Mycenaean and later Greek societies by analysing goods and those artefactual and linguistic elements that are unique to RCT tablet and no longer appear on tablets from later deposits. By doing so, it also addresses the question of what a cultural border is and what is 'foreign' in the earliest stages of the Mycenaean culture, whether the Minoan or the Indo-European elements.

## 14 THE CHALLENGES OF USING DIGITAL TECHNOLOGIES FOR UNDERSTANDING ANCIENT NETWORKS IN THE LYBIAN SEA: THE PERAIA PROJECT EXPERIENCE

**Abstract author(s):** Laguna-Palma, David (Department of Prehistory and Archaeology, University of Granada)

**Abstract format:** Oral

The PERAIA project emerges within a research framework that aims to reconceptualize Eastern Mediterranean connectivity. PERAIA aims at representing and analyse the social, economic, and cultural impact of the historical transport networks between territories in the context of the ancient Libyan Sea, from the Late Bronze to the Early Iron Age (c. 1500 – 700 BC).

This international project envisions land (landscape) and maritime (seascape) human interactions, not as fixed physical networks, but instead, as dynamical, social, and dependent on the ecological context. Thus, the project represents these networks as a bidirectional process, where the networks influence and at the same time are influenced

by these factors. For this reason, our methodological approach combines the use of satellite imagery, GIS spatial analysis, and social network analysis (SNA).

In this paper, I will seek to reflect on some of the theoretical caveats brought by this approach. More specifically, the challenges of correctly identifying what and how to map material remains that can serve as proxies for tracing ancient social networks and the importance of assessing critically how to deploy SNA. These digital challenges, I argue, should be confronted with other landscape data, such as understanding the mental-phenomenological approach of cultural movement in harsh environments – and, conversely, the environmental effects on the development of these societies. With this, I aim to show the importance of a critical assessment of digital technologies, which both help and problematise our understanding of the landscape.

## **A. THE HANDMADE BURNISHED WARE PHENOMENON AND ITS CRETAN CONNECTION: A CERAMIC TECHNOLOGICAL APPROACH AT LATE MYCENAEAN CHANIA**

**Abstract author(s):** Fouriki, Stavroula (University of Sheffield)

**Abstract format:** Poster

Handmade Burnished Ware (HBW), referred to a distinct ceramic category that is also known as 'Barbarian Ware', appeared in a number of coastal sites of the eastern Mediterranean, just before, during and after the collapse of the palatial organisation (c. 13th to 12th century BC). Its appearance has been interpreted in various ways and has ultimately been linked to the demise of the Mycenaean centres, as a result of the diffusion of people from the north. Nevertheless, recent research has revealed that HBW is a complex phenomenon that does not manifest itself in the same way at the different sites. Its presence is rather related to deeper cultural interconnections and to what is known as metallurgical koine or "Urnfield bronzes".

This paper focuses on the HBW of Chania in west Crete, which constitutes the earliest example of this pottery class in the Aegean region and it shows stylistic affinities with the Italian Impasto Ware. Based on the chaîne opératoire approach, it combines data from the macroscopic examination and petrographic analysis of pottery classes of a typical Chaniote tradition and HBW, with the aim to understand the underlying technological connections. The results show that HBW is locally made in Chania but distinct stages of the manufacturing process, from raw material selection and forming techniques to surface treatment and decoration, differ from the more typical shape repertoire. The local production of this southern Italian pottery ware indicates a rather complex phenomenon of technological transmission that required a direct contact achieved through mobility of potters, and not simply by copying highly visible traits, such as type and decoration.

## **B. STRUCTURES OF LIFE AND DEATH THROUGH SPATIAL PLANNING AND BURIAL PRACTICES IN VOULA, ATTICA (GREECE)**

**Abstract author(s):** Christakopoulou, Olga - Giamalidi, Maria (Hellenic Ministry of Culture and Sports)

**Abstract format:** Poster

In an era of violent yet peaceful population movements, Voula of Attica is a characteristic case study of a Society in Transition, as it is impacted by the deep transformations occurring in contemporary Aegean societies. Archaeological research has brought to light an important ancient cemetery dated to the Late Geometric/Classical period.

The population groups that settled in the area acted as bearers of so-called social memory as they seem to have played an important role in the social life of the region diachronically, with the ultimate aim of preserving and demonstrating a unified identity that was necessary to legitimize their occupation.

Irrespective of the origin of the population groups, the cemetery demonstrates homogeneity in terms of burial practices compared to adjacent cemeteries. This fact is indicative of the common acceptance of basic operating structures in the wider Attica region. Even though there is evidence of diversity in social stratification, the use of common types of graves and the treatment of the dead, as a whole, demonstrate a society with democratic structures that accepts diversity over time.

How can architectural remains in the form of simple walls and burial enclosures emphasize family bonds and values, even after death? How can they be interpreted as the inviolable boundaries of social stratification evidence?

How can the spatial placement of cemeteries, which are inherently dynamic landscapes, bear witness to the integration of different population groups in an organised society?

How can burial practices give evidence to the functioning of social and political activities of population groups that settled and functioned in that specific place?

The cemetery confirms that death has been a crucial ideological tool throughout time. All the conflicting policies once ignited were suppressed, thus creating an ideological tool of negotiation, which was seemingly invisible yet practically tangible.

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Heilmann, Daniela (LMU Munich) - Gori, Maja (Consiglio nazionale delle ricerche) - Penezić, Kristina (Biosense institute, University of Novi Sad)

**Format:** Regular session

The two main shifts that European (and world) archaeology has experienced and that have challenged traditional paradigms of interpretation – the emergence of processual versus traditional archaeology starting from late 1960s, and the emergence of post-processual archaeology from the early 1980s – have not had much impact on research in Balkan Late Prehistory. That put much of Balkan archaeology firmly in the traditionalist camp and traditional explanations of archaeological patterns accordingly endured. This is reflected in the persistence of the cultural-historical paradigm in the study of material culture, with a strong focus on typological sequences and relative chronologies to explain ethnogenies. If we consider, for example, widespread models explaining changes in material culture, they are mostly understood as a result of migration. This paradigm has never really been challenged and thus migrations continue to be regarded as destructive events, materialized by a new set of material culture (i.e. pottery) brought by migrants that replaces the one belonging to an autochthonous population. The Yugoslav wars and the economic downfall that followed the collapse of communist regimes in the Balkans in the 1990s have further impoverished the debate on these issues. Recently, the so-called 3rd scientific revolution (Kristiansen 2014) has introduced a large array of new methods and techniques to Balkan Prehistory that are being increasingly applied and becoming a new standard in the discipline. That approach alone is nevertheless insufficient to fill the void left by the standstill of theoretical debate.

This session aims to fill this gap by inviting scholars working on Balkan Late Prehistory (Neolithic to Iron Age) to challenge with novel theoretical approaches and methods the entrenched paradigms that are still widespread in archaeological interpretations, and to use Balkan archaeology with its rich source material as a laboratory for new models, paradigms, and approaches.

## ABSTRACTS

### 1 THE FUTURE OF THE PAST: BALKAN ARCHAEOLOGY AS A LABORATORY

**Abstract author(s):** Heilmann, Daniela (LMU Munich) - Gori, Maja (Consiglio nazionale delle ricerche) - Penezić, Kristina (Biosense institute, University of Novi Sad)

**Abstract format:** Oral

European archaeology experienced major turns in the 1960s and 1980s, and more recently in 2014 with what has been defined by K. Kristiansen the 3rd Scientific Revolution. However, these theoretical and methodological turns had little impact on Balkan archaeology. In contrast, Balkan archaeology has often been criticized for being rather conservative and for being not particularly active in changing perspectives and paradigms, even in the cases in which new scientific methods are applied. Cultural-historical paradigms as well as the centrality of typo-chronological studies of material cultures are still representing the backbone of archaeological interpretation of past entities and identities.

With its extremely rich material culture, prehistoric archaeology of the Balkans offers a fertile ground for the development and refinement of new interpretative paradigms, methods and research questions. New scientific approaches (e. g. aDNA, archaeozoology and proteomics, isotope analysis) combined with statistical techniques have shown that there is a broad spectrum of possibilities to reconstruct and interpret prehistoric living conditions and environments. In this paper that will work as introduction to the session, we will address past and present developments in the Late Prehistory of the Balkans. By presenting selected case studies, we will try to understand which paradigms should be challenged or even discharged, and with which methods and approaches the discipline may work as laboratory for new ideas and forms of archaeological knowledge.

### 2 PLUS ÇA CHANGE? BALKAN ARCHAEOLOGY IN SEARCH OF IDENTITY

**Abstract author(s):** Babic, Staša (Dept. of Archaeology, Faculty of Philosophy)

**Abstract format:** Oral

Over the last couple of decades, there have been numerous attempts to remedy the perceived delay in the development of archaeology in the region of the Balkans, in the form of conferences, workshops or edited volumes. The frequency seems to testify that the progress is yet to be achieved. There are two common denominators to these efforts: the archaeological record from the region is rich and highly relevant from the wider European and/or Mediterranean perspective; yet, the discipline itself does not meet the requirements of the general theoretical and

methodological standards of research, being permanently petrified in the state of the outdated culture-historical paradigm. This assessment presupposes that the archaeological knowledge has been advancing along a unified trajectory and that at a certain point in time the entire research community operates under the same, universally accepted paradigm. However, this has never been the case, and especially at the present moment, when archaeologists engage in exploration of many equally challenging possible paths. It may therefore be more productive to consider the ways in which the Balkan archaeology can contribute to the rich multivocality of the discipline, with our distinctive experiences of the past and present, rather than to partake in the everlasting quest of catching up with the idealized mainstream of the discipline.

### 3 **TYOLOGY VS. TECHNOLOGY: THEORETICAL AND METHODOLOGICAL FRAMEWORKS FOR STUDYING TOOLS IN SERBIAN PREHISTORIC ARCHAEOLOGY**

**Abstract author(s): Vitezovic, Selena (Institute of Archaeology, Belgrade)**

**Abstract format: Oral**

Throughout the 20th century, Serbian prehistoric archaeology was preoccupied with problems related to the relative and absolute chronology, culture contacts and influences, studied predominantly through the analyses of pottery styles. Everyday tools, produced from lithic and osseous raw materials, were largely left aside, furthermore, lithic and osseous assemblages were often selectively collected during excavations. Bone industry was more affected because of the lack of systematic zooarchaeological analyses – broken tools, tools without conspicuous morphology and traces of use, manufacture debris, were often not recognised during field work and not collected. Even when collected and analysed, lithic and osseous assemblages were only briefly described in excavation reports, and simply classified into arbitrary morphological types. Within past two or three decades, the situation changed gradually, and an approach based on technology, widely adopted in other European archaeological traditions, began to be applied in Serbian prehistoric archaeology. The lithic artefacts were the first to gain more attention, and functional, technological criteria and raw materials were included in analyses, while the bone industry followed at somewhat slower pace. The technological approach is used more in the Neolithic archaeology, while assemblages from metal ages are still not sufficiently included in systematic researches. In this paper will be provided an overview of the history of research of tools from different materials, and approach based on the study of technological aspects will be discussed. The author in particular advocates the technological approach based on the works by French authors (including A. Leroi-Gourhan, P. Lemonnier – concepts of chaîne opératoire, technological systems, multiple technologies), but also with more recent theoretical frameworks included.

### 4 **IMPRESSA SHEEP: UNRAVELING OF EXPLOITATION OF CAPRINES DURING THE EARLY NEOLITHIC IN DALMATIA THROUGH PEPTIDE FINGERPRINTING**

**Abstract author(s): Sierra, Alejandro (AASPE «Archéozoologie, Archéobotanique: Sociétés, Pratiques, Environnements» UMR 7209 CNRS MNHN) - Radovic, Sinisa (Croatian Academy of Sciences and Arts, Institute for Quaternary Palaeontology and Geology) - Presslee, Samantha (BioArCh, Dept of Archaeology, Environment Building, University of York; Department of Chemistry, University of York)**

**Abstract format: Oral**

Balkans is the area where the two streams neolithisation of Europe (Mediterranean and Continental) is first observed. Dalmatia is important because marks the beginning of the expansion of farming along the Mediterranean coast, linked to Impressa pottery. This trend has been characterised by the domination of caprines (especially sheep). The problem we encounter when trying to reconstruct husbandry strategies in caprines is to separate sheep and goats, which are morphologically similar but have different productive capacities and are therefore often managed and exploited in different ways. This work is part of the Impressa sheep project which will attempt to characterise the model of production and management strategy of the caprines herd from an approach based on multiple analysis of teeth (archaeozoology, Stable Isotopes Analysis, microwear and ZooMS). Mortality profiles of sheep and goats from the Tinj and Crno Vrilo sites, both of which belong to the Impressa Ware and date to the first half of the 6th millennium BC, are presented. Mortality profiles have been carried out by separating sheep and goats using the ZooMS method, which allows distinguishing species by their peptide fingerprint. In this way we can know what was the importance of each of the species and if there were different exploitation strategies between the two species. This new approach, which combines archaeozoology and palaeoproteomics, will allow us to reformulate the animal husbandry models of the early Neolithic period in the Adriatic by separating two species that have always been analysed together.

## 5 THE EARLY NEOLITHIC SETTLEMENT IN NORTHERN BANAT – THE SITES BUCOVA PUSTA IV AND MOVILA LUI DECIOV

**Abstract author(s):** Krauss, Raiko (Institut für Ur- und Frühgeschichte und Archäologie, es Mittelalters) - Ciobotaru, Dan (Museum of the Banat, Timisoara)

**Abstract format:** Oral

Since 2010 we have been researching various Early Neolithic settlements in the far west of Romania. The two sites to be presented here show typical elements of the Early Neolithic in the Balkan region, such as permanent dwellings, pottery production and the use of domestic animals and cultivated plants. However, the use of numerous aquatic resources by the inhabitants of these settlements is also remarkable, which seems unusual for a Neolithic population. By evaluating the stone tool inventories of the settlements, it is possible to show wide-ranging networks that refer on the one hand to the southern areas of origin of the Neolithic and on the other hand to the more northerly areas that were still completely Mesolithic populated at this time. The evaluation of the settlements in northern Banat confronts us with a hitherto little-known characteristic of the Neolithic in south-eastern Europe, in which possibly older local elements play a greater role. Landscape reconstruction is also important for understanding these settlement sites. Nowadays, this natural area presents itself as a steppe-like landscape. First interpretations of our results allow to reconstruct a pronounced micro relief and the landscape was apparently more heavily forested. A special feature of the region is the absence of stones in the wider surroundings of the settlements. This aspect is of fundamental importance for our understanding of the Neolithic in general, since the use of flint or other lithic resources is a decisive factor in this period. Our lecture will present this project and the first results of the archaeological and scientific evaluation.

## 6 EVALUATING THE IMPACT OF CHRONOMETRIC UNCERTAINTY IN DETECTING CHALCOLITHIC DISPERSALS IN EASTERN BALKANS AND LOWER DANUBE BASIN

**Abstract author(s):** Popescu, Gabriel - Covătaru, Cristina - Lazăr, Cătălin (Research Institute of the University of Bucharest)

**Abstract format:** Oral

Advances in computation modelling and the continuous increase of the radiocarbon available databases, have led to the development of macro-scale models relative to the timing, tempo, and mode of both demographic and/or demographic-cultural dispersals in prehistory. While previous studies have established the major, general framework of the early Neolithic dispersals (their timing and tempo) into Balkans and Eastern Europe overall, many important aspects of the process, at a smaller regional scale and those related to the Chalcolithic dispersals, are waiting for explicit answers. This is mostly due until the last decade to the low number of radiocarbon dates. The increasing number of radiocarbon datasets and the expanding access to computational tools, make the use of aggregated radiocarbon series highly appealing and with great potential, as shown by recent studies on this domain.

Our goal in this paper is to address the very important issue of the Chalcolithic dispersals in the Eastern Balkans and Lower Danube basin by 1) formally taking into account the extent of chronometric uncertainty in radiocarbon data, 2) assessing the statistically significant evidence of the dataset for a dispersal process, and eventually 3) the timing and the speed of the putative Chalcolithic cultural dispersals in the area.

This succession of research steps is very important, as shown recently with new developed analytical tools, because it addresses the fundamental qualities of archaeological datasets, as well as enabling to explore the limits of statistical inference from chronology dates series.

To achieve this, we build on newly available analytical tools used elsewhere to explore similar dispersal related research questions, and on new high resolution radiocarbon datasets combined with good quality legacy dates, from Chalcolithic contexts in the targeted region.

Acknowledgements: Research to produce this presentation was funded from the research grant number 351 PED/2020, project code: PN-III-P2-2.1-PED-2019-4171, sponsored by UEFISCDI, Romania.

## 7 MULTI-ISOTOPIC ( $\Delta^{13}C$ , $\Delta^{15}N$ ) APPROACH TO THE LIFE IN THE CHALCOLITHIC SITE OF GUMELNIȚA (ROMANIA)

**Abstract author(s):** García-Vázquez, Ana (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB, University of Bucharest) - Balasescu, Adrian - Vasile, Gabriel - Golea, Mihaela ("Vasile Pârvan" Institute of Archaeology, Romanian Academy, Bucharest) - Radu, Valentin (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB, University of Bucharest; National Museum of Romanian History, Bucharest) - Lazar, Catalin (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB, University of Bucharest)

**Abstract format:** Oral

The Gumelnița site (also known as "Măgura Gumelnița" or "Măgura Calomfirescu") is probably the biggest tell settlement north of the Danube, and it belonged to the Kodjadermen-Gumelnita-Karanovo VI civilization that occupied the Balkan area in the second half of 5th millennium BC. Is located in the northern area of the Balkan region, in the

southeast of Romania, on the left bank of the Danube River floodplain, immediately south of the confluence area of the Argeş River.

The site consists of a tell-settlement and an adjacent cemetery area where 10 skeletons were excavated in the 60s and 14 tombs were found in the archaeological campaigns from 2017 to 2019. Dating of both human skeletons from the cemetery area and fauna from the tell itself has yielded dates ranging from  $4448 \pm 10$  to  $4360 \pm 42$  Cal BC.

Stable isotopes had provided a qualitative leap in knowledge of the societies of the past and allows us to estimate the assimilated diet and change the previously established paradigms based solely on archaeological remains.

For this work, the stable isotopes of a total of 16 humans, from 2017-2019 campaigns, of different ages have been studied. In order to characterize the diet of Gumelnița inhabitants, the stable isotopes ( $\delta^{13}C$ ,  $\delta^{15}N$ ) of domestic (cattle, sheep, goats, pigs and dogs) and wild (urochs, horse, roe deer, red deer, wild boar, beaver and hare) mammals, fish (carp and catfish), reptiles (European pond turtle), molluscs and plants (crops and wild) have also been analysed.

The results for this population are very homogeneous, and with a lower  $\delta^{15}N$  than the previous hunter gatherers. Thus, this supports that the economy of this society was based mainly on agriculture and cattle husbandry, although sheep, goats and pigs, and that hunting and fishing was a minor activity for this people.

## 8 AN UNUSUAL ENEOLITHIC TRIPLE BURIAL FROM LOVAS, EASTERN CROATIA: ARCHAEOLOGICAL AND BIOARCHAEOLOGICAL ASPECTS

**Abstract author(s):** Novak, Mario (Centre for Applied Bioanthropology, Institute for Anthropological Research) - Franković, Filip (Institute of Prehistory, Protohistory and Near-Eastern Archaeology) - Đukić, Ana (Archaeological Museum in Zagreb)

**Abstract format:** Oral

Recent archaeological excavations at Lovas-Kovači in Eastern Croatia produced archaeological remains dated to various stages of Eneolithic, as well as Middle and the early phase of the Late Bronze Age (Belegiš I and Belegiš II cultures). One of the most significant discoveries is a triple burial dated to the Late Eneolithic (Kostolac culture), which was found within the settlement context. This paper presents contextual analysis of the grave, as well as results of bioarchaeological examination conducted on the retrieved skeletal remains. Both the arrangement and biological characteristics of the interred individuals suggest an unusual character of the grave. A middle-aged woman was buried in the middle, lying face-down; on the left side, lying on her back, was a younger woman; and finally, on the right side, in an almost identical position to the leftmost individual, was a younger male. All three skeletons show evidence of subadult physiological stress while the middle individual also has a massive antemortem, badly healed injury of the left forearm. Carbon and nitrogen isotopic data indicate that all three individuals had largely a C3 plant dominated diet. Considering the fact that this type of burial is quite rare, we tried to find similar parallels in contemporary cultures from Central/South-Eastern Europe, and to provide a viable explanation/hypothesis on what this burial might represent. We believe that through the employment of new methodological approaches (e. g. isotope and DNA analyses) on the funerary data sets we can re-question earlier interpretative models, largely developed within the theoretical framework of the cultural-historical archaeology and extensively employed in Balkan archaeology until today. Only by focusing on data sets from the bottom up, and not from the top down as commonly done, can we hope to deconstruct the simplified interpretative models which uncritically use migration and cultural diffusion to explain cultural change.

## 9 "WHAT DO YOU MEAN BY MIGRATION?" POSSIBLE ANSWERS AND WORKABLE MODELS FOR THE 3RD MILLENNIUM BC IN THE WESTERN BALKANS

**Abstract author(s):** Gori, Maja (National Research Council of Italy)

**Abstract format:** Oral

Theories on human migration in prehistoric archaeology are old as the discipline itself. However, despite the popularity that migration enjoyed lately within the discipline – thanks to both advancement in genomic research and the so-called "refugee crisis" – a striking gap is revealed between archaeological research on migration and that of other human sciences. This talk will start by discussing some of the most relevant approaches to migration in Sociology, Human Geography and Migration Studies and evaluate if and how different models elaborated for present migration can be profitably used in Balkan archaeology. Two case-study from the 3rd millennium BC in the Western Balkans will be discussed. The first is the so-called Cetina phenomenon, a widespread connectivity pattern involving Western Balkans and the Central Mediterranean. The second case study is the so-called "Armenochori complex", a definition for a particular set of pottery types that was in use in the southern Balkans. What was originally regarded as a purely local Macedonian ceramic assemblage proved to be instead indicative for close connection among distant regions as far as Thessaly in the south and the Carpathian Basin in the north. In the conclusions, possible models for migration in these two areas will be discussed and compared with recent aDNA based models proposed for the European Bell Beaker phenomenon, aiming at providing a better and more nuanced understanding of 3rd millennium mobility.

## 10 THE RUSH FOR WHITE GOLD: BRIQUETAGE FROM THE VELEBIT LITTORAL AND BRONZE AGE SALT PRODUCTION ON THE EASTERN ADRIATIC COAST

**Abstract author(s):** Domines Peter, Pio (Department of Archaeology, University of Zadar)

**Abstract format:** Oral

The recent archaeological progress in the study of late prehistoric periods of the Velebit Littoral, a region beneath the largest Croatian mountain range stretched along the eastern Adriatic coast, revealed significant traces of prehistoric salt production with briquetage. Regarding the specific concentration, considerable density, and large quantity of documented objects in the form of characteristic ceramic three-horned spindly items, together with the enormous amount of highly fragmented pottery sherds of thin-walled recipients, several registered sites can be directly identified as salt production areas where saltwater brine evaporation process occurred. The turning point of the adoption of new knowledge took place in the Late Bronze age when specially chosen locations in the maritime landscape fulfilled prerequisites of organization of such kind of economic activity. Characteristics of Velebit's briquetage assemblage, comparative studies, chronology issues, production sites patterns, technological requirements, consumption practices, implications on the social structure of local communities and organization of livestock-based economies are questions which are discussed in order to understand the overall content of the package which „salt revolution“ brought on the regional context in challenging times of great changes and increased circulation of objects and ideas.

## 11 DAUNIAN GEOMETRIC POTTERY IN EASTERN ADRIATIC NETWORKS: CONTEXTUAL APPROACHES TO DIFFUSION, APPROPRIATION, AND EMULATION OF PRESTIGE GOODS

**Abstract author(s):** Bernardo-Ciddio, Leah (University of Michigan)

**Abstract format:** Oral

Elaborate matt-painted pottery from Daunia (northern Apulia, Italy) has been found across Iron Age cemeteries in the Dolenjska and Notranjska in Slovenia, on Croatia's Istrian peninsula, and in Dalmatian coastal settlements. Local impasto emulations of Daunian shapes have also been recovered. Although these objects have been frequently discussed, there has been no exploration of the social and political structures or interactive behaviours they reflect, nor what they suggest about the significance of foreign prestige goods and of the networks that drove their circulation.

My study pushes back on the cultural historical, structuralist, and positivist approaches and that have alternatively characterised the discussion of Daunian pottery. The development of universal laws and interpretations for understanding this material has obfuscated the social and cultural variability it reflects.

I undertake a systematic study to discern whether local elites in the Eastern Adriatic used these pots just as Daunians did, attributed similar meanings, or communicated affinity with Daunia or the wider Adriatic through their use. I draw from theoretical approaches in globalization studies and mortuary archaeology, arguing that the exploration of local practice in the context of global connectivity is essential to understanding the development of new meanings attached to supposedly “foreign” objects.

I apply statistical techniques to contemporary funerary assemblages from burials on either side of the Adriatic. The results clarify relationships between specific objects, allowing for the reconstruction of typical funerary rituals. I first identify typical patterns of co-presence between object types in Daunia. Attention is paid to co-presence of other objects emblematic of extended Adriatic networks. The Eastern Adriatic analyses establish the function of Daunian pottery within a local assemblage to determine whether it filled a role played previously or elsewhere by local objects and shapes and whether there is indication of corresponding changes in funerary practice.

## 12 RECONCILING ARCHAEOLOGICAL THEORY WITH DATA: THE CASE OF IRON AGE/ARCHAIC MACEDONIA

**Abstract author(s):** Giamakis, Christos (University of Sheffield)

**Abstract format:** Oral

Balkan archaeology unfortunately remains deeply rooted in nationalistic agendas adopting cultural-historical approaches despite the latest developments in theoretical archaeology. Insights gained by processualism, post-processualism and more recently post-humanism have yet to be adopted by Balkan archaeologists when approaching the study of the archaeological material. The aim of this paper is to reconcile these major theoretical trends with the archaeological material found in the geographical region of Greek Macedonia in order to shed important new light on themes such as human agency and the formation of collective identities. More specifically, these themes will be explored through the presentation of material from a selection of Iron Age/Archaic (700-480 BC) cemeteries across the region. Grave goods, tomb types, burial rites and the topography of the cemeteries will all be studied as part of the same ontology, influencing and influenced by agency and collective identities. Past approaches have treated this region as a politically unified one, a phenomenon passively reflected on the material discovered there. By challenging such cultural-historical approaches and by drawing upon particularly post-processual theory and the more

recent 'ontological turn' in archaeology, the present paper will emphasise the agency of the local communities in actively employing material culture in order to strengthen the potency of certain kinds of identities at the expense of others. Consequently, it will be argued that instead of an overreliance on a dominant umbrella term when describing the populations inhabiting these regions, more emphasis should be given at the active role of both people and material culture at a local level. The time has come for Balkan archaeology with its largely underexplored archaeological riches to act as laboratory for new models and paradigms which could propel it to the centre stage of world archaeology. The present paper is hopefully a step towards this direction.

### 13 **ASSEMBLING THE PUZZLE - THE HORIZON OF OSTENTATIOUS BURIALS IN THE IRON AGE BALKANS**

**Abstract author(s):** Heilmann, Daniela (LMU Munich)

**Abstract format:** Oral

A central issue in research on the Balkan Iron Age/Archaic Period is the question of the immediate appearance of ostentatious graves in the 2nd half of the 6th century BCE. While models explaining the occurrence of so-called "princely tombs" in the Central and Southern Balkans differ in their contents, they are linked by the concept of cultural and socio-political "change". This change, referring to the transformation in the significance of the burial as a monument for individual and collective display of status, power, and identity, was initially seen in a supra-regional context. The idea of a supra-regional and linked phenomenon of the appearance of ostentatious graves is still clashing with the concept of sharply delineated Iron Age cultural groups and resulted – also due to nationalistic discourses – in the "fragmentation" of a "princely grave horizon", which is discussed nowadays mainly on a regional level. One crucial element in the discourse of the lavishly furnished graves of the 6th and 5th BCE is the conception of powerful centres controlling or integrating a specific territory, suggesting a hierarchical organization of communities concerned. The aim of the paper is to challenge this fragmented and territorial view of the Iron Age Balkans by experimenting with ritual and practice theories, highlighting patterns of social structures beyond the phenotypical analysis of the material culture.

### 365 **LIFE AND DEATH BEHIND THE WALL: A MULTIDISCIPLINARY APPROACH TO MONASTICISM IN PAST**

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Sarkic, Natasa (Aita Bioarchaeology) - Janeš, Andrej (Croatian Conservation Institute, Department for Archaeology)

**Format:** Regular session

For centuries monasteries had a very important role in society. Not only were they the centre of spirituality, but also the centre of education, and they often provided shelter and food for beggars, medical care for the sick and home for orphans and the elderly poor. Nuns and monks, at least in theory, lived in communities under vows of poverty, chastity and obedience, dedicating their time to prayer, contemplation, intellectual and physical work.

However, the information that we have at hand is mainly based on written sources, such as historical data, monastic books and rules of monastic orders. But history can often be subject to manipulation and provides only general facts.

Using a multidisciplinary approach, we can shed a light on various aspects of monastic life and its evolution through centuries. While archaeological studies can answer questions regarding architecture, economy, facilities and religious landscapes, archaeozoology and archaeobotany can inform us about production and consumption of food and drinks, bioarchaeology can tell about health and diet, traumas, degenerative diseases, dental health, occupational stress, infectious diseases etc. We can also observe possible differences between monastic orders, between male and female communities as well as possible violations of monastic rules. With new approaches, we can follow the development of these large complexes through space and time, their adaptation to new social and environmental changes through a long period of time, from the late antique period till the 19th century.

We invite papers addressing topics of European monasticism in a broad sense. Contribution can be focused on monastic populations (both monks and nuns) or specific cases and can present results from different perspectives: bioarchaeology (analysis of human remains, archaeobotany, archeozoology...), biomolecular analysis, landscape archaeology etc. We particularly welcome papers that provide examples of cross-disciplinary research, regardless of geographic region or time period.

**1 IDENTIFICATION OF PIARIST COFFINS FROM ARCHAEOLOGICAL RESEARCH IN THE CRYPTS OF THE CHURCH IN SZCZUCZYN (PODLASKIE VOIVODESHIP, POLAND)**

**Abstract author(s):** Michalik, Jakub (Institute of Archaeology, Nicolaus Copernicus University in Torun) - Openkowski, Rafał (Institute of History and Archival Sciences, Nicolaus Copernicus University in Torun)

**Abstract format:** Oral

The Order of Regular Clerics of the Poor Mother of God of Pious Schools played the most important role in the history of the monastery and church complex in Szczuczyn. The Piarist monastery was built in the years 1697–1700, and then the construction of a brick church of Name of the Blessed Lady Mary, lasted until 1711. The order operated there until its dissolution by the Prussian authorities at the beginning of the 19th century. Archaeological research in the crypts of the church of The Name of the Blessed Lady Mary in Szczuczyn has been run since 2011. The work carried out so far in the crypts under the church presbytery and in the western nave was aimed at organizing and inventorying the burials in the crypts. As the research progressed, a huge amount of information was gathered regarding the burials of lay people and clergy. In the crypts in Szczuczyn, local elites, clergy and people of merit for the church were buried. Observations made during archaeological research indicate that even wooden coffins, apart from the clothes of the deceased and complex devotional articles, could provide information about the social condition of the person buried in it. The coffins of the monks differed to a large extent from the coffins of lay people, primarily in the simplicity of execution, shape, painting, and the type of wood used. Thanks to the information posted on the coffins of the deceased, it was possible, thanks to the interdisciplinary work of archaeologists and archivists, to identify 25 coffins belonging to clergy. The difference between a coffin intended for a lay person and a clergyman allows for the observation of unwritten rules regarding the burying of Piarists in Szczuczyn.

**2 AN APPROACH THROUGH BEHAVIORAL ARCHAEOLOGY OF FORMER FRANCISCAN CONVENT OF THE LA PURISIMA CONCEPCION DE SIERRA DE PINOS, ZACATECAS**

**Abstract author(s):** Laue, Francisco (Instituto Nacional de Antropología e Historia)

**Abstract format:** Oral

The object of study was focused on carrying out a reconstruction of the behaviors of the different societies that inhabited the Ex-Convent of the La Purísima Concepción of the Sierra de Pinos for three centuries.

When we speak of behavior and conduct we will be referring to any performance of the phenomenon in its participation with the various forms of subject-object, object-subject, subject-subject and object-object interaction (Schiffer, 1991). Such relationships, for their correct understanding, must be framed in a certain method; the methodology proposed by behavioral archeology starts from the creation of a conceptual map based on analytical units to record the processes formation and make inferences of social behaviors through the information derived from the material artifacts.

The hypothesis is based on the assumption of the existence of various systems of behavior that occurred in different occupations, where we think that certain areas were involved in a domestic behavior such as the transfer of resources for food preparation, due to the presence of "mixed" materials. Under the idea that any past or contemporary society needs to discard materials for different reasons, it is possible to think that those could have passed by a maintenance process; In the particular case of the spaces of the Ex-Convent, each one plays a fundamental role, such as the implementation of an adequate deposit for the disposal of waste.

**3 TRACING TEWKESBURY: A MULTIDISCIPLINARY APPROACH TO EXPLORING THE MONASTIC PRECINCT OF A POWERFUL BENEDICTINE MONASTERY IN THE WEST OF ENGLAND**

**Abstract author(s):** March, Eleanor (University of Exeter)

**Abstract format:** Oral

Tewkesbury Abbey (Gloucestershire) was one of the foremost Benedictine institutions in the west of England, if not the whole of the country, during the medieval period. Its patrons constituted some of the most powerful and influential contemporary families and in 1535 it was one of only twenty-four monasteries with an annual income of over £1000 listed in the Valor Ecclesiasticus. Nevertheless, despite its significance, the historical and archaeological study of the abbey has been relatively neglected, especially compared to some of the major Benedictine sites in the southeast of England.

Notably, the study of Tewkesbury's monastic precinct has been particularly neglected. While the monastic church survives almost in its entirety, having been purchased by the townspeople following the Dissolution in 1540, the cloister and wider precinct was virtually completely destroyed. Although a heavily stylised plan for the cloister and southside of the monastery has been proposed, this is predominantly based upon the survey of the monastic buildings made

at the time of the Dissolution and very limited archaeological investigations, the most significant of which remains unpublished.

This paper presents the results from a holistic study of Tewkesbury's monastic precinct. It draws upon a wide range of evidence: from historic maps and documents in order to map the boundaries of the monastic precinct and its relationship with the town; to LiDAR, geophysical survey, and unpublished archaeological excavation data to trace the physical development of the precinct and the activities taking place there. It showcases the potential that a truly multidisciplinary study has for exploring life in and around a monastic precinct even in light of apparently few sources.

#### 4 **MORE THAN JUST A MAN'S WORLD: A PRELIMINARY ANTHROPOLOGICAL ANALYSIS OF THE OSTEOLOGICAL MATERIAL FROM THE MONASTERY HILANDAR (ATHOS, GREECE)**

**Abstract author(s):** Sarkić, Natasa (Aita Bioarchaeology) - Vranić, Mirko (University of Belgrade, Department of Archaeology) - González-Garrido, Laura (Department of Physical Anthropology of the University of León)

**Abstract format:** Oral

The Orthodox monastery of Hilandar, dating from the 12th century, is one of the most important centres of Serbian culture and spirituality. It is located in the northern part of Mount Athos on the Halkidiki peninsula, in northern Greece. This area, with a total surface of 335 square, through its history always had a special jurisdiction and presents the largest area in the world from which women and female animals are banned. Today, over 2,000 monks live an ascetic life in Athos, isolated from the rest of the world. This region is known for its strictness and closeness; therefore, investigations were limited only to rescue archaeology.

According to the customs that prevail on Hilandar, three years after burial, the skeleton is exhumed and washed in wine. The postcranial skeleton is then deposited in the ossuary, and the skull is placed on a shelf. In some cases, the monk's name and year of death are written on the skull. There are currently about 2,000 skulls in this ossuary. This extremely valuable osteological material represents a fantastic opportunity to expand our knowledge of life in the most important Serbian monastery.

In 2019, preliminary anthropological analyzes of 40 skulls from the Hilandar monastery were performed. Although small in size, these analyzes are of great importance for the study of Orthodox monasticism, and at the same time, as the first systematic research of skeletal remains from Athos, represent a huge step towards understanding this complex and isolated community.

#### 5 **PRELIMINARY RESULTS OF ARCHAEOLOGICAL EXCAVATIONS AND ANTHROPOLOGICAL ANALYSIS FROM THE RAŠAŠKA - RAČEŠA SITE (CROATIA), 13TH-16TH CENTURY**

**Abstract author(s):** Sarkić, Natasa (Aita Bioarchaeology) - Matković Vrban, Marina - Mihaljevi, Marija (Nova Gradiška city museum) - Čavka, Mislav (University Hospital Centre Zagreb; Faculty of Medicine, University of Zagreb)

**Abstract format:** Oral

Historical sources first mention the Račeša estate in 1210, when King Andrew II donated it to the Templars in Požega County.

The site was discovered in 2011 as part of a reconnaissance of the surrounding area. There were no visible above-ground remains of construction on the site. Research has revealed the remains of a fortification complex built of carved blocks of sandstone, architectural details and profiling confirm that this is a fortification from the first half of the 13th century when the Templars are mentioned as the owners of Račeša.

The fortification consisted of an oval central core measuring 54x38 m, oriented west-east, surrounded by a defensive trench approximately 13 - 14 m wide and 2.5 - 3 m deep. Two rectangular rooms next to each other were discovered. The walls of the rooms were built of quality sandstone blocks.

Archaeological excavations, up to now, have fully explored two rooms, as well as the area around the outer walls of those rooms. In addition to the architectural remains of the fortification, numerous findings were collected, as well as 128 individual graves and an immense quantity of dislocated bones, which can be dated to the period between the 13th and 16th centuries.

Preliminary results of anthropological analysis have brought many interesting discoveries, among which the case of successful trepanation of an adult individual and perimortem injuries on the child's skull, a possible consequence of interpersonal violence, certainly stands out.

## 6 MONKS OR WARRIORS? BURIALS IN THE BENEDICTINE MONASTERY OF ST. MARGARET IN BIJELA

**Abstract author(s):** Janeš, Andrej (Croatian Conservation Institute)

**Abstract format:** Oral

The Benedictine monastery of St. Margaret in Bijela was one of the most important monastic centres of medieval Slavonia. The monastic community was probably founded during the 13th century as a priory, that was elevated to the rank of monastery during the 14th century and later also to the rank of abbey. Being the centre of a large estate, but also a focal point in regional ecclesiastical hierarchy, being the only Benedictine abbey in the territory of the Zagreb diocese. During its existence the monastery changed rulers, from abbots, over bishops to laic and military administrators till it was taken by the Ottomans in 1543. During all this periods the monastic church was used for burials of individuals. The excavations yielded 42 preserved burials and a few dozen skeletons from disturbed graves. Most of them belong to male individuals, which is in line with the male monastic community. Finds of females and children indicate the use of the church for nonmonastic individuals. In chronological terms, burials are dated between the 14th and the end of the 17th centuries. This data shows that the Christian burial place still was important even during Ottoman rule. Bioarchaeological research showed a large percentage of perimortal traumas on at least a third of the excavated skeletons. This paper will show the perseverance of a sacred site for Christians during the Ottoman period and the unusual profile of the buried inside of a monastery.

## 7 ON THE MONKS TABLE – THE CISTERCIAN FOOD AND EATING CULTURE IN MEDIEVAL DENMARK

**Abstract author(s):** Mollerup, Lene (Museum Skanderborg)

**Abstract format:** Oral

The Cistercians arose as a spiritual reform of the European monasticism around 1100 AD. A group of French monks wanted to change the monastic life and return to the Rule of Saint Benedict. The Cistercians were known for their severity and harshness in all matters of Monastic life, including their daily consumption of food.

The monks were supposed to refrain from gluttony. Food was considered as fuel for the body and not to be consumed with pleasure. Meat from four-legged animals was prohibited; since meat was regarded as too stimulate the carnal desire, so abstinence from meat-eating was an important tool to curb the sexual drive.

This study describes the Cistercians in Denmark and their relationship towards food based on an interdisciplinary approach using historical, archaeological, archaeobotanical and bioarchaeological sources. The aim is to identify the diet of the Danish Cistercians and to investigate if it is possible to detect changes in the Cistercian food intake through time.

## 8 THE LANDSCAPE IMPACT OF CISTERCIAN GRANGES - THE CASE OF PLSY ABBEY

**Abstract author(s):** Ferenczi, Laszlo - Janovský, Martin (Charles University, Prague) - Horák, Jan (Czech University of Life Sciences, Prague) - Malina, Ondřej (National Heritage Institute, Loket) - Klír, Tomáš (Charles University, Prague)

**Abstract format:** Oral

There is a common assumption that medieval Cistercian monastic communities played a significant role in transforming their environments by clearing woodlands, reclaiming wetlands, constructing grange farms, fishponds, etc., and colonizing previously uncultivated lands. They were renowned for their superior agricultural farming techniques and for cultivating an interest in pastoral economy, obtaining several grants (of pasture rights) in order to sustain their considerable livestock. While this image of the order is based mostly on well documented – and unique – examples from Western Europe, in other regions, which were peripheral to the Cistercian expansion, their environmental impact remains uncharted. Our presentation draws on the example of Plsy Abbey (Central Bohemia), where previous research already offered an interpretation different from the above-described model: most of the abbey farms seem to have been established with minimal investments, having relocated the already existing rural communities and using their lands instead of clearing new areas for cultivation. We have used state-of-the-art methodologies (LiDAR, XRF spectrometry) to investigate the landscape features around the abbey farms, assessing soil geochemistry, and finding out more about the possible agricultural/industrial uses and how the historic landscape was transformed by the monks.

## 9 NOURISHING BODY AND SOUL: A MULTI-TISSUE AND ISOTOPE STUDY ON THE DEVELOPMENT OF MONASTIC DIET IN A MEDIEVAL ROYAL BURGH

**Abstract author(s):** Czére, Orsolya (University of Aberdeen) - Cameron, Alison (Cameron Archaeology Ltd) - Sayle, Kerry (Scottish Universities Environmental Research Centre) - Britton, Kate (University of Aberdeen)

**Abstract format:** Oral

Stable isotope analytical techniques are ideal to uncover dietary and mobility patterns within and between populations rooted not only in status, sex but also religiosity. Recent methodological improvements based on the analysis

of incrementally growing tissues can allow the production of higher resolution longitudinal dietary ( $d_{13}C$ ,  $d_{15}N$ ) and mobility ( $d_{34}S$ ) data. Studies of incremental dentinal collagen, for example, enable access to more nuanced early-life isotopic information associated with specific individuals. In combination with bulk sampling approaches (e.g. bone collagen) the analysis of dentinal increments allows isotopic biographies of individuals to be constructed. Accessing these long-term dietary profiles in combination with known historical information and osteological interpretations can help assess isotopic patterns in association with the wider socio-economic development of past monastic and lay individuals.

As a royal burgh city, Aberdeen was not only one among a limited number of urban centres in Scotland with exclusive rights to engage in overseas trade, but also represented a melting pot of monastic and secular populations. This study discusses the dietary and mobility patterns of multiple religious orders (Carmelite, Dominican, and Franciscan) alongside the local laity. To assess both early and late-life patterns, in addition to bulk bone collagen data, incremental dentinal samples (from M2 and M3 teeth) were also analysed from two individuals presumed to have belonged to the Franciscan order and from remains (both male and female) unearthed from a contemporary high-status burial ground. As part of this study, long-term dietary profiles were utilised to gain insight into the influence of social and religious variability on these distinct groups in a developing medieval urban centre in north-east Scotland, and evidence of dietary changes likely associated with personal adherences to novel diets in later childhood as a result of joining religious orders was found.

#### **A. PANEM NOSTRUM QUOTIDIANUM. DENTAL ANTHROPOLOGY OF A CONVENT IN MEDINA SIDONIA (SPAIN). FIRST DATA**

**Abstract author(s):** Castro Moreno, Gonzalo (FAPAB Research Center) - Rosa Machado, Francisco Douglas (Independent Researcher)

**Abstract format:** Poster

First data on the dental anthropology of a 17th century convent in the Spanish town of Medina Sidonia, where it has been possible to analyze a whole series of dental remains from the burial crypt of the demolished Franciscanos Descalzos convent, destroyed in the 19th century and excavated during the year 2007. The preserved lower jaws as well as the remains of teeth preserved in the upper jaws have been taken as samples, all of them from secondary burials, so that with both the macroscopic and microscopic analysis of the dental pieces we have been able to see the eating habits of the inhabitants of the convent as well as its reflection on their dental health, with their own pathologies that in many cases have led to the partial or total loss of teeth, as has been observed in the existence of lower jaws with the absence of said pieces.

#### **B. FROMBORK CATHEDRAL - LIFE AND DEATH VISIBLE IN THE ARCHITECTURE**

**Abstract author(s):** Zdeb, Katarzyna (Institute of Archaeology Cardinal Stefan Wyszyński University in Warsaw) - Adamić, Jacek (GPR24.com.pl)

**Abstract format:** Poster

The cathedral basilica of the Blessed Virgin Mary and St. Andrew in Frombork was erected as a three-nave hall with an elongated and rectangularly closed chancel. This Gothic church was built between 1329 and 1388 on the site of a former wooden church on a fortified hill. There are two chapels by the right nave - one of them is the chapel of St. George, known as the Polish one, and the second - the Savior's Chapel (Szembek's Chapel) with a plate decorated with iron handles. In the naves and in the presbytery, there are numerous tombstones of Warmia bishops, as well as an epitaph.

Part of the presbytery was associated with the funeral rites of monks and the later clergy. There are many tombstones there. Among them, there is also one with metal fittings - it is a shaft of an old elevator. The elevator was used to transport the coffins to the crypt. In addition to the crypt under the presbytery, there was also a crypt under the floor of the nave.

The architectural reconstruction and the new interior arrangement made the location of the crypts non-obvious. A GPR was used to research the location of the crypts and to find their distribution. The research was carried out in order to locate the burial places, as well as to identify the funeral cycle of Frombork monks and clergy.

**Theme: 2. [Re]integration**

**Organisers:** Still, Beverley (Department of Archaeology, University of Durham) - Spillane, Ben (Department of Archaeology, University College Cork) - Louwen, Arjan (Faculty of Archaeology, Leiden University)

**Format:** Regular session

The analysis of mortuary practices and their cultural context remains one of the most effective methods of tracking societal transitions. For this session we will be exploring the subject of continuity or change in burial modes during the Late Bronze - Early Iron Age in Atlantic Europe. Identifying specific change in funerary customs of this period has traditionally been difficult and varies widely between the Continent, Britain and Ireland. The end of the Bronze Age was not marked by a sudden incursion of culturally distinctive, iron-using groups. It was a prolonged, fluid process of gradual change which saw the intermingling of pre-existing traditions with new material culture. Chronologically defining these nuanced developments with the use of radiocarbon dating was limited due to the Hallstatt Plateau (800-400 BC). However, with the wide-scale adoption of Bayesian Chronological Modelling, it is now possible to overcome this limitation and provide absolute chronologies for individual cemeteries and wider burial traditions. In addition, advances in osteoarchaeology, isotope analysis and ancient DNA allow for a multifaceted approach to the analysis of human remains. The application of these methodologies assists in identifying subtle changes in funerary customs such as burial modes, demography, treatment of the body, mobility, kinship and the spatio-temporal origins of these developments. The subtle and regionally specific developments identified can be juxtaposed with the more pragmatic 'big data' approach, to track broader patterns across the entire period. By integrating these multiple approaches, a robust narrative of the cultural developments in funerary practices during this transition in Atlantic Europe can be achieved.

We will accept papers from researchers that incorporate the novel approaches mentioned above with a focus on site-based and interregional mortuary practices and the degree to which they represent spatio-temporal change during the Late Bronze to early Iron Age in Atlantic Europe.

## ABSTRACTS

### 1 FROM ASSESSMENT TO EXCESS: THE SHEER ABUNDANCE OF URNFIELD DATA IN THE LOWER-RHINE-BASIN

**Abstract author(s):** Louwen, Arjan (Leiden University)

**Abstract format:** Oral

The Lower-Rhine-Basin is literally dotted with Late Bronze Age and Early Iron Age cremation grave cemeteries. In the Netherlands alone more than 700 sites have been discovered that produced graves dating to the period between 1100 and 500 BC and their numbers are still growing rapidly. When one comes to think of the fact that cemeteries like these could easily host hundreds of individual graves and that the true extent of these funerary landscapes only recently started to reveal itself thanks to large scale commercial excavations, it is safe to state that what we are dealing with is probably the most abundant funerary legacy from prehistory in this corner of Europe.

The potential of these 'big data' has until recently only slightly been touched upon. A recent study of some 3.000 graves and over 200 radiocarbon dates collected from 75 cemeteries in the Netherlands not only challenges our current views on the genesis, lifespan and extent of these cemeteries but also raises questions about the representativity of the data at hand: Do our excavations in some way approach the original number of graves once present in Late Bronze Age and Early Iron age cemeteries or are we still dealing with only a fraction of the original situation?

This paper will present a brief state of affairs of urnfield research in the Netherlands and will suggest several directions the urnfield research could be heading when the potential of these big datasets is really put to use.

### 2 WHAT A TIME TO BE ALIVE. INTERDISCIPLINARY RESEARCH OF AN EXCEPTIONAL URNFIELD IN TILBURG – UDENHOUTSEWEG, THE NETHERLANDS.

**Abstract author(s):** Brattinga, Joris (Archeologisch Onderzoek Leiden bv - Archol) - Veselka, Barbara (Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel.; Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Boudin, Mathieu - van Strydonck, Mark (Royal Institute for Cultural Heritage Brussels - KIK/IRPA) - De Mulder, Guy (Department of Archaeology, Ghent University) - van den Eynde, Guido (Town archaeologist, Municipality of Tilburg)

**Abstract format:** Oral

In the fall of 2020, large parts of an extensive Late Bronze Age and Early Iron Age urnfield were excavated in the municipality of Tilburg, The Netherlands. Compared to similar sites in the Meuse-Demer-Scheldt region, this site is remark-

ably well preserved. A total of 42 tumuli and long barrows and no less than 232 cremation graves were discovered, most of them still fairly complete.

Fortunately, it was possible to anticipate the good preservation of the site during the early stages of the project. An extensive and interdisciplinary research strategy could be determined, increasing the quality of the excavation and preservation of the cremation deposits, the funerary features and the grave goods. Moreover, geophysical research has been carried out prior to the excavation.

In collaboration with an international team of specialists a comprehensive sampling plan was set up beforehand allowing specific bioarchaeological and archaeobotanical research questions to be answered. This includes lipid analyses of the many vessels collected from the graves for information on their use and strontium isotope analyses of the cremated human remains to obtain information on in-life mobility. To firmly contextualize all this data, an extensive number of cremation graves (ca. 60%) is being radiocarbon dated, providing interesting insights in the development of this cemetery through time.

This paper will present the multidisciplinary research strategy and excavation methodology of this remarkable site.

### **3 AMS 14C DATING OF LATE BRONZE AND EARLY IRON AGE CREMATED BONES FROM BARROWS IN WESTERN LITHUANIA: RESULTS AND INTERPRETATION**

**Abstract author(s): Muradian, Lijana (Vilnius University)**

**Abstract format: Oral**

In the Bronze and Early Iron Age, various changes in the East Baltic Region occurred in the pattern of settlements, economical strategies, and funerary practices. During this period, the first customs of the cremation of the deceased appeared and spread, and the practice of creating barrow mounds widely spread in some parts of the East Baltic Region. Burial mounds in western Lithuania were the main type of burial monument through the Late Bronze and Early Iron Ages, even when transitioning from cremation to inhumation. Changes in mortuary practices during this period could be related to social and/or ideological transformations. The emergence of the cremation custom led to a decrease in the amount of grave goods, and most cremated burials in Lithuania do not contain any grave goods. For this reason, it is difficult to determine the beginning and span of the cremation custom based only on the typological method. The AMS 14C method was applied to date cremated bones of Late Bronze and Early Iron Age barrows in western Lithuania. The obtained data was used to determine the duration of the cremation custom practiced. The cremation custom of the deceased in this microregion was practiced from 860–565 cal BC to 383–151 cal BC. Furthermore, stone arrangements associated with cremation burials differ in barrow mounds, and some of the deceased were separated and buried not in barrows with other members of the community, but outside external stone circles. The obtained AMS 14C data was also used to compare differently arranged cremation graves. This data suggests that collective burials in barrows, burials outside the external stone circle of the barrow, and barrows containing only one deceased, could have co-existed. This could be related to a number of reasons, including: the social status of the deceased, ideological aspects, etc.

### **4 A TAPHONOMIC APPROACH OF CREMATED REMAINS: RECONSIDERING THE BODY THROUGH CASE STUDIES IN BRONZE AGE SCOTLAND**

**Abstract author(s): Chaumont Sturtevant, Elisabeth (University of Aberdeen)**

**Abstract format: Oral**

Cremation burial practice is a central mortuary practice during the Bronze Age. A constant issue in the analysis of cremated human remains is the difficulty to visualize the body of the dead, a contrast to inhumations.

For the purpose of my ongoing Ph.D. research, human remains emanating from Bronze Age cremation burial sites in Scotland are examined. Applying osteological methods, this research is more specifically interested in reviewing what cremated bone can tell us about mortuary practices during the Bronze Age in Scotland.

For this session, we would like to discuss the survival and occurrence frequency of bone fragments by presenting anatomical reconstructions from Scottish case studies. Such examples include Leuchars Brae Skene, a Late Bronze Age cremation burial. These case studies will include information on our current understanding of cremated bone taphonomical survival. Better visualization of the cremated bone allows us to review our expectation of body representation and better recognize natural fragmentation patterns. Reviewing such patterns across different types of sites in Scotland can help better recognize different mortuary practices in the handling of the bones.

In conclusion, this study aims to consolidate our information on Scottish cremated skeletons and review how gaining a better understanding of cremated bone survival can help us better understand past mortuary practices.

## 5 FUNERARY PRACTICES ON THE EDGE OF SCOTLAND: THE ANALYSIS OF THE DISARTICULATED HUMAN BONE ASSEMBLAGES FROM THE COVESEA CAVES

**Abstract author(s):** Primeau, Charlotte (University of York) - Booth, Tom (Ancient Genomics Laboratory, The Francis Crick Institute) - Büster, Lindsey (University of York; Canterbury Christ Church University) - Armit, Ian (University of York)

**Abstract format:** Oral

The Covesea Caves are a series of funerary caves on the south shore of the Moray Firth in Scotland. There are at least five caves of archaeological significance, although not all have been extensively excavated. The Sculptor's Cave is the largest and best-known. The name derives from the Pictish symbols adorning its entrance walls. Immediately west of the Sculptor's Cave are two additional caves: Covesea Cave 1 and Covesea Cave 2. These three caves appear to have been used intermittently for funerary rituals from the Neolithic to Roman Iron Age with human bones being retrieved from several excavation campaigns. The human material that remains today was examined using macroscopic, microscopic and histological methods. The results showed that the bones displayed evidence of a variety of surface modifications such as cut marks, trampling, fire and surface exposure. Additionally, there was evidence of decapitation, mummification and no or very little bioerosion, indicating enhanced preservation of the bodies interred in the caves. Results from the multidisciplinary analysis of the human remains support the interpretation that excarnation was at least one mortuary treatment offered to the dead brought to the Covesea Caves in this enigmatic funerary coastal environment.

## 6 WORLDS APART: LOCAL LANDSCAPES AND COSMOPOLITAN CENTRES FOR DEALING WITH THE DEAD IN LATER PREHISTORIC BRITAIN

**Abstract author(s):** Büster, Lindsey (Canterbury Christ Church University; University of York) - Bleasdale, Madeleine - Fischer, Claire-Elise - Primeau, Charlotte - Armit, Ian (University of York)

**Abstract format:** Oral

The dead of later prehistoric Britain are notoriously elusive. New methodological and analytical techniques are, however, offering rare glimpses into relationships between the living and the dead at a number of important sites where mortuary treatment and preservational conditions have rendered the dead visible. The Sculptor's Cave in north-east Scotland, which saw protracted funerary use for around 1500 years, was part of a coastal mortuary landscape used by local communities for millennia. Meanwhile, ancient DNA and isotope data has revealed a very different picture for another landscape on the edge: Cliffs End Farm on the Isle of Thanet, in the far south-east of England. Here, a cosmopolitan population (some newly arrived, some local) reused an ancient mortuary landscape to communicate complex and multi-faceted identities in a highly ritualised and structured setting. This paper will use these two important sites to demonstrate the value of multi-proxy approaches in exploring the fundamental role that the dead played in place-making among the living.

## 7 INVISIBLE AND MISUNDERSTOOD: IDENTIFYING THE DEAD IN LATE BRONZE AND EARLY IRON AGE BRITAIN

**Abstract author(s):** Still, Beverley (Durham University)

**Abstract format:** Oral

The dead of the Bronze to Iron Age transition in Britain are disproportionately invisible compared to many other periods of prehistory. The application of methodologies based on new scientific techniques have enabled some understanding of burial rites practised at this time. Central to the identification of human remains, is the use of radiocarbon dating and it is through the construction of firm chronologies, that we can begin to build a database of the elusive dead.

Funerary practices in this transition period are currently understood through the more sensationalist sites. The mummified remains of Cladh Hallan, skulls from the River Thames, death pits of Cliffs End Farm. What of the rest of the population? Mortuary remains were highly variable during this time, but one burial rite stands alone, that of cremation. Demonstrating continuity, a tradition centred on the ancestors, interments in or close to earlier monuments used intermittently through space and time.

This paper will examine the practice of cremation and using a big data approach I will assess the evidence from Britain.

## 8 SETTING THE SCENE: HOW A STUDY BURIAL AND SOCIETY IN EARLY BRONZE IRELAND CONTEXTUALISES DEVELOPMENTS IN THE LATER BRONZE AGE

**Abstract author(s):** McSparron, Cormac (Queen's University Belfast)

**Abstract format:** Oral

This paper will present an analysis of the chronology of the Irish single burial tradition from its Chalcolithic origins (circa 2200BC) through to the Middle Bronze Age (circa 1500BC). It will examine the chronology of the development of the

single burial tradition and the accrual of its constituent elements. The paper will highlight the existence of a parsimonious variation of the single burial tradition, the "potless-burial", which seems to emerge in the 21st century BC and continues throughout the remainder of era, in parallel to more complex variants of the tradition. It will be proposed that this very simple set of burials may provide a link to, or possibly an origin point for, the simplified burial traditions of the later Bronze Age and beyond. The paper will finish with an examination of social context and ideology which may help explain evolution in the single burial tradition in Ireland from the Chalcolithic to Middle Bronze Age and provide a backdrop for discussion of the societal changes that were to come, suggesting that the parsimonious funerary practices typical of Late Bronze Age Ireland may.

## 9 LATER BRONZE AGE URN BURIAL AND CULTURAL CHANGE AT THE END OF THE BRONZE AGE.

**Abstract author(s):** Becker, Katharina - Spillane, Ben (Department of Archaeology, University College Cork)

**Abstract format:** Oral

Excavations of the past three decades in Ireland have produced plentiful evidence for later, i.e Middle and Late Bronze Age burial sites. Our survey of excavation records, largely in form of grey literature excavation reports, has produced a substantive corpus of later prehistoric burials of a wide range of forms. In this paper we will set out its fundamental characteristics and, in particular, consider cremations contained by or covered by coarse ware urns to examine their articulation, association and possible social significance as part of the broader range of burial forms. A large number of these urned coarse ware burials were dated as part of the post-excavation programmes of the respective excavation schemes. Applying principles of Bayesian sample selection retrospectively to the assessment of these dates, models for the chronological extent of the phenomenon will be evaluated. This will allow a discussion of the burial evidence in relation to issues of cultural change at key points between ca. 1600 and 600 cal. BC, especially focused on the transition between the Bronze Age and the earliest Iron Age.

## A. THEY LAY BEYOND THE BORDERS: THE STUDY CASE OF 4TH-17TH CENTURY BURIAL MOUND RATULĀNI IN THE TERRITORY OF LATVIA

**Abstract author(s):** Erkske, Aija (Institute of Latvian History at the University of Latvia)

**Abstract format:** Poster

Ratulāni cemetery, which is located in the southern part of Latvia, was excavated in 1978-1979 by archaeologist Elvīra Šnore. The cemetery was intensively used during Iron Age (4th-12th c.) by local tribe Selonians and reused during the Early Modern period (15th-17th c.). It is argued that initially there were two burial mounds, one of them destroyed, leaving one 1 m high and 20 m diagonally large burial mound where 76 burials were located, both Iron Age and later burials. An unexpected discovery was found at the North West side of the mound – four Late Iron Age flat burials which were not buried within a limited burial place – communal barrow. Monuments with both – barrows and non-barrow burials are a rare phenomenon in Latvian archaeology, therefore we don't have enough data to conclude correctly whether this was a dual burial tradition during this period and territory or these burials were some exception and buried outside the border intentionally. This research will discuss possibilities why some of the community members were buried "outside the border", does burial type and adornments differ from those in the barrow, and what are the differences in mortuary landscape and organization between burials within restricted place inside barrow borders and outside?

This research is carried out within a project of Latvian Council of Science No. lzp-2021/1-0163 "Burial practices in the landscape: present-day Latvia in the Iron Age (AD 1-1200)".

---

## 367 AGENT-BASED MODELLING OF SOCIO-ECOLOGICAL SYSTEMS IN ARCHAEOLOGY. TOWARDS A NEW RESEARCH COMMUNITY

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Daems, Dries (Middle East Technical University) - Verhagen, Philip (Vrije Universiteit Amsterdam) - Romanowska, Iza (Aarhus Institute of Advanced Studies)

**Format:** Regular session

Agent-based modelling (ABM) has developed into an important methodological tool in archaeological research. ABM allows us to simulate the dynamics of complex systems, hypothesize individual and collective action, and investigate socio-ecological processes at various scales. It represents a veritable paradigm shift, not just for the study of the human past but also for the social sciences in general. Formal modelling tools such as ABM have several advantages over more informal approaches to study complex dynamics in past human and environmental systems. They 1) enforce conceptual clarity, 2) define mechanisms of change, 3) help infer dynamics in the past from the static archaeological record, and 4) allow for rigorous hypothesis testing. Applications in archaeology have been growing in number in recent years, but ABM is still on its path towards full maturation as a conceptual and methodological

tool for studying the past. To continue making this maturation possible, we need to encourage wider dissemination among researchers and the establishment of standardized practices.

This session will be a follow-up to last year's session introducing the Network for Agent-based modelling of Socio-ecological Systems in Archaeology (NASSA) and its associated models library as an important first step towards building a new research community. In this regard, we wish to organize this session within the scope of a new EAA community named "Computational Modelling of Socio-ecological Systems (COMS)", which will be proposed to the EAA organization later this year.

Contributions can consist of, but must not be limited to:

- 1) Individual case studies highlighting a specific issue, method or solution in ABM
- 2) Proposals for the NASSA models library, including demos of ABM modules
- 3) Examples of integration of ABM with other (archaeological) methods
- 4) Standards and best practices in ABM, as well as directions for the current and future development

## ABSTRACTS

### 1 TWO ABM APPROACHES TO THE SPREAD OF THE NEOLITHIC IN THE WESTERN MEDITERRANEAN

**Abstract author(s):** Fort, Joaquim (Universitat de Girona)

**Abstract format:** Oral

The spread of Neolithic along the northern shore of the western Mediterranean was extremely rapid [1] compared to inland [2-4]. Using a new, updated database, we have estimated a rate of 7.1-8.7 km/yr for this coastal expansion. We have built two ABM approaches to simulate demic-cultural waves of advance along a coast. The first approach is isotropic and involves jumps forward and backward along the coast. The second one is strongly anisotropic in the sense that it considers only forward jumps. Comparing the results of ABM simulations for both approaches with the observed rate (7.1-8.7 km/yr), we find that the length of coastal jumps was between 227 and 351 km per generation. These ABM approaches also make it possible to conclude that the importance of cultural diffusion in this Neolithic spread was less than 21%, so demic diffusion was responsible for at least 79% of the observed spread rate. We argue that these results suggest that the spread took place using boats, and also a limited interaction between the incoming farmers and the autochthonous hunter-gatherers.

### 2 POLISABM: MODELLING URBAN SYSTEMS AND SOCIAL COMPLEXITY IN THE EASTERN MEDITERRANEAN

**Abstract author(s):** Daems, Dries (Middle East Technical University)

**Abstract format:** Oral

Urbanism has traditionally been one of the most extensively studied topics in Mediterranean archaeology, resulting in an abundance of both empirical observations and theories on the origins and development of ancient cities. Unfortunately, such theoretical models have rarely been expressed formally, nor have they often been directly validated against the available empirical data. This paper aims to present a formal model of urbanism and social complexity formation, built on the core tenets of fission-fusion dynamics, settlement scaling and central place formation. The model posits a series of steps in the process of polis formation, starting from face-to-face communities constrained by cross-cultural attractor states and selection pressures such as cognitive limits to information processing and territorial restrictions imposed by walking distances from the settlement. Population growth constrained by these thresholds will induce scalar stress resulting in community fission. To overcome these thresholds and facilitate polity growth, communities develop additional mechanisms of social organization and hierarchies, initiating a trajectory of community fusion and polis formation. The main output of the model will be community sizes recorded through rank-size plots. I will then compare these simulated data with the available empirical data from the Iron Age to Hellenistic period (1000-100 BCE) in various regions of the eastern Mediterranean. Through this work, I aim to contribute to the further integration of theory building, computational modelling and data analysis in the study of Mediterranean urbanism.

### 3 **MODELLING HUNTING BEHAVIOR IN ARID LANDSCAPES USING EMPIRICAL DATA ON SAN HUNTER-GATHERER MOVEMENTS AND DECISION-MAKING**

**Abstract author(s):** Cobo Sánchez, Lucía - Paliou, Eleftheria - Lenssen-Erz, Tilman (University of Cologne)

**Abstract format:** Oral

Hunting in prehistoric times is a well-studied subject in archeological research, yet many aspects of early human foraging and subsistence are not reflected in the archeological record and are therefore hard to address using traditional methods. Agent-based models simulating foraging behaviour represent a very useful approach with which researchers can explore the dynamic aspects of hunting, such as the relationship between foraging decisions and ecological changes, and gain insight into emerging behavioural patterns from relatively simple rules of interaction among hunters, their prey and the environment. Such computational models of hunter-gatherer behaviour could be further enhanced when they are informed with empirical data. To this aim, we collaborated with Ju/'hoansi and Hai//kom San hunters to document their movement and decision-making processes during hunting with traditional means (i.e. on foot without firearms, optical aids or hunting dogs) in an arid landscape in western Central Namibia (Doro Inawas region) that is famous for its richness in prehistoric rock art sites. The recorded and analysed qualitative and quantitative data includes geospatial information on the trajectories, caloric expenditure, and walking speed of the indigenous tracking experts, as well as information about decisions made during hunting based on their knowledge of the environment and animal behaviour. This paper explores how the data resulting from this collaboration could be used in developing models that simulate hunting in arid environments taking into consideration human-animal and human-environment interactions, and which can be used to predict hunting success under varying environmental conditions. The present study aims to contribute to the growing body of foraging and past hunter-gatherer behaviour agent-based models and support theoretical model-building efforts in archaeology.

### 4 **DELINEATING SITE CATCHMENTS WITH AGENT-BASED MODELLING**

**Abstract author(s):** Romanowska, Iza (Aarhus University)

**Abstract format:** Oral

Establishing the catchment area of a settlement is a common task in archaeology. Whether this refers to an area of activity around a small hunting camp or the hinterland of a whole city, it is critical to establish a radius of the settlement's activity and the area used for resource exploitation. Depending on the modes of transport (whether on foot, with pack animals, etc), the topography of the terrain and other factors, this distance can vary from a few hundred meters to tens of kilometres.

GIS-based methods have been successfully deployed to model the catchment areas in different contexts. Usually, this involves estimating the cost-distance, based on the topography and drawing an envelope around the settlement that delineates the area that can be reached in a given time. The advantages of the GIS approach include standardised algorithms, clean analytical solutions, ease of use and short development time. In some cases, the question of how far would people venture from their homes is more complicated though. Such factors as individual mobility, infrastructure such as the presence of roads or availability of water in dry environments define what is the true catchment of a site. A new more dynamic and flexible method could overcome some of the limitations of GIS algorithms. Here, we test the utility of a bottom-up simulation - agent-based modelling (ABM). It offers a higher degree of freedom in defining what are the most significant factors determining mobility in a given case and provides the means of assessing site catchment in a probabilistic manner. This, however, comes at a cost in terms of time necessary for the development and less systematic results. The objective of this study is to compare the two techniques and evaluate under what conditions application of the more work-intensive ABM approach is worthwhile.

### 5 **DEVELOPING BEST PRACTICES FOR AN OPEN LIBRARY OF ARCHAEOLOGICAL ABM MODULES: LESSONS LEARNED FROM OTHER INITIATIVES**

**Abstract author(s):** Angourakis, Andreas (Institute for Archaeological Studies, Ruhr University Bochum; McDonald Institute for Archaeological Research, University of Cambridge) - Riede, Felix (School of Culture and Society, Aarhus University) - Romanowska, Iza (Aarhus Institute of Advanced Studies, Aarhus University) - Verhagen, Philip (Vrije Universiteit Amsterdam) - Saqalli, Mehdi (GEODE, Université Toulouse II - Jean Jaurès) - Taelman, Devi (Department of History, Archaeology, Arts, Philosophy and Ethics, Vrije Universiteit Brussel) - Vlach, Marek (Institute of Archaeology of the Czech Academy of Sciences) - Sikk, Kaarel (Masaryk University) - Galán Ordax, José Manuel (Universidad de Burgos) - Brughmans, Tom (School of Culture and Society, Aarhus University)

**Abstract format:** Oral

The main objective of the Network for Agent-based modelling of Socio-ecological Systems in Archaeology (NASSA) is to create and manage an open library of agent-based modelling (ABM) modules (not entire models) to be used by our community and beyond. The library will hold contributions from a diverse community of archaeological modellers as well as non-archaeologists in the form of reusable code modules that can be recycled and repurposed in new models. This open repository will improve communication, reproducibility and reusability helping to streamline model

development and facilitate skilled and specialist knowledge acquisition for learners. The added value of the repository will be generated by the explicit use of transparent standards, strong metadata and active feedback from users. Although singular in its specific domain, this is neither the first nor the only initiative that attempts to openly collate and curate collective knowledge. This paper will focus on identifying a non-exhaustive list of "good" practices and illustrate them with real-world examples taken from our experience with other similar initiatives (CoMSES Computational Model Library, R and Python packages, specialised modelling systems or libraries, large projects in archaeology with strong ABM components, and open databases). We bring to attention the lessons learned in other disciplines that address socio-ecological systems, such as earth sciences, ecology, sociology and economics, but also reflect on what are the constraints and needs of modelling for archaeological questions with archaeological data. Is archaeology a special case, and if so, what are the prerequisites of the field for making this a successful endeavour? Against the canvas of experiences collected, we raise awareness about both the design and maintenance of the library itself, as well as the preparation and submission of modules by the broader community.

## **6 SUBSISTENCE, SURPLUS AND TRADE ALONG THE LOWER GERMANIC LIMES: MODELLING RURAL-URBAN SOCIO-ECONOMIC INTERACTIONS**

**Abstract author(s):** Verhagen, Philip (Vrije Universiteit Amsterdam) - Romanowska, Iza (Aarhus Institute of Advanced Studies, Aarhus University)

**Abstract format:** Oral

Over the past 10 years, several research projects have focused on modelling the rural subsistence economy of the Dutch part of the Lower Germanic limes in order to answer the question whether the local population could provide the Roman military with surplus food. For this, various modelling techniques have been used, including GIS-based carrying capacity models, agent-based models and cellular automata approaches. All these models have pointed to the possibility, if not the plausibility, of surplus agrarian production in the region.

In these models the investigation of socio-economic relations between the rural population and the urban centres has not played a significant role, even when a strong economic dependency between the two can be assumed, given the widespread occurrence of imported goods in the countryside and the spatial configuration of the rural settlement patterns. The specific mechanics of economic interaction thus remain poorly understood, leading to divergent hypotheses on the reasons for economic and demographic growth and decline.

In this paper we will present a first exploratory model that can be used to simulate rural-urban socio-economic interactions in the Lower Germanic limes. It departs from, on the one hand, understanding and modelling the processes of production and trade for some of the core goods involved, in particular agrarian produce, pottery and building materials. It then focuses on the decision-making processes of producers, traders and consumers: what were the socio-economic goals of these groups, what positions did they occupy, and to what extent could they adapt their economic behaviour to changing circumstances? In the end, this should allow us to identify to what extent dependencies and inequalities arose from internal economic dynamics, or were governed by larger political, social and environmental developments. The model will be applied to the town and surrounding countryside of Forum Hadriani (modern Voorburg).

## **7 MODELLING CHIEFDOM SOCIETIES OF THE MIDDLE DANUBE DURING THE ROMAN PERIOD**

**Abstract author(s):** Vlach, Marek - Komoróczy, Balázs (Institute of Archaeology of the Academy of Sciences of the Czech Republic Brno)

**Abstract format:** Oral

A large part of the long-term archaeological research of the Roman Period chiefdom societies within the Middle Danube region has been traditionally anchored in the cultural-historical paradigm. Despite the relatively low level of complexity of the scoped societal context, several structural phenomena in its development have been documented throughout the period. The presently ongoing research project (Czech Science Foundation) aims to build a comprehensive dataset of available archaeological and other relevant information, which would provide a basis for the derivation of relevant proxy indicators of various development trajectories. Eventually, it is the main objective to test the existing theoretical models and assumptions about the scoped societies via computational techniques, amongst others, agent-based modelling. The presentation aims to outline some of the presently developed models, which are designed to provide further insights into some of the featuring topics such as spatio-temporal aspects of the settlement structure and its demographic properties, complexity and hierarchy of a political organization, or formation processes of the burial grounds.

**Theme: 1. Archaeologists and Archaeology Here and Now**

**Organisers: Deckers, Pieterjan (Vrije Universiteit Brussel) - Oksanen, Eljas (University of Helsinki) - Rohiola, Ville (Finnish Heritage Agency - Museovirasto)**

**Format: Round table**

In this roundtable, organized by members of the European Public Finds Recording Network, we aim to explore appropriate responses to avocational metal-detecting in different European countries. We focus on Eastern Europe in particular, and discuss ways by which shared challenges may be met on a transnational basis.

Avocational detecting remains a contested topic amongst heritage professionals (e.g. Deckers et al. 2018, Hardy 2017). Approaches differ greatly across jurisdictions, ranging from highly restrictive to liberal or even supportive. As such, the issue forms a microcosm of broader debates about public participation in scientific knowledge creation. Given the variety in local conditions and approaches, a key question in this debate is to what extent the principles and practices of a cooperative approach, as adopted in several countries in northern and western Europe (Dobát et al. 2020), can serve as inspiration elsewhere, notably in eastern Europe.

A specific concern is the impact of increasing digitisation and connectivity amongst detectorist communities as well as in the availability of finds data. We bring together a panel of researchers from mainly Eastern European countries, including the host country Hungary, to discuss these issues. Following short opening statements from the panelists, the debate will be structured along three themes regarding avocational detecting in Europe:

- Methodology: deploying digital tools for recording and managing of public finds data.
- Ethics and practical aspects: citizen archaeology, heritage protection, use of data in research, engaging with detectorist communities online.
- Promoting international collaboration, in terms of finds recording, sharing data, practices and technology, and scientific analysis.

Confirmed panelists are Tuuli Kurisoo (Tallinn University), Jan Mařík (Institute of Archeology of the CAS, Prague), Sergiu Musteata ("Ion Creanga" State University), Tibor Ákos Rácz (Ferenczy Museum) and Anna Wessman (University of Bergen).

David Wigg-Wolff (Goethe- Universität Frankfurt) will moderate the debate.

**Theme: 4. Polis, Empire, League and Beyond – Living in Interconnected Societies**

**Organisers: Schmidts, Thomas (Römisch-Germanisches Zentralmuseum) - Dobрева, Diana (Università di Verona) - Schimmer, Florian (Römisch-Germanisches Zentralmuseum)**

**Format: Regular session**

The period between the late 4th and the early 6th centuries AD is marked by a fundamental change of the Roman World, in particular the gradual decline of Roman rule in the West resulting in the end of the Western Roman empire in 476 AD. The considerable political transformations affected the late Roman economy to a greater or lesser extent, although developments varied from region to region. Phenomena such as regionalisation or the collapse of economic structures on the one hand contrast with the persistence of certain long-distance trade networks or the formation of new networks on the other.

Archaeological research on the trade networks of the later Roman Empire is dominated by Mediterranean pottery fine wares and amphorae, which have great potential for knowledge. But long-distance commerce beyond these Mediterranean trade networks is still to be understood in detail. It should be asked to what extent other groups of finds might be suitable as proxies of trade relations. The presence of valuable goods such as silk in the Roman provinces in the north shows that exchange with the Mediterranean may have worked, even though there may be no evidence of contemporary Mediterranean pottery.

The aim of the session is to bring together the results of studies on pottery, glass, coins, building material etc. or archaeometry and spatial network analysis, to assess the patterns and developments of regional and supra-regional economic structures in the various regions of the Late Antique West to its full extent. Furthermore, the rise and fall of commercial hubs and economic landscapes has to be considered. Beyond the aspect of trade, the availability of resources, especially precious metals, and the role of coin circulation are potential topics to be discussed at the session.

## 1 URBAN ECONOMIC NETWORKS IN A PERIOD OF CHANGE: ISSUES OF ARCHEOLOGICAL REPRESENTATIVENESS

**Abstract author(s):** Furlan, Guido (Aarhus University, Centre for Urban Network Evolutions - UrbNet)

**Abstract format:** Oral

Approaching ancient trade beyond the impressionistic view provided by simple presence/absence models requires reliable quantitative data. This is the only way to appreciate the importance of a given route compared to another, to assess the existence of periods of economic expansion or depression, and to address the issue of the integration of different markets.

The need for reliable quantitative data collides with the intrinsic sampling nature of archaeological field practice. For each group of finds recovered in a single trench or excavation area, one should ask to what extent it represents the whole set of materials which could be recovered in the site.

On an urban scale, several factors are biases against the representativeness of the samples of collected artefacts: the main ones are issues of visibility (of single artefacts as well as of whole areas), archaeological agendas (more or less randomly driven by development projects or by the mainstream academic interests), and the uneven distribution of deposits (produced by different formation processes).

Some of the factors coming into play can be modelled, particularly for periods of relative urban stability. Nonetheless, times of substantial change in urban life (4th–6th c. AD) also affect the patterns of distribution of artefacts, therefore generating even more complicated panoramas.

Deciphering the main factors shaping the representativeness of urban assemblages is a basic, yet fundamental step to effectively evaluate late antique trade from a quantitative point of view. Eventually, this can contribute to frame our future excavation agendas to provide the most suitable assemblages for dealing with inter-urban trade.

## 2 THE ROLE OF THE CHURCH IN LATE ANTIQUE WINE TRADE

**Abstract author(s):** Komar, Paulina (Cardinal Stefan Wyszyński University in Warsaw)

**Abstract format:** Oral

The starting point of this presentation is an increase in Palestinian wines imported to Italy during Late Antiquity, which can be observed by analysing numbers of amphoras discovered in Rome and the main centres of the Adriatic region. This increase cannot be explained only by the disappearance of western amphoras from the archaeological record caused by a growing role of barrels in the Western Mediterranean trade.

Considering that the increase in importations regards wines from the Holy Land it might have been associated with the development of the Church and the interference of the representatives from this institution in wine production in Palestine and trade in the Mediterranean. Although clerics were not allowed to act as negotiators, the ban did not cover commercial activities undertaken for the benefit of either the poor or the Church. There is plenty of archaeological, epigraphic and literary evidence to suggest that the clergy took part in commercial exchange, and, moreover, that their position was privileged compared to ordinary traders, given that they incurred no costs when conducting long-distance commerce. This evidence will be presented and analysed in order to answer the question whether the Church was an important player in wine commerce during Late Antiquity.

## 3 RAT REMAINS AS A PROXY FOR LATE ANTIQUE AND EARLY MEDIEVAL TRADE

**Abstract author(s):** Orton, David - Everett, Sarah (University of York) - Holmes, Mathilda (Consultant zooarchaeologist; University of Leicester) - García García, Marcos (Universidad de Alicante) - Salvadori, Frank (independent researcher)

**Abstract format:** Oral

This paper assesses the potential of commensal rats as a proxy for trade networks in Roman and medieval Europe. Originally from southern Asia, the black rat (*Rattus rattus*) reached the Mediterranean by the late 1st millennium BCE, before spreading into temperate Europe with the Roman Empire. Rats' presence in various well-connected Roman settlement types — including villas and forts as well as urban settlements — and near-absence beyond the limes suggests that populations this far beyond native habitats were dependent on the combination of bulk trade/provisioning (notably of grain and other perishables) and major settlement nodes that characterised the Roman economic/settlement system. As such, rats represent a potentially powerful indicator for the breakdown of elements of that system. A post-Roman decline in archaeological rat finds has indeed been noted (e.g. McCormick 2003) but its extent and timing are unclear, and it may be an artefact of research bias or result from 6th C climate and plague rather than economic change.

Via systematic review of over 500 rat records from western Europe, we show that rat finds disappear from the 5th C CE in England but persist until the 7th C in Italy, corresponding with expectations based on declining trade rather than environmental factors. Iberian data are limited, but rat finds become rare in the 6th C and common again in the Islamic period from the 8th C. We demonstrate that for England, at least, this post-Roman decline cannot be attributed to research bias, while recent aDNA results (Yu et al. 2022) support the idea of significant discontinuity in rat populations. Finally, we briefly consider the implications of these results for the mechanisms of the First Plague Pandemic, and close by assessing the potential of future zooarchaeological and archaeogenetic research to increase the temporal and spatial resolution of this picture.

#### 4 **ECONOMY AND TRADE IN 5TH CENTURY TRIPOLITANIA**

**Abstract author(s): Schimmer, Florian (Römisch-Germanisches Zentralmuseum Mainz)**

**Abstract format: Oral**

The North African provinces of the Roman Empire represented one of the most important areas for the production and export of ceramics and agricultural goods in Late Antiquity. The conquest of North Africa by the Vandals from 429 A.D. onwards led to a fundamental change of the political framework conditions. These developments had also an impact on both economy and trade, although these effects were not as drastic as had long been assumed.

The presentation will focus on the province of Tripolitana, which did not come under Vandal rule until 455 A.D. In recent decades, archaeological research at various sites in this region, including civil settlements and military sites, as well as a number of material studies have provided new results and insights. These allow a more differentiated assessment of trade and economic structures in Tripolitania during the late antique period. The aim of the presentation is to give an overview of a few central aspects.

#### 5 **SHIPPING IONIAN WINE TO THE NORTH: THE DISTRIBUTION OF SICILIAN AND CALABRIAN FLAT-BOTTOMED AMPHORAE IN THE ADRIATIC**

**Abstract author(s): Riccato, Anna (Università degli Studi di Padova) - Dobрева, Diana (Università di Verona)**

**Abstract format: Oral**

In the last decades, a growing interest has developed in a particular group of flat-bottomed wine amphorae, produced in ancient Sicily and Bruttium over a period spanning between the 1st and 6th centuries AD. In the Adriatic area, such containers remained unidentified for a long time, but recent research led to the discovery of an increasing number of specimens in many Late Antique contexts. Although less intense than other traffics of the same period, the Ionian wine trade is thus emerging as a significant element in the economy of Late Roman Adriatic centres.

The purpose of the present contribution is to address this issue through the study of published and unpublished data, which can allow to identify the most widespread types and map their distribution along both Adriatic coasts and in their immediate hinterland. In addition, an attempt will be made to recognise the manufacturing centres of the containers and thus trace with greater detail the preferential trade routes which brought South Italic wine to the North. The final aim is to understand the reasons for this success during Late Antiquity, analysing the collected data in the broader economic and socio-political framework.

#### 6 **NEW AMPHORA DATA FROM THE UPPER ADRIATIC. TORCELLO AND GRADO BETWEEN THE 4TH AND 7TH CENTURIES: TWO ECONOMIC OBSERVATORIES COMPARED**

**Abstract author(s): Cipolato, Andrea (Ca' Foscari University - Venice)**

**Abstract format: Oral**

The contribution aims at presenting part of the results of a wider project concerning the study of the commercial evolution between the Roman age and the early Middle Ages in the coastal territories of the Upper Adriatic Sea, through the analysis of transport containers. Despite the fact that this area played a crucial role in ancient times in terms of trade and traffic, the studies carried out on amphorae are still partial, thus limiting an organic analysis of the economic framework. The aim here is to compare amphorae trends from two newly formed late antique centres: Torcello, in the northern lagoon of Venice, and Grado, in the area in front of the city of Aquileia. The archaeological tradition describes these sites as large emporiums, able to become part of the dynamics of the global market immediately. They soon became real hinges connecting the sea and the inland markets, managing the reception and redistribution of goods. But what is the overview described by the study of amphorae? What degree of detail is possible in describing the complexity of these phenomena? How did the relationships between local and international economies develop? Through a systematic approach that includes the study of amphorae from reliable stratigraphies between the 4th and 7th centuries A.D. of the sites of Torcello and Grado, supplemented by quantifications of fragments and computer/statistical analyses, the aim is to provide a commercial reference framework that is as exhaustive as possible and truly comparable with that of other sectors. Similarities and differences between the two sites will be highlighted, relating to the tendency to favour specific commercial relations with markets and productive

regions, as well as to the methods and timing of the evolution of the flow of goods in a fundamental historical moment for ancient economic and social dynamics.

## 7 MARKET SPACE IN LATE ANTIQUE AQUILEIA

**Abstract author(s):** Basso, Patrizia (University of Verona)

**Abstract format:** Oral

From 2018 to present the University of Verona, in collaboration with the Fondazione Aquileia and Soprintendenza archeologia beni culturali e paesaggio per il Friuli Venezia Giulia, carried out an archaeological excavation on the former Pasqualis property in Aquileia. The area has been already excavated in the '50s of the last century when two of the town's parallel curtain walls that run along the river and market buildings located south from the basilica were uncovered.

As much as the work is still in progress, some important results already came to light. It is about some structure that seem to be part of a monumental market building that most probably was used to sell different types of goods. Its strategic position next to the river from one side and close to the basilica from another could be of great importance to better understand the development of Aquileia during Late Antiquity.

The town has a marked commercial character due to its geographical position: it is open not only the Orient and the Mediterranean area via the Adriatic but also to the Balkan and continental Europe.

## 8 TRACING NETWORKS IN THE ADRIATIC DURING LATE ANTIQUITY

**Abstract author(s):** Dobрева, Diana (University of Verona)

**Abstract format:** Oral

Studies concerning the Late Antique economy, traditionally entrusted to historical investigations, have enjoyed new perspectives thanks to archaeological research, especially based on material culture. The pottery assemblages' analysis proved to be an excellent lens through which to observe the impact that institutional, political and economic transformations had on northern Adriatic and the inner land territory. Between the second half of the 5th and the first half of the 6th century AD a fairly homogeneous situation is recorded: Aquileia and the regional territory still show a certain trade continuity, albeit in a context of general regression compared to the previous phase dated between the 4th and the first half of 5th century AD. Aquileia has not yet lost its role in the redistribution of goods and foodstuffs within the surrounding area, despite the passage of the Huns in 452 AD, which probably left traces of destruction in some parts of the city but certainly did not determine the end of its political, administrative and commercial importance. During the middle of the 6th century AD it represents a real social divide when one observes, in a context of general impoverishment, a greater resilience of commercial relations in the regional inner sites compared to some coastal cities. An organism dominated by a single large port acting as a regional emporium was replaced by a complex, more dispersive sorting system, made up of several multiple port sites of lesser importance, which have arisen in the recent lagoons of Grado and Marano. The present paper aims to discuss the establishment of this new distribution Adriatic system responsible for many imports from East to West.

## 9 LAMPS AND TRADE NETWORKS IN LATE ANTIQUE NORTH ADRIATIC REGION

**Abstract author(s):** Zago, Sabrina (Università di Verona)

**Abstract format:** Oral

This poster aims to analyze the transformation of the North Adriatic trade routes in late antiquity throughout the study of the late roman terracotta lamps. These manufactures have shown to be very influenced by the economic events that happened between the end of the Roman Times and the early Middle Ages.

In this research, I start from the observation of the lamps found in Aquileia during emergency excavations held between 1968 and 1972 in order to create the modern drainage system of the city. The typo-chronological study and the comparison with other late roman lamps found in other excavations in Aquileia show, at the same time, the persistence of long-distance trade networks (in particular with the North African region) and the growth of short and medium-range commercial relations. To better examine this phenomenon the data will be considered within the context of the late roman trade routes of the North Adriatic region.

## 10 IMPERIAL NETWORKS FOR THE SUPPLY OF AN IMPERIAL RESIDENCE IN LATE ANTIQUE GAUL

**Abstract author(s):** Schmidts, Thomas (Römisch-Germanisches Zentralmuseum)

**Abstract format:** Oral

In the *expositio totius mundi* (§58), an important source on the economic geography in the middle of the 4th century, the special role of Trier as an Imperial residence is pointed out for Gaul. Likewise, Arles is mentioned as a port city that plays a decisive role in supplying this metropolis. Thus there can be no doubt that in the 4th century AD Trier was

supplied via the axis of the Rhône and Saône rivers, which had already been decisive for the transport of goods from the Mediterranean to Inner Gaul and to the border areas of the Germanic provinces in the centuries before.

Although evidence of Mediterranean goods in Late Antiquity is rare in northern Gaul, Trier nevertheless seems to have had remarkable trade contacts. On the one hand, the lecture aims to reconstruct the Trier trade network on the basis of archaeological evidence and, on the other hand, to appreciate the importance of the route from Arles to the interior of Gaul. Among the goods known from Trier, e. g. lamps from North Africa are present in a remarkable quantity for this region. In addition, due to its high status as a residence or one of the most important administrative centres in Gaul, there was also a need for luxury goods, some of which can be evidenced by organic remains. Another important question is to what extent state measures helped to secure the trade route along the rivers into the interior of Gaul.

## 11 **TIMES OF CHANGE OR CONTINUITY? CERAMICS AND QUERNSTONES FROM MAYEN AND THEIR TRADE BETWEEN THE 4TH AND THE 6TH CENTURY**

**Abstract author(s):** Grunwald, Lutz - Wenzel, Stefan (Römisch-Germanisches Zentralmuseum)

**Abstract format:** Oral

The transition from the Late Antiquity to the Early Middle Ages is often associated with a collapse of trade networks and the economic fabric that occurred in the 5th century. But was this really always the case?

In order to find answers, the export of ceramic vessels (the Mayen ware) and lava quern stones from Mayen in the Eifel, which were widely used in the north-western provinces of the Roman Empire and beyond, will be examined from the 4th to the 6th century. It will have to be discussed whether the trade networks to be explored on the basis of the respective distribution areas collapsed during the 5th century or whether there is evidence for the continuation of the Roman economic structure into the Early Middle Ages. The influence of state agencies on the distribution of these goods has also to be examined, since the state apparently predetermined the structure of Roman Mayen and because it secured the first stage of the transport routes of the Mayen products in the long-distance trade networks.

## 12 **TOGETHER OR APART - WHAT GLASS BEADS FROM MEROVINGIAN GRAVES REVEAL ABOUT THEIR TRADE AND USE IN WESTERN EUROPE**

**Abstract author(s):** Van Ham-Meert, Alicia (Earth and Environmental Sciences, KU Leuven) - Langbroek, Mette (Faculty of Archaeology, Leiden University)

**Abstract format:** Oral

Beads provide a unique way of looking at trade in the Merovingian period. In this paper the beads from bead-ensembles (bracelets, necklaces, etc.) given as gravegoods in female burials from Lent, Wijchen en Elst are considered. Each string consists of a variety of bead-types that were made using different techniques, some originating from as far away as India, others made locally using heavily recycled roman materials (such as tesserae). This gives a composite image of a world where material from afar is still available even outside seats of power (i.e. in rural cemeteries), yet some of the material found in the same context points to re-use and recycling as a normal practice. Because of the large number of beads within a necklace, the chemical analysis (using pXRF and LA-ICP-MS) of these beads allows to answer questions not just of provenance, but also of similarity and variety within a single necklace. We want to interrogate the data to see whether beads (either from far away or with a more local origin) travelled together to be used in a string of beads, or whether strings of beads were collected over a long period of time. To answer these questions statistical tools are used. These analyses reveal the breadth of trade still occurring in this period. Besides the exchange of beads across Europe, ideas travelled as well, as strings of beads from different parts of Western Europe were strung in remarkably similar ways.

---

## 371 **POPULATION HISTORY AND COMMUNITY FORMATION IN EARLY MEDIEVAL EAST-CENTRAL EUROPE: INTEGRATING GENETIC, ISOTOPIC, ARCHAEOLOGICAL AND HISTORICAL PERSPECTIVES**

**Theme:** 3. The Carpathian Basin: Integration, Mobility and Diversity

**Organisers:** Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest; Institute of Archaeology, Research Center for Humanities, Eötvös Loránd Research Network, Budapest) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology, Leipzig; Department of Archaeology and Museology, Masaryk University, Brno) - Koncz, István (Institute of Archaeological Sciences, ELTE - Eötvös Loránd University, Budapest) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Network, Budapest) - Knipper, Corina (Curt-Engelhorn-Centre of Archaeometry, Mannheim)

**Format:** Regular session

Few parts of Europe witnessed as many population shifts as the Middle Danube region between 400-900 CE. In this macro-region, Pannonians, Romans, Goths, Gepids, Longobards, Avars, Bulgars, Slavs and many other groups came,

settled and/or continued their migration or expansion towards other regions of Europe. Several very different social models coexisted here or replaced each other (e.g. the complex Christian and Barbarian societies, realms of steppe nomads and communities under their rule). The cohabitation and later the amalgamation of locals and newly-arriving foreign groups led to a continuous cultural transformation during this period that affected both lifestyle and material culture. The abundance of archaeological finds and the series of historical-political changes attested by the written sources make this region an intriguing test case for the relationship between ethnic identities constructed in texts, cultural and social habitus attested in the archaeological record and isotopic signatures, biological ancestries and relatedness attested by biomolecular analysis of human remains.

Recent bioarchaeological investigations and discoveries provide new perspectives on the role of mobility and kinship, social structure and organizations of these communities. This session aims to explore the people and their communities through comprehensive case studies from East-Central-Europe. The contributions should be based on interdisciplinary approaches, which interpret ancient DNA, isotope and other bioarchaeological results in the context of archaeology and history. Both fine-scale and large-scale studies are welcome. Furthermore, methodological papers on the integration of different disciplines are also invited to join the discussion.

## ABSTRACTS

### 1 INTEGRATIVE ARCHAEOLOGICAL AND ARCHAEOGENOMIC DATABASE FOR STUDYING THE POPULATION HISTORY OF THE HUN PERIOD

**Abstract author(s):** Vyazov, Leonid (University of Ostrava) - Flegontov, Pavel (University of Ostrava; Harvard University, Cambridge) - Işıldak, Ulaş (University of Ostrava; Middle East Technical University, Ankara) - Flegontova, Olga - Sagmanova, Gulnaz (University of Ostrava)

**Abstract format:** Oral

The Migration period in the Eurasian steppe and forest-steppe is a bizarre pattern of population processes. Hunnic invasion to the East European steppes in the 3rd started dramatic and wide-scale relocations of the local groups of different origins. It resulted in intensive population admixture and formation of heterogeneous societies, which were the main actors during the whole period. The sophisticated nature of the migrations process caused by the Huns and the associated groups requires a multi-proxi study based on integrated archeogenomic and archaeological records.

To perform multidisciplinary analysis, we developed a Web-based and GIS-driven database, integrating archeogenomic and archaeological data. From the archeological side, our database deals with both cultural and stylistic interpretations and relative chronological sequences as well as absolute datings. It is based on the use of a graph database (Neo4j) that allows us to store, analyze and manage complex relationships between the archaeological evidence, its context, and interpretations. The functionality of our multi-user system includes data mapping, visualization, selection, and processing.

Published genome-wide archeogenetic data from the Allen Ancient DNA Resource are stored in the database and linked to respective burials. The web-GIS toolkit enables users to select certain groups of burials and archaeological sites and perform simple analyses of genetic data: hierarchical clustering of genetic distances, PCA (both basic and with projection on user-defined axes), ADMIXTURE, f-statistics, and qpWave/qpAdm.

The database also enables users to store connections between ancient individuals revealed by the identity by descent (IBD) methodology. IBD sharing (autosomal haplotype sharing) is a high-resolution method of genetic analysis that recently became applicable to ancient DNA samples due to advances in genotype imputation and phasing for ancient DNA data in the Reich Lab.

We hope that this database and a simple toolkit will help to cross the divide between research in archaeology and archaeogenetics.

### 2 Y-CHROMOSOME ANALYSIS OF GOTHS FROM THE MASŁOMECZ GROUP CEMETERIES IN SOUTHEASTERN POLAND

**Abstract author(s):** Golubinski, Michal - Baca, Mateusz - Molak, Martyna - Popović, Danijela (Centre of New Technologies, University of Warsaw) - Kokowski, Andrzej (Institute of Archeology, Maria Curie-Skłodowska University, Lublin) - Węgleński, Piotr (Centre of New Technologies, University of Warsaw)

**Abstract format:** Oral

The Goths were an important part of European history from the 1st to the 8th century AD. For many years, various hypotheses have emerged among researchers regarding their origin and dispersal. Unknown is also the scale of assimilation of the local people they encountered during their migrations across Europe. The aim of this study was to determine the origin and genetic structure of the male lineages of the Goths from the Masłomęcz group who inhabited the Hrubieszów Basin (southeastern Poland) from the 2nd -4th century AD using Y chromosome. The material for analysis consisted of skeletal fragments collected from 43 individuals. Samples with the highest endogenous DNA

content were sequenced directly to low genome coverage. For the others, after sex determination, we performed targeted enrichment with a custom panel of 10k Y chromosome SNPs. This allowed us to determine the Y chromosome haplogroup of 18 individuals. A total of 14 individuals (78%) represents the Y chromosome haplogroups most closely related to the Scandinavian population. Thirteen individuals were classified into subclades of haplogroup I1, four to haplogroup R1a and one to haplogroup J2b. Haplogroup I1 currently occurs mainly among people living in Scandinavia. Ancient DNA analyses showed that I1 has been present in the Scandinavian population since at least the Bronze Age. One of the individuals belonging to haplogroup R1a-Z284 belongs to a subclade found almost exclusively in the ancient and modern Scandinavians. The remaining four individuals belong to haplogroups R1a and J2b most probably represent the effect of assimilation of local people, met by Goths during their numerous war expeditions and settlement expansion.

The research is part of the project „Genetic history of Poles” (2018/31/B/HS3/01464) financed by the National Science Centre, Poland.

### 3 **SNAPSHOT INTO KINSHIP STRUCTURE AND POPULATION HISTORY OF A LATE AVAR-PERIOD COMMUNITY FROM GENOME-WIDE ANALYSES OF THE WHOLE RÁKÓCZIFALVA CEMETERY.**

**Abstract author(s):** Gneccchi Ruscone, Guido Alberto (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Rácz, Zsófia - Samu, Levente (Institute of Archaeological Sciences, Eötvös Loránd University) - Szeniczey, Tamás (Dept of Biological Anthropology, Eötvös Loránd University) - Traverso, Luca (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Schmid, Magda (Kiel University) - Hajdu, Tamás (Dept of Biological Anthropology, Eötvös Loránd University) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University; Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology, Leipzig; Department of Archaeology and Museology, Faculty of Arts, Masaryk University)

**Abstract format:** Oral

Recent ancient DNA studies revealed the Avar period in the Carpathian Basin was characterized by the appearance of a population with an East Asian ancestry traceable to the ancient Mongolian steppe. This eastern profile is tightly associated but not exclusive to the early elite burials found in the core of the Avar empire. This finding opens many new questions about the population history of the Avar period. How did these eastern migrants interact with the “western” populations already living in the region? Did they admix with the local population? What happened to them after the fall of the Avar dominion in the Carpathian Basin? Only a multidisciplinary approach combining the co-analyses of complete cemeteries from an archeological and genomic perspective could allow to gain new insights into these complex societal phenomena. The site of Rákóczifalva 8 dated between the end of the 7th beginning of the 9th century located at the border of the core Avar region, represents a unique opportunity to this end. The cemetery spans the second half and end of the Avar rule in the Carpathian Basin and the archaeological record, as well as the spatial situation shows connections with other middle and late Avar period sites. At the same time, it reveals several elements of discontinuity with earlier cemeteries of the Transisza region. We sampled the entire cemetery and produced genome-wide data for all the individuals, which were integrated together with archaeological, anthropological, isotopic analyses in the framework of the ERC funded project ‘HistoGenes’. Our results reveal unprecedented insights into the kinship structure of this late Avar-period community and provide a glimpse into the dynamics of populations transformations occurring in this period.

### 4 **KINSHIP RELATIONS AND SPATIAL ORGANIZATION IN A LATE AVAR-PERIOD CEMETERY: ARCHAEOLOGICAL PERSPECTIVES ON THE RÁKÓCZIFALVA SITE (CENTRAL HUNGARY)**

**Abstract author(s):** Rácz, Zsófia (Institute of Archaeological Sciences, Eötvös Loránd University) - Gneccchi Ruscone, Guido Alberto (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Samu, Levente (Institute of Archaeological Sciences, Eötvös Loránd University) - Szeniczey, Tamás (Department of Biological Anthropology, Eötvös Loránd University) - Traverso, Luca (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Schmid, Magdalena M. E. (Kiel University) - Hajdu, Tamás (Department of Biological Anthropology, Eötvös Loránd University) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology, Leipzig; Department of Archaeology and Museology, Faculty of Arts, Masaryk University, Brno) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University; Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network, Budapest)

**Abstract format:** Oral

Two Avar-period (late 6th – early 9th c.) cemeteries were excavated in 2006–2007 in the area of Rákóczifalva, in close proximity to each other. The sites are located in the Great Hungarian Plain, east of the Tisza River, along the Tisza's middle course. Cemetery No. 8 and 8A contains 58 and 249 graves, respectively. Early burials of the sites suit the cultural traits of Avar-period communities in the Transisza region (steppean nomad features, early Byzantine imports), whereas later burials blend into the more uniform material culture and burial rituals of the entire Carpathian Basin in

the 8th century. We investigate both sites using an interdisciplinary approach as part of the ERC HistoGenes project, conducting archaeological, anthropological, isotopic, and aDNA analysis.

In our presentation, we discuss the relationship between the two sites from an archaeological and anthropological point of view. We look at the demographics of the cemeteries as well as the health status of the people buried there. The new genomic analyses of the smaller Rákóczfalva burial place allow us to map the familial links of the deceased as well as the site's spatial organization. As a result, we will be able to learn more about community organization in the Avar period than ever before. We are also looking for answers to how funerary representation, grave goods and family relations of the cemetery are linked.

## 5 CHILDHOOD OF THE AVARS AND GEPIDS: RECONSTRUCTING DIET AND WEANING PRACTICES USING STABLE ISOTOPIC ANALYSIS AND MULTIPLE TISSUES

**Abstract author(s):** Verostick, Kirsten (Department of Geology and Geophysics, University of Utah, Salt Lake City) - Hajdu, Tamás - Szeniczey, Tamás (Department of Biological Anthropology, Institute of Biology, Faculty of Science, Eötvös Loránd University) - Farkas, Zoltán (Salisbury Ltd., Budaörs) - Dani, János (Déri Museum, Debrecen) - Bernert, Zsolt (Hungarian Natural History Museum, Budapest) - Masek, Zsófia (Institute of Archaeological Sciences, Eötvös Loránd University) - Kovács, Péter (Department of Archaeology, Damjanich János Museum, Szolnok) - Hoppál, Krisztina (MTA-ELTE-SZTE Silk Road Research Group, Eötvös Loránd Research Network) - Rácz, Zsófia (Institute of Archaeological Sciences, Eötvös Loránd University)

**Abstract format:** Oral

This presentation explores the breastfeeding, weaning and overall dietary practices in non-adults of Avar and Gepidic period populations in the Great Hungarian Plain during the Migration Period (5th-8th century). This research investigated hypothesis that breastfeeding and weaning practices (BWPs) differed between Avar and Gepid populations due variation in overall subsistence practices and general cultural practices. Bone collagen samples from 131 individuals (60 non-adults) from five sites (Berettyóújfalu, Tiszapüspöki, Tiszabura, Rákóczfalva sites 8 and 8/A), were analyzed for nitrogen and carbon stable isotopes. Collagen samples from non-adults were assessed using a Bayesian model called WARN. First permanent molars were also samples from 37 (16 adults, 21 non-adults) individuals across the five sites with tooth dentine incrementally sampled to analyze for nitrogen and carbon isotopic values. No significant differences in isotopic values from bulk collagen analysis was found between adults and non-adults at each of the sites analyzed, apart from breastfeeding or weaning non-adults. BWPs patterns drawn from the stable isotope data and the WARN program revealed no specific similarities between sites or populations. Incremental sampling of the first molars also suggests no specific patterns of BWPs within populations, as each site analyzed revealed different BWPs.

With no clear BWPs within the populations and a generally similar diet, it is suggested through the lens of life course theory that cultural practices, generational cohort differences and agency are responsible for variations in BWPs within the sites and populations. Additionally, the dietary practices found in non-adults paired with other archaeological evidence offer indications of the roles non-adults played in Avar and Gepid society.

## 6 HOW ARCHAEOLOGY AND ANTHROPOLOGY CAN BUILD ON ADNA ANALYSES OF ENTIRE CEMETERIES

**Abstract author(s):** Tobias, Bendeguz (Institute of Medieval Research, Austrian Academy of Sciences) - Berner, Margit - Pany-Kucera, Doris - Eggers, Sabine - Klostermann, Paul - Koger, Robin (Department of Anthropology, Natural History Museum Vienna) - Hofmanova, Zuzana - Wang, Ke (Max Planck Institute for Evolutionary Anthropology Leipzig) - Daim, Falko (Institute for Prehistory and Historic Archaeology - University of Vienna) - Pohl, Walter (Institute of Medieval Research, Austrian Academy of Sciences)

**Abstract format:** Oral

Within the ERC-funded HistoGenes project, we assess several hundred inhumations from Austrian cemeteries dated between the 4th and the 9th century A.D. The interdisciplinary analysis encompasses archaeological, anthropological as well as molecular methods, including aDNA and isotope analyses. Ancient DNA data creates new possibilities to reevaluate and interpret funerary customs and chronological sequences by tracking generations and families in the population. Based on preliminary data from the cemetery of Leobersdorf (7th to 8th c. A.D.), located at the periphery of the Avar empire, we will demonstrate new possible investigations on demography and disease burden.

This interdisciplinary perspective will show the impact of the integrated analyses on the anthropological, archaeological, and ultimately the overall cultural-historical interpretation. Joint interpretations shed new light on aspects of chronology, age at death, biological sex estimations gender, pedigrees, and maternity. Our data on these aspects will open up new perspectives on social life which previously could not have been recognised or verified.

This project has received funding the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme (grant agreement n° 856453 ERC-2019-SyG).

## 7 ANCIENT DNA REVEALS THE SETTLEMENT OF AVAR COMMUNITY IN LOWER AUSTRIA DURING EARLY MEDIEVAL PERIOD

**Abstract author(s):** Wang, Ke (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Tobias, Bendeguz (Institute of Medieval Research, Austrian Academy of Sciences, Vienna) - Berner, Margit - Pany-Kucera, Doris (Department of Anthropology, Natural History Museum Vienna) - Ingrová, Pavlína (Department of Archaeology and Museology, Masaryk University, Brno) - Eggers, Sabine (Department of Anthropology, Natural History Museum Vienna) - Daim, Falko (Institute of Medieval Research, Austrian Academy of Sciences, Vienna) - Pohl, Walter (Department of Anthropology, Natural History Museum Vienna) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology, Leipzig; Department of Archaeology and Museology, Masaryk University, Brno)

**Abstract format:** Oral

The archaeogenetic evidence of the Avar period in Europe records a group of people coming from the East Eurasian steppe. So far, the study of Avar-period individuals in Europe has been around the Carpathian Basin, where most of the rich archaeological material associated with the Avars has been found. That is also in concordance with historical records that designate this area as the core of the Avar Empire, waging wars against Byzantium. While eastern Austria is located in the periphery of the presumed Avar territory, there are also numerous finds associated with the Avar period, including a considerable amount of human skeletal remains buried during and after the Avar period. Within the HistoGenes project, we study the genetic architecture of several hundreds of samples from Austrian cemeteries dated to between the 4th and the 8th century A.D. One such cemetery, studied in detail by several disciplines involved in the project, is the cemetery of Leobersdorf. Located south of Vienna, it has been dated from the first half of the 7th until the beginning of the 9th century A.D. This is a particularly good example for studying Avar communities in Austria through a thorough archaeological, anthropological and genetic analysis of this necropolis. Within the ERC HistoGenes project, we show that the application of archaeogenetic approaches will allow us to uncover the past of population movements and admixture even in recent times. Ancient DNA studied in its archaeological, anthropological and historical context, and for an entire cemetery, enables us to jointly reconstruct the genetic origin, family relationships, social structure and demography of the inhabitants of Leobersdorf and gives us an insight into their genetic connections to the wider region.

## 8 BIOLOGICAL KINSHIP PATTERNS IN AN EARLY MEDIEVAL GRAVEYARD OF THE RHEINLAND AS PART OF THE FRANKISH KINGDOM

**Abstract author(s):** Lacher, Laura - Schiffels, Stephan - Gretzinger, Joscha (Max Planck Institute for Evolutionary Anthropology) - Pääffgen, Bernd (Ludwig-Maximilians-Universität München) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology)

**Abstract format:** Oral

The Frankish kingdom included vast areas of western Europe and has undergone intense archaeological examination. Ancient DNA studies on the other hand have not been performed so far. Here I present an interdisciplinary project regarding an early medieval graveyard of the Rhineland in northwestern Germany. We are using the archaeological record for chronological placing and interpreting social status; perform osteological analyses with focus on age estimation and identification of non-metric traits; and analyse genome-wide aDNA data to determine biological sex and kinship, as well as the broader ancestry patterns observed with contemporary and present-day genetic data. First, we reconstruct close genetic multigenerational kinship patterns among individuals, portraying the exploitation of the cemetery by a continuous population throughout its 400 years of usage. Second, we demonstrate a relatively high degree of genetic diversity as seen in ancestry profiles in these samples. Third, we compare genetic kinship patterns with kinship patterns obtained by non-metric traits, which have been traditionally used in anthropometric research.

Finally we interpret our results in light of comparison with contemporary patterns observed in East-Central Europe.

## 9 POPULATION DYNAMICS AND HISTORY OF SOUTH MORAVIA DURING THE 2ND HALF OF THE 5TH AND THE 6TH CENTURIES AD

**Abstract author(s):** Loskotová, Zuzana (Archeologický ústav AV ČR, Brno)

**Abstract format:** Oral

The contribution presents a new project of the Institute of Archaeology of the CAS in Brno "Lombard population in Moravia. Interdisciplinary research of the Migration Period necropolises" (granted by the Czech Science Foundation GACR). The revision of previous research but especially based on geophysical prospecting and field excavation of the selected cemeteries is aimed to bring new information about the structure, dynamics and mobility of populations. The horizon of the end of the 5th and the beginning of the 6th century AD deserves special attention as groups of the newly arriving Lombard population appear in the area of interest inhabited by the Germanic populations (Herules, remains of the local Suebian tribes, etc.). The project, which is currently in its initial phase, is based on an interdisciplinary

nary approach; archaeological-historical interpretations will be validated through the analyses of strontium, carbon and nitrogen isotopes; palaeopathological analysis, analysis of metals and textiles. Through the involvement in the international project "Histogenes", aDNA data from the Moravian cemeteries will be part of the European database and thus contribute to tackling the issue of migration and the formation of the Early Medieval Europe.

## 10 CONTINUITY AND DISCONTINUITY PRECEDING THE FORMATION OF GREAT MORAVIA IN POHANSKO REGION

**Abstract author(s):** Zlámalová, Denisa (Masarykova univerzita) - Schultz, Ilktra (Department of Biology, University of Fribourg; Swiss Institute of Bioinformatics, Lausanne) - Gneccchi-Rusccone, Guido - Traverso, Luca (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Dresler, Petr (Department of Archaeology and Museology, Masaryk University, Brno) - Přichystalová, Renáta - Morris, Sam (UCL Genetics Institute, University College London) - Macháček, Jiří (Department of Archaeology and Museology, Masaryk University, Brno) - Wegmann, Daniel (Department of Biology, University of Fribourg; Swiss Institute of Bioinformatics, Lausanne) - Hofmanová, Zuzana (Department of Archaeology and Museology, Masaryk University, Brno; Max Planck Institute for Evolutionary Anthropology, Leipzig)

**Abstract format:** Oral

To this day, the question of the impact of migrations in the period predating the formation of the first Slavic states in East Central Europe is still debated. Traditionally accepted consensus is that Slavs migrated from East into the rest of Europe in the 5th or 6th century AD. There are however voices that question this narrative and suggest that the Slavic languages arrived in the region without a large migratory event. Even in the presence of a demographic shift in the population, the process itself is not well described and the social structure of the presumed incomers might have played a strong role (e.g. elite migration versus slow immigration distributed over generations). The situation is complicated by geographical and cultural variability throughout Central Europe at this time. To overcome this challenge, in this part of the project FORMOR (GAČR grant The Formation of Multi-ethnic Complex Societies in Early Medieval Moravia. Collective Action Theory and Interdisciplinary Approach), we focus on an archaeologically well-defined region near Pohansko (Břeclav, South Moravia, Czechia) where there was a settlement that was a part of one of the first states where Slavic language has been used (Great Moravia) and where there are skeletal remains also from preceding ("Early Slavic" and "pre-Slavic") occupation. We analyze whole genomes of medium coverage from these contexts and investigate continuity with various methods including explicit coalescent modeling. We also investigate the genetic relationship of these individuals to each other and known reference data in the wide region.

## 11 SLAVS OR MAYBE NOT? RADIOCARBON DATING OF CREMATED BONES FROM "PÄUCA - HUNGARIAN CHURCH SITE" (ROMANIA, SIBIU COUNTY)

**Abstract author(s):** Tiplic, Ioan Marian (Lucian Blaga University of Sibiu)

**Abstract format:** Oral

Archaeological research in the site of "Păuca - Hungarian Church" has started in 2010, and between 2010-2021 has uncovered over 90 graves, some being simple cremation graves with the deposit of remains in the urns, others being double graves (with two urns) and a single one is a mixed double grave (incineration and inhumation).

The dating of three samples from the necropolis would suggest that Păuca necropolis is contemporary with the final phase of the late Germanic period (Gepids) and the early Avar period. If we admit that it is more accurate to date to the upper limit of the range (7th century A.D.), the necropolis at Păuca could be connected with historical events spent between 567-630 A.D., i.e. the establishment and consolidation of Avars power in the Pannonian-Transylvanian space.

The C14 dating of the cremated bones from the Păuca necropolis is intending to launch a debate on the need for more samples of C14 data for the cremation necropolises attributed to the so-called Mediaș group and at the same time may represent a starting point for a re-discussion of the chronology for the period between 6 to 9 Century A.D. in the eastern part of Carpathian Basin.

## 12 AN INTEGRATIVE GENETICS APPROACH FOR STUDYING DISEASE IN EARLY MEDIEVAL EUROPE

**Abstract author(s):** Hiss, Alina - Gneccchi Ruscone, Guido - Traverso, Luca - Wang, Ke (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest; Institute of Archaeology, Research Center for Humanities, Eötvös Loránd Research Network, Budapest) - Pohl, Walter (Institute for Medieval Research, Austrian Academy of Sciences, Vienna; Department of History, University of Vienna) - Geary, Patrick (Institute for Advanced Study, Princeton) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology, Leipzig; Department of Archaeology and Museology, Masaryk University, Brno) - Herbig, Alexander - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig)

**Abstract format:** Oral

In the fields of archaeology, anthropology, and history, the study of human health and diseases have always played an important role as they have a substantial impact on individuals and societies. However, this is often limited to

diseases that either leave traces on the skeleton or are documented in historical sources. Applying genetic methods, the field of archaeogenetics could add to our understanding of numerous pathogens that do not leave visible lesions on the skeleton. However, meaningful interpretation of genetic results is only possible following an integrative approach by combining information from all disciplines. In the ERC funded project 'HistoGenes', researchers and scholars from various fields work together to study the population history of Early Medieval Eastern Central Europe to understand more about human migration and mobility, the structure of past societies, such as kinship, as well as health and diseases.

One pathogen that can be observed across sites and through time is the hepatitis B virus, the causative agent of chronic hepatitis, cirrhosis and hepatocellular carcinoma in humans, which can be transmitted vertically from mother to child and horizontally as a sexually transmitted disease. Combined with our knowledge about relatedness and kinship within these social groups, we can interpret infections in much more detail, potentially tracing back chains of transmission and gain insights about the impact this disease might have had on individuals in the past.

Here we present first genetic results about the hepatitis B virus in Early Medieval Europe that are discussed and interpreted in an interdisciplinary context.

### 13 WHAT WAS IT LIKE LIVING WITH LEPROSY IN THE AVAR AGE COMMUNITY OF KISKUNDOROZSMA–KETTŐSHATÁR I (HUNGARY)? – A CASE STUDY

**Abstract author(s):** Spekker, Olga (Department of Biological Anthropology, University of Szeged; Institute of Archaeological Sciences, Eötvös Loránd University) - Tihanyi, Balázs (Department of Biological Anthropology, University of Szeged; Department of Archaeogenetics, Institute of Hungarian Research, Budapest) - Kis, Luca (Department of Biological Anthropology, University of Szeged; Department of Archaeogenetics, Institute of Hungarian Research, Budapest) - Szalontai, Csaba (Archaeological Heritage Protection Directorate, Hungarian National Museum, Budapest) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University) - Pálfi, György - Marcsik, Antónia - Molnár, Erika (Department of Biological Anthropology, University of Szeged)

**Abstract format:** Oral

The aim of our study is to demonstrate an individual (KK61) from the 8th-century-CE cemetery of Kiskundorozsma–Kettőshatár I (Hungary), who appears to have lived with leprosy (Hansen's disease). The severity and extent of the detected bony changes imply that KK61, a middle-aged male, suffered from the disease for a long time prior to his death. It has affected not only the rhinomaxillary region of his face but also his lower limbs, with severe deformation and disfigurement of the involved anatomical areas. Consequently, he would have experienced disability in performing the basic activities of daily living; and thus, he would have required regular and substantial care from others to survive. Despite his very visible disease and associated debility, that clearly marked the middle-aged male as afflicted with leprosy, he has not been segregated but buried within the cemetery boundaries, among others from his community. His grave has conformed to the mortuary practices characteristic of the Kiskundorozsma–Kettőshatár I cemetery. Based on the above, there seems to have been no distinction, leper from non-leper, in death in the late Avar Age community of Kiskundorozsma–Kettőshatár I. These findings are in accordance with the results of previous studies on other Avar Age cemeteries from the present-day territory of Hungary, indicating that prior to the 13th century CE, lepers have not been segregated from the healthy population, at least in death. It should be noted that distinction or segregation in life do not preclude normative treatment in death. Nevertheless, the long-lasting survival of KK61 with Hansen's disease indicates that he would not have been abandoned but cared for by others. The detailed contextual analysis of KK61 illuminates both the biological and social consequences of living and dying with leprosy in the late Avar Age community of Kiskundorozsma–Kettőshatár I.

### 14 POSTMARITAL RESIDENCE PRACTICES IN THE AVAR PERIOD EASTERN TRANS-DANUBIA, HUNGARY

**Abstract author(s):** Szeniczey, Tamás (Department of Biological Anthropology, Institute of Biology, Faculty of Science, Eötvös Loránd University) - Kiss, Krisztián (Department of Biological Anthropology, Institute of Biology, Faculty of Science, Eötvös Loránd University; Department of Anthropology, Hungarian Natural History Museum) - Líbor, Csilla (Department of Biological Anthropology, Institute of Biology, Faculty of Science, Eötvös Loránd University, Budapest, Hungary; Szent István Király Museum) - Marcsik, Antónia (Department of Biological Anthropology, University of Szeged) - Hajnal, Zsuzsanna (Hungarian National Museum) - Szűcsi, Frigyes (Szent István Király Museum) - Rácz, Zsófia (Department of Hungarian Medieval and Early Modern Archaeology, Institute of Archaeological Sciences, Eötvös Loránd University) - Hajdu, Tamás (Department of Biological Anthropology, Institute of Biology, Faculty of Science, Eötvös Loránd University)

**Abstract format:** Oral

In 568 AD the Avars, an Asian-originated tribal confederation appeared in the Carpathian Basin. The Avar conquerors united under their rule the whole territory, subjugated its inhabitant and eventually established the Avar Khaganate.

The provision of the regions was mainly implemented in a nomadic way. Thus, the established polity constituted a different way from the early European development.

During the early Avar period, Eastern Transdanubia can be regarded as a contact zone between the steppe, the Merovingian and the Mediterranean worlds. The coexistence was not only cultural, but it took also place at the biological level of populations.

Postmarital residence analysis accompanied with biodistance analysis could provide a suitable tool to explore the biological and social interactions between the different populations. Phenotypic traits of the human remains can be used as a proxy to evaluate the diversion between different populations and the extent of sex-specific variation. Significant differences in morphological variability between the sexes could be indicative of a sex-biased pattern of postmarital residence. Postmarital residence analysis in this study is based on the assumption that the sex with a higher migration rate exhibits greater phenotypic variability.

Concerning the between- and within-group variability of the sexes, it is possible to assume a higher rate of female exchange between the communities.

The study was supported by the „HistoGenes” (ERC Synergy grant).”

## 15 **COMPARATIVE ANALYSES OF SOCIOCULTURAL CHANGES AND GENETIC TRANSITIONS IN THE AVAR PERIOD SOUTHERN-TRANSDANUBIA**

**Abstract author(s):** Gyuris, Balázs (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Network; Department of Genetics, ELTE-Eötvös Loránd University, Budapest) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest; Institute of Archaeology, Research Center for Humanities, Eötvös Loránd Research Network, Budapest) - Hajnal, Zsuzsanna (Hungarian National Museum) - Szeniczey, Tamás (ELTE Department of Biological Anthropology, ELTE-Eötvös Loránd University, Budapest) - Rácz, Zsófia (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest) - Mende, Balázs G. (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Network) - Hofmanová, Zuzana (Department of Archaeology and Museology, Masaryk University, Brno; Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany) - Knipper, Corina (Curt-Engelhorn-Centre of Archaeometry, Mannheim) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Leipzig) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Network)

**Abstract format:** Oral

Kölked-Feketekapu is one of the largest cemeteries from the Avar Period Carpathian Basin. With more than 1300 graves and well-documented archaeological remains, it provides a unique resource for observing the numerous cultural transitions in the Southern-Transdanubian region. The cemeteries and the attached settlements were used between the 6th and the 8th century AD. This wide timescale gives archeologists and geneticists a great chance to track not only the impact of the Late Antique, Merovingian and eastern nomadic cultures but also the Avar Period transitions in the region. The social stratification can be examined at the site, due to the higher social status of several families in the community. Kölked-Feketekapu A site consists of a traditional Reihengräberfeld that contained around half of the burials excavated at Kölked. The other part of the graves are divided into 16 groups (Kölked-Feketekapu B) and were scattered all over the settlement's area. In the 6-7th centuries, the settlement was divided into households and elite grave groups which could be connected with several economic units of the village. This structure provides great potential in the reconstruction of social stratification. Our main goal in this paper is to 1) better understand the complex sociological and genetic kinship-based structure of the community in Kölked-Feketekapu B cemetery; 2) remodel the genetic and archeological transition in the Southern-Transdanubian region. For these purposes we have sequenced ~200 human DNA samples targeting 1.2 million polymorphic sites genome wide, involved stable isotopic data for most of the samples and analysed them in the context of the HistoGenes ERC project.

## 16 **DIETARY AND CULTURAL DIFFERENCES BETWEEN NEIGHBOURING COMMUNITIES: A CASE STUDY ON THE AVAR PERIOD CARPATHIAN BASIN**

**Abstract author(s):** Gulyás, Bence - Faragó, Norbert (ELTE) - Szenthe, Gergely (Hungarian National Museum)

**Abstract format:** Oral

Stable isotope ( $\delta^{15}\text{N}$ ,  $\delta^{13}\text{C}$ ) and  $^{14}\text{C}$  results from two early medieval cemeteries are presented and evaluated in this study in order to draw conclusions about diet, social differentiation and chronology in the Carpathian Basin during the Avar period (7th–9th century CE). At Tiszafüred and Hortobágy, two contemporaneous but distinct groups buried their deceased. The results reflect basic diet deviations between the two communities, which originated in alternative subsistence strategies and/or social differences. The Tiszafüred samples fit well into the general dietary picture of the period. The members of the rustic population consumed mainly cereals and millet, while the proportion of animal protein was significant also. Because of the exceptionally high  $\delta^{15}\text{N}$  levels of the Hortobágy-Árkus elite community, their diet was primarily based on animal protein, most probably of freshwater origin. Concerning the low number of our samples that were selected for radiocarbon dating, the present information is insufficient for an exhaustive recon-

struction. For now, we intend to grant some new additions to the sporadic data available for dietary reconstruction from this region and period. Our dataset is thought-provoking not only for the two distinct clusters of the plot but also for the rarity of stable isotope results from Avar sites.

## 17 THE ISSUE OF CONTINUITY OF POPULATION HISTORY BETWEEN 8-12TH CENTURIES IN CARPATHIAN BASIN BASED ON ARCHAEOGENETIC RESULTS OF FOUR CEMETERIES

**Abstract author(s):** Csáky, Veronika (Institute of Archaeogenomics, sResearch Centre for the Humanities, Eötvös Lóránd Research Network, Budapest) - Szeifert, Bea (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Lóránd Research Network, Budapest; Doctoral School of Biology, Institute of Biology, ELTE Eötvös Loránd University, Budapest) - Gerber, Dániel (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Lóránd Research Network, Budapest; Doctoral School of Biology, Institute of Biology, ELTE Eötvös Loránd University, Budapest) - Szőke, Béla (Institute of Archaeology, Research Centre for the Humanities, Eötvös Lóránd Research Network, Budapest) - Merva, Szabina (Freelancer) - Évinger, Sándor (Department of Anthropology, Hungarian Natural History Museum, Budapest) - Líbor, Csilla (King St. Stephen Museum, Székesfehérvár) - Petkes, Zsolt (Gyula Siklósi Research Centre for the History of the City of Székesfehérvár) - Mende, Balázs (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Lóránd Research Network, Budapest; Institute of Archaeology, Research Centre for the Humanities, Eötvös Lóránd Research Network, Budapest) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Lóránd Research Network, Budapest)

**Abstract format:** Oral

As the Carpathian Basin is reputed as the westernmost point of the Eurasian steppe, it was influenced by movements of many nomadic tribes during migration period, as well.

One of the most important question for discussion in archaeology is the continuity or discontinuity of populations in the investigated region. Although the survival of population of e.g. 9th century in the 10th century is taken as evidence in Carpathian Basin (among others Avars and Slavs), based on only archaeological research these observations cannot provide unambiguous data to this day. For example, over half a dozen cemeteries are known in which conquering populations were excavated above or near of the late Avar tombs, and it could not be decided yet whether we could speak of population and/or place continuity in these cases. In this study we try to answer this question in a different extent by examining power centres of Transdanubia with a broader time range: late Avar period, Carolingian period, Hungarian Conquest period and the early Árpáadian Age.

We investigated 172 individuals from four cemeteries using NGS sequencing methods: Zalavár-Vársziget (9-12th centuries), Himod-Káposztásföldek (9-11th centuries), Visegrád (8-11th centuries), Sárbogárd-Tringer tanya (10th century). At least two of them (Zalavár-Vársziget and Himod-Káposztásföldek) contain well-separable chronological phases, based on which we created groups for population genetic analysis. The statistic and phylogenetic analyses based on whole mitogenomes were completed by whole genomic shotgun results. According to the later one, more precise conclusions have been drawn at individual level, although the different composition of the investigated populations is seen based on mitogenomic results as well.

This research was supported by The House of Árpád Programme (2018–2023) Scientific Subproject: V.1. Anthropological-Genetic portrayal of Hungarians in the Árpáadian Age.

## 18 POPULATION DYNAMICS IN THE ODER AND VISTULA BASINS AS INFORMED BY NOVEL GENOME-WIDE DATA

**Abstract author(s):** Molak, Martyna - Goluibinski, Michal - Popović, Danijela - Baca, Mateusz - Węgleński, Piotr (University of Warsaw)

**Abstract format:** Oral

Throughout the history the terrains of Oder and Vistula basins, which now make the Republic of Poland, have been a witness to an intense movement of people caused mainly by trade- or warfare-related factors. Despite the growing amount of the available genetic and genomic information for historic and prehistoric inhabitants of these lands, they remain severely understudied comparing to, for example, these of Germany or Hungary. Our project was designed to fill these gaps in the spatiotemporal genomic map of Central Europe. The skeletal material was obtained opportunistically with aim to cover the most periods and areas possible. We performed genomic analyses for individuals from between the Neolithic and Early Modernity from across today's Poland and neighboring regions. Shotgun sequencing, as well as Human Affinities Prime Plus and custom Y chromosome SNP panel enrichment were used to obtain confirmed aDNA low-coverage genome-wide data for 60 individuals (with the number still growing as our dataset is continuously updated). Using population genomic tools we explore the patterns of demographic changes in the Oder and Vistula basins since the Neolithic, the directions, timing and intensity of gene flow and its relation to the available written and material culture evidence as well as funerary practices and relatedness among the studied individuals within particular cultures and archaeological sites.

## BIOARCHAEOLOGICAL STUDY OF MEDIEVAL POPULATIONS BETWEEN THE DNEIPER AND DNIESTER VALLEYS

**Abstract author(s):** Szeifert, Bea (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Network - ELKH, Budapest; Doctoral School of Biology, Institute of Biology, ELTE Eötvös Loránd University, Budapest) - Gyuris, Balázs (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Network - ELKH, Budapest; Doctoral School of Biology, Institute of Biology, ELTE Eötvös Loránd University, Budapest) - Gerber, Dániel (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Network - ELKH, Budapest; Doctoral School of Biology, Institute of Biology, ELTE Eötvös Loránd University, Budapest) - Telnov, Nikolaj (Institute of Cultural Heritage, Academy of Sciences of Moldova, Kishinev) - Sinika, Vitalij - Kvitnytskyi, Maksym (Pridnestrovian State University named after T. G. Shevchenko, Tiraspol) - Komar, Oleksii (Institute of Archaeology, National Academy of Sciences of Ukraine, Kyiv) - Türk, Attila (Institute of Archaeological Sciences, Faculty of Humanities and Social Sciences, Pázmány Péter Catholic University, Budapest; Hungarian Prehistory Researchgroup, Research Centre for the Humanities, Eötvös Loránd Research Network - ELKH, Budapest) - Mende, Balázs - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Network - ELKH, Budapest)

**Abstract format:** Oral

Genetic data is very scarce on the medieval people of the Dnieper and Dniester Valley. We examine more than 50 human DNA samples from different medieval cemeteries, which can be dated to the 8-10th century AD and linked to different ethnic groups (like Slavs, Pechenegs, Hungarians) based on historical and archaeological findings.

This region was the last settlement area (so-called *Etelköz*) for Hungarian conquerors before arriving in the Carpathian Basin. The archaeological material of some studied cemeteries – dated to the 9th century AD by <sup>14</sup>C measurements – shows connections with cultures of the Volga-Ural region and the Carpathian Basin as well.

Our uniparental and genomic analyses also show that several distinct groups lived in the studied area. Moreover, Slavic groups on the left and right bank of the Dnieper have a different genetic composition. Keeping in mind the archaeological data, we examine genetic relations of the studied groups in comparison with other Eurasians at both individual and population levels. In addition to identification of the "Hungarian component" in the region, we compare our results with the data of medieval groups from the Carpathian Basin and Volga-Ural regions. These areas can be related to each other through the early Hungarians, whose migration is not just documented by fresh archaeological data but has been also confirmed by the genetic examinations of the recent years.

Our goals are to gain genetic insight into the composition of the Dnieper and Dniester Valleys' ethnic groups and to learn about unique stories of the individuals who composed the populations. Our results can not only shed light on the sources of migration events, but also show the impact of the newcomers on the population of the studied area.

This research was supported by: Eötvös Loránd Research Network; Thematic Excellence Program (TKP2020-NKA-11); Árpád dynasty program (IV.2).

## DIVERSITY, COMMUNITY FORMATION, AND SOCIAL STRUCTURE IN THE EARLY MEDIEVAL CARPATHIAN BASIN – ARE WE THERE YET?

**Abstract author(s):** Szabó, Dóra (University of Exeter)

**Abstract format:** Oral

It has long been acknowledged that the Carpathian Basin has a great potential in the understanding of the various aspects of transformation during the Early Middle Ages. Due to its geographical position, this territory was a hotspot of changes: communities with diverse backgrounds – the late Roman population and the manifold newly arrived groups of people – created here a fusion of cultures, lifestyles, social models, and probably languages. In the last decade, a growing number of studies have used bioarchaeological tools to better understand the population histories and mobilities in the addressed period. Genetic data has informed about the heterogeneity of populations, multi-isotope analyses have shed light on mobility, migration, and diet, and physical anthropology has provided clues about general health and lifestyles. However, key aspects of the question – how these heterogeneous, probably multi-lingual people, who practised diverse lifestyles formed communities? – have remained unrevealed.

The reconstructed diet profiles indicated diverse strategies containing elements of both pastoral and sedentary lifestyles. This paper argues that the processes of community formation – the survival strategies, lifestyles, and social organisation – of these heterogeneous communities cannot be understood without the careful examination of contemporary settlements and their natural environments. The choices of settling places, the use of local resources, the layouts of settlements, the organisation of productive tasks, the crop and animal husbandry strategies, and storage systems are crucial elements of the formation, survival, and ultimately success of a community.

Aiming for a deeper understanding of the diversity in the period, this paper proposes a pilot methodological framework, which integrates various disciplines – bioarchaeological evidence on population history, general health, and

diet, archaeological data on settlements and cemeteries, environmental data, and historical information – and demonstrates their application through various case studies from the early medieval Carpathian Basin and beyond.

## A. YOU EAT WHAT YOU HAVE - SOCIAL DIFFERENCE AND FOOD CONSUMPTION IN AN EARLY MEDIEVAL COMMUNITY

**Abstract author(s):** Koncz, István - Faragó, Norbert (Institute of Archaeological Sciences, ELTE - Eötvös Loránd University, Budapest) - Pap, Ildikó (Savaria Museum, Szombathely) - Tugya, Beáta (Thúry György Museum, Nagykanizsa) - Tóth, Gábor (Department of Biology, Berzsenyi Dániel Teacher Training Centre, Savaria University Centre, ELTE - Eötvös Loránd University, Szombathely) - Vida, Tivadar (Institute of Archaeological Sciences, ELTE - Eötvös Loránd University, Budapest) - Knipper, Corina (Curt-Engelhorn-Zentrum Archäometrie gGmbH, Mannheim)

**Abstract format:** Poster

In the Carpathian Basin during the early Medieval period, i.e. between the 5th and the 9th centuries CE, many graves contained various remains generally described as food offerings, such as animal bones or different types of vessels including pottery, glass or even wooden containers. While they are clearly part of the grave inventory, their purpose is often largely unexplained or they are vaguely interpreted as sacrifices, leftovers from funerary feasts or offerings necessary in the afterlife. Nevertheless, access to good quality food, especially animal protein could be a similar indicator of social status, as certain artifact types, such as weapons or jewellery. But how did the people decide which member of a community should be buried with food offerings? Did it only depend on the social and/or economic standing of the individual or their family, or did personal preference also come into play? Did individuals buried with animal remains consume more meat than those buried without?

We address these questions with the help of the fine-scale analysis of the 6th-century cemetery at Szeleste, Hungary. We combine archaeological and osteological data and results of carbon and nitrogen stable isotope analysis to see whether there is a difference in nutrition among different socially identifiable groups (age, gender, economic or social status, etc.) in a community, where different types of food offerings are much more common - circa half of the graves contained animal remains or vessels - than in case of other contemporaneous sites.

## B. POPULATION HISTORY OF EARLY MEDIEVAL UKRAINE

**Abstract author(s):** Saag, Lehti (University College London) - Utevska, Olga - Zadnikov, Stanislav - Shramko, Irina (V. N. Karazin Kharkiv National University) - Scheib, Christiana (University of Tartu; University of Cambridge) - Anastasiadou, Kyriaki - Kelly, Monica - Gilardet, Alexandre - Skoglund, Pontus (The Francis Crick Institute) - Thomas, Mark (University College London)

**Abstract format:** Poster

Ancient DNA research indicates that, to a first order of approximation, the genomes of present-day Europeans comprise ancestries of three major groups of people: 1) indigenous Mesolithic hunter-gatherers; 2) Near Eastern early farmers; 3) Steppe pastoralists. However, the detailed genetic history of any given area is always much more complex, calling for more focused and local-scale studies. One such interesting but so far understudied region is modern-day Ukraine which borders with Central European Poland, Slovakia and Hungary to the west while Southern Ukraine is part of the vast Eurasian Steppe. As such, the area has been in the path of several migrating groups, including Yamnaya Steppe pastoralists, mixed-origin Cimmerians and Scythians, Gothic Chernyakhov people, Iranian Alans, Golden Horde Mongols, Turkic Nogais, Slavic Cossacks.

Here we present novel genome-wide shotgun sequencing data from 9 individuals associated with the Alan group of the Early Medieval Saltovo-Mayaki Culture, 11 individuals associated with the preceding Chernyakhov Culture and 4 and 7 individuals, respectively, from the succeeding Golden Horde and Nogai periods. Most of the genomes – 23 out of 31 – have been sequenced to an average coverage of around 1x. The ancestry compositions of the individuals are characterised in the context of modern and ancient samples, and interpreted in the context of archaeological and historical information.

---

## 372 ADVANCES IN GEOMETRIC MORPHOMETRIC METHODS APPLIED TO LITHIC STUDIES [PAM]

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Araujo, Renata (Museum of Archaeology and Ethnology, University of São Paulo.) - Matzig, David (School of Culture and Society, Department of Archaeology and Heritage Studies, Aarhus University.) - Okumura, Mercedes (Department of Genetics and Evolutionary Biology, Biosciences Institute, University of São Paulo.) - Araujo, Astolfo (Museum of Archaeology and Ethnology, University of São Paulo.) - Riede, Felix (School of Culture and Society, Department of Archaeology and Heritage Studies, Aarhus University.)

**Format:** Regular session

Geometric morphometric methods (GMM) applied to the analysis of stone tools have gained sharply in popularity over the last decade. Many traditional lithic-based culture-historical sequences are fundamentally based on artefact

shape changes. GMM offer the possibility of translating narrative or qualitative assessments of shape into precise and data-rich quantifications readily amenable to downstream statistical analyses. Often but by no means always embedded in a cultural evolutionary framework, GMM have shown to be effective, robust and replicable tools for elucidating processes of cultural change in prehistoric artefact classes, as well as for assessing re-use and re-sharpening dynamics in the context of curation. Morphological analysis of lithic artefacts by means of GMM do not stand alone. They may be considered complementary to, for instance, technological studies. This session welcomes papers focused on GMM analyses or analyses that couple morphometric evidence to other information, such as technological attributes or microwear studies; we also highly welcome papers that explore innovative further analyses of shape data (e.g. cultural phylogenetics). The session focuses on lithics, although other artefact classes will be considered. In surveying current approaches, we seek to also explore what theoretical, methodological and empirical developments are moving the field of artefact morphometrics forward.

## ABSTRACTS

### 1 3D GEOMETRIC MORPHOMETRICS AND LITHIC ANALYSIS OF RECURRENT CENTRIPETAL KNAPPING METHODS: TWO CASE STUDIES

**Abstract author(s):** Bustos-Pérez, Guillermo - Romagnoli, Francesca (Universidad Autónoma de Madrid)

**Abstract format:** Oral

Lithic morphological variability has long been a challenge for lithic analysis. The application of 3D geometric morphometrics has allowed quantifying the morphological variation of lithic elements. The combination of geometric morphometric methods with Machine Learning models allows performing high precision classification along with gaining insights into variable importance. In this presentation, the authors present the results from two case studies that combine 3D geometric morphometric methods with Machine Learning models. Both case studies are focused on backed products (core edge flakes –débordant–, core edge flakes with limited back, and pseudo-Levallois points) removed from Discoid and recurrent centripetal Levallois experimental knapping. In the first case study geometric morphometrics along with Machine Learning models have been applied to differentiate backed flakes removed from each knapping method. Results show that a high level of classification (accuracy of 0.76 and AUC of 0.8) can be achieved. Interpretation of principal components indicate that laminarity index and the interaction between IPA and carenated index account for much of the differentiation between methods. In the second case study geometric morphometric methods and Machine Learning models have been applied along with resampling methods (obtaining balanced datasets) to evaluate the validity of technological categories employed to classify backed flakes. Results show little overlapping between the three categories (average precision above 0.8) indicating that geometric morphometric methods are effective in identifying the morphological features which are linked to their technological definitions of backed products. The results of this investigation highlight the potential of combining geometric morphometrics with Machine Learning not only as classificatory methods, but also to evaluate technological categories employed in lithic analysis.

### 2 STATISTICAL CULTURAL TRANSMISSION MODELS PROVIDE INSIGHTS INTO THE SOCIAL CONTEXTS OF TECHNOLOGICAL CHANGE DURING THE LATE PLEISTOCENE IN KOREA

**Abstract author(s):** Park, Gayoung - Marwick, Ben (University of Washington)

**Abstract format:** Oral

Concepts of cultural evolution link material evidence to cultural processes and phenomena. This provides testable frameworks for archaeologists to understand human behaviors. Cultural transmission suggests that technological transitions can result from changes in social learning processes, with transmission biases as important loci of changes. Through the identification of material traces of different transmission biases, we investigate the social contexts of technological transitions during the Late Pleistocene in Korea, from the Early to Late Paleolithic. The onset of the Late Paleolithic period in Korea, represented by the appearance of projectile points and blades, is a key event in understanding modern human dispersal in East Asia. Previous studies mainly focus on the possible origin locations of new technologies, but they rarely address the process of change. Using a cultural evolutionary approach, we examine the transitioning process by asking: what is the dominant mode of cultural transmission for technological innovation in the Korean Late Palaeolithic? Inspired by Bettinger and Eerkens (1999), we propose two models using guided variation and model-based bias. To test the models, we compute coefficients of variation (CV), correlations, and Principal Components Analysis (PCA). Our results show that information about the new technology was transmitted via combinations of guided variation and model-based bias. Some attributes including length and width were transmitted through model-based bias, while other attributes appear to have been more dependent on raw materials or other local factors. Our results indicate that people learned and copied crucial parts of the stemmed points from one origin and then adjusted the shape based on their own situation. We anticipate this approach to be applicable to understanding technological change in a variety of social and cultural contexts.

### 3 UNRAVELLING SHAPE VARIABILITY OF STONE TOOLS IN SOUTHEASTERN BRAZIL FOR REASSESSING ARCHAEOLOGICAL TRADITIONS

**Abstract author(s):** Araujo, Renata (Museum of Archaeology and Ethnology, University of Sao Paulo - MAE-USP) - Okumura, Maria Mercedes (Laboratory for Human Evolutionary Studies, Department of Genetics and Evolutionary Biology, Biosciences Institute, University of São Paulo) - Araujo, Astolfo (Laboratory for Interdisciplinary Research in Culture, Evolution and Environment, Museum of Archaeology and Ethnology, University of São Paulo)

**Abstract format:** Oral

The application of geometric morphometric methods (GMM) in Brazilian archaeology is a fairly new endeavour and was introduced by the co-authors of this paper about twelve years ago, at the same period when geometric morphometrics use saw a significant increase in material culture studies. The co-authors of this paper were the first to apply geometric morphometrics to the analysis of Brazilian lithic bifacial points. The project consisted in an initial attempt to describe the morphological variability of projectile points from Southern and Southeastern Brazil to reassess the original classification of bifacial points in an archaeological tradition named Umbu, defined in the 1960s. This paper presents preliminary results of the doctoral research under development by the first author, featuring GMM analysis of lithic bifacial points and unifacial tools from Southeastern Brazil. Theoretically embedded in a framework that combines Evolutionary Archaeology and Cultural Transmission Theory, this project highlights the relation between shape variability and cultural traditions, giving endurance to previous work published by the co-authors.

### 4 MESOLITHIC HARPOONS IN ACTION. GEOMETRIC MORPHOMETRICS AND CONTINUUM MECHANICAL SIMULATION AS TOOLS TO IDENTIFY FUNCTIONAL ROLES"

**Abstract author(s):** Lundström, Fredrik (Stockholm University) - MacLeod, Norman (Nanjing University) - Isaksson, Sven - Glykou, Aikaterini (Stockholm University)

**Abstract format:** Oral

Projectile and point performance research has long been an important part of Stone Age archaeology. Arguably, projectile functionality research is largely focused on issues that require direct conclusions, for example projectile/delivery system identification and classification. These are common themes in Palaeolithic research where material can be scarce and time deep. In contrast, technological studies of lithic (and osseous) projectiles and points often provide quantitative and descriptive data that can address societal questions and test specific narratives. Naturally, these types of studies are far more common than projectile performance studies in Mesolithic and Neolithic research. In our project, we approach Mesolithic projectile morphology from the opposite direction of technological studies—the produced form in action—with the goal of providing geometric data. The project aims to study the relationship between environmental, social and projectile function changes around the Baltic Sea after the 8200 cal BP cold event. In order to obtain quantitative descriptions of osseous Mesolithic harpoons, a geometric morphometrics approach (the extended eigenshape analysis) is employed, and the results will be combined with continuum mechanical simulations, archaeological experiments and organic residue analysis. This paper presents preliminary results of the geometric morphometrics analysis and highlights theoretical and methodological problems related to morphology and function, particularly the relations between craft tradition, cultural evolution, physiology, mechanics and environment.

### 5 2D GEOMETRIC MORPHOMETRIC APPROACH TO KNAPPER SKILLS AMONG NEOLITHIC AXES

**Abstract author(s):** Bustos-Pérez, Guillermo - Castañeda, Nuria (Universidad Autónoma de Madrid)

**Abstract format:** Oral

Although different levels of expertise among knappers is a commonly referred cause of variation of the lithic archaeological record, it is not usually explored, especially in post-Palaeolithic assemblages. The shaping of lithic artifacts into a desired morphology (façonnage) offers an ideal material record to evaluate different knapping levels since it is expected that as the knappers ability decreases so will the ability to reach the desired morphology. Flaked Neolithic axes are standardized products were the knapper aims to obtain a tool symmetric in three axes (failing to do so results in increasing amounts of work in the following stages). Thus, Neolithic axes are ideal to search for different levels of expertise. Geometric Morphometrics are an effective way to quantify morphological variation among lithic materials. However, 3D approaches are sometimes limited for the analysis of archaeological collections (time, size, accessibility, etc.) making the use of digital photographs a highly desirable method despite the loss of resolution due to a missing dimension. We present the results from an experimental program aimed to test morphological variability among Neolithic axes according to knappers expertise. A total of 67 experimental flaked Neolithic axes were knapped, classified according to knapper experience level (inexperienced, intermediate and expert), and selected for Geometric Morphometrics. Specially developed porcelain was employed as raw material allowing standardizing initial morphology and volume for all knappers. 2D Geometric morphometrics were performed on the photographs of the front, laterals and edge views. Principal Components Analysis is employed for dimensionality reduction and Machine Learning models are employed for the classification of knapper experience. Results indicate a good level

of separation according to knapper experience, especially when lateral views are considered. These results support the use of digital photographs in combination with Geometric Morphometrics and Machine Learning and allow for an application to the archaeological record.

## 373 DISCUSSING THE FUTURE OF BIG DATA FOR THE STUDY OF THE HUMAN PAST

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Coccozza, Carlo (Ludwig-Maximilians-Universität München, Fakultät für Kulturwissenschaften; Max Planck Institute for the Science of Human History, Department of Archaeology) - Fernandes, Ricardo (Max Planck Institute for the Science of Human History, Department of Archaeology; University of Oxford, School of Archaeology; Masaryk University, Arne Faculty of Arts) - Lubritto, Carmine (Università degli studi della Campania Luigi Vanvitelli, Dipartimento di Scienze e Tecnologie Ambientali, Biologiche e Farmaceutiche) - Rosenstock, Eva (Universität Bonn, Bonn Center for ArcheoSciences)

**Format:** Regular session

The use of Big Data for the study of the human history is a major trending topic. In this session, we want to promote a fruitful dialogue that engages with multiple and diverse issues concerning the usage of Big Data for the study of the human past.

Much is being promised of how Big Data and interfaces with modelling methods such as Artificial Intelligence will revolutionize our study of the past. However, there is apparently less debate on the underlying theoretical framework that should support such initiatives. There are also reasonable concerns that highly centralized systems, typically based in Western countries, may appropriate data from the rest of the world resulting in a kind of "data colonialism". Whereas the use of rigid metadata standards can produce highly-structured data, which is useful to address specific research questions, it also risks marginalizing some sectors of research which are less easily subject to standardization. Another concern, relates to the potential dilution of original data production efforts by those working in the field, lab, or library. As Big Data projects draw in increasingly more attention, it becomes necessary to faithfully acknowledge those who produced the data in the first place. Related to this, safekeeping and impartial original IDs, for instance those given by the excavators, across databases is sometimes a neglected asset to maintain the context of samples and allow for their recontextualization. A broader question concerns what should be collaborative and network models for Big Data initiatives bringing together various archaeological and historical disciplines.

We welcome both contributions offering a theoretical perspective and case studies that showcase the development of innovative organizational models and technological solutions.

## ABSTRACTS

### 1 MAPPING MONGOLIA: TRANSMETHODOLOGICAL DATA INTEGRATION AND NATIONAL CULTURAL PATRIMONY

**Abstract author(s):** Fisher, Michael - Jamsranjav, Bayarsaikhan - Jambajanstan, Delgermaa - Jurkenas, Dovydas (Max Planck Institute for the Science of Human History)

**Abstract format:** Oral

The Mongolian Archaeology Project: Surveying the Steppes (MAPSS) draws on a variety of methodologies to document the archaeological and ethnographic landscapes of Mongolia. The overarching goal of the project is to produce the first open-access, semantically interoperable, reproducible, and comprehensively populated geospatial database of Mongolian cultural heritage resources. This work is 'transmethodological' in that it integrates several distinct approaches in order to address questions in both the archaeological and cultural heritage disciplines. MAPSS combines archival field data with the results of manual remote sensing, Machine Learning detection, ground truthing survey, and digital imaging to record tens (and potentially hundreds) of thousands of sites and their conditions. Our research uses these data to explore topics such as palaeohydrology and human-environment interaction, diachronic patterns of nomadic mobility, development of an early nomadic state, large-scale prehistoric funerary practices, community archaeology, and heritage resource vulnerability.

Among the issues that MAPSS considers in the design of its data collection and management systems are breadth versus depth of data, modeling uncertainty at scale, multilinguality, multivocality, and interpretive multiplicity. Thus, the project balances capture of metadata, paradata, resource relationships, site conditions, and archaeological interpretation with the scope, ambition, and inclusivity of populating a national cultural heritage database. In this paper, we demonstrate how our design principles reflect this balance. We present an argument for the interrelationship between reproducibility, sustainability, and inclusivity. Finally, we discuss future directions for utilizing a dataset as large as—but fully situated within—the national boundaries of Mongolia.

## 2 OPENATLAS - A DATABASE SYSTEM FOR ARCHEOLOGICAL DATA AND BEYOND

**Abstract author(s):** Richards, Nina (Austrian Academy of Sciences) - Watzinger, Alexander (Austrian Centre for Digital Humanities and Cultural Heritage)

**Abstract format:** Oral

OpenAtlas (<https://openatlas.eu/>), developed mainly at the Austrian Center of Digital Humanities and Cultural Heritage (ACDH-CH) of the Austrian Academy of Sciences (ÖAW), is an open-source database software developed especially to acquire, edit and manage research data from various fields of humanities. It allows recording archeological data, linked with anthropological analyzes and the results of scientific methods, such as radiocarbon dating or stable isotope analyses.

OpenAtlas is an open-source project (<https://github.com/craws/OpenAtlas>) and projects that use the database in a cooperative effort subsequently make their data available as open access.

The user interface, which is accessible via any common browser, allows for easy data entry, while the data is mapped in the background according to CIDOC CRM version 7.1.1 (<https://cidoc-crm.org/>). Therefore, using OpenAtlas takes care of today's requirements regarding data standards, data management, and aims for FAIR principles (<https://www.go-fair.org/fair-principles/>) against the background of current standards in Digital Humanities. The usage of CIDOC CRM allows easy re-use of the created data by other scientists and projects. In addition, OpenAtlas offers possibilities to link data entries with external references - such as GeoNames or Wikidata - which can be freely selected by the projects and can thus provide Linked Open Data.

Integrated map applications allow easy acquisition of geographic data and subsequently the creation of cemetery plots and distribution maps. Data created within the OpenAtlas system can further be used to create presentation sites for state-of-the-art dissemination (compare for example <https://thanados.net>).

## 3 "BIG DATA" FOR STABLE ISOTOPE RESEARCH IN THE CARIBBEAN AND MESOAMERICAN ARCHAEOLOGY

**Abstract author(s):** Ebert, Claire (University of Pittsburgh) - Hixon, Sean (Max Planck Institute of the Science of Human History) - Buckley, Gina (University of Missouri Research Reactor) - George, Richard (University of California, Santa Barbara) - Pacheco-Forés, Sofía (Hamline University) - Palomo, Juan Manuel (University of Arizona) - Solís-Torres, Óscar (Instituto Nacional de Antropología e Historia - INAH) - Kennett, Douglas (University of California, Santa Barbara)

**Abstract format:** Oral

Large-scale syntheses of stable isotope data can answer "big questions" with "big data." In the Caribbean and Mesoamerica, however, comparative regional analyses of diet and mobility based on stable isotope analyses of human skeletal tissues are difficult because of inconsistencies in reporting and publication. CAMBIO (the Caribbean and Mesoamerica Biogeochemical Isotope Overview) is a collaborative effort led by Early Career researchers working in Latin America, the US, and Europe to systematically compile published isotopic data in an open-access and multilingual format (Spanish, French, and English). As the largest repository for human isotopic measurements from the Caribbean and Mesoamerica, analyses of the datasets in CAMBIO have the potential to address major questions in archaeology about the spread of maize agriculture and migration related to urban development and colonial encounters. Here we describe our preliminary analyses of these events based on the CAMBIO dataset. We also highlight the potential to expand stable isotope projects to focus on the dynamic interactions between humans, animal, and ecological in Caribbean and Mesoamerican over the past 10,000 years.

## 4 EXPLORING SHIFTS IN ROMAN SUBSISTENCE PRACTISES THROUGH A BAYESIAN META-ANALYSIS OF ISOTOPIC DATA

**Abstract author(s):** Formichella, Giulia - Soncin, Silvia (Sapienza University of Rome, Department of Environmental Biology, and Mediterranean bioArchaeological Research Advances - MAREa - centre) - Coccozza, Carlo (Ludwig-Maximilians-Universität München, Institut für Vor- und Frühgeschichtliche Archäologie und Provinzialrömische Archäologie, and ArchaeoBioCenter; Max Planck Institute for the Science of Human History, Department of Archaeology, Jena; Università degli studi della Campania "Luigi Vanvitelli", DiSTABIF, and Mediterranean bioArchaeological Research Advances - MAREa - centre) - Tafuri, Mary Anne (Sapienza University of Rome, Department of Environmental Biology, and Mediterranean bioArchaeological Research Advances - MAREa - centre) - Lubritto, Carmine (Università degli studi della Campania "Luigi Vanvitelli", DiSTABIF, and Mediterranean bioArchaeological Research Advances - MAREa - centre) - Craig, Oliver (University of York, Department of Archaeology, and BioArCh) - Fernandes, Ricardo (Max Planck Institute for the Science of Human History, Department of Archaeology, Jena; University of Oxford, School of Archaeology; Masaryk University, Arne Faculty of Arts)

**Abstract format:** Oral

In our presentation we explore the interplay between shifting human subsistence practises and the establishing, expansion, apogee and collapse of the Roman Empire. To achieve this, we introduce "Isotópia", a collection of

human, animal, and plant stable isotope data ( $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$ ,  $\delta^{18}\text{O}$ ,  $\delta^{34}\text{S}$ ,  $^{87}\text{Sr}/^{86}\text{Sr}$ ) measured on archaeological material dated between 800 BCE and 500 CE and set within the geographical extension of the Roman Empire.

The increasing number of isotopic datasets has led to a significant accumulation of data that can be gathered together within independent databases. Amassed isotopic data, combined with historical, archaeological and biological metadata, represent a palimpsest of information providing for new insights on past human lifeways at different scales and resolutions. Isotópia is part of the IsoMemo&Pandora initiatives bringing together a network of independent isotopic databases and aiming to investigate past human societies via open-access compiled data and advanced spatio-temporal Bayesian modelling tools.

We combine Isotópia and the CIMA isotopic database on medieval Europe and employ Bayesian models to explore subsistence practises over nearly two millennia. Preliminary results of the meta-analysis suggest an increase in both  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values during the Roman imperial period, which could be explained by a general increase in marine protein consumption, imports of  $^{15}\text{N}$ -enriched cereals from North Africa and more intensive manuring and animal husbandry. A following decrease of  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values during the Late Antiquity (300-600 CE) possibly relates to political and economic collapse, depopulation processes and different cultural traditions derived from incoming populations but also to climatic and/or environmental changes.

Our results illustrate the research potential of large-scale meta-analysis of bioarchaeological data and obtained preliminary results reveal clear links between historical developments and human lifeways in pre-Roman, Roman and Post-Roman Europe.

## 5 A NETWORK OF ISOTOPIC DATASETS FOR MEDIEVAL EUROPE: THE COMPENDIUM ISOTOPORUM MEDII AEVI (CIMA)

**Abstract author(s):** Cocozza, Carlo (Institut für Vor- und Frühgeschichtliche Archäologie und Provinzialrömische Archäologie, Ludwig-Maximilians-Universität München; Department of Archaeology, Max Planck Institute for the Science of Human History) - Fernandes, Ricardo (Department of Archaeology, Max Planck Institute for the Science of Human History; School of Archaeology, University of Oxford; Arne Faculty of Arts, Masaryk University)

**Abstract format:** Oral

In our contribution, we present the Compendium Isotoporum Medii Aevi (CIMA), an open-access and collaborative database gathering more than 50,000 isotopic measurements for bioarchaeological samples located within Europe and its margins and dating between 500 and 1500 CE. One the CIMA's aims is to disentangle archaeological data collections from rigid and hierarchical approaches and to convey a message of collaboration among fellow researchers from different countries and institutions. This offers a better recognition of contributions to data collection effort and to the employment of meta-data structures better suited to address specific, and often localized, research questions. This will benefit both individual researchers and the broad scientific community.

Stable isotope analysis has been employed since the late 1970's to pursue a variety of archaeological goals. In the last decade, an exponential growth highlighted the need for a new research perspective. Isotopic "Big Data" collections and new statistical meta-analyses are now widely employed to address archaeological questions at super-regional scales. This includes, the study of human lifeways across space and time. However, whenever information from the cultural, social, political and religious spectrum are available, the analysis may offer a deeper understanding of past societies. This becomes particularly relevant for the Medieval period, where written evidence and a vast archaeological knowledge might allow for novel insights.

CIMA includes a variety of supporting information offering, for instance, taxonomic characterisation of the samples and data on social, religious, and political contexts. In addition, CIMA operates as a network of independent isotopic databases each with regional or sub-regional focus. This increases data quality via having multiple data checks and offers the possibility of undertaking multiple spatiotemporal meta-analyses.

## 6 ISOBERMED: USING BAYESIAN META-ANALYSIS TO EXPLORE A NEW ISOTOPE DATABASE FOR MEDIEVAL IBERIA

**Abstract author(s):** Alexander, Michelle (BioArCh, Department of Archaeology, University of York) - García-Collado, Maite (BioArCh, Department of Archaeology, University of York; GIPYPAC, Department of Geography, Prehistory and Archaeology, University of the Basque Country - UPV/EHU) - Cocozza, Carlo (Institut für Vor- und Frühgeschichtliche Archäologie und Provinzialrömische Archäologie, Ludwig-Maximilians-Universität München; Department of Archaeology, Max Planck Institute for the Science of Human History, Jena) - Teegen, Wolf-Rüdiger (Institut für Vor- und Frühgeschichtliche Archäologie und Provinzialrömische Archäologie, Ludwig-Maximilians-Universität München) - Fernandes, Ricardo (Department of Archaeology, Max Planck Institute for the Science of Human History, Jena; School of Archaeology, University of Oxford; Arne Faculty of Arts, Masaryk University)

**Abstract format:** Oral

Over the last 15 years, growing attention has been placed on the rich context of medieval Iberia using isotopic analysis. We have created the IsolberMed database collating publicly available isotopic data from the Medieval period

comprising approximately 2500 human, 750 fauna and 300 plant data from all over Iberia (Spain, Portugal, Andorra) and the Balearic Islands. This represents mainly carbon and nitrogen stable isotope values of bulk collagen from bones in the majority, but also teeth, with contributions of a small proportion of sulphur, oxygen and strontium data.

The Medieval period (c. 500-1500 CE) was a transformative time in the history of the Iberian Peninsula and Balearic Islands which witnessed multiple significant socio-political transitions. Suevo, Vandal and Visigothic kingdoms emerged after the disarticulation of the Roman Empire, which themselves fell after the Islamic conquest in 711. For around 800 years Iberia harboured a multifaith society, where the co-existence of Christian, Jewish and Muslim communities led to a uniquely blended culture. New Christian kingdoms arose in the north and slowly expanded south throughout the later Medieval period (the so-called Reconquista), consolidating feudal regimes and finally taking the last Islamic rulership of Granada in 1492.

We use a large-scale meta-analysis of this isotopic data using newly developed Bayesian approaches (IsoMemo <https://isomemoapp.com/>) to examine patterning in diet and mobility through time and space exploring these intricate cultural backgrounds in the context of a mosaic of climatic and environmental differences that also characterise this dynamic region between the Atlantic and the Mediterranean. We will explore dynamics related to faith, sex, status, age and urban and rural economies, and finally the patterning of C4 and marine resources.

## 7 ISOMEDITA, AN ISOTOPIC DATABASE FOR MEDIEVAL ITALY AND BAYESIAN META-ANALYSIS

**Abstract author(s):** Mantile, Noemi (Dipartimento di Scienze e Tecnologie Ambientali Biologiche e Farmaceutiche - DISTABIF, Università degli studi della Campania "Luigi Vanvitelli") - Coccozza, Carlo (Institut für Vor- und Frühgeschichtliche Archäologie und Provinzialrömische Archäologie, Ludwig-Maximilians-Universität München; Department of Archaeology, Max Planck Institute for the Science of Human History, Jena) - Lubritto, Carmine (Dipartimento di Scienze e Tecnologie Ambientali Biologiche e Farmaceutiche - DISTABIF, Università degli studi della Campania "Luigi Vanvitelli") - Fernandes, Ricardo (Department of Archaeology, Max Planck Institute for the Science of Human History, Jena; School of Archaeology, University of Oxford; Arne Faculty of Arts, Masaryk University)

**Abstract format:** Oral

Whereas many past stable isotope applications in Italian archaeology focused on Prehistoric and Roman sites, the last decade saw a substantial number of published isotopic measurements exploring human lifeways in medieval populations. Hence, we compiled IsoMedIta, a database for stable isotope measurements ( $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$ ,  $\delta^{18}\text{O}$ ,  $\delta^{34}\text{S}$ ,  $^{87}\text{Sr}/^{86}\text{Sr}$ ) on human, animal and plant samples from Italian medieval sites (c. 500-1500). The database currently gathers together more than 2000 human individuals, circa 500 animal samples and a small number of available plant data. Furthermore, IsoMedIta is furnished of archaeological, historical and biological meta-data rendering the isotopic database well-framed within the composite Italian Middle Ages.

IsoMedIta is part of the IsoMemo network which includes several independent collaborative isotopic databases. Moreover, a series of Bayesian modelling options are available through <https://isomemoapp.com/>. A meta-analysis of IsoMedIta data employing these modelling tools allows to explore subsistence practises in the Italian Middle Ages across spatial and temporal variables.

The medieval period in Italy marks an age of fragmentation amidst multiple political entities. Since the collapse of the western part of the Roman Empire, the Early Middle Ages presented a period of socio-economic crisis following invasions, wars, famines and power fragmentation that led to subsistence diversification. For example, an increase in C4 cereals (millet) consumption in Northern Italy in the late 6th century is observed. This finds no parallel in central and southern Italy. The existence of "two Italies" in the Late Middle Ages, contraposing the Norman Kingdom of Sicily and the Communes, still underlies a clear political, cultural and economic break.

Preliminary results from the meta-analysis of IsoMedIta data suggest that the existence of several political entities, multiple faiths, different cultures and varying environmental features across the peninsula likely affected local adaptations of crop and animal management strategies and potential dietary diversification.

## 8 CREATING DATA NETWORKS USING THE PANDORA PLATFORM

**Abstract author(s):** Fernandes, Ricardo (Max Planck Institute for the Science of Human History; University of Oxford; Masaryk University)

**Abstract format:** Oral

To better understand the historical trajectories followed by past societies it becomes necessary to gain access to large and diverse datasets informing on multiple aspects that characterize these and their environments. To achieve this a collective effort is necessary which, given the magnitude of the task, is incompatible with hierarchical models of data collection. In my contribution, I will present Pandora, the first data platform devoted to the study of the human past following a distributive data model based on an equity principle. This allows independent data communities to self-manage their data space and community membership, self-curate data, and to establish networks of datasets. A characteristic of this approach is its flexibility. Data communities may define own metadata standards while

simultaneously within Pandora it is possible to link diverse datasets to address historical research questions at various spatio-temporal scales.

The Pandora data platform (<https://pandora.earth/>) was developed using open-source technology and it interfaces with newly developed R apps offering additional options for data querying and modelling. It now includes over 40 data communities from diverse fields within historical and archaeological research (e.g. aDNA, isotopes, radiocarbon, archaeobotany, archaeozoology, physical anthropology, etc.). It also includes a first dataset network, IsoMemo which brings together datasets from independent data communities devoted to the collection of isotopic data.

In this contribution, I will describe the philosophy behind Pandora, its technological implementation, and exemplify its research potential through illustrative examples that include the application of machine learning in the study of historical causation.

---

## 374 THE ARCHAEOBOTANICAL PUZZLE: (DIS)INTEGRATING BOTANICAL PROXIES TO BETTER COMPREHEND PAST PLANT-PEOPLE INTERACTIONS

**Theme: 6. A Decade after the 'Third Science Revolution in Archaeology'**

**Organisers:** Esteban, Irene (ERAAUB, Universitat de Barcelona; Evolutionary Studies Institute, University of the Witwatersrand) - Albert, Rosa Maria (ERAAUB, University of Barcelona; ICREA) - Théry-Parisot, Isabelle (CEPAM, Université Côte d'Azur; Directrice de Recherche au CNRS) - Neumann, Frank (Geology, School for Geo- and Spatial Science, North West University)

**Format:** Regular session

The study of plant remains recovered from archaeological deposits provides information about past people's subsistence strategies, technology and behaviours, past environments and vegetation changes. However, this can only be achieved after overcoming important challenges that can impact the way past plant use and gathering strategies are examined and interpreted.

The first of these challenges relates to the origin of different botanical remains found in archaeological sites, which may be natural (in-situ growth; transport of plants or plant remains by animals, wind or water) or induced by humans (introduced by site inhabitants intentionally or accidentally). The second refers to their preservation after deposition, since various depositional environments and taphonomic processes might affect the various plant remains in different ways. The third is related to the information that can be obtained from these plant remains, which is closely related to their taxonomic and anatomical identification, and therefore intrinsic to each discipline. The fourth and last relates to the factors triggering plant gathering activities, which may be associated with human preferences and actions (opportunistic or targeted collection) or natural, thus depending upon availability and abundance in the surrounding environments, therefore influenced by climate changes.

The session aims to bring together researchers working in different archaeobotanical disciplines to discuss factors ruling plant taphonomy, peoples' uses of plants and palaeoenvironments. We specifically seek case studies that address the challenges of integrating the signatures obtained through a diversity of macro- and micro-botanical remains, as well as those that researchers must overcome when plant preservation is poor. We are also interested in contributions from studies that discuss the strengths and weaknesses of proxy data, and ways to overcome the latter to better contribute to the study of past societies and human behaviour. Contributions concerning different regions and chronologies are welcomed.

## 1 APPROACHING PREHISPANIC HERDING ACTIVITIES IN LA PALMA (CANARY ISLANDS) THROUGH COUPLED PALEOBOTANICAL AND BIOMOLECULAR PROXIES

**Abstract author(s):** Fernández-Palacios, Enrique - Castilla-Beltrán, Alvaro (UDI de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers - AMBI - Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Jambrina-Enríquez, Margarita (Departamento de Biología Animal, Edafología y Geología, Facultad de Ciencias, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers - AMBI - Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Rodríguez de Vera, Caterina (Archaeological Micromorphology and Biomarkers - AMBI - Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Hernández, Cristo (UDI de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna) - Herrera-Herrera, Antonio (Archaeological Micromorphology and Biomarkers - AMBI - Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna; Departamento de Química, Facultad de Ciencias, Universidad de La Laguna) - de Nascimento, Lea (Island Ecology and Biogeography Group, Universidad de La Laguna) - Mallol, Carolina (UDI de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers - AMBI - Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna)

**Abstract format:** Oral

The indigenous populations of La Palma (Canary Islands) arrived on the island from Northwest Africa around the change of Era and their subsistence relied heavily on pastoralism. However, the procurement and use of plant resources in this insular environment, mostly concerning fodder and fuel, is still unclear. Here, we present results from an interdisciplinary study combining phytoliths and lipid biomarker analyses. Phytoliths constitute a major component of the identifiable microbotanical archaeological record, and are useful to identify past presence and use of specific plants; and n-alkanes, lipid molecular compounds derived from leaf epicuticular waxes, also provide taxonomic clues to plant and plant part sources. For this study, we obtained phytolith reference material from native and endemic Canarian flora, analysed phytoliths on sediment samples from the prehispanic archaeological site of Belmaco Cave, and coupled these data with previously obtained n-alkane data from the same sequence. Belmaco Cave is an indigenous rockshelter site, located in the southeastern part of La Palma, which displays an approximately 700-to-1100-year old fumier deposit. Sediment samples for botanical and biomolecular analyses were extracted from the 2.8 m-deep fumier sequence located at the central area of the cave. Our results shed light on plant use at the cave, the local endemic vegetation and the preservation potential of its phytolith and lipid molecular components.

## 2 THE CURIOUS CASE OF HORVAT KUR (GALILEE, ISRAEL): A CISTERN BENEATH AN ANCIENT SYNAGOGUE REVEALS A ROMAN-BYZANTINE LANDSCAPE

**Abstract author(s):** Neumann, Frank (Geology, School for Geo- and Spatial Science, North West University) - Rassalle, Tine (Department of Religious Studies, University of North Carolina at Chapel Hill) - Shvitiel, Yinon (Zefat Academic College, Israel Studies) - Muenger, Stefan (Universität Bern, Institut für Judaistik) - Belmaker, Miriam (The University of Tulsa, Department of Anthropology) - Bes, Philip (Österreichisches Archäologisches Institut – Österreichische Akademie der Wissenschaften, Vienna) - Zangenberg, Jürgen (Universiteit Leiden, Institute for History)

**Abstract format:** Oral

We present palynological results from a sealed Roman-Byzantine cistern in the village of Horvat Kur. The deposits produced pollen, spores, bones, charcoal, fungal, mollusc remains in large quantities and in excellent preservation due to reduced environmental conditions. This assemblage of organic findings offers a great potential for multi-proxy studies.

The chronology of the sediment deposits inside the cistern warrants further investigation. One sample, on a mollusc shell, points to 80-240 AD. The second sample on bulk sediments gives an older age, probably due to hardwater effect: 1105-920 BC. The latter date pre-dates the ceramics -so far 38 complete and restored ceramic vessels were excavated- from the same sediments.

The pollen content points to a Mediterranean open woodland with e.g. pollen of the mallow family (Malvaceae), daisy family (Asteraceae), carrot family (Apiaceae), rock rose (Cistus), pincushion flower (Scabiosa), chenopods (Amaranthaceae/Chenopodiaceae), lilies (Liliaceae), oak (Quercus), pine tree (Pinus), and carob tree (Ceratonia). Cultivars like olive tree (Olea), cereals and rare findings of flax (Linum) as well as weeds indicate agricultural activities.

The small vertebrate remains are dominated by frogs, toads and a large assemblage of *Crocidura* ssp. (White toothed shrews) and murids (*Mus* sp., *Apodemus* sp.). The absence of open grassland species such as voles (*Microtus guentheri*) and jirds (*Meriones tristrami*) support the reconstruction of the immediate vicinity of the cistern as a Medi-

terreanean woodland. While amphibia probably estivated in the cistern, small mammals might have been transported in after the cistern was disused probably until Late Byzantine or early Ummayyad times.

The multi-proxy data from Horvat Kur reveal 1. the functional change of the cistern from a regularly cleaned water reservoir to a waste deposit, 2. a whole landscape reflecting agriculture and animal husbandry, local living conditions and vegetation, as well as local fauna and can provide information on climatic changes.

### 3 **NORTHERN EUROPEAN AGRICULTURAL TERRACES: A MULTI-PROXY APPROACH TO BJØRNSKINN (NORWAY) TO UNDERSTAND ITS USES BY APPLYING GEOCHEMISTRY, PHYTOLITHS, AND POLLEN**

**Abstract author(s):** Alonso-Eguiluz, Mónica (Fundació Bosch i Gimpera) - Albert, Rosa María (ICREA; Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona) - Fallu, Daniel - Alsos, Inger (Tromso University Museum, UiT The Arctic University of Norway) - Høeg, Helge (University of Oslo) - Brown, Antony (Tromso University Museum, UiT The Arctic University of Norway)

**Abstract format:** Oral

Agricultural terraces are widespread around the world, with a chronology that ranges from Prehistory to modern times. The construction of terraces allows the preservation of soils and sediments reducing erosion, retaining nutrients, and soil organic carbon (SOC). All these improvements have a direct impact on food production, as they enhance the quality, quantity, and range of agricultural products, which has a direct effect on society at the subsistence level. Terraces can also provide a surplus which has implications for demography and contributes to the complexity of past societies. Stratigraphically, agricultural terraces are complex due to their variable construction and reworking due to maintenance and cultivation, inevitably resulting in the movement of sediments and datable materials. For this reason, the TerrACE project has designed a protocol that includes thin section micromorphology (TSM), portable x-ray fluorescence spectroscopy (pXRF), Fourier-transform infrared spectroscopy (FTIR), environmental scanning electron microscope (ESEM), portable optical stimulated luminescence (pOSL), carbon dating, and the analysis of biological microremains (pollen, phytoliths, ash pseudomorphs, and fecal spherulites), to better understand their formation, chronology and uses. This protocol is being applied to different agricultural terraces around Europe. As one of the main goals of the project is to better understand the development of farming practices, here we present the results obtained from the pollen, phytoliths, and geochemical (pXRF) analyses to shed new light on the agricultural practices carried out in one of the northernmost known agricultural terraces, Bjørnskin (Norway). Carbon dating and pOSL provisionally date the construction of and use of this terrace to the 17th-19th centuries. The results of the microremains analyses point out the presence of animals, through the occurrence of *Sordaria* spores, and also cereal pollen. Phytoliths identified in the sequence highlight the presence of C3 grasses, however crop morphotypes were scarce to absent.

### 4 **THE USAGE OF WOOD IN FUNERY CULTURE, THE EXAMPLE OF COFFINS FROM A CHURCH IN SZCZUCZYN (PODLASKIE VOIVODESHIP, POLAND)**

**Abstract author(s):** Michalik, Jakub (Institute of Archaeology, Nicolaus Copernicus University in Torun)

**Abstract format:** Oral

Archaeological research at the Church of the Name of the Blessed Lady Mary in Szczuczyn (Podlaskie Voivodeship, Poland) has been carried out since 2011. Originally, the main task of the work was to preserve three crypts under the church, as they had been systematically devastated and looted since the beginning of the 19th century, due to their easy access. This caused significant pollution that disturbed the local microclimate, which in turn began to destroy wooden coffins and the mummified bodies of people buried in them. Hence, the research conducted in Szczuczyn was largely of a rescue nature. For the next three seasons, until 2014, two crypts under the presbytery and one under the west nave were tidied up. The archaeological work in Szczuczyn so far has focused on classifying coffins based on their shape and, if possible, on determining the social status of the person buried in it. The compilation of archaeological, historical and xylogenetic analyzes makes it possible to trace whether the species and quality of the wood used for the construction of the coffin and coffin's joints may indicate differences in the burials of clergy, lay people and children. The wood used for the coffin's joints should be harder than the wood intended for boards. The comparison of the results of the taxonomic analysis of the wood used for the construction of both the coffin and its joints allows to observe whether the coffins were made in accordance with the art of carpentry. The presented results are a contribution to further research on the use of wood in the broadly understood modern funeral culture.

## 5 INTEGRATING CONTRASTING SIGNATURES OF ARCHAEOBOTANICAL PROXIES: THE CASE OF WATERFALL BLUFF, EASTERN CAPE PROVINCE, SOUTH AFRICA

**Abstract author(s):** Esteban, Irene (ERAAUB, Universidad de Barcelona; Evolutionary Studies Institute, University of the Witwatersrand) - Bamford, Marion (Evolutionary Studies Institute, University of the Witwatersrand) - Cawthra, Hayley (Geophysics and Remote Sensing Unit, Council for Geoscience Western Cape Office) - Fisher, Erich (ICARHEB, Universidade do Algarve) - House, Alisoun (Evolutionary Studies Institute, University of the Witwatersrand) - Miller, Charlotte (MARUM, University of Bremen) - Neumann, Frank (School for Geo- and Spatial Science, North West University) - Pargeter, Justin (Department of Anthropology, New York University) - Schefuss, Enno (MARUM, University of Bremen)

**Abstract format:** Oral

Waterfall Bluff, in Eastern Mpondoland (Eastern Cape Province, South Africa), is a recently excavated coastal archaeological site with deposits spanning Marine Isotope Stage 3 to the Middle Holocene. From an archaeobotanical point of view, the site stands out by the good preservation of botanical remains, such as preserved plant remains, charcoal, phytoliths and pollen, as well as of plant waxes. This unusual high variety of biotic and abiotic indicators preserved at Waterfall Bluff provided a unique opportunity to investigate the coupled response of coastal movements and climate change to palaeoenvironments and plant availability, and hunter-gatherer's use of plants in coastal Eastern Mpondoland from MIS 3 to the Early Holocene.

Here, we discuss this previously published data, but this time focusing on the approach used to integrate the contrasting signals obtained, both from an anthropogenic and environmental perspective. We centre our discussion on the taphonomical pathways that each of these proxies might have undergone to be introduced and preserved in the archaeological record. Special mention is made of the challenges we faced in using these proxies to reconstruct past uses of plants and plant foraging activities, and infer past environmental conditions.

## 6 IDENTIFYING RITUAL BEHAVIOUR WITHIN THE HUMAN-PLANT RELATIONSHIP. THE CASE OF CHALCOLITHIC SITE ISĂIIA, EASTERN ROMANIA

**Abstract author(s):** Brasoveanu, Casandra (Arheoinvest Centre, Institute of Interdisciplinary Research, Alexandru Ioan Cuza University of Iasi) - Danu, Mihaela (Faculty of Biology, Alexandru Ioan Cuza University of Iasi) - Tencariu, Felix-Adrian (Arheoinvest Centre, Institute of Interdisciplinary Research, Alexandru Ioan Cuza University of Iasi) - Vornicu, Diana Măriuca (Institute of Archaeology, Romanian Academy, Iasi Branch) - Asăndulesei, Andrei (Arheoinvest Centre, Institute of Interdisciplinary Research, Alexandru Ioan Cuza University of Iasi) - Delhon, Claire (CNRS, CEPAM, UMR 7264, Université Côte d'Azur)

**Abstract format:** Oral

During the last decades, the analysis of phytoliths has provided important insights to the research of historical periods, in general, and prehistoric ones, in particular. On the Romanian territory, the Chalcolithic period, although with a long history of research, still benefits of a relatively small number of studies dedicated to archaeobotanical analysis, which are absolutely necessary when talking about the human-plant relationship. These are all the more necessary given the specific beliefs of these communities, which are concentrated around the fertility cult.

Thus, we aim to present the archaeological context and palaeobotanical investigations of an important discovery, from Isăia-Balta Popii Chalcolithic settlement of Eastern Romania. The excavation of a dwelling in 2015 and 2017 brought to light a rather rare finding, meaning a medium sized ceramic vessel sitting on the floor near the western corner of the house, having deposited inside two objects of burnt clay: an anthropomorphic figurine depicting pregnancy attributes and a small cone. Given the special character of the deposition, several samples from the vessel and near it were collected for phytolith analysis; also, samples of bone found next to the vessel and from the nearby features were dated by AMS radiocarbon.

The palaeobotanical evidence based on phytolith analysis nuances and augments the ritual interpretation of the deposition. The plants which possible were in association with the small artefacts are cereals and mugwort; both, and especially the latter, are known, besides their practical uses, as powerful symbols, used through the ages in magic practices. All of these facts are strong arguments to interpret this find as a result of a ritual related to fertility (possible to counteract some physiological problems or reproductive disorders), involving both feminine and masculine symbols and use of plants.

## HOW TO SEE POLYETHYLENE GLYCOL IN REINFORCED WATERLOGGED ARCHAEOLOGICAL WOOD?

**Abstract author(s):** Grupa, Malgorzata (Nicolaus Copernicus University in Torun, Faculty of History, Institute of Archaeology) - Wypych, Aleksandra (Nicolaus Copernicus University in Torun, Centre of Modern Interdisciplinary Technologies) - Łukaszewicz, Jadwiga (Nicolaus Copernicus University in Torun, Faculty of History, Institute of Archaeology)

**Abstract format:** Oral

Underwater research carried out (since 1982) in Ostrów Lednicki (Wielkopolska province) delivered unique information concerning the construction of early mediaeval bridge crossings (eastern and western) and many other artifacts of material culture of the period. They included both flat and spherical objects (spoons, bearers, bowls, buckets, and many others). The excavated objects came from various depths of deposition - from 6 to 15 m down. Brief analysis of the items' surfaces indicated differences in their state of preservation, which was problematic for their restorers, because they were uncertain as to the final results of impregnation processes using polyethylene glycol 400 and 4000.

One of the most important research problems in the conservation of archaeological wood is to determine its internal texture before and after consolidation. So far, only phenomena occurring on the surface of the object have been described. The internal structure of the reinforced wood remains unrecognized. Therefore, for over 30 years, researchers have been looking for non-destructive analytical methods that would allow to visualize the internal structures of wood.

The main objective of the research in the presented work was to determine the distribution of consolidants in model wood samples, and in real archaeological objects. Two imaging techniques were used to analyze the internal structure of wet archaeological wood: 64-slices computed tomography and 3T magnetic resonance. MRI was more effective in assessing the internal features of the wood structure and visualizing elements that were invisible in traditional imaging methods. What's more, thanks to the use of several different test protocols, it was also possible to assess internal structures in terms of the maintenance carried out and the degree of penetration of polyglycol solution into the tested object.

## IMPACT OF THE SAMPLING STRATEGY ON THE REPRESENTATIVENESS OF PLANT ASSEMBLAGES AT THE EARLY NEOLITHIC SETTLEMENT OF BISKUPICE (S POLAND)

**Abstract author(s):** Moskal-del Hoyo, Magdalena - Kapcia, Magda - Wacnik, Agnieszka - Korczyńska, Marta (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) - Kenig, Robert (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków; Institute of Archaeology, Jagiellonian University, Kraków) - Nowak, Marek (Institute of Archaeology, Jagiellonian University, Kraków)

**Abstract format:** Oral

The first Neolithic communities that appeared in southern Poland occupied regions exclusively limited to loess-mantled areas. They represented the Linear Pottery Culture of Danubian origin. Although this culture was responsible for introducing the agriculture, the archaeobotanical remains, representing plant-based economy, were not frequently studied. Therefore, there is still a relatively low number of representative macroscopic plant assemblages that may shed light on the earliest agrarian practices. Partly, this is due to the generally insufficient number of samples collected during excavation and a low density of plant charred remains recovered at Early Neolithic settlements located in so-called dry sites. In order to show the importance of sampling strategy for gaining a relatively high number of plant remains we will present the case-study site no. 18 of Biskupice situated in the Wieliczka Foothills, where remains of five so-called longhouses were discovered (within the framework of the project no. NCN 2018/30/E/HS3/00867). This site provided numerous samples from various archaeological features (e.g., typical so-called clay extraction pits, features with hearths at their bottoms, post-holes). The presentation will focus on the data obtained from all features associated to two fully excavated houses, which differ slightly in their chronology, although both represent the youngest Źeliezowce phase. Sampling in archaeobotanical research is a crucial factor, which has a significant impact on the knowledge about the use of plants in prehistory. This is especially relevant in the case of dry archaeological sites like Biskupice, in which only a small part of plants utilized by people are usually preserved as charred due to environmental conditions. Thanks to relatively deep archaeological features also some samples taken for palynological analysis contained pollen grains. The results of carpological, anthracological and palynological analyses will be discussed in the context of the type of archaeological features and their possible functions.

## A. UNLOCKING THE KING'S SPICE CABINET – PLANT REMAINS FROM A 15TH CENTURY ROYAL SHIPWRECK IN THE BALTIC SEA

**Abstract author(s):** Larsson, Mikael - Foley, Brendan (Department of Archaeology and Ancient History, Lund University)

**Abstract format:** Poster

Underwater archaeobotany has recently recovered plant material from the wreck of a warship called Gribshunden, the flagship of King Hans of Denmark and Norway that sank close to the southern edge of Sweden more than 500 years ago. The exceptional environmental conditions of the Baltic Sea have preserved plant foods stored on the ship, including cereals, oilseeds, fruits, vegetables, spices, nuts and berries. Among these are plants species from far distant origins: saffron, peppercorn, clove, ginger, almond and grape. Despite the status of exotic foods and spices among the aristocracy in Scandinavia and around the Baltic Sea during the Middle Ages (AD 1050-1550), few of these foods have survived archaeologically, and much of our knowledge of the use of such foods are reliant on written sources. Taking this into account, the preservation of these plant foods from Gribshunden constitutes a valuable discovery.

Exotic food items are probably some of the most easily identifiable indicators of social context. From historical sources, we know that King Hans and his courtiers, noblemen, and soldiers, were travelling on Gribshunden, together with a squadron of ships to attend a June 1495 political summit in Sweden. Many of them never arrived, as the king's flagship sank after a fire broke out en route. The plants remains recovered from the wreck offer not only the unique possibility to contextualize the social environment in which such luxurious foods were consumed, but to link these food commodities to a travelling medieval king and a historical event.

While these discoveries will add relevance to research on medieval ships and provide insights to the use of luxury foods in medieval society, it also illustrates the potential of plant remains in underwater environments connected to wreck sites.

## B. PLANTBITES – A DATABASE FOR PLANT RESOURCES IN EARLY HUMAN ENVIRONMENTS

**Abstract author(s):** Bruch, Angela (ROCEEH Research Centre, Senckenberg Research Institute, Frankfurt/M) - Papikyan, Astghik (A.L. Takhtajyan Institute of Botany, Armenian Academy of Sciences, Yerevan) - Hahn, Karen (Institute for Ecology, Evolution and Diversity, Goethe University, Frankfurt/M) - Altolaguirre, Yul - Haidle, Miriam (ROCEEH Research Centre, Senckenberg Research Institute, Frankfurt/M)

**Abstract format:** Poster

Studies on possible plant food and its availability for different groups of early humans so far usually consider only a pre-selected set of plant species often based on the scarce archaeobotanical record. In contrast, the database PlantBITES is a tool to consider the full range of potentially available, dominant plant species in vegetation units. It serves assessing the amount and variety of obtainable food (and other) resources for early humans. Data collected in PlantBITES comprise information mainly on edibility and other uses of plants that occur in natural environments as well as their relevant botanical traits. Based on such records it is possible to analyze and quantify plant resources and their seasonal availability for humans in a given environment.

The availability of plant resources is considered taking into account not only natural aspects but also the different levels of cultural capacities necessary for the utilization of plants – as it is usually not included in ethnobotany. Cultural capacities of different hominin groups regarding the exploitation of plant resources change considerably through time with respect to the use of tools and fire, and especially the capability to process and store plant materials. Therefore, the PlantBITES database facilitates the evaluation of the relevance and impact of climate or other environmental changes as well as of cultural developments on the resource availability for early humans through time.

PlantBITES provides a range of applications for exploring the resource space of early humans. This will be highlighted by examples of exploring the database to quantify the spatial and seasonal availability of plant food resources for early Homo in the South of the Iberian Peninsula, as well as the availability of plant food resources in relation to changing cultural performances of early Homo in Southern Africa.

## 375 THE SOCIETAL IMPACTS OF CLIMATE CHANGES IN THE PAST – WHAT CAN HUNTER-GATHERER ARCHAEOLOGY CONTRIBUTE TO THE CURRENT DEBATE? [PAM]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Grimm, Sonja (CRC 1266 Scales of Transformation; ZBSA - Centre for Baltic and Scandinavian Archaeology) - Nyland, Astrid (Museum of Archaeology, University of Stavanger) - Riede, Felix (School of Culture and Society, Aarhus University) - Wygal, Brian (Environmental Studies and Sciences, Adelphi University)

**Format:** Session with presentation of 6 slides in 6 minutes

The realities of climate change are with us: rising sea levels, melting glaciers, droughts, desertification, deforestation, changing storm tracks, and extreme weather events. Calls for socio-economic changes are getting louder, yet im-

plementations remain slow. Palaeolithic and Mesolithic archaeology has often focused on responses to changing climatic and environmental conditions; discussing human adaptation is not new. But can an archaeological perspective and the study of hunter-gatherers bring new understanding and knowledge to the current debate?

Climate change was sometimes creeping, rapid at others, including systemic tipping points; adaptations similarly had to occur at different times. In analogy with foragers of the recent past and present, the people of the Pleistocene and Early Holocene were likely astute observers of their surroundings. Observations of short-term extreme phenomena such as tsunamis or volcanic eruptions, and of long-term developments such as sea-level rise were vital and transmitted across generations. Such knowledge is today referred to as Traditional Ecological Knowledge (TEK) and widely recognised as essential in climate change response. Yet, demonstrating the efficacy of such TEK under current climate remains elusive, raising the question of hunter-gatherers' limits to adapt.

In this session we ask:

- When did the people of the Palaeolithic and Mesolithic move from 'business as usual' to significantly changing their behaviours? How can these changes be identified archaeologically?
- Can we recognise the socio-economic responses to tipping points?
- How does TEK influence responses and their timing?
- Are there general patterns of responding to climate and environmental change?
- What methods and proxies – traditional and innovative – do we have for studying deep past coping strategies?
- And finally, is understanding Palaeolithic/Mesolithic adaptations relevant to the present?

We invite you to discuss these topics and questions through short talks or statements (6 slides in 6 minutes) to initiate what we hope may be fruitful discussions.

## ABSTRACTS

### 1 CONTINUITY AND CHANGE AT THE MESOLITHIC-NEOLITHIC TRANSITION ON THE NORWEGIAN WEST COAST: INSIGHTS GAINED FROM PREHISTORIC DEMOGRAPHY AND CULTURAL EVOLUTION.

**Abstract author(s):** Lundström, Victor - Bergsvik, Knut (University Museum, University of Bergen)

**Abstract format:** Oral

Some cultural traditions last for centuries or longer, some go out of fashion and disappear whereas others emerge rapidly, and sometimes seemingly, out of nowhere. Understanding why these patterns emerge and what their potential correlates may be is not only an important task for archaeologists in particular, but also for future challenges to society in general. Many of the above-mentioned patterns become particularly pronounced during the transition from the late Mesolithic (8500-6000 cal. BP) to the Early Neolithic (5950-5250 cal. BP) on the west coast of Norway. Although hunter-fisher-gatherer subsistence patterns persisted across the transition, old and long-standing modes of lithic blade production and axe production either continued or disappeared, whereas completely new technologies emerged. Furthermore, some lithic raw materials continued to be used, while others were introduced during the transition. These changes have, so far, only been described rather than explained. We wish to contribute to this session by conceptualising cultural change as the material expression of socially transmitted information between individuals which, in turn, also interfaces with larger macro-scale patterns in both palaeodemography and palaeoclimate.

### 2 RECONCILING LATE PLEISTOCENE ENVIRONMENTAL ARCHAEOLOGY IN ALASKA WITH THE FUTURE OF HUMANITY ON EARTH

**Abstract author(s):** Wygal, Brian (Adelphi University, New York)

**Abstract format:** Oral

Late Pleistocene archaeology in Alaska informs us how hunter-gatherers responded to abrupt changes in climate. Deep time studies into human environmental interactions are fundamental to informing policy development around our species' survival on planet Earth. Of particular interest, where in archaeology can we determine if or when a society responded to climate changes? Were there climate shifts so rapid that its effects were noticeable within a single lifetime? From central Alaska, there are enough dated archaeological components between 14,000 and 8,000 cal BP to broadly assess population numbers and categories of stone technology over time and from different ecological zones. Matching dated cultural components to climate proxy records has been a standard method of analysis for describing adaptations to environmental changes. And comparing site elevations and faunal assemblages can provide data at the seasonal level. But these hypotheses are difficult to prove and, in some cases, contradict one another. During the late Pleistocene in Alaska, it appears that colonizing populations fluctuated in size over the first two millennia after initial arrival into eastern Beringia followed by a spike during the initial onset of the Younger Dryas. A population bottleneck may have occurred in Alaska mid-way through the Younger Dryas. Are these studies accurate

or even relevant to our current climate conundrum? How did hunter gatherers survive difficult climatic transitions? Wisdom accumulated through generations are preserved among descendant Dene communities.

### 3 WEATHER-WATER-MESOLITHIC WORLDS

**Abstract author(s):** Nyland, Astrid (Museum of Archaeology, University of Stavanger)

**Abstract format:** Oral

In the 7th Millennium BC, the 8.2 ka climatic cold event arguably made the weather wetter and wilder, and the massive Storegga tsunami, 8200 years ago, battered the coasts of the North Sea basin and Norwegian Sea. Both may significantly have impacted the worlds of the marine oriented coastal dwellers. In archaeological literature, these events together are claimed to have caused demographic decline, even societal collapse. However, despite geological evidence of the tsunami itself, there are no direct trace of 'squashed Mesolithic people' (Wickham-Jones 2002), nor does the tsunami seem to have caused immediate massive material change. Should we still regard the events as significant thresholds in time, or as considerably influencing the coastal societies we seek to understand? Is there a paradox in the way mobile fisher-hunter-gatherers are (more often than not) portrayed as adaptive and flexible, but not when facing bad weather or crisis? In this paper, I suggest to utilize knowledge of the physical world, of stormy weather and waters, to learn how societies lived with natural hazards. But how do we do that if the material demonstrates continuity? I admit I have more questions than answers, but hope that to raise these questions, and suggest some alternative interpretative perspectives, we might explore more sides of the Mesolithic worlds.

### 4 CLIMATE CHANGE AND ENVIRONMENTAL RISK PERCEPTION ON PREHISTORIC COASTAL COMMUNITIES

**Abstract author(s):** Fernández-López de Pablo, Javier (I.U. I en Arqueología y Patrimonio Histórico - INAPH, University of Alicante)

**Abstract format:** Oral

Hunter-gatherer archaeology holds a privileged position to the current debate of societal impacts of climate change, as no other discipline provides the longest record of human-environmental interactions. However, identifying behavioral and cultural responses to climatic and environmental change remains a difficult task. The adoption of appropriate analytical scales, the acquisition and/or downscaling of palaeoenvironmental data of sufficient spatial and temporal resolution, and the need of multi-proxy archaeological evidence are fundamental components of modern archaeological research. Very often this scientific effort remains not fully understood by the general non-specialized public, social media, policy makers and stakeholders.

In this contribution to the session 'Societal Impacts of Climate Changes in the Past', I will discuss the applicability of 'environmental change risk perception' in the study of human-environmental interactions in prehistoric communities. Adopting an explicit human scale approach based on central place foraging, I will use recent ethnographic studies on traditional fisher communities to illustrate how local groups perceive environmental disruptions on coastal ecosystems and produce different kind of behavioral and societal responses to mitigate risk in timescales of just one generation. I will then show how this conceptual framework and analytical scale is well suited to interrogate the impacts of Postglacial sea level rise on Mesolithic communities through intergenerational timescales.

We believe human-scale approaches can foster fruitful discussions for the session and holds the potential of bridging gaps between science and society on the recognition of past, present and future impacts of climate change.

### 5 OUR HUNTER-GATHERER FUTURE? EVALUATING THE EFFICACY OF FORAGER-INSPIRED UNCIVILIZATION SCENARIOS FOR THE FUTURE OF HUMANITY UNDER CLIMATE CHANGE

**Abstract author(s):** Riede, Felix (Department of Archaeology and Heritage Studies Aarhus University)

**Abstract format:** Oral

In a recent paper, John Gowdy (2020) has presented the argument that future climate change will make agriculture impossible, lead to state collapse and a return to resilient hunter-gatherer lifestyles globally. Anthropogenic warming will seriously challenge agriculture and both increasing heat and the increasing frequency of extreme events will put global networks under pressure; system collapse may indeed follow, most likely at temporal horizons beyond 2100. To equate uncivilization (cf. <https://dark-mountain.net/about/manifesto/>) with a return to foraging, however, reproduces the tired trope of primitiveness and ecological noblesse said to be inherent in hunter-gatherer societies. In this short contribution, I seek to offer a more cross-culturally and archaeological informed evaluation of which aspects of a hunter-gatherer lifestyle may prove efficacious as we move into the warm and unstable future of the Anthropocene. The cultural distance between most contemporary humans and past hunter-gatherers is substantial making it unlikely that direct and specific insights about resilience can be derived. However, there are good reasons to see the hunter-gatherer lifestyle *sensu lato* as hyper-resilient, so the structural combination of risk management strategies with

a primacy on reciprocity and mobility does offer useful insights. And these insights can, I suggest, be made useful in the context of risk communication, story-lining and scenario-planning.

## USING THE GRAVETTIAN-SOLUTREAN TRANSITION TO CREATE AWARENESS OF CURRENT CLIMATE CHANGE: THE EXAMPLE OF PORTELA 2 (PORTUGAL) PUBLIC ARCHAEOLOGY ACTIONS

**Abstract author(s):** Gameiro, Cristina (UNIARQ - Lisbon University) - Carvalho, Vânia (Leiria Museum) - Gomes, Telmo (Leiria SMAS) - José, Cátia (Leiria Museum) - Lucena, Armando (Independent researcher)

**Abstract format:** Oral

In early 2009, the opening of a ditch related to the Maceira (Leiria, Central Portugal) sanitation network led to the discovery of the Portela 2 archaeological site. The recovery of Vale Comprido points suggested a Proto-Solutrean occupation dating from the beginning of the Last Glacial Maximum (LGM). The fact that this is a transitional phase between the Gravettian and the Solutrean, poorly known in south-western Europe, prompted a new archaeological excavation, conducted in 2021 in the scope of the PALEORESCUE project. Several public archaeology actions were undertaken: guided visits to the excavation, open day during the weekend, advertised locally with the help of social media, and a conference held in the municipal museum.

Paleolithic archaeology is often seen as 'Stone & Bones'. Surprisingly, the local population showed an enormous curiosity about our work, felt very proud of their local heritage and made an effort to understand the twenty-thousand-year-old knapped stones.

We strongly believe that emphasizing a common History, the same type of lithic artefacts, and a social network during the beginning of LGM, joining people across different countries of south-western Europe, is a way of promoting equality and inclusion among these countries and of showing the existence of gathering, sharing and transmission of knowledge in the past. Being able to establish a correlation between technical innovation and the setting-up of long-distance networks and paleoclimate history (LGM) is relevant when dealing with climate change and a pandemic situation that broke human contact and interactions. Demonstrating that social contact can lead to innovation and that learning to adapt to environmental variability is part of human history can strengthen resilience today and contribute to increasing awareness of the need for urgent measures to fight climate change.

## ECONOMIC SYSTEMS IN THE NEOLITHIC AND BRONZE AGE: PATHWAYS OF PRODUCTION, CONSUMPTION, STORAGE, CONTROL AND EXCHANGE

**Theme:** 2. [Re]integration

**Organisers:** Schaefer-Di Maida, Stefanie - Brozio, Jan Piet - Filipović, Dragana (Institute of Pre- and Protohistoric Archaeology, CAU Kiel; CRC 1266) - Nordvall, Linn (Department of Historical Studies, University of Gothenburg) - Iversen, Rune (Saxo Institute, University of Copenhagen)

**Format:** Regular session

The Neolithic was marked both by the dominance of materials and food production and by the increased scale of storage and consumption. Steady increase has since been observed globally in the production and consumption of goods and materials, and in the distribution of resources, techniques, skills and ideas. This has enabled the establishment of networks which, in the Neolithic and Bronze Age, gave rise to important exchange and trade routes.

Residential and ritual elements of the built environment – huts, houses, megaliths, barrows – entailed not only high production and consumption of raw materials but also many hours of labour and logistics expenses. Similar economic investments and cooperation structures were also required, for example, for the extraction and production of tradable goods (both raw materials and finished products). Storage pit-complexes of the Neolithic and Bronze Age serve as evidence of food production and surplus, offering insights into their management. Finds of hoards, weights and ingots are crucial for the reconstructions of networks and exchange systems, while they can also be taken as evidence of the complex politics of storage and control of goods and resources. The latter were key to sustaining large-scale economic investments and labour.

With this session we would like to bring together Neolithic and Bronze Age studies that discuss and problematize the complex interplay between production, storage, control and exchange of resources and the significance of economy on the Longue durée. We welcome contributions from all over the world and from, but do not limit them to, archaeology (including subdisciplines), environmental science and geosciences, in the form of case studies, comparative studies or theoretical approaches.

## 1 SCALES OF ECONOMIC SYSTEMS – NEOLITHIC SOCIOECONOMIC STRATEGIES FROM THE CENTRAL EUROPEAN PLAIN

**Abstract author(s):** Brozio, Jan Piet (Institute of Pre- and Protohistoric Archaeology CAU Kiel)

**Abstract format:** Oral

In the agricultural communities of the Neolithic of the Central European Plain we find phases of different economic intensities and characteristics. Improvements in production methods, selective use of crops and domestic animals, and the generation of a surplus led to demographic growth, the construction of monumental structures and the agglomeration of people.

In addition to production at the household level, groups were involved to varying intensities in regional and supra-regional exchange networks. This is also reflected in the import of metal objects and early metallurgical knowledge, which, based on the origin of the raw materials, points to long-distance trade relations.

The socioeconomy of the Neolithic can therefore be described on different spatial scales. Besides small-scale economic action at the micro level of households, economically conditioned actions at the level of meso-regions can be reconstructed, as well as macro-scale integration into exchange networks. These different scales of action and their interaction are in the focus of this talk.

## 2 SUBSISTENCE AND EXPANSION IN LATE NEOLITHIC SOUTHERN SCANDINAVIA

**Abstract author(s):** Johannsen, Jens (Aarhus University; ROMU)

**Abstract format:** Oral

The Late Neolithic period in Southern Scandinavia (2350-1700 BC) is marked by several shifts. Where settlements from the preceding period are few, small and dispersed, hundreds of Late Neolithic settlements have been excavated throughout Southern Scandinavia. These are often large and were sometimes inhabited for centuries indicating a heavy increase of sedentism. The period is also characterised by the transition from regional cultural diversity to overall cultural homogeneity and by the emergence of the first stable Neolithic societies in some of the outskirts of Southern Scandinavia. Thereby the Late Neolithic represent a third Neolithic expansion after the introduction of the Funnel Beaker Culture around 4000 BC, and secondly the Corded Ware Culture around 2800 BC. The background for all these changes shall likely be sought in Bell Beaker influence, but the fuel for the expansion were improvements in the subsistence economy and the thereby derived population increase, while the motor may have been continuous migrations into hitherto unoccupied land, possibly as a reaction against attempts of power centralisation.

## 3 A WEB OF WEALTH MEASURES – QUANTIFYING WEALTH AND INEQUALITY IN 3RD MILLENNIUM BCE CENTRAL EUROPE

**Abstract author(s):** Nørtoft, Mikkel (Saxo Institute, University of Copenhagen) - Rohrlach, Adam (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

**Abstract format:** Oral

Following the mostly male-driven migrations of people from the Pontic steppe in the 3rd millennium BCE, the genetic landscape of most Europe was forever changed, and individualized burials became the dominant form of interment. As it has been suggested that this major migration made societies more patriarchal, it is of importance to quantify this phenomenon, both before and after the steppe migrations, and to incorporate both aspects of production, and trade of raw materials, into consistent measures.

Here we introduce QuantWealth, a multi-variable approach for modeling prehistoric grave wealth and wealth inequality, which we apply to a number of case studies from Central Europe, and compare the results. Our approach combines grave wealth measures such as grave good manufacturing hours (incorporating their respective chaîne opératoires), skill, scarcity, prestige, imported raw material distance, grave good category count, and estimated meat expenditure from deposited animal bones. However, we also include critically important grave architecture measures such as grave depth, as well as mound and cist labour-hours. These wealth measures can be used to model wealth and wealth inequality in different ways, including via Gini indices of inequality (and combined Gini indices from different grave measures), but can also be used as more holistic grave wealth measures correlated with demographic aspects such as age, genetic sex and archaeological gender determination, mobility, diet, pathologies, and genetics.

QuantWealth, and its growing collections of grave, house size, and raw material GIS data, is open source, flexible, and semi-automated, making results comparable between regions, periods and grave contexts, allowing researchers to obtain a deeper understanding of the development of social organization across time and space in Europe. The system is currently focused on Middle-Late Neolithic to Early Bronze Age periods, but its open format allows expanding it to other periods as well.

- 4 VALUE, SIGNIFICANCE AND USE OF 'EXOTIC' MATERIALS – IN VIEW OF THE PRESENCE OF OBSIDIAN ON NEOLITHIC SITES IN POLAND**
- Abstract author(s):** Werra, Dagmara H. (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Warsaw) - Szeliga, Marcin (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin) - Pyżewicz, Katarzyna (Faculty of Archaeology, University of Warsaw)

**Abstract format:** Oral

The 'exotic' (non-local) raw materials are marked as special by humans cross-culturally, and we imagine that Neolithic communities may have made analogous distinctions. There are no natural outcrops of obsidian in Poland, so all of the artefacts and nodules recovered from archaeological sites must have been conveyed there by some means (exchange, direct access, mobility, etc.) at different times in the past.

In Poland, we have obsidian recovered from more than several dozen Neolithic sites. The occurrence of obsidian at any one site could have represented different prehistoric communities activities. This could be a redistribution effect, and the redistribution centre could be the site with the highest presence of these artefacts. Whereas it is conceivable that a stray find could represent a non-systematic message such as a personal keepsake and/or gift.

During the presentation, we would like to discuss what economic systems can be observed in the conveyance of obsidian. To investigate the importance of "exotic" items (obsidian) for the economy of Neolithic communities. It will be conducted taking into consideration the forms in which obsidian reached the territory of present-day Poland in the Neolithic. In order to see changes in its use through time. Furthermore, to challenge the hypothesis of "special" use of "imported" raw materials. Those investigations support the results of the obsidian use-wear analysis.

The conveyance and use of obsidian in the Neolithic will be presented as an example to reconstruct the transaction, distribution, and importance of "exotic" items in the economy of prehistoric communities.

Acknowledgements: The research is carried out thanks to funding from the National Science Centre, Poland (grant No 2018/29/B/HS3/01540).

- 5 RAW MATERIALS PROCUREMENT AND TECHNOLOGY OF MACROLITHIC TOOLS FROM THE NEOLITHIC AND COPPER AGE IN THE INNER AND SOUTH IBERIA**
- Abstract author(s):** Martínez-Sevilla, Francisco - Barroso Bermejo, Rosa - Bueno Ramírez, Primitiva (University of Alcalá) - Rojas Rodríguez-Malo, Juan (Independent Researcher) - Cárdenas Párraga, Juan (Independent Researcher) - Lozano Rodríguez, José (Instituto Español de Oceanografía. Centro Oceanográfico de Canarias)

**Abstract format:** Oral

Macrolithic tools are among the most abundant archaeological materials at late prehistoric sites. These tools were used in many activities of daily life, from food processing to making and maintenance of other objects. Among them, grinding tools were used for cereal processing and the production of flour, making them important since cereals were one of the main food sources for farming societies. It has been assumed, based on their lithologies, that sources of these essential objects for domestic activities are geological contexts located close to the settlements. However, the archaeological evidence suggests that the

picture is much more complex and varied. Furthermore, the technological processes and tool maintenance have rarely been studied. In this communication, we present a study of raw materials, their geological source and the technological processes involved with macrolithic tools from four archaeological sites in the inner and south parts of the Iberian Peninsula. The chronology of these sites spans from the Early Neolithic to the Copper Age. The evidence on the variety of rocks and the places where they were acquired to make macrolithic tools is diverse and complex, showing similar patterns to other broadly studied artifacts such as knapping tools.

- 6 NEOLITHIC AND EARLY BRONZE AGE SETTLEMENT IN SOUTH MORAVIA IN A DIACHRONIC PERSPECTIVE**
- Abstract author(s):** Novotný, Jaroslav - Hons, David - Denis, Solène (Masaryk University) - Čerevková, Alžběta (Moravian Museum)

**Abstract format:** Oral

Our paper is focused on the research of Neolithic and Early Bronze Age settlement of South and South-Western Moravia. Our goal is dedicated to the recognition of socioeconomical interactions in archaic societies. Models based on theoretical study will be tested by the analysis of lithic chipped industry. Krumlovský les, located in the center of our studied area, is a geomorphological unit from which the chert of the same name originates. This chert was distributed over a wide area in Prehistory. During the Neolithic and Early Bronze Age, a network of settlements, hillforts and round enclosures was created around the Krumlovský les area. Using a diachronic perspective, we want to find out: a) how social and economic ties were developing in time, b) how the power of individuals or groups manifested itself and c) how social institutions were formed. The combination of diachronic and synchronous perspective could be appropriate for better understanding the development of socio-political and economic relationships.

## 7 THE CONNECTIVITY OF LAND AND SEA. INTERACTION OF LOCAL COMMUNITIES FOR THE EXCHANGE OF GOODS IN THE EARLY BRONZE AGE

**Abstract author(s): Nordvall, Linn (Göteborgs universitet)**

**Abstract format: Oral**

Interpretations of interaction in the Bronze Age has been drawing on the mobility of prestige goods and other commodities, as well as changes in architecture, movement of people, and transfer of technological know-how. Interaction between local communities and the underlying organization needed for participating in long distance exchange as regards to maritime transport, surplus production, resource utilization and labor on a micro-level are still to be discussed. Political and economic relations between inland and coast bound settlements, topographical landscape features, rivers and lakes providing landing places for seaborne transport and distribution of goods further inland are important for understanding the interaction between local communities as being part of broader networks of exchange. Single depositions and hoards, grave goods, settlements, and architecture as well as maritime conditions and resource utilization are analyzed in a coast bound micro-region in the province of Halland, Western Sweden, in the present case study where the concept of Maritory is explored.

## 8 SOCIAL ORGANIZATION AND PRODUCTION IN THE BRONZE AGE IN TRANSYLVANIA

**Abstract author(s): Wittenberger, Mihai (National History Museum of Transylvania)**

**Abstract format: Oral**

In this presentation, I try to remake some aspects of the organisation of the production of metal artifacts, starting from the extraction until the finished product. Unlike other prehistoric activities, metallurgy required social, political, military and religious support. While in the Early and Middle Bronze Age we have relatively few pieces made of bronze and these are generally famous pieces, in the Late Bronze Age things has changed. Bronze is becoming more popular! The company's communal involvement in the metallurgical process has been highlighted over time by several specialists. New studies have recently appeared about the social component of metallurgy. I am referring in particular to the community's ability at the time to organize the production of metal starting with the mining phase until the finished product. When I talk about the organization of society, I think about all the components: economic, political, military and spiritual ones. The Bronze Age craftsmen were people with a special status in their communities, not only because of their ability to turn "stone" into metal, but also because they were able to turn metal into finished products. For this reason, I believe that the research of metallurgical settlements provides special information on the craftsmen in the Bronze Age. Certainly, a large part of the bronze products was made for exchange purposes. Either as a ingot, raw or as a finished product. Trading, both over short distances, but especially over long distances, has led to the social cooperation between different communities, the exchange of ideas and cultural elements.

## 9 SILO PITS AND STORAGE VESSELS: WAYS OF STOCKPILING IN THE YOUNGER AND LATE NEOLITHIC OF THE GERMAN LOWER MOUNTAIN RANGE

**Abstract author(s): Hoffmann, Robert (Institut fuer Ur- und Fruehgeschichte Kiel; CRC 1266, CAU Kiel)**

**Abstract format: Oral**

The primary goal of subsistence economies is the extraction and/or production of sufficient food for its own consumption (Bartl 2004). One strategy to ensure adequate food supply in times of, e.g. environmentally-caused, food shortages is to build up stocks. The focus of this paper is on pit structures and ceramic finds connected to storage as an indicator of economic transformations in the region of the German Lower Mountain Range during the transition of the Younger to the Late Neolithic in the 4th millennium BCE. The results contribute to a better understanding of the shift from the Michelsberg to the Wartberg culture.

Analyses of settlement and burial structures have shown that there is a notable change in the idea of collective during the Younger and Late Neolithic and one aim of this project is to find out if these changes had an impact on subsistence strategies or vice versa. To explore this, metric dimensions of selected pits and ceramic vessels from settlement sites will be used to determine the form and capacity of these storage containers, as the degree of stockpiling in a settlement might indicate a change, or even a continuity, in agricultural strategies.

## 10 THE ORIGIN OF SURPLUS ECONOMY. UNDERGROUND SUPRA-HOUSEHOLD STORAGE DURING THE LATE NEOLITHIC AND EARLY BRONZE AGE IN NE IBERIA

**Abstract author(s): Prats, Georgina - Moya, Andreu (Grup d'Investigació Prehistòrica, Departament d'Història, Universitat de Lleida) - Antolín, Ferran (Natural Sciences Department, German Archaeological Institute) - Alonso, Natàlia (Grup d'Investigació Prehistòrica, Departament d'Història, Universitat de Lleida)**

**Abstract format: Oral**

Storage capacity analysis of silo pits can be used as an indicator of productivity and, often, of the existence and development of social inequality. The interpretation of capacity values must be done in close connection to archae-

obotanical research (in order to understand what was being produced and how) and, in general, archaeological research of a given region. This communication wants to put the focus on underground storage features that are clearly beyond the average capacity values in the NE of the Iberian Peninsula, a region with a large dataset of silo pit features generated by the team.

The boundary in the domestic unit between a usual surplus and extraordinary surplus is blurred, particularly in the initial stages of the Neolithic, when most structures tend to be of small size. Storage features exceeding what is considered domestic production first appeared at the end of the Neolithic and the beginning of the Bronze Age. How can one interpret supra-household storage capacity in this period? Which are the sites where this sort of storage is detected? Who is managing the production? How can it be integrated in the context of the origin of social inequalities? Although it is impossible to rule out that these features represent the outset of modest speculative and commercial actions, they could have a cooperative finality. The extraordinary silos could evidence specific needs in episodes of social coalescence or indicate collective use of the structures by the community's inhabitants. They could also reflect the beginning of social inequality. These different scenarios will be discussed in the light of the information available at a site level.

## 11 BETWEEN THE DOMESTIC AND THE COLLECTIVE: A COMPARATIVE STUDY OF TWO BRONZE AGE STORAGE METHODS AT CABEZO REDONDO (VILLENNA, SPAIN)

**Abstract author(s):** Martín de la Sierra Pareja, Paula - García Atiénzar, Gabriel - Barciela González, Virginia (University of Alicante)

**Abstract format:** Oral

The Bronze Age site Cabezo Redondo (Villena, Spain) represents one of the earliest known models with defined and structured urban planning based on houses, quarters, and streets. In addition, other areas related to specialised craft activities and food storage have been documented. In this study, we will analyse two different storage systems both inside domestic spaces -House XXXII- and in specialised areas -open space-.

House XXXII corresponds to a household unit that contained large ceramic vessels for storage, one of them even embedded in a bench as part of the room's furniture. The size and capacity of some of the vessels suggests that the stored grain was possibly intended for the subsistence of the members of a domestic unit. This activity shares space with other daily tasks such as working with raw materials, cooking, and eating. This diversity of activities in the same space has also been documented in other houses in the settlement, although not with the same level of preservation.

In an area located on the periphery of the residential zone, a small building used exclusively for storage was documented. Inside, abundant ceramic vessels and sacks of esparto grass were documented, as well as a large quantity of charred seeds. The location of this room in an open space associated with other specialised activities (metallurgy, ivory work, etc.) could indicate its collective and redistributive nature.

In short, we will try to define the two food storage systems by studying the documented vessels (typology, number, capacity, etc.). Our main objective is to analyse the social and economic implications derived from the possible coexistence of different storage systems in the same settlement.

## 12 UNDERSTANDING DIET, POPULATION, AND LABOR THROUGH STORAGE IN BRONZE AGE WESTERN ANATOLIA

**Abstract author(s):** Shin, Nami (Koç University; Eberhard Karls Universität Tübingen)

**Abstract format:** Oral

To date, the archaeobotanical record from western Anatolia is represented by a very small number of sites, with only a few from the Bronze Age. The analysis of plant remains from Late Bronze Age Kaymakçı, a citadel site, provides new insights into the agricultural patterns and practices of this understudied region. The citadel's size, location, and close proximity to several contemporary citadels demonstrates its importance and points to its potential participation in larger networks of interaction.

Kaymakçı houses dozens of circular features within its walls, with the majority of these potential storage structures located in the more heavily fortified inner citadel.

Preliminary calculation of the volumes of the circular features provides initial understanding of how much plant food could have been stored in the citadel. Archaeobotanical analyses at Kaymakçı thus far have revealed that barley (*Hordeum vulgare*), free-threshing wheat (*Triticum aestivum/durum*), bitter vetch (*Vicia ervilia*), chickpea (*Cicer arietinum*), and grape (*Vitis vinifera*) are the major crops at the site. The combined assessment of plant-food storage capacities and archaeobotanical analysis evidence helps to reconstruct ancient diets and nutrition as well as the potential sustainable population of Kaymakçı. Calculating crop storage capacity not only allows population size reconstruction, but can also indicate the amount of labor necessary to produce enough plant food to fill up the site's circular storage features. By understanding the relationship between storage capacity, population, and labor needs,

we are able to begin answering the question of whether Kaymakçı could have served as a central storage place for the other smaller citadels surrounding the lake basin.

### 13 SUBSISTENCE STRATEGIES AND SOCIAL COMPLEXITY IN THE BRONZE AGE LESSER POLAND

**Abstract author(s):** Korczynska, Marta (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) - Lityńska-Zając, Maria (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Kraków) - Moskal-del Hoyo, Magdalena (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków)

**Abstract format:** Oral

Obviously, food is essential to survive and as an economic capital it can be converted into a symbolic one, augmenting prestige, authority and status. The other way round, prestige and status can also be converted into economic capital thanks to advantages in access to resources and networking they provide. Subsistence and food production are crucial elements of societal activity, with the balance of costs and yields determining the range of possible economic strategies allowing a community to avoid crisis. Changing a strategy permit a community to adapt to changes in ecological or/and cultural (social or ideological) environment. In the Middle/Late Bronze Age southern Lesser Poland we can notice the implementation of new land-use strategies (e.g. increase in the popularity of broomcorn millet) and food storage techniques. These new elements appear parallel with the demographic growth and stabilisation of settlement structures, which become evident from the turn of the Late Bronze Age onwards. In our presentation we use the available archaeological and archaeobotanical record to investigate food supply strategies among Bronze Age communities of Lesser Poland. Furthermore, we ask whether the food supply strategies introduced during that period reflect increased levels of cooperation, and did they eventually triggered social inequality. In order to do so, we analyse these strategies and the scale of social differentiation in the Late Bronze Age against models proposed for Early Neolithic, traditionally viewed as egalitarian, and those used to describe more complex Eneolithic societies.

### 14 BRONZE AGE ANIMAL HUSBANDRY IN SZÁZHALOMBATTA-FÖLDVÁR AND THE BENTA VALLEY

**Abstract author(s):** Bergerbrant, Sophie (Department of Historical Studies, Gothenburg University) - Giblin, Julia (Department of Sociology and Anthropology, Quinnipiac University) - Vicze, Magdolna (Hungarian National Museum) - Gál, Erika - Kiss, Viktória - Kulcsár, Gabriella (Institute of Archaeology, Research Centre for the Humanities, ELRN) - Kovács, Gabriella (Hungarian National Museum, Hungary)

**Abstract format:** Oral

The relationship between communities who lived on tell settlements and those that lived in the surrounding landscape during the Neolithic and Bronze Age have long been debated within archaeology. Is it one of dominance or equivalence? This paper will explore the relationship between the tell inhabitants at Százhalombatta-Földvár and its neighbours in the Benta Valley by weaving together traces of animal husbandry practises during the Hungarian Middle Bronze Age. Drawing from evidence of land-use, the composition of faunal remains, patterns of secondary products use, and strontium isotope data from animal teeth, we will reconstruct how domesticated animals were managed across these varying types of settlements. We will then evaluate whether subsistence practices were similar both on and off the tell, or whether there is evidence for centralized control and exchange by the inhabitants of Százhalombatta-Földvár. The strontium isotope data will also be used to identify whether animals were traded from regions outside of the Benta Valley.

### A. MILK IT FOR ALL IT'S WORTH: DAIRY CONSUMPTION AND DIACHRONIC DIETARY PATTERNS OF NEOLITHIC TO BRONZE AGE COMMUNITIES (SOUTHERN PORTUGAL)

**Abstract author(s):** Leite, Adriana (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) - Costa, Cláudia (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, University of Algarve) - Maurer, Anne France (HERCULES Laboratory, University of Évora) - Zdráhal, Zbyněk (Central European Institute of Technology, Masaryk University, Brno) - Chocholová, Eva (Department of Experimental Biology, Faculty of Science, Masaryk University, Brno) - Gillis, Rosalind (Referats Naturwissenschaften an der Zentrale des Deutschen, Deutsches Archäologisches Institut, Berlin, Deutschland; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, University of Algarve) - Godinho, Ricardo Miguel (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour - ICArEHB, University of Algarve)

**Abstract format:** Poster

Milk is a rich nutritional food source and, nowadays, considered as a product of global major importance. Adoption of animal milk represents one of the major transitions in human diet that, consequently, brought profound changes to diet. The role of dairy production and consumption in prehistoric communities is a key topic that is still in the centre of a long-standing debate in Archaeology. To date, the role of dairy products within the diet of these communities remains unclear, with only a few published studies proving direct dairy consumption. In Iberia, this period was characterized by the introduction of farming in the beginning of the Neolithic, followed by a growing complexity of the communities during the Chalcolithic and Bronze Age. Within this geographical region, Southern Portugal emerges

as an excellent study case to further comprehend recent prehistoric communities and dairy subsistence practices. Zooarchaeological studies in this region suggest increased presence of dairy animals (and probably increased dairy consumption) in the Chalcolithic – Bronze Age, but direct evidence for such hypothetical increases in consumption is lacking. New insights based on multi-disciplinary studies are crucial to perform a complete and comprehensive assessment towards understanding consumption and long-term evolution of milk and dairy products. This project will apply a novel approach of Neolithic to Bronze Age populations from the Lower Guadiana Basin (Southern Portugal) to clarify this debate. Through an integrated investigation in bioarchaeology combined with cutting-edge methodologies (proteomic analysis of ancient human dental calculus and stable isotope analysis), the project will investigate the role of foodstuffs, more specifically milk and dairy products, within prehistoric societies and its impact on health and nutrition. This will enable an enhanced understanding of dairy consumption patterns, strategies and differential access to food (sex, age-at-death, geographical location, and chronology).

## **B. EVALUATING ANIMAL REMAINS FOR RECONSTRUCTIONS OF PALAEOECONOMY AND PALAEOENVIRONMENT IN BRONZE AGE SETTLEMENTS (WIETENBERG CULTURE) IN THE MUREŞ VALLEY (ROMANIA)**

**Abstract author(s):** Malaxa, Daniel (Alexandru Ioan Cuza University of Iasi; Iasi Institute of Archaeology) - Marc, Antoniu (Museum of Dacian and Roman Civilisation, Deva) - Stanc, Simina (Alexandru Ioan Cuza University of Iasi) - Benjenaru, Luminita (Alexandru Ioan Cuza University of Iasi; Romanian Academy – Iaşi Branch, “Olga Necrasov” Center of Anthropological Research)

**Abstract format:** Poster

The archaeological Wietenberg culture is a local one, attributed to the Middle Bronze Age, and dated to about 1900-1450/1400 BCE.

The present study, based on the faunal remains recovered from sites located on the Mureş Valley in Hunedoara County, Romania (i.e., Şoimuş-Telegi, Şoimuş-Lângă sat, and Uroi-Sighet), evaluates the animal resources in terms of palaeoeconomy (i.e., animal husbandry, hunting, fishing and mollusk gathering) and palaeoenvironment.

The studied material belongs to the phases II (1900-1700/1650 BCE) and III (1700/1650-1450/1400 BCE) of the Wietenberg culture (noted W II, and W III). Animal husbandry was the main activity that supplied animal protein, with domestic mammals being predominant in all the studied assemblages. The identified domestic species are *Bos taurus*, *Ovis aries*, *Capra hircus*, *Sus domesticus*, *Equus caballus*, *Equus asinus*, and *Canis familiaris*. The list of hunted wild mammals includes *Cervus elaphus*, *Sus scrofa*, *Capreolus capreolus*, *Bos primigenius*, *Canis lupus*, *Castor fiber*, *Lepus europaeus*, *Lynx lynx*, *Meles meles*, *Vulpes vulpes*, and *Ursus arctos*.

As additional food procurement activities, the studied Wietenberg communities also practiced wild bird hunting in the W II and W III of Şoimuş-Telegi, mollusk gathering at all of the analysed settlements, and fishing in the W II of Şoimuş-Telegi and W III of Uroi-Sighet.

The paleoenvironment was composed predominately of forested areas, with the rich hydrological network of the Mureş River, and also with forest edges and open spaces, especially near the Şoimuş-Telegi and Uroi-Sighet settlements.

---

## **378 MOVING BEYOND THE FACT OF MOBILITY? RE-EVALUATING THE STRENGTHS AND LIMITATIONS OF STRONTIUM ISOTOPE ANALYSES IN ARCHAEOLOGY**

**Theme:** 6. A Decade after the ‘Third Science Revolution in Archaeology’

**Organisers:** Snoeck, Christophe (Brussels Bioarchaeology Lab - BB-LAB, Vrije Universiteit Brussel - VUB) - Britton, Kate (Department of Archaeology, School of Geosciences, University of Aberdeen)

**Format:** Regular session

Strontium isotope ( $^{87}\text{Sr}/^{86}\text{Sr}$ ) analysis is now widely used in archaeology to investigate the movements of past humans and animals. In recent years, significant methodological advances have been made, e.g., in sampling approaches (e.g., laser ablation); the establishing of baseline spatial datasets (isoscapes); and in assessing diagenesis. However, the abundance of data available also highlights potential new limitations and caveats: a need is emerging not only for continued experimental and methodological innovation, but also for further cross-disciplinarity and critical consideration of the archaeology of human and animal movements. This session aims to bring together scholars focused on the methodological refinement of strontium isotope analyses with those interested in applying these approaches to study past movements, as well as archaeologists interested in the archaeology of movement more broadly or from a theoretical standpoint. Some questions this session will aim to answer through presentations and in depth discussions are:

1. When can we use Sr isotopes and what are the sampling requirements?
2. How important are baselines and how best can we use them in analysing our data?

3. What is 'local' and how do we determine this for past sites and populations?
4. How can we discriminate between mobility, landscape use and migration?
5. How can we best combine Sr data with other types of evidence?
6. Can we use Sr data to reconstruct individual life histories, and how?
7. What are the limitations of Sr isotope analyses?
8. How can we better understand physiological and dietary impacts on tissue Sr?
9. How should we approach 'origins' in isotope archaeology?
10. How can we manage the potential politicization of our data?

We encourage presentations that will foster the discussion on the use of Sr in archaeological studies, bring novel issues to light, and help answer some of the abovementioned questions.

## ABSTRACTS

### 1 STRONTIUM ISOTOPE ANALYSIS IN A GEOLOGICALLY VARIABLE LANDSCAPE: IRON AGE LANDSCAPE USE AND MOBILITY IN THE SOUTHERN UPPER RHINE VALLEY

**Abstract author(s):** Knipper, Corina (Curt Engelhorn Center Archaeometry gGmbH, Mannheim) - Bräuning, Andrea (Regierungspräsidium Stuttgart, Landesamt für Denkmalpflege) - Kilian, Imma (Independent Researcher) - Plouin, Suzanne (Université de Strasbourg, UMR 7044) - Roth-Zehner, Muriel (Archéologie Alsace, Sélestat; Université de Strasbourg, UMR 7044) - Stephan, Elisabeth (Regierungspräsidium Stuttgart, Landesamt für Denkmalpflege)

**Abstract format:** Oral

The southern Upper Rhine valley of Eastern France, Southwest Germany and Northern Switzerland is a fertile landscape, which was settled throughout pre and early history. A recent research project focused on the burials and settlements of the Hallstatt and early La Latène period along both sides of the Rhine River in Alsace and in the Breisgau area. Embedded in an interdisciplinary approach, isotope analysis of strontium, oxygen, carbon and nitrogen of human and animal remains aimed at exploring diet, mobility and landscape use of the Iron Age population. The geological properties of the area cause considerable variation in the isotopic composition of the biologically available strontium. Loess and riverine sediments prevail in the plain, the Vosges and the Black Forest consist of granites and gneisses, and the Kaiserstuhl hills have a core of Tertiary volcanic rocks. These circumstances are advantageous to explore ancient patterns of landscape use and the spatial organization of animal husbandry. However, at the same time, they challenge the identification of human and animal individuals that are non-local to specific sites and the research area in general. Using examples from Iron Age burial mounds and settlements from both sides of the Rhine River, the paper contributes to a differentiated evaluation of possibilities and limitations of Sr isotope analysis in a geologically variable landscape.

### 2 HOW TO CONSTRUCT A RELEVANT BASELINE OF BIOAVAILABLE $87\text{Sr}/86\text{Sr}$ ? TESTING DIFFERENT APPROACHES TO CONSTRAIN MOBILITY IN BRONZE AGE GREECE

**Abstract author(s):** Frank, Anja (National Museum of Denmark; University of Hamburg) - Ioanna, Moutafi (University of Cambridge; American School of Classical Studies at Athens) - Herrmann, Nicholas (Texas State University) - Anna, Lagia (University of Freiburg) - Frei, Robert (University of Copenhagen) - Kristiansen, Kristian (University of Gothenburg; GLOBE Institute) - Frei, Karin (National Museum of Denmark)

**Abstract format:** Oral

Sr isotopes have provided us with unprecedented insights into past human mobility, but their interpretation can drastically change based on the applied reference baseline of bioavailable  $87\text{Sr}/86\text{Sr}$ . At present, no consensus exists on the methods and materials applied to establish these baselines. A recent multi-proxy baseline of Greece has shown that despite a heterogeneous geological background the bioavailable Sr isotopic range is rather narrow. This complicates the identification of ancient mobility within Greece, as overlapping baseline ranges from different regions can mask the presence of mobility. Here, we present a large Sr isotope dataset of ancient human remains from Greece, consisting of 260 Bronze Age individuals from ten archaeological sites, and test the results within regional and site-specific  $87\text{Sr}/86\text{Sr}$  baselines. The regional baselines constrain bioavailable  $87\text{Sr}/86\text{Sr}$  based on 1) the municipality and 2) surface lithology of the sites, while the site-specific baselines were defined using human  $87\text{Sr}/86\text{Sr}$  values of 1) the entire population and 2) children of the sites. The investigated individuals are characterised by a narrow range in  $87\text{Sr}/86\text{Sr}$  (0.70822-0.7105), resulting in significant overlap and similar average human  $87\text{Sr}/86\text{Sr}$  values for all sites. While the municipal baselines identify only two non-local individuals at two sites, the surface lithological baselines flag six individuals from three different sites as non-local. At five sites, a total of seven non-locals were identified using the  $87\text{Sr}/86\text{Sr}$  values of their population, of which only three were grouped as non-local by the surface lithological baselines. Finally, the  $87\text{Sr}/86\text{Sr}$  values of the children identify potential mobility at every site with sufficient individuals,

suggesting a more transient population. The different number of non-locals identified by the different baseline approaches reveal the limitations of Sr isotopes in regards to identifying mobility in regions characterised by isotopically narrow ranges, emphasising the need for caution when interpreting Sr data.

### 3 **87SR/86SR AT COASTAL SITES – WHAT WE LEARN FROM MODERN ENVIRONMENTAL SAMPLES, GREENHOUSE STUDIES, AND PREHISTORIC INDIVIDUALS OF KNOWN RESIDENCE**

**Abstract author(s):** Göhring, Andrea (Ludwig Maximilian University, Faculty of Biology, Department of Biology I, Anthropology and Human Genomics) - Jungklaus, Bettina (Anthropologie-BüroJungklaus) - Hölzl, Stefan (RiesKraterMuseum Nördlingen)

**Abstract format:** Oral

At coastal sites strontium isotope ratios of terrestrial individuals are influenced by the local sea spray aerosols. Isotope analyses of modern environmental samples (plants, soil, water) at the Baltic coast illustrate the marine impact on the  $87\text{Sr}/86\text{Sr}$  ratios of the terrestrial environment (sea spray effect). Regional and seasonal differences in the strontium isotope ratios of the collected samples show differences in the local as well as the seasonal magnitude of the sea spray effect. This is also of importance for baseline maps of strontium isotope ratios.

Moreover, an artificial sea spray applied to greenhouse plants demonstrates that the  $87\text{Sr}/86\text{Sr}$  ratios of plants are clearly shifted towards the isotopic signature of spray water. This experiment allows to quantify the local sea spray effect on the isotopic signature of environmental samples.

The impact of the sea spray effect can additionally be visualized by the investigation of prehistoric individuals of known identity and known residence, namely some of the dukes and duchesses of Schleswig-Holstein-Gottorf (16th/17th century), buried in the Schleswig Cathedral in Northern Germany. By investigating the individuals' diet based on an isotopic mixing model, a marine impact on strontium isotope ratios caused by sea spray can be clearly distinguished from a shift due to a marine-based diet. Based on these results, sites with higher or lower sea spray impact can be identified.

### 4 **PROGRESS AND PITFALLS IN THE QUEST FOR FINDING THE TRUE NON-LOCALS. LESSONS FROM THE NORTH EUROPEAN PLAIN**

**Abstract author(s):** Pospieszny, Lukasz (Bristol Isotope Group, University of Bristol; Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Lewis, Jamie (Bristol Isotope Group, University of Bristol)

**Abstract format:** Oral

In our paper, we will discuss the potential and limitations of using the strontium isotope ( $87\text{Sr}/86\text{Sr}$ ) in human mobility studies in the context of examples from the lowlands of East-Central Europe. Here the ranges of bioavailable  $87\text{Sr}/86\text{Sr}$  are largely determined by the postglacial origins of most of the surface sediments. Theoretically, this also allows the detection of long-distance migrants from two main directions, in the north and south. The first is Scandinavia, built mostly of older rocks of the Fennoscandian Shield that are the source of highly radiogenic strontium. The second is a strip of highlands covered with loess, stretching along the southern mountain ranges, mainly the Carpathians. Recent studies show that although strontium isotope values are higher in the South than previously assumed, they are still clearly less radiogenic than in the northern lowlands. In practice, tracking travellers from beyond the plains, is extremely difficult. The growing amount of data revealed a high variability of strontium isotope ratios in the postglacial landscapes. As a consequence, it has become clear that non-local strontium isotope values observed in humans may reflect both long-distance travels and migrations, and more local mobility ruled by specific residence patterns.

We will address the challenges of using strontium isotopes to answer archaeological questions, basing on our own research and re-analysis of published data. These will include tackling the problem of establishing local baseline values, selection and processing of environmental samples, and statistical and spatial analysis of the obtained data. We will also give examples of using other isotope systems to increase the efficiency and accuracy of detecting non-local individuals and determining their places of origin. Finally, we will look at the possibilities of integrating strontium and other isotopic data with archaeological evidence, and the role of archaeological theory in creating narratives about human mobility and migrations.

### 5 **SR VS TRIPLE (S-SR-O) ISOSCAPES: WHAT IMPACT ON GEOGRAPHICAL AND HISTORICAL ASSIGNMENTS OF MEDIEVAL INDIVIDUALS?**

**Abstract author(s):** Jaouen, Klervia (GET/OMP/CNRS) - Méjean, Pauline (Géosciences Environnement Toulouse) - Marcigny, Cyril - Carpentier, Vincent (INRAP) - Colleter, Rozenn (Simon Fraser University; INRAP) - Bataille, Clément (University of Ottawa)

**Abstract format:** Oral

The use of Sr isotope ratios as a tracer of past human mobility has been greatly enhanced by the development of isoscapes. However, for medieval populations that sometimes traveled thousands of miles in the context of wars

and raids, it is not possible to accurately determine the geographic origin of single individuals due to overlapping Sr isotope ratios of various regions with similar geologies. We recently developed a sulfur isoscape which we combined with pre-existing oxygen and strontium ones. We were thus able to define very precise probabilistic geographical assignments. In this paper, we take the example of two medieval French archaeological sites, one associated with the French-Breton war (1491) and the other with Viking raids (Rennes and Alizay-Igoville, respectively) and produced maps of probable geographical origin for individuals suspected of being soldiers in the first case, and either locals or Vikings in the second one. Our aim is to present how our conclusions would change using the Sr isoscape alone, compared to the story we were able to tell using the triple S-Sr-O isoscape.

## 6 LEAD ISOTOPES OF PERSONAL OBJECTS AND STRONTIUM ISOTOPES OF HUMAN REMAINS – USEFUL COMBINATION IN MULTI-ISOTOPE PROVENANCING

**Abstract author(s):** Danielisova, Alzbeta - Bursák, Daniel (Institute of Archaeology of the CAS, Prague)

**Abstract format:** Oral

In prehistory, for which only a few contemporary sources exist, diachronic perspective to societal phenomena, like mobility, can be approached through limited evidence only. The common approach is aimed mostly at the identification of “foreigners” through stylistic analysis of their material culture. However, the La Tène culture (4th – 1st century BC), which is our period of interest, is known for its high level of interconnectedness that resulted in shared artistic and stylistic techniques across the large areas.

Nowadays, the standard way to detect movement is through strontium isotope analysis. The isotopic data on mobility can indicate changes of residence, although evidence of long-distance movement is problematic as same manifestations of mobility reflected in the data can represent different socio-economic, cultural or demographic models. Analysis of skeletal material from La Tène cemeteries across Europe shows that bio-archaeometric evidence alone makes no case for large-scale migrations labelled as the great “Celtic expansion”: a phenomenon between the 5th to 2nd century BC, that is supposed to affect large territories of Europe by repeated waves of migrants. Seemingly thus, the usual image of ‘Celtic migrations’ as conveyed in historical sources does not seem to be supported by isotopic analysis.

It is amid such fragmentary evidence that provenancing involving geochemical analysis of personal objects, in addition to traditional mobility isotopes (Sr, O, Pb) of human remains, may be useful in addressing questions of mobility by detecting various origins for what seem to be typologically identical everyday objects.

In this presentation, we would like will demonstrate our methodological approaches by examples and the individual case studies from this period in Central Europe.

## 7 RECONSTRUCTING LIFE HISTORIES USING SERIAL CARBON, OXYGEN, AND STRONTIUM ISOTOPE VARIATION IN HUMAN DENTAL ENAMEL

**Abstract author(s):** Griffith, Jacob - James, Hannah - Veselka, Barbara - Cheung, Christina - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel)

**Abstract format:** Oral

The application of strontium (Sr) isotopic analysis to bulk human dental enamel is an established technique used to assess mobility. However, conventional Sr bulk analysis provides only a single averaged datapoint, which hinder our ability to investigate mobility patterns at high resolution. In recent years, researchers have attempted to tackle this issue by constructing incremental sampling milling protocols, which enable the tracking of Sr isotopic variations over an individual's early life. Whilst these hand-milling methodologies significantly increase our interpretations of residency biographies, they are currently limited in the number of increments one can remove, in comparison to their application on faunal specimens and in-situ analysis. As such, there is a requirement to continue adapting these techniques, increasing the number of viable increments sampled, to improve the resolution of mobility life-histories observable in human teeth.

This study presents an expanded incremental technique for human tooth enamel, revealing variations in strontium isotopes ( $87\text{Sr}/86\text{Sr}$ ) and elemental concentrations, in combination with carbon ( $\delta^{13}\text{C}$ ), oxygen ( $\delta^{18}\text{O}$ ) isotopic values, to be observed at a high-resolution during the tooth enamel formation period. This technique uses thin sections of enamel to guide the milling of incremental samples. Preliminary results from a collection of recently excavated human teeth reveals a promising indication that enamel increments can be successfully sampled along a human tooth enamel growth axis. However, the growth pattern of human tooth enamel, and the volume of powdered enamel required for analysis, limits the number of increments that can be milled in a resolvable time series. As such, this presentation will discuss the potential as well as the limitations of this technique, providing a plan of how to we will increase the resolution of the methodology in future research.

## 8 COMBINING STRONTIUM AND SULPHUR ISOTOPIC ANALYSIS WITH ISOSCAPE MODELLING TO BETTER UNDERSTAND FAUNAL MOBILITY AND SPATIALITY

**Abstract author(s):** Barakat, Sarah (Department of Archaeology, University of Aberdeen) - Jimenez, Elodie-Laure (Department of Archaeology, University of Aberdeen; Department of Direction Earth and History of Life, Royal Belgian Institute of Natural Sciences, Brussels) - Le Corre, Mael (Department of Archaeology, University of Aberdeen) - Grimes, Vaughan (Department of Archaeology; Department of Earth Sciences, Memorial University, St. John's) - Discamps, Emmanuel (TRACES, French National Centre for Scientific Research, University of Toulouse Jean Jaurès) - Britton, Kate (Department of Archaeology, University of Aberdeen)

**Abstract format:** Oral

Strontium isotopic analysis ( $87\text{Sr}/86\text{Sr}$ ) has dominated human mobility studies since the mid-1980s. While strontium allows researchers to identify movement between different lithologies, it can prove ineffective in regions with homogenous or overly heterogenous lithology. Additionally, the multi-isotope systems can often prove more effective in determinations of origin (e.g.,  $87\text{Sr}/86\text{Sr}$  with  $\delta^{18}\text{O}$ ).

Sulphur isotopic analysis ( $\delta^{34}\text{S}$ ) is proving increasingly useful in archaeological case studies due to an ever-improving understanding of sulphur isotope variability within ecosystems, recent innovations in mass spectrometry, and its potential to infer aspects of both diet and movement histories in the past. Sulphur isotopic variation across landscapes is correlated with lithology and is strongly influenced by the coastline and the sea spray effect allowing researchers the potential to identify mobility through variations in geology but (perhaps more so) also with changes in distance from the coastline. When combined with strontium isotope analysis, sulphur isotopes have the potential to allow exploration of individual movement histories and to infer species-specific spatial behaviours.

This project aims to explore the potentials in multi-isotopic analysis and isoscapes to reconstruct Late Pleistocene herbivore spatial ecology. Focusing on combining strontium with sulphur isotopic analysis, this project is being approached in three phases: 1) the development and refining of a sulphur isoscape for the Dordogne, France; 2) application of sulphur isotope analyses to faunal remains (bone and dentine) from Middle and Upper Palaeolithic study sites in the Dordogne and 3) the integration of sulphur isotope data with laser ablation strontium isotope data from the same fauna. Furthermore, this project will also focus on best methods to establish a sulphur isoscape and how to meaningfully interpret sulphur results when combined with strontium.

## 9 IS THREE A CROWD? APPLICATIONS OF MULTI-ISOTOPE ANALYSIS OF TOOTH ENAMEL TO RECONSTRUCT SUB-ANNUAL MOBILITY PATTERNS IN PLEISTOCENE HOMININ PREY-SPECIES

**Abstract author(s):** Heddell-Stevens, Phoebe (Max Planck Institute for the Science of Human History; Friedrich-Schiller-Universität) - Roberts, Patrick (Max Planck Institute for the Science of Human History; University of Queensland)

**Abstract format:** Oral

It is increasingly acknowledged that comparison of hominin adaptive behaviours and capacities necessitates detailed, multi-scalar analysis of the local environments they inhabited. Stable isotope analysis has long played a key role in providing direct evidence of hominin prey-species ecology, most prominently via stable carbon and nitrogen analysis of bone collagen in relation to individual diet and habitat preference. More recently, stable oxygen isotope analysis and strontium isotope analysis ( $87\text{Sr}/86\text{Sr}$ ) of tooth enamel have been increasingly used to explore mobility, range and migration patterns of hominin prey. As researchers begin to move beyond 'local' and 'non-local' interpretations, a number of studies have demonstrated the potential of strontium isotope analysis to reconstruct individual mobility at higher resolution on a sub annual scale, providing key data on prey species' movement on the scale of human activity. Unfortunately, the use of stable oxygen isotope analysis and strontium analysis is often hindered by a lack of local isoscapes, the complexities of underlying geological or hydrological variation, and a lack of past references. When used in tandem, however, combination of isotopic proxies can refine interpretations. Here we present a multi-isotope case study of archaeofaunal material for two prey-species, horse and reindeer, from two Palaeolithic sites in Central Germany. We applied stable carbon and oxygen isotope analysis, as well as strontium isotope analysis, of serially sampled tooth enamel. We demonstrate the advantages of combining strontium isotope analysis with other isotopic proxies when reconstructing Pleistocene prey species ecology and discuss how the information generated can contribute to broader interpretations of Palaeolithic hominin subsistence adaptations.

## PREY MOBILITY DURING THE LAST GLACIAL MAXIMUM IN EASTERN CENTRAL EUROPE

**Abstract author(s):** Lengyel, György (University of Miskolc, Miskolc, Hungary; The Institute of Systematics and Evolution of Animals, Polish Academy of Sciences, Kraków) - Anczkiewicz, Robert (Institute of Geological Sciences, Polish Academy of Sciences, Kraków) - Kowalik, Nina (The Institute of Systematics and Evolution of Animals Polish Academy of Sciences, Kraków) - Szegedi, Kristóf (Hungarian National Museum, Budapest) - Wilczyński, Jarosław (The Institute of Systematics and Evolution of Animals Polish Academy of Sciences, Kraków)

**Abstract format:** Oral

Marine Isotope Stage (MIS) 2 was the coldest period of the Upper Pleistocene between 26.5 and 20.0 ka cal BP, the Last Glacial Maximum (LGM). This climatic condition greatly limited the geographic distribution of human settlements and herbivorous large mammal faunal elements in Eastern Central Europe (ECE). Recent archaeological studies implied MIS2 human population withdrew the northern area of ECE (south Poland) from the foraging area and occupied the southern areas, the Carpathian Basin, Moravia, and Lower Austria. Therefore, humans ceased visiting northern ECE. A reason to restrict northbound mobility could have been the absence of a sufficient amount of prey (reindeer and wild horse) in the north, thus we supposed that the foraging area of reindeers and wild horses was also restricted to the south of ECE. To test whether these species limited the area of their habitat and changed behaviour in the LGM, we performed  $87\text{Sr}/86\text{Sr}$  isotope analyses on reindeer ( $n = 14$ ) and horse ( $n = 8$ ) molars from the faunal assemblages of archaeological sites of Poland, Hungary, Slovakia, Czechia, and Austria. We applied laser ablation to sample the enamel. Having compared to the current geological and bioavailable  $87\text{Sr}/86\text{Sr}$  isotope ratios of ECE, we expected to find matches with the archaeological samples. The results, however, were not straightforwardly supporting the theory, and thus we aim to present the difficulties we faced during the accomplishment of this research.

## RECONSTRUCTING RANGIFER PALAEO-MIGRATIONS: USE OF COMPUTATIONAL MODELLING TO LINK INTRA-TOOTH STRONTIUM ISOTOPE PROFILES TO BIOAVAILABLE STRONTIUM ISOSCAPES

**Abstract author(s):** Le Corre, Mael (Department of Archaeology, University of Aberdeen) - Grimes, Vaughan (Department of Archaeology, Memorial University of Newfoundland, St. John's) - Wright, Joshua (Department of Archaeology, University of Aberdeen) - Côté, Steeve (Caribou Ungava, Département de Biologie, Université Laval, Québec) - Britton, Kate (Department of Archaeology, University of Aberdeen)

**Abstract format:** Oral

Hunting strategies and landscape use of past human groups were likely shaped by the seasonal mobility of prey taxa, such as reindeer. It is therefore crucial to reconstruct the movement palaeoecology of these species to understand past human behaviour. Recent developments in isotope techniques offer the tools to study past mobility. Strontium ( $87\text{Sr}/86\text{Sr}$ ) isotope can be used to assess the geographic origin of archaeological and palaeontological remains. By targeting tissues that develop incrementally such as tooth enamel,  $87\text{Sr}/86\text{Sr}$  analyses can be used to determine migratory behaviour and to assess potential seasonal ranges. However, to identify possible migratory pathways, new approaches linking intra-tooth  $87\text{Sr}/86\text{Sr}$  profiles to  $87\text{Sr}/86\text{Sr}$  isoscapes are needed. We developed an isotope-based model, the PleistoHERD model, to assess the distribution and the seasonal movements of Rangifer from their intra-tooth  $87\text{Sr}/86\text{Sr}$  isotope data using modern caribou data from the Western Arctic herd (Alaska, USA) and the Rivière-aux-Feuilles herd (Québec, Canada). High resolution  $87\text{Sr}/86\text{Sr}$  sampling profiles of the 2nd and 3rd molars of the individuals were obtained by laser ablation multi-collector inductively coupled plasma mass spectrometry (LA-MC-ICP-MS). Variations in the  $87\text{Sr}/86\text{Sr}$  isotope profiles of most of the individuals reflected their migratory behaviour during their first 18th month of life. We performed a Bayesian spatial assignment of the endmembers of the profiles to identify potential seasonal ranges and we generated a distribution map time-series for each caribou, using their intra-tooth profile. Caribou movements were then modelled throughout the distribution map time-series accounting for topography and hydrography. As a case study, we applied the model to archaeological reindeer data from France, contrasting seasonal movements of resident and migratory individuals. The interdisciplinary approach we developed, combining isotope analysis, isotope mapping and animal movement modelling, will allow us to better understand the movement ecology of past ungulates and, consequently, how past humans used their landscape.

## RECONCEPTUALIZING THE "EXOTIC SPECIES" THROUGH STABLE ISOTOPE ANALYSIS; THE INSIGHT FROM THE WARI EMPIRE'S ZOOARCHAEOLOGY

**Abstract author(s):** Tomczyk, Weronika (Stanford University) - Ebert, Claire (University of Pittsburgh)

**Abstract format:** Oral

Regardless of the epoch or context, Andean zooarchaeological assemblages are dominated by the remains of large endemic mammals such as camelids and deer, which were valued for their multipurpose use. Species that are less frequently encountered often fall under the umbrella term of "exotic" animals. This category includes non-edible (e.g., Andean condors) and non-local animals (e.g., Amazonian parrots and monkeys). Using a multi-isotopic approach that combines carbon, nitrogen, oxygen, and strontium stable isotopes, we reconstruct the osteobiographies of "exotic" species recovered from Castillo de Huarmey, the only known Pacific coast center of the Wari Empire.

Combined with standard zooarchaeological data, our results shed light on multispecies mobility and document the extent of Wari control over various Andean landscapes. Simultaneously, we aim to reconceptualize the term "exotic species" itself. The modern distinctions between local and non-local fauna might not be identical in the past and likely varied among social groups. People acculturate the meaning of animal species, and we argue that modern scientists construct their own. Such constructs should be acknowledged when differentiating between rare zooarchaeological finds and rare species, as these distinctions influence not only archaeological interpretations but also contemporary conservation policies.

### 13 ACCEPTING THE CHALLENGE: STRONTIUM ISOTOPES ON THE BALEARIC ISLANDS (SPAIN)

**Abstract author(s):** Valenzuela-Suau, Lua (ArqueoUIB Research Group. University of the Balearic Islands; SERP Research Group. University of Barcelona) - Valenzuela-Lamas, Sílvia (CSIC-Institució Milà i Fontanals) - Pena, Leopoldo (GRC Geociències Marines. University of Barcelona) - Díaz-Zorita Bonilla, Marta (Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters. University of Tübingen) - Ramis Bernad, Damià (Independent researcher)

**Abstract format:** Oral

Strontium isotopes ( $^{87}\text{Sr}/^{86}\text{Sr}$ ) have been broadly used in Archaeology to discriminate local and non-local humans and animals. In an archipelago context like the Balearic Islands, the application of these analyses enables us to assess how people and animals moved between islands as well as the arrival of new populations. However, there are a number of challenges to consider, most especially when none or limited studies have previously been done on that geographical area surrounded by water.

This paper will present our most recent work on animal and human mobility in the Balearic Islands during the Recent Prehistory, presenting both the main challenges and the strontium isotopic results. To achieve this goal, animal and human samples from more than 10 Bronze Age-Iron Age archaeological sites located on Mallorca, Menorca and Formentera are included, which provides the first and most comprehensive overview for both animal and human mobility for this archipelago so far.

### 14 FACING CHALLENGES: MOBILITY STUDY THROUGH $^{87}\text{SR}/^{86}\text{SR}$ AND $\delta^{18}\text{O}$ IN HUMAN DENTAL REMAINS BETWEEN THE CHALCOLITHIC AND IRON AGE IN BEJA(PORTUGAL)

**Abstract author(s):** Melo, Linda (CIAS) - Bonilla, Marta (Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters, Tübingen Universität) - Soares, António (Centro de Ciências e Tecnologias Nucleares - C2TN, Instituto Superior Técnico, Universidade de Lisboa) - Silva, Ana (Laboratory of Prehistory. Research Center in Anthropology and Health - CIAS, Department of Life Sciences, University of Coimbra)

**Abstract format:** Oral

During the last years strontium isotope analysis has been widely used in studies of archaeology as a way to investigate the movements of the past populations, animals and objects. However, the application of this method has some issues and limitations that we are facing and that we would like to discuss.

The study that we carried out is based on an interdisciplinary methodological approach combining anthropological, archaeological and biochemical data from the Chalcolithic to the Early Iron Age in Portugal. We applied strontium and oxygen ( $^{87}\text{Sr}/^{86}\text{Sr}$ ,  $\delta^{18}\text{O}$ ) isotope analyses. The sample is composed by dental enamel of 65 human and 3 faunal remains. Our purpose is trying to understand whether changes could be observed through time and if we can detect any exogenous individuals in the communities.

Furthermore, we also consider interesting to address other questions such as: evidences of disease and signs of physiological stress, signs of inequalities between community members or social distinctions (age, sex, gender or status) during 2500 years in Beja region (southern Portugal).

### 15 STRENGTHS AND WEAKNESSES OF STRONTIUM ISOTOPES ANALYSIS ON THE EXAMPLE OF RESEARCH ON MEDIEVAL COMMUNITIES OF MAZOVIA AND PODLACHIA, POLAND

**Abstract author(s):** Blaszczyk, Dariusz (University of Warsaw)

**Abstract format:** Oral

In the last decades strontium isotope analyses have become a wide applied method of tracing movement of humans and animals in archaeology beside traditional archaeological methods used so far like object attribution. As every method, stable isotope analysis has its strengths and weaknesses.

In my speech, I would like to present and discuss the experience gained from the use of strontium stable isotope analysis to investigate provenancing and mobility of medieval communities living in Poland (Mazovia and Podlachia regions), burying their dead in graves with stone structures. Cemeteries with stone settings have been the subject of interest for researchers and amateurs for over a hundred years. One of the main questions concerns the origin of people buried in this type of cemeteries. Were they the local Slavic individuals or newcomers from other areas, e.g. from Scandinavia or Rus', who brought a specific funeral rite with them. So far, attempts have been made to answer

this question using traditional archaeological methods, such as ethnic attribution of graves constructions and objects, which provided contradictory results. As part of the research project Populus Masoviae Medii Aevi, it was decided to use the method of stable strontium isotopes analysis to answer this question. Samples were taken from human and animal bone remains unearthed during earlier excavations and stored in museum resources. The conducted research has provided the largest database of isotope signatures collected so far for the Polish lands. They allowed us to answer some research questions, but also created some methodological and interpretation problems.

## 16 **CONSIDERING CULTURAL DIETARY PRACTICES FOR INTERPRETING STRONTIUM ISOTOPES: THE PROBLEM OF NIXTAMALIZATION IN ANCIENT AND MODERN MEXICO**

**Abstract author(s):** Buckley, Gina - Renson, Virginie (University of Missouri Research Reactor)

**Abstract format:** Oral

For the past 20 years, strontium isotope analysis of human skeletal remains has drastically changed and improved the way archaeologists understand and interpret mobility and migration in Mexico, home to the great ancient cultures of the Maya, Aztecs, and Teotihuacan, among many others. However, widespread cultural practices that influence diet have not been meaningfully considered until recently. Nixtamalization is a process that was frequently used in the production of tortillas in ancient times and continues to be used in domestic and commercial settings today. This method adds an alkali solution of lime or wood ash to maize (corn) to enhance the nutritional value of this staple dish in Mexico. However, limestone is not easily assessable in key parts of this country, particularly in the Trans-Mexican Volcanic Belt that runs across the central-southern region and encompasses modern-day Mexico City, the Aztec Empire, and the ancient city of Teotihuacan. Additionally, wood ash can also affect bioavailable Sr-isotope signatures when used from a non-local source. Two case studies from Teotihuacan and the Soconusco region of Mexico are presented that demonstrate the potential effect of the nixtamalization process on strontium isotope measurements of human tissue. New and recent data from the site of Teotihuacan highlights the importance of a multi-isotope approach for this region, and further research into the feasibility of using lead isotopes in Mexican migration studies is also discussed.

## 17 **BEYOND MOBILITY: STRONTIUM, BARIUM AND CALCIUM RATIOS IN TOOTH ENAMEL AS SUPPLEMENTARY PALAEODIETARY INDICATORS**

**Abstract author(s):** Blanz, Magdalena (Archaeology Institute, University of the Highlands and Islands; Vienna Institute for Archaeological Science - VIAS, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna) - Stewart, Samuel (Environmental Research Institute, University of the Highlands and Islands; Université Paris-Saclay) - Mainland, Ingrid (Archaeology Institute, University of the Highlands and Islands) - Ascough, Philippa (NEIF Radiocarbon Laboratory, Scottish Universities Environmental Research Centre) - Raab, Andrea - Feldmann, Jörg (Institute for Chemistry, TESLA - Analytical Chemistry, University of Graz) - Taggart, Mark (Environmental Research Institute, University of the Highlands and Islands)

**Abstract format:** Oral

In strontium isotope ratio studies, strontium concentrations are routinely determined prior to the determination of the strontium stable isotope ratios themselves. During this initial step, concentrations of additional trace elements can easily be determined at little to no additional cost. Concentrations of barium in particular may be helpful to provide additional dietary information, provided the sampled enamel is sufficiently well-preserved.

This presentation provides a brief overview on the history and use of Ba, Sr and Ca concentrations and ratios as palaeodietary indicators, starting with initially inflated expectations, and followed by disillusionment in the face of diagenetic problems. Nevertheless, concentration ratios of Sr to Ba in tooth enamel may provide additional information on past diets: Using both present-day reference material and archaeological tooth enamel samples from the Orkney islands, this presentation gives a case-study on the use of Ba/Sr ratios to identify seaweed-consumption by sheep, with a comparison to the use of  $\delta^{13}\text{C}$  as a palaeodietary indicator. It was found that tooth enamel from present-day seaweed-eating sheep had significantly lower  $\lg(\text{Ba}/\text{Sr})$  values (-2.4 to -1.6; enamel  $\delta^{13}\text{C}$  of -6.7‰ to -3.3‰; n = 10) compared to terrestrial-feeding sheep (0.6 to -0.5; enamel  $\delta^{13}\text{C}$  of -15.5‰ to -14.7‰; n = 5). Comparisons between  $\delta^{13}\text{C}$  values and  $\lg(\text{Ba}/\text{Sr})$  values from several Neolithic archaeological sites showed similar trends, indicating that  $\lg(\text{Ba}/\text{Sr})$  may be useful as a dietary indicator, supplementary to  $\delta^{13}\text{C}$ .

Literature data indicates that Ba/Sr ratios may also be useful to study dietary uptake in other contexts, including trophic level, consumption of fish and seaweed-fertilised crops and differentiating between grazing and browsing. In conclusion, the inclusion of Ba and Ca concentration measurements in preparatory analyses of strontium concentrations for later strontium isotope ratio measurements is strongly advocated.

## MOBILITY AND PALAEODIETARY RECONSTRUCTIONS FROM COMBINED $\Delta 88\text{Sr}$ AND $87\text{Sr}/86\text{Sr}$ ANALYSIS WITH FOCUS ON SLOVENIAN CEMETERIES

**Abstract author(s):** Gerritzen, Carina (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel; Maritime Cultures Research Unit, Vrije Universiteit Brussel) - Goderis, Steven (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel) - Leskovar, Tamara - Črešnar, Matija (Centre for interdisciplinary Research in Archaeology, Department of Archaeology, Faculty of Arts, University of Ljubljana) - James, Hannah (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel; Maritime Cultures Research Unit, Vrije Universiteit Brussel) - Potočnik, Doris - Ogrinc, Nives (Department of Environmental Sciences, Jožef Stefan Institute) - Snoeck, Christophe (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel; Maritime Cultures Research Unit, Vrije Universiteit Brussel)

**Abstract format:** Oral

Radiogenic strontium isotope ratios ( $87\text{Sr}/86\text{Sr}$ ) have been widely applied to the archeological study of landscape use. Vast amounts of isoscapes created in the past decade are used to studying past populations' mobility. Slovenia, as a crossroads country of Europe, is an excellent target for investigation. Thousands of cremated and inhumated remains buried in Slovenia's ancient cemeteries give access to a millenium's worth of European history, stretching from the late bronze age to the region's conquest by the Roman empire in the late iron age (LIA).

While  $87\text{Sr}/86\text{Sr}$  ratios are relatively static on the strontium path from bedrock, through soil, to plants,  $\delta 88\text{Sr}$  can vary depending on multiple processes, including chemical and biological processes. The  $\delta 88\text{Sr}$  analysis in this study focuses on a better understanding of bioavailable strontium. These analyses will help investigate the limitations of  $87\text{Sr}/86\text{Sr}$  datasets, and help to curtail them by using  $\delta 88\text{Sr}$  to better understand chemical and biological processes that affect exogenic strontium. The interpretation of  $87\text{Sr}/86\text{Sr}$  ratios is based on local stratigraphy and is limited regarding the influence of weathering, sea spray, and soil contamination. This study shows the significance of adding  $\delta 88\text{Sr}$  to available baselines and isotopic maps for a better understanding of the exogenous strontium cycle. This tackles the question of sampling strategies regarding isotope mapping for future studies. This allows a first-principles trace from bedrock to teeth, refining isotope mapping to help discriminate between landscape use, mobility and migration.

$\delta 88\text{Sr}$  can be combined with Sr and Ca concentration measurements to provide further insights into physiological and dietary impacts on tissue Sr. Previous studies have shown that  $\delta 88\text{Sr}$  are linked to changes in trophic levels. Therefore, differences in  $\delta 88\text{Sr}$  may allow for better understanding of paleodietary choices of consumed goods.

## A. DETERMINING THE BEST TECHNIQUE FOR $87\text{Sr}/86\text{Sr}$ ISOTOPE ANALYSIS OF BIOARCHAEOLOGICAL REMAINS

**Abstract author(s):** Rogers, Bryony (Department of Archaeology, Durham University; National Environmental Isotope Facility, British Geological Survey) - Nowell, Geoff (Department of Earth Sciences, Durham University) - Pashley, Vanessa - Horstwood, Matthew (National Environmental Isotope Facility, British Geological Survey)

**Abstract format:** Poster

Strontium (Sr) isotope analysis on archaeological human and animal remains, which can be used to infer mobility, origin, and lifeways (e.g. herding strategies), has become widespread since its initial uses nearly four decades ago. In that time, several sampling and analytical techniques have been developed to determine the  $87\text{Sr}/86\text{Sr}$  isotope ratios recorded in an individual's bones and teeth. Initial Sr isotope studies utilised bulk sampling techniques, but in-situ techniques, such as laser ablation (LA) and micro-drilling, have been developed that are less destructive and provide greater sampling spatial resolution. Each of the main analytical methods: Thermal Ionisation Mass Spectrometry (TIMS), solution-Multicollector-Inductively Coupled Plasma-Mass Spectrometry (solution-MC-ICP-MS) and Laser ablation -Multicollector-Inductively Coupled Plasma -Mass Spectrometry (LA-MC-ICP-MS), have their advantages and disadvantages regarding speed and ease of analysis; precision and accuracy of results; ionisation and transport efficiency; and (perceived) destructiveness. Different research questions require different levels of compositional and/or spatial resolution, dependent on a whole range of factors including sample size; uniqueness of a particular sample; the Sr concentration of the sample; and the degree of variation in the bioavailable  $87\text{Sr}/86\text{Sr}$  values in the relevant biosphere. Furthermore, the availability of facilities can impact what questions can be addressed. There is also ongoing debate in the literature regarding the reliability of some results, specifically about potential interferences during LA-MC-ICP-MS analysis of enamel and the accuracy of  $87\text{Sr}/86\text{Sr}$  measurements in low Sr concentration teeth. Here we present suggested guidelines for establishing which technique(s) might be most appropriate for the Sr isotope analysis of bioarchaeological remains for a variety of scenarios.

## B. WERE THEY ACTUALLY LOCAL? STRONTIUM ISOTOPE ANALYSIS OF INDIVIDUALS FROM THE ROMAN CEMETERY OF LUCUS FERONIAE (ROME, ITALY)

**Abstract author(s):** Farese, Martina (Dipartimento di Biologia Ambientale, Sapienza Università di Roma) - Bernardini, Sara (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA, Aix-en-Provence; Dipartimento di Biologia Ambientale, Sapienza Università di Roma) - Zeppilli, Carlotta - Micarelli, Ileana - Manzi, Giorgio - Tafuri, Mary Anne (Dipartimento di Biologia Ambientale, Sapienza Università di Roma)

**Abstract format:** Poster

The town of Lucus Feroniae (I-III century CE) was inhabited, according to the archaeological record, by local people, war veterans and liberti (freed slaves). The study of this community makes it therefore possible to shed light on individuals whose lives are often not reported by classical literary sources. In particular, to understand from which other parts of the Roman Empire the liberti and veterans came from. In order to answer this question, this research couples skeletal evidence and isotopic analyses. The former has highlighted six individuals from the necropolis of Lucus Feroniae who display skeletal features associated with a harsh quality of life, in particular fractures on the skull and postcranial bones, which in turn might be associated with the consequences of being a slave or a labourer. Strontium isotopic analysis has then been performed on such individuals to explore their geographic origin. Analysing the dental enamel of the first molar, it was possible to gain information about their first decade of life, approximately. A baseline was created to look at the local range of strontium isotopic ratio using bones and teeth of archaeological animals, focusing on animals that lived, supposedly, in confined areas, rather than free-ranging ones. Soil samples have also been collected for this purpose. However, in several instances local strontium ratios are similar among very distant areas. It is therefore difficult to tell whether an individual spent her/his first years of life in Lucus Feroniae or came from further-away areas. Despite the diversified geological background of Italy that might appear promising for strontium isotope analyses, our results hold up as a cautionary tale about the use of these data.

---

## 379 THE ARCHAEOLOGY OF LARGE-SCALE CONFLICTS: THE EMERGENCE OF THE MONGOL EMPIRE AND THE INVASION OF CENTRAL-EUROPE IN ITS EURASIAN CONTEXT

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Laszlovszky, József (Central European University PU, Vienna) - Nagy, Balázs (Eötvös Loránd University, Budapest)

**Format:** Discussion session

The Mongol Invasion of Central Europe in 1241-42, is a crucial episode in European history, and it occupies a position of pan-Eurasian historical significance. It was a decades-long historical process which saw the Mongol Empire occupy Central Asia, defeat the Russian principalities, and drive into the region of Central-Europe. Therefore, it is crucial to offer a reliable reconstruction of the invasion itself, and also the short and long-term impact of it. Thus, we are proposing here is a session aimed at improving our understanding of the invasion and of its broader historical context through a fuller analysis of the most recent archaeological findings and the surviving textual records. The significance of the invasion is evinced by the wide range of written sources, European and non-European. Meanwhile, new finds have been discovered that highlight the growing role of archaeological research on this topic. Publications in the last few years related to ongoing archaeological excavations (from Mongolia to Central Europe, from Russia to the Near East), along with publications on earlier finds, continue to offer new clues which help shed light on the invasion and related events. Therefore, the aim of this session is to bring together specialists from Central-Asia, Russia, Central-Europe and from other regions influenced by the emergence of the Mongol Empire in the thirteenth century, and to share the new archaeological data and interpretations related to this continental-scale process. Various archaeological fields (conflict, environmental, settlement, fortified sites, etc.) are in the focus with their relevant theoretical and methodological issues. They will be discussed in the context of large-scale historical processes: mass migration, climatic change, environmental impact of the invasion, and socio-economic transformation processes.

## ABSTRACTS

### 1 NEW TRENDS IN THE RESEARCH OF THE ARCHAEOLOGY OF THE MONGOL INVASION IN CENTRAL-EUROPE

**Abstract author(s):** Laszlovszky, József (Central European University, Budapest - KEE, CEU PU Vienna)

**Abstract format:** Oral

The Mongol invasion of Central-Europe in 1241-42 and the later attacks in the region (for example in 1285) were described in contemporary written sources. Chronicles and charter evidence can be used to study the sequence of events during these military attacks, or the impact of the invasion. Archaeological research has been carried out to find the traces of these invasions for decades, but significant development can be seen in these investigations during the last twenty years. Development-led archaeology, community archaeology and targeted research projects have

produced significant new results and new archaeological interpretations have emerged in the context of the history of the invasion. This paper will offer an overview on the new methods and approaches of a major research project carried out by several institutions and by a large groups of scholars in Hungary. At the same time, the paper will place the Mongol Invasion of Central-Europe in its Eurasian context. Special attention will be given to conflict archaeology, destroyed settlements and archaeological indicators of the invasion. Archaeological data will be confronted with written documents and conclusions will be drawn on the basis of an interdisciplinary investigation.

## 2 URBANISATION IN THE PERIOD OF LARGE-SCALE CONFLICTS: IMPACT OF THE MONGOL INVASIONS ON THE URBAN NETWORK OF THIRTEENTH-CENTURY HUNGARY

**Abstract author(s):** Nagy, Balázs (Eötvös Loránd University, Budapest)

**Abstract format:** Oral

The Mongol invasions of Hungary in 1241-42 caused the most significant disaster in the medieval history of the country. Although the main events of the military campaigns were reconstructed by the scholarship of the last decades, some details of the events have not been clarified yet. Traditionally it was assumed that the Mongols were not prepared for town sieges, but several examples from their campaigns in the territory of the Kievan Rus' prove their capacity and skills to perform successful sieges.

In Hungary, the siege and devastation of the towns marked the process of the invasion of the country, but there were significant differences in the level and gravity of the devastation. The variances can be explained partly by the geographical conditions of the given settlement, partly by the structure of fortifications and also its strategic significance. The paper will attempt to synthesize the evidence on the effects of the Mongol invasions on the urban network of thirteenth-century Hungary.

## 3 LONGTERM IMPACTS OF THE MONGOL INVASION: TRACES OF STRUCTURAL CHANGES IN THE KINGDOM OF HUNGARY (1241-1332)

**Abstract author(s):** F. Romhányi, Beatrix (Károli Gáspár University of the Reformed Church)

**Abstract format:** Oral

In recent years research focused not only on the direct effects caused by the Mongol Invasion in the early 1240s, but also on the longterm impacts. Several articles published by researchers working on the project "The Mongol Invasion of Hungary in its Eurasian Context" (OTKA K128880) have dealt already with the complex analysis of different features (churches, place names, archaeological findings) connected with the devastation. The present paper's aim is to analyse those indicators, mainly monasteries and churches/parishes, that can be used for to reconstruct the longterm structural changes of the Hungarian Kingdom, including population distribution and areas of economic activity. The latter can be discussed based on a unique source, the papal tithe register, compiled between 1332 and 1337, that not only preserved data about the parish network of the kingdom, but also allows some insight into the economic strength of the rural and urban communities through the tax paid. The emerging late medieval castle network and its correlation with the above will also be addressed.

---

## 380 CAN YOU FUTURE PROOF SKILL DEVELOPMENT WORK IN ARCHAEOLOGY?

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Jones, Cara (Chartered Institute for Archaeologists) - Karl, Raimund (University of Vienna)

**Format:** Round table

Great strides have been made with formalising skill development initiatives for archaeologists, and we are now beginning to see the positive impact of taking a more strategic approach to how we develop and upskill members of our profession. This work is often completed in collaboration with non-heritage focused organisations who are integral to supporting (and at times delivering) these initiatives. These collaborations can also help give focus to future priorities with skill development work and help release much needed funding to support the development work to take place.

One challenge that has been identified is the need to make sure that work is future proof or at least, impervious to outside shocks or changes in priorities or wider strategic directions.

This is roundtable discussion proposes to discuss

1. How can we future proof skills development work?
2. What mechanisms can put in place to mitigate against outside influences which can impact on your skill development work?
3. How can we anticipate what skills archaeologists will need in the future to ensure we are ready to meet outside challenges or demands for our expertise?

This session is delivered by the EAA community for teaching and training in archaeology.

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Sampaio, Hugo Aluai (University of Minho) - Bettencourt, Ana (University of Minho) - Diaz-Guardamino, Marta (Durham University)

**Format:** Regular session

Oceans, rivers, lakes are not motionless entities. Earth Sciences have been studying how coastline fluctuations of seashores and transformation of river flows constantly create new opportunities for human groups, but also how these changes can trigger a wide range of interactions and transformations.

In this session we will focus on approaches that explore a wide array of archaeological evidence of sustained interactions between European human groups and water, from the Neolithic to the Bronze Age. This includes traces of interactions where the cultural and the natural are entangled in the same places: from resources exploitation to sea/river/water use; activities linked to traditions, social organizations, beliefs or ideological meanings; the use as a border, or simply marking a special place; possessing magic properties or simply blessing life; the unfolding of regional or supra-regional contacts or the negotiation of power relations. All these interactions contribute to the creation of waterscapes ("seascapes", "riverscapes", "lakescapes"), which were part of daily perception, interaction and cognition of human life beyond (dry) land.

## ABSTRACTS

### 1 EVIDENCE FOR CULTURAL AND ECONOMIC IMPORTANCE OF WATERSCAPES: NEOLITHIC PATTERNS FROM THE NORTHERN GERMAN LOWLANDS

**Abstract author(s):** Brozio, Jan Piet (Institute of Pre- and Protohistoric Archaeology CAU Kiel) - Feeser, Ingo (Institute of Pre- and Protohistoric Archaeology CAU Kiel)

**Abstract format:** Oral

Water always attracted people. For the Neolithic in the central European lowlands this is attested by the close association of archaeological sites with coasts, lakes and rivers. The reasons for this seem to have been manifold. The exploitation of water-bound resources can be observed in many archaeological records. Likewise, the distribution of sites along within waterscapes speaks to their importance as transport and mobility routes. In this talk, we will present evidence from several Neolithic wetland sites from the Northern German lowlands where combined archaeological and palaeoenvironmental investigations allowed insight to local cultural activities in context of changing hydrological situations.

In contrast to the use and creation of cultural (dry) landscapes, a more dynamic interplay between natural developments of the water landscapes and human activity is obvious. Hereby rising sea levels and groundwater levels have altered both coastal and inland wetlands. Changes that may, on one hand, pose a threat or an end to local human activities. On the other hand it seems that the presence of extensive wetlands or waterscapes could have increased the resilience of regional communities during phases of over-regional economic downturn. Based on a comparative consideration, we aim at identifying the cultural, ritual and/or economic significance of waterscapes for the sites.

### 2 AT THE THRESHOLD TO THE MOUNTAINS: SOCIAL MEANING AND RELEVANCE OF MONUMENTS ALONG COASTAL WATERWAYS IN NEOLITHIC SOUTHEAST NORWAY

**Abstract author(s):** Schülke, Almut (Museum of Cultural History University of Oslo)

**Abstract format:** Oral

The 4th and 3rd millennium BC, the time of the so-called Neolithic period (3900-2350 BC) in Southeast Norway, is a period with a shifting archaeological record, which suggests social complexity and change, oscillating between local hunter-gatherer societies and impulses from full-Neolithic communities in Southern Scandinavia. While farming most likely only was practiced sporadically, hunting and fishing are the main strategies for food provision. The rich biotopes of the coastal areas of the region, with the southern Norwegian skerry coast and the Oslofjord protruding to the North from the Skagerrak, played an important role in people's social, cosmological and economic life. However, these waterways also served as communication routes and not least as gateway to and from the inland and mountain areas. This talk will point out the social importance of these waterways, not least as (strategic) communication routes, in times where encounters with people from the Neolithic world became more increased. The strategic placement of a number of ritual monuments directly at the estuary of the Drammen fjord, at Rødtangen, will be used as a starting point to discuss possible social encounters in these shifting times, which were closely tied to the fjord as coastal waterway and to potential questions of access, overview and negotiation of spatial power.

### 3 **AT THE EDGE OF THE WATERSCAPE: INTERACTION AT THE BOUNDARIES BETWEEN DRAINAGE BASINS IN EARLY PREHISTORIC BRITAIN AND IRELAND**

**Abstract author(s):** Goldberg, Martin (National Museums Scotland)

**Abstract format:** Oral

River catchments and drainage basins are being increasingly used as units of ecological and socio-political organisation. There is also ample evidence in the archaeological record that knowledge of drainage basins was important in the past. This paper will explore a wide array of archaeological evidence that the watershed boundaries of drainage basins were places of sustained interaction and interest for human groups in the past. While the topographic boundaries of drainage basins are often hills and mountains, the vagaries of geo-morphology and the interaction between topography and hydrography mean that sometimes the watershed boundary is in relatively low-lying areas where the topographic separation of river systems is unclear— paradoxically these can be the most important areas for human interaction. These are often referred to in English as passes or gaps and can be both the boundary between separate drainage basins and the most convenient access point at the lowest altitude for communication and movement between regions and human communities. Bogs, marshes, springs and lakes, features of the waterscapes at the extremities of drainage basins were often the sites of artefact/votive deposition in the Bronze Age in Britain and Ireland, but this landscape enculturation can also be explored through other forms of evidence – middens, burnt mounds, burial monuments, rock art, and traced back to Neolithic stone tool production. This perception of space and place, developed over huge amounts of time, challenges both our understanding of ancient geography and the systems of knowledge that contributed to these concepts in the past.

### 4 **OCEAN AHOY! SPATIAL ANALYSIS, SETTLEMENT PATTERNS AND THE LATE PREHISTORY OF THE ATLANTIC COAST OF LISBON PENINSULA**

**Abstract author(s):** Texugo, André - Rendeiro, Luís (UNIARQ - Centro Arqueologia da Universidade de Lisboa; CEG - Centro de Estudos Geográficos da Universidade de Lisboa) - Sousa, Ana (UNIARQ - Centro Arqueologia da Universidade de Lisboa) - Ramos-Pereira, Ana (CEG - Centro de Estudos Geográficos da Universidade de Lisboa)

**Abstract format:** Oral

The 3rd millennium BC Atlantic coast of Lisbon Peninsula has an apparent cultural uniformity when it comes to settlement strategies, types of occupation, architecture, material culture and even regarding the connection to landmarks.

This coast consists of a rocky platform, with well-marked cliffs and regularized features, with successive natural bays at the mouth of small rivers that flow directly into the Atlantic Ocean. Connected to those, settlement clusters were formed, during the 3rd millennium, materializing a connection between the settlement pattern and its relative proximity of the Atlantic coast, especially in the walled enclosures, namely P. Lexim (Mafra), Zambujal (Torres Vedras) or Paço (Peniche).

Nevertheless, it is in the micro-regional analysis where the difference between clusters or even sites is emphasized.

Recent studies carried out for the prehistoric walled enclosure of Paço (visibility patterns, least cost paths and network analysis), show a clear relationship with the ocean in association with an integrated network of settlements.

Therefore, we sought to replicate and test the same approach for Chalcolithic sites in the Atlantic Coast of Lisbon Estremadura in order to analyze patterns of mobility, interconnected settlement strategies and the existence of specific type of settlements directly associated with the seashore.

### 5 **EBB & FLOW: EXPLORING RIVERS IN LATER PREHISTORIC BRITAIN**

**Abstract author(s):** Nimura, Courtney - Schulting, Rick (University of Oxford) - Sturt, Fraser (University of Southampton) - Snoeck, Christophe (Vrije Universiteit Brussel) - Green, Chris - Cooper, Anwen (University of Oxford)

**Abstract format:** Oral

'When the first rains came, the world changed forever' (Lawrence C. Smith, Rivers of Power). In our 2021 EAA paper, we presented interim results from our two-year (2020–2022) Leverhulme-funded project 'Ebb & Flow: Exploring rivers in later prehistoric Britain'. This project focuses on the later prehistory of Europe (c. 2500–400 BC), which was a period of unprecedented pan-European mobility. In this period, water travel increased, and people and objects, and the ideas that they held, circulated widely. Here we encounter a changing world, one in which the centrality of rivers comes to the fore.

Our project revolves around three themes that lead us into many areas of later prehistoric life: rivers have entangled physical and cultural histories, rivers are magnets for people and things, and rivers move people and things. In this paper, we will present a range of project results that address these themes, from strontium isotopes along the River Avon to the distribution of material culture around the Ribble, Great Ouse, and Nene to the new mapping of palaeochannels across our case study catchments. Drawing on a wide range of evidence, we will consider the importance of rivers to prehistoric communities in Britain and the power of these rivers in shaping them.

## 6 THE EXPLOITATION OF MARINE RESOURCES BY COMMUNITIES FROM THE NORTHEAST OF THE IBERIAN PENINSULA IN THE EARLY BRONZE AGE

**Abstract author(s):** Gluitz, Alicia - Estebanz-Sánchez, Ferran (Autonomous University of Barcelona) - Martínez, Laura (University of Barcelona) - Molist, Miquel (Autonomous University of Barcelona)

**Abstract format:** Oral

The prehistoric period of the Barcelona plain has been broadly studied by researchers due to the richness of the archaeological register. Nonetheless, one of the most understudied periods is the Early Bronze Age, whose archaeological register is very poor. Our research focuses on the subsistence economy from the population of Plaça de la Gardunya, which is an Early Bronze Age site located near the Mediterranean Sea. Our aim is to observe if these communities were exploiting marine resources and characterize their dietary habits by doing a buccal microwear analysis from molars and premolars from adult and child individuals.

Once obtained, their microwear patterns have been compared to reference patterns linked to known dietary habits and subsistence economy strategies, as well as to other archaeological communities from the Iberian Peninsula. We have taken into account the archaeological evidence as well to interpret our results, which show differences in dietary habits between age groups and between sexes. Males had a more carnivorous diet than females, and subadults ate harder foods than adults. Plaça de la Gardunya's microwear patterns have similar values to carnivorous diets from anthropological populations. We propose that the community of Plaça de la Gardunya had a soft mixed diet with a high intake of fish, meat and secondary products such as milk or cottage cheese. Agricultural produce was also consumed, mostly by subadult individuals, which was stored in grill plan structures and silos and processed with more refined milling techniques.

## 7 LAKE, WETLAND AND ISLAND: REVEALING THE HUMAN OCCUPATION OVER THE PALAEO LAKE IN BRUSZCZEWO IN CENTRAL GREATER POLAND THROUGH GEOARCHAEOLOGICAL RESEARCH.

**Abstract author(s):** Niebieszczanski, Jakub - Bahyrycz, Cezary - Żurkiewicz, Danuta - Szambelan, Witold (Adam Mickiewicz University in Poznań)

**Abstract format:** Oral

The post-glacial lakelands of Northern Central Europe attracted human habitation since the Late Palaeolithic and Mesolithic times. Some of the previously occupied lakes are currently gone or overgrown due to climate change or human intervention. The remaining peatlands are the last indication of former lakes and wetlands that were the vital point of human interest. The wetland archives offer a great potential in reconstructing the human-environment relations. Often such areas remain unrecognized due to the low accessibility in archaeological surface survey. Geoarchaeological approach combined with archaeological excavations might however bring to light high resolution data to understand the human-environment relations. The following presentation concerns the changing waterscape from the Early Bronze Age up to the Medieval period in Central Greater Poland, on the basis of Bruszczevo site case study. This site comprise of several habitation phases, i.e. the Unetice culture's fortified settlement, Lusitanian Urnfields culture's ritual center and cemetery, Roman Times settlement and Early Medieval stronghold. In the light of geoarchaeological research (drillings and multi-proxy reconstruction supported by 14C dating) it appears that each of settlement episodes was characterized by different sedimentary environment (transformation from deep lake conditions to wetland and river flood plain). Geoarchaeological investigations combined with geophysics and a specific archaeological surface survey approach revealed also the presence of esker in the center of the former lake, which might have been an island.

The presentation aims to share the results of a geoarchaeological works that aimed to reconstruct the connection between different phases of human occupation to the past waterscapes and use of particular morphological features of the area in habitation purposes. The study was funded by the National Science Center, Poland, grant no. 2019/33/N/HS3/00193.

## 8 FLOWING EVERYDAY ROUTINES: INTERRELATING BRONZE AGE HUMAN GROUPS AND WATER COURSES BETWEEN THE RIVERS AVE AND CÁVADO (NORTHWEST OF PORTUGAL)

**Abstract author(s):** Sampaio, Hugo Aluai (Landscape, Heritage and Territory Laboratory - Lab2pt; University of Minho - UM; Centre of Research, Development and Innovation in Tourism - CiTur; Polytechnic Institute of Cávado an Ave - IPCA)

**Abstract format:** Oral

capable of adapting to environmental and cultural changes, human groups dealt with territory according to different needs. The increasingly importance of certain daily routines during the Bronze Age, such as agriculture, metallurgy, or dealing with life and death impelled these groups to move and to occupy the space considering certain prerequisites. In this sense, proximity to (and control of) water gained a crucial and strategic importance: essential life

support resource, imperative to raise crops and shepherding, source of food and alluvial mining ores, water can also detain magical properties, that can metaphorically represent the conduction of the dead to afterlife or contain the ability of honoring supernatural entities or ancestors.

More than the symbolic control over the territory, many daily practices during the Bronze Age seem to flow with water courses: settlement occupation, funerary practices, or offerings of prestige goods are some physical traces that can be mentioned. A vast range of places and (inter)actions connected by a same source, the water, which confers unity to a wider reality, but denounces an apparent socio-cultural complexity during the regional Bronze Age in the Portuguese Northwestern.

## 9 BRONZE AGE CERAMICS FROM ALTO DAS MALHADAS AS AN INDICATOR OF INFLUENCES THAT GO BEYOND REGIONAL AND NATIONAL BOUNDARIES

**Abstract author(s):** Botica, Natalia (Lab2PT; Unidade de Arqueologia da Universidade do Minho) - Luís, Luís (Fundação Côa Parque) - Larrazabal, Javier - Rocha, Bruna (Lab2PT; Fundação para a Ciência e Tecnologia) - Sousa, Rui (Lab2PT; Instituto de Ciências Sociais da Universidade do Minho) - Magalhães, Fernanda (Instituto de Ciências Sociais da Universidade do Minho)

**Abstract format:** Oral

The Côa Valley, inscribed by UNESCO as a World Heritage Site in 1998, has an extensive area with more than 1000 open-air rocks, decorated with rock art from prehistoric to contemporary times. As part of the RARAA project, funded by the Fundação para a Ciência e Tecnologia (FCT) "COA / OVD / 0097 / 2019- Rock Art Open Access Repository", we conducted archaeological excavations, at Alto das Malhadas (Vila Nova de Foz Côa), in order to increase knowledge about the societies that created the artistic representations in the rock art of the Côa valley.

Thus, from these archaeological works resulted a large set of ceramic material, very diverse both in techniques and in shapes and decorations, which led us to seek parallels to understand the influences suffered by the communities. In this paper we will present the methodology for recording, visualizing and cross-referencing data, used to study the materials and the interactions between the regional communities, focused on the communications through the rivers and the Vilariça Valley.

## 10 NEW APPROACHES TO UNDERSTANDING LATE BRONZE AGE SWORD DEPOSITION IN THE TRANSDANUBIAN RIVER SECTION OF THE DANUBE

**Abstract author(s):** Tarbay, János Gábor (Hungarian National Museum, Department of Archaeology) - Soós, Bence (Hungarian National Museum, Department of Archaeology; ELTE University, Institute of Archaeological Sciences)

**Abstract format:** Oral

In the Late Bronze Age (LBA), the Danube River was a borderland where different cultural spheres interacted. It was also an important zone of the LBA ritual landscape where the tradition of sword deposition was practiced by different cultural groups. In the case of Transdanubia, this was done between the periods of 1450 BC and 1000 BC, when numerous rapiers and metal-and-flange hilted swords were surrendered to the Danube River.

We intend to study the pattern of ritual itself more precisely through the deposited objects and attempt to model the origin, cultural connections, and motivation of their owners. 1. The first approach draws conclusions from the metal-work production and use-wear analysis carried out on all LBA swords originating from the Hungarian river section of the Danube. It provides a means to seek out an answer: what kinds of weapons were surrendered to the rivers (used, symbolic, intact or manipulated)? 2. LBA swords are also representative objects, customized for and probably used in combat by a single person whose choice of weapon may reflect a specific area. Swords can be arranged into well-defined style groups that may refer to regional metalworking traditions, which makes them a suitable candidate for the analysis of interaction, movement of individual combatants or larger groups. We are trying to determine who participated in the deposition of swords into the Danube River. In order to propose an answer to this question, we set out to delimit possible zones of provenience of the swords recovered from the Danube River. With the help of these modelled zones, we endeavor to assess how diverse the communities participating in the deposition of swords could have been. In addition, our aim is to look for trends in which regions were involved in the deposition practices throughout different stages of the LBA.

## 11 LATE BRONZE AGE METAL DEPOSITIONS IN THE NORTHWEST IBERIAN PENINSULA IN RIVERSCAPES CONTEXTS: AN ONTOLOGICAL APPROACH

**Abstract author(s):** Bettencourt, Ana (University of Minho; Lab2PT - Landscapes, Heritage and Territory Laboratory)

**Abstract format:** Oral

Deposition of metal artefacts during the Bronze Age is a wider phenomenon attested in Northwestern Iberia, as well as all over Europe. The study of such a phenomenon in that area has been conducted using several approaches, including typological, metallurgical, contextual, and interpretative.

The main goal of this oral communication is to interpret the Late Bronze Age metal depositions in water contexts - mainly those containing axes and swords - considering that they resulted from intentional and structured depositions in the context of the Bronze Age network landscape.

Based on recent research this approach will consider several variables, such as the physical organisation or orientation of the objects' deposition, and the micro and medium contexts of their deposition.

Interpretations related to the importance of certain liminal places, rivers or river banks positioned over natural pathways can be explained by a communal interpretation about the cosmos and in the framework of an increasing amount of autochthonous and non-autochthonous journeys and exchanges that connected peoples during the Late Bronze Age, and fostered encounters between different communities.

## 12 RE-EVALUATING RIVERINE AND MARITIME TRADE IN MIDDLE-LATE BRONZE AGE BRITAIN AND BEYOND

**Abstract author(s):** Roberts, Benjamin (Durham University) - Casaly, Allison (New York University)

**Abstract format:** Oral

This paper will re-evaluate three aspects of riverine and maritime trade in Middle-Late Bronze Age Britain. It will be argued that there has been a consistent underestimation of Bronze Age trade and exchange along the waterways of Britain and beyond. Firstly, the paper will explore the potential scales of the trade involved with a particular focus on the specialist knowledge and logistics of moving people, animals and goods along rivers and across seas. Secondly, it seeks to identify the coastal and riverine locations where trade may have occurred based on the geographical, environmental and archaeological evidence. It will concentrate specifically on evidence from personal ornamentation, hoards and shipwrecks from across Britain. Finally, it will discuss how trade along the waterways of Britain and beyond potentially re-shaped the communities across the landscape. It will conclude on how research integrating settlement, mobility and activities along the rivers and coasts of Britain can be further developed.

## 13 LIVING IN A FLOODPLAIN: LATE BRONZE AGE SERBIAN BANAT COMMUNITIES' ADAPTATION STRATEGIES

**Abstract author(s):** Estanqueiro, Marta (University College Dublin; CEAACP-Universidade de Coimbra)

**Abstract format:** Oral

As the Middle Bronze Age tells of the south-eastern Carpathian Basin were being abandoned, a vast and dense network of flat settlements, some encircled by ramparts and ditches, began to emerge, reaching substantial sizes.

The known number of these Late Bronze Age settlements continues to grow every day, usually detected through satellite images, due to the concentration of subcircular pale soil marks that stand out in the ground. These are believed to represent dwellings, where high concentration of pottery sherds can be found. However, there is still little information about them, as only a few have been researched.

This presentation will focus on the floodplains of the Serbian Banat, a flood-prone area where LBA communities built their settlements, addressing how these spread across the territory, by adapting to the landscape taking advantage of their locations.

It will also discuss how building their settlements in the vicinity of secondary watercourses, they channelled water by digging shallow or more deeper ditches, probably for agricultural purposes, or even as a defence mechanism.

Finally, it will aim at how this area became depopulated around 1200 BC.

## A. OCEAN AND ETERNITY. A BRONZE AGE MEGALITHIC TOMB IN CAPE TRAFALGAR (CÁDIZ, SPAIN)

**Abstract author(s):** Cantillo Duarte, Juan Jesus - Vijande Vila, Eduardo - Becerra Martín, Serafín (Universidad de Cádiz) - Moreno Marquez, Adolfo (Universidad de Almería) - Corona Borrego, José María - Gómez Sánchez, Leticia - Fernández Sánchez, Diego - Carmona Gil, María - Pavón González, Laura - Ramos Muñoz, José (Universidad de Cádiz)

**Abstract format:** Poster

Situated in the far south of the Iberian Peninsula, Cape Trafalgar is a sui generis natural location. In this impressive landscape, land and sea converge to form a landscape loaded with symbolism, a horizon where every evening the sun dies in the ocean. The islet and tombolo of Trafalgar have been witnesses of History. Occupied since prehistory, in the Roman period they hosted the Temple of Juno, and in front of its coast, in 1805, one of the most famous naval battles of the 19th century was fought.

In 2021, a team of archaeologists and prehistorians from Universidad de Cádiz excavated there an intact megalithic burial. The archaeological sequence has provided very valuable evidence concerning the funerary ritual and aspects related to the social status of those interred there.

This contribution presents some preliminary information about the typology of the burial, radiocarbon dates and anthropological studies, as well as addressing the motivations that led this Bronze Age community to choose this impressive location as a space for eternity.

## **B. YOU SHOULD EAT IT WHILE IT'S FRESH – EXPLOITATION OF RIVERS IN NORTHEASTERN EUROPEAN LOWLANDS**

**Abstract author(s):** Nessel, Bianka (Institute for Pre- and Protohistory, Mainz University)

**Abstract format:** Poster

During recent excavations in the Late Bronze and Early Iron Age settlement of Lanke in north-eastern Germany, hundreds of freshwater shells were uncovered in a large settlement pit. The pit was divided in two layers and the shells were tightly packed in the north-western corner of the upper layer. Usually finds like this are assumed to represent simple food waste, no further questions asked. However, the consumption of freshwater mussels does not only have a much more complex meaning, but it is also evidence of constant or at least seasonal interactions between communities and the waterscape. In this particular cultural setting, the exploitation of in this case "riverscapes", is part of a wide phenomenon, which shows not only different preferences of types of shellfish in certain regions, but also imply differences in social and hierarchical status of shellfish consumers within a community. This poster presentation focuses on the first results of the interdisciplinary investigation of the shellfish assemblage from Lanke and the implications of the deposition. We will show that freshwater shellfish can tell much more about contacts and mobility patterns on a microscale level than usually assumed.

---

## **382 TECHNOLOGY, RISK, AND CHANGE**

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Taylor, Timothy (Comenius University in Bratislava; Journal of World Prehistory) - Zubrow, Ezra (Applied Social Systems Laboratory & Anthropology University at Buffalo; McDonald Institute University of Cambridge; SUNY Distinguished Service)

**Format:** Regular session

As technology has been persistently seen as a principal means of adaptation/risk reduction in human societies, past and present, and is intimately implicated in our biological and cultural evolution, archaeology, with its artefact (i.e. material-technology) centred approach appears well placed to contribute to a deepened understanding of some themes which have only fairly recently become a focus of attention. Aaron Wildavsky and co-researchers, in discussing modern economic and social settings, note that "Only by comparisons across types of danger can we learn whether individuals have a general tendency to be risk averse or risk-taking, or whether their perceptions of danger depend upon the meaning they give to objects of potential concern" (Dake & Wildavsky 1991). Risk is not normally associated with diachronic archaeological research and yet it is increasingly clear that prehistoric populations have faced similar challenges to those faced today in relation to disease, demography, environmental degradation, resource management, short- and long-term climate change and, last but not least, changes in and to their own technology, whether chosen, imposed, or entailed/consequent in some way ('drifted into'). Although these challenges can be judged similar from an etic, or external and comparative perspective, emically, in terms of culturally-valorised categories, it is far harder to say how threats ('real' or 'imaginary') were conceptualized, and thus it is difficult to identify the baseline assumptions (to use modern terminology) that underpinned past decision-making. Contributions to this session will critique a range of risk-analysis tools in relation to a variety of archaeological cases.

## **ABSTRACTS**

### **1 RISKS BEYOND THE DITCH**

**Abstract author(s):** Diachenko, Aleksandr (Institute of Archaeology, National Academy of Sciences of Ukraine) - Sobkowiak-Tabaka, Iwona (Faculty of Archaeology, Adam Mickiewicz University in Poznan) - Gerasimenko, Natalia (Taras Shevchenko National University of Kyiv) - Kufel-Diakowska, Bernadeta (Institute of Archaeology, Wrocław University) - Kurawska, Aldona (Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Moskal del-Hoyo, Magdalena (W. Szafer Institute of Botany, Polish Academy of Sciences) - Ridush, Bogdan (Yuriy Fedkovych Chernivtsi National University) - Boltaniuk, Petro (Kamianets-Podilskyi State Historical Museum) - Levinzon, Yevhenii (National University of Kyiv-Mohyla Academy)

**Abstract format:** Oral

How do people react to potential risks of different kinds? A widely known expression, "the satiated does not understand the hungry" often seems to apply well to the archaeological interpretations considering a "risk" for some large-scale threat. Meanwhile, dealing with what we usually call daily needs, people in fact manage small-scale risks attempting to stay alive, healthy etc. The focus on conflict and ideology on the one hand, or adaptation and devel-

opment of technologies on another hand underline different paradigms in the discipline. Both the large-scale and small-scale risks were the cases in prehistory. However, do we always properly distinguish between them analyzing archaeological records?

Based on the recent evidence from the excavations in Kamenets-Podolskiy (Ukraine) and a number of similar features from other sites, our paper contributes to the discussion on the function of ditches in the Neo-Eneolithic of Central and Southeastern Europe. Geomorphological, archaeobotanical, archaeozoological, malacological and use-wear analyses make possible the discussion on understanding ditches as defense systems and features related to the religious practices against the long-term development of technologies, adaptation to local environment, and resource management.

## 2 RECONSIDERING NEOLITHIC DITCHED ENCLOSURES AND RISK MITIGATION ON THE GREAT HUNGARIAN PLAIN

**Abstract author(s):** Salisbury, Roderick (Austrian Archaeological Institute, Austrian Academy of Sciences) - Bácsme-gi, Gábor (Munkácsy Mihály Museum, Békéscsaba)

**Abstract format:** Oral

Ditches around settlements are known from many periods and regions. In Southeast Europe, ditches take several forms, including the formalized Kreisgrabenanlagen of the Lengyel culture, rounded rectilinear forms of the preceding LBK, and oblong ditches enclosing tells and tell-like mounds. Neolithic ditched enclosures have been interpreted as defensive or intended for animal management or flood control. Similar ideas are applied in other areas; Iroquoian palisades have been interpreted as being defensive, snow screens, and for keeping wolves or bears away from stored foods. More recent interpretations have focused on the role of ditches in social memory and community-building. These assorted interpretations share one common attribute: we have little or no material evidence to support them. There are several key aspects of these ditches that remain unresolved, but which could contribute to improving our explanations. These include whether all ditches were in contemporaneous use, and when they were built in relation to tells and surrounding flat settlements. Did the construction sequences of ditches and palisades form a tradition, a regular plan, or did they vary from settlement to settlement? One of our research questions is to what degree these people were willing to commit resources to construction projects to address threats that might well have been partly or wholly imaginary. In this presentation, we discuss ditched enclosures in eastern Hungary as a threat mitigation strategy. Existing data from excavated and surveyed Neolithic sites are compared with evidence from later periods, including Arpad age, and new evidence from the South Békés Landscapes project in the northern Maros fan in Békés County, Hungary.

## 3 HONOR THE PAST AND WELCOME THE FUTURE: ONLY A PERSON WHO RISKS IS FREE

**Abstract author(s):** Zubrow, Ezra (University at Buffalo; University of Cambridge)

**Abstract format:** Oral

This paper discusses how risk changes over long, sequential time periods. In particular, the temporal periods are the Mesolithic, the Mesolithic-Neolithic transition, and the Neolithic in Europe dating from approximately 15000 BC to 5000 BC. It compares risk at an abstract level as innovations in subsistence technology change. The presentation argues that Mesolithic societies exploited a system of updating risk i.e. Bayesian probabilities in their hunting, gathering, fishing, and settlement location strategies. Sustenance and location decisions are made and remade frequently based upon prior probability hypotheses. In the early Neolithic, this system was reformed to frequentist probabilities. The number of decisions is reduced. The testing of the hypothetical outcomes takes place far less frequently and are neither assigned prior probabilities nor updated. The empirical part of the paper has ethnographic and archaeological examples as well as simulations. Factors such as yield variability and the risk of crop failures indeed affect technology adoption decisions in subsistence agriculture. However, Neolithic farmers are reluctant to adopt new innovations because of the enormous downside risk. The broader implications are examined as one considers how and how frequently a person needs to take risks in order to be free as technology changes.

## 4 THE PARAMETERS OF RISK IN UNFOLDING TECHNO-CULTURES

**Abstract author(s):** Taylor, Timothy (Comenius University in Bratislava; Journal of World Prehistory)

**Abstract format:** Oral

This paper attempts to understand how risk may have been perceived in ancient, especially prehistoric, societies where the main source of evidence is archaeology and related disciplines. 'Risk' implies 'benefit'; one of the most (apparently) straightforward ways benefit has previously been calculated is looking at success over time in a cultural community. Success is therefore gauged in terms of demographic/territorial persistence/expansion, over some significant period. In the New Archaeology of the 1960s this was tied to the concept of 'adaptation', considered as a kind of objectively-apprehensible equation between an outside 'environment' and the ability of the human unit (to insulate its members from this environment while extracting benefits. This strand of thinking has developed in a broadly

processualist direction, via such bodies of theory as Optimal Foraging Theory and the canonical model of increasing social complexity embedded in Cultural Evolution theory. A contrasting stream of thought begins, perhaps surprisingly, with V. Gordon Childe, who suggested that 'the environments to which societies are adapted' are, not least, 'worlds of ideas'; similar considerations were foregrounded in the work of Niklas Luhmann. Risks assume very different complexions according to the timeframes we have in mind (short, medium, long-term), so different temporal metaphysics should be associated with different assessments of risk in the face of the 'same' stimuli or challenge. I argue that they will also vary according to the scales of societies and their norms. I want to show how the etic-emic tension has to remain at the core of innovative theorising, and to propose for consideration in archaeology a body of theory developed in economics and social anthropology in the 1980s – Douglas and Wildavsky's 'Grid and Group' – as one way to typologise the emic, making sense of different kinds of quantifiable response to 'risk'.

## 5 MONUMENTS, MAGIC, AND RISK

**Abstract author(s):** Taylor, Timothy (Comenius University in Bratislava; Journal of World Prehistory)

**Abstract format:** Oral

We are all familiar with the sequential events of the Mayan 'collapse' in which temple-building reaches a crescendo just prior to the dramatic dissolution of central authority. One way of understanding this is to consider that the need for collective action in the face of challenges leads to an injection of effort into the appeasement of distal, and physically non-existent, forces – the gods – rather than more practical, proximal, physical action to counter issues such as environmental degradation or buffering climate change. Such an assessment of behaviour is, of course, externalist, and can be slotted neatly into the canonical model of cultural theory (for example). But it begs the question of what kinds of risks and benefits were actually perceived at the time. In this paper I will take a series of case studies, ranging from the double and triple interments of neonates, young adults, and persons with non-standard physiques in the Middle Upper Palaeolithic through to the first truly monumental settings of Middle Neolithic Europe, the Kreisgrabenanlagen, and on to Woodhenge and Stonehenge, to show how, in different periods and settings, similar kinds of 'theatres of violence' were created in order to stimulate social cohesion and guard against perceived chaos. In each case I try to show how anachronistically back-projecting our own calculations of risks obscures the logic of the social investment being made.

## 6 THE END OF PAX ROMANA: HOW ROMAN EMPERORS FACED RISKS AND CHANGES ON COINS

**Abstract author(s):** Glomb, Tomas (Masaryk University)

**Abstract format:** Oral

A range of data testifies that Pax Romana, i.e., the period of the relative stability and prosperity of the Roman Empire (ca 27 BCE-180 CE), was followed by turbulent times eventually resulting in the so-called crisis of the 3rd century CE. Decreasing intensity of Roman mining attested by ice cores from Greenland, the decline in the fineness and weight of silver in the Roman Denarii, or the steep fall of Latin military diplomas are representative proxies for the downward turn in prosperity after the reign of Marcus Aurelius. The question explored in this paper is then how Roman emperors dealt with political instability and socio-environmental issues such as the Antonine Plague on coins. Roman coins represented a suitable medium for conveying ideological messages by Roman Emperors. Quantitative temporal analysis of attributes of specific deities or personified virtues depicted on Roman coins has the potential to reveal iconographic trends that, when compared with the proxies for the development of Roman prosperity, can help us understand what Roman emperors communicated to the population in times of change and crisis. Preliminary results show that iconographic trends on coins connected to values such as peace or security changed after the Pax Romana and reveal the Roman coinage was a relevant tool for mitigating or enhancing specific sentiments in the population.

## 7 BRONZE AGE HOARDS AS A FORM OF RISK MANAGEMENT

**Abstract author(s):** Lane, Dominik (University of Vienna)

**Abstract format:** Oral

Hoards of the Bronze Age have been an important aspect of archaeological research, a focus for interpretations for a long time. Scholars often debate whether profane or cultic backgrounds and intentions should be assumed for their deposition. This contribution aims to show that hoarding can also clearly be seen as a form of risk management/coping with risks, whether those are seen on a rather everyday level or in form of a selective actual threat. Potential risks may have been seen as predominantly 'economic' but also significantly 'metaphysical'. This paper examines what it is to consider bronze was as a valuable material, and a significant form of property. The raw form which could be remelted and used for many purposes but, in object form, the specific artefacts also carried a symbolic and individual value and meaning, involving real or imagined object biographies (or, quite possibly, both). This paper is based around an analysis of the early Urnfield hoard of Attersee I, excavated on Buchberg am Attersee in Austria as part of the BeLaVi-project in 2019. This hoard, and several related hoards, was very likely deposited as a means of protecting

goods in relation to a proximal experience of a 'historical' threat. This paper presents the contents of the hoard and then problematizes and contextualizes the ideas involved.

## 8 NO COUNTRY FOR OLD MEN

**Abstract author(s): Baca, Martin (Department of Archaeology, Comenius University in Bratislava)**

**Abstract format: Oral**

The Central-European Bronze Age stretches for almost one and a half millennia. Certainly, there are vast differences between the Early and Late Bronze Age on almost every level. Still, at least in the area of Central Danube, one can see the slim but strong line of connection between the slow burning society of cattle herders not so much different from their Eneolithic ancestors and vibrant multi-stratified society of Early Urnfield people. The increasingly accelerating dynamics of change are of crucial importance, especially considering the almost exponential growth of population starting at 15/14th century BC. If we are not wrong, and the ever increasing number of multi-proxy data supports that we are not, then this period of time should be of great interest for all prehistoric archaeologists interested in change. In my paper I would like to focus on risk scenarios that had to occur and were most certainly connected to rising number of young people challenging the present as well as the past and putting great pressure on economy and society as a whole.

## 9 COMPLEXITY, MAGIC AND RISK: HOW THE DEFINING CHARACTERISTIC OF INCREASING CIVILIZATIONAL COMPLEXITY BLINDS US TO ITS INHERENT RISKS

**Abstract author(s): Scannell, Patrick (Independent researcher)**

**Abstract format: Oral**

Human systems today are characterized by increasingly accelerating complexity. A complex system is recognized primarily by attributes of highly differentiated and specialised structure and functions within a system, and also by a lack of ability to know, understand, and predict the outcomes of that system, and thus unable to anticipate endemic risks, some that could lead toward system collapse. This paper reflects a non-archaeological view, looking back at the ancient past from the perspective of an expertise in decision making policy in 5G and AI. I will argue that the contemporary phenomenon of our shrinking ability to understand the techno-ecological niche we have created for ourselves (what I term 'the return of magic') is one of the inherent risks of the complexity but may not be a wholly novel phenomenon. I suggest ways to leverage the work of prehistoric archaeologists to inform the modern construct, including some areas for future research for those scholars, along with an understanding of the fundamental limits of using the past to forecast complex future systems.

## 10 RISK AND REWARD IN ATHENIAN MARITIME TRADE (4TH CENTURY BCE)

**Abstract author(s): Cohen, Edward (-)**

**Abstract format: Oral**

Throughout classical antiquity the sea was the principal channel of wholesale trade. Maritime commerce accordingly was of enormous importance to fourth-century Athens: hundreds of ship cargoes were required annually to satisfy Attika's enormous need for food and other items. Numerous other cargoes were trans-shipped through Athens, attracted by its dominant position as an entrepôt for the eastern Mediterranean, and by the Athenian commercial maritime courts (*dikai emporikai*) whose expedited procedures and rigorous enforcement processes were available only to ventures involving a written contract providing for trade through the port of Athens. Virtually all these ships and cargoes generated revenue for Athens and required financing, often with high leverage that could vastly magnify entrepreneurs' potential gains, offering lenders the potential for startlingly high yields.

But the possible windfall returns came with substantial risk of calamitous losses. Lenders were generally entitled to recover principal and yield only if the security underlying a loan — vessel or cargo — survived the journey. In a world in which "insurance" had not yet been invented, and the possibility of ship-wrecks were terrifying, the high yields on maritime lending and venturing are best understood as compensation for the enormous hazards inherent in sea finance, and as a reflection of the high skills required to deal with the extraordinary complexity of overseas trade and finance in the fourth century BCE.

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Milek, Karen (Durham University, Department of Archaeology) - Armstrong-Oma, Kristin (University of Stavanger, Museum of Archaeology)

**Format:** Discussion session

Archaeological science is constantly pushing the boundaries of how we understand past human-animal and human-animal-environment relations. The emergence of new techniques in bioarchaeology and environmental archaeology, including lipid biomarkers, environmental DNA, proteomics, isotopic analyses, GIS, and statistics, are providing opportunities to collect new types of data and generate more precise, nuanced interpretations about how humans and animals lived with each other and their environment. But archaeological scientists face a challenge: the expertise and time required to develop new and improved analytical techniques and generate complex datasets means that they often work on and publish single case studies at a time. Amid accusations of not seeing the forest for the trees, what are the most effective ways for scientists to look up, scale up, and integrate their results with big-picture narratives of how humans and animals have interacted with each other and their environment? Such larger-scale narratives are crucial for our broader understanding of past multi-species societies, their resilience (or lack of resilience) in the face of environmental change, and our modelling of sustainable and unsustainable practices. This session invites speakers involved with scaling up and integrating archaeological science so that it contributes to a broader understanding of human-animal relations at national or continental scales, and/or through deep time, or in relation to written sources. Examples of best practice from collaborative interdisciplinary teams, multi-national teams, and big data projects involving published and unpublished archives are particularly welcomed.

## ABSTRACTS

### 1 FISH FOR FOOD? NOT AT ALL! FISH AS PRESTIGE OBJECTS IN ANCIENT ROME

**Abstract author(s):** Schmölcke, Ulrich (Centre for Baltic and Scandinavian Archaeology - ZBSA)

**Abstract format:** Oral

In the course of the last pre-Christian century in Roman Italy, first individuals and then more and more members of the nobility began to keep fish - not as food, but for ornamentation. Conservative contemporaries criticized them severely for this, even defamed them, and - since these conservative contemporaries are also most of the authors of the surviving written sources - this caricature has persisted to this day: fish keeping e.g. of moray eels as a prime example of Roman decadence.

In this lecture we will try to look behind this caricature with archaeological and zoological methods. The picture that emerges is that of enthusiasts who spare no effort to make the tanks as animal-friendly and species-appropriate as possible, who decorate their animals as pets are decorated today, who cry when an old fish dies. It also shows how the hobby of a few aquarists soon became a fad that hardly anyone in the nobility could escape.

### 2 THE BIG PIG PICTURE: SUID-HUMAN RELATIONSHIPS AND MANAGEMENT PRACTICES IN THE NEOLITHIC AND CHALCOLITHIC OF SOUTH-EASTERN EUROPE AND BEYOND

**Abstract author(s):** Blanz, Magdalena (Vienna Institute for Archaeological Science - VIAS, University of Vienna, Austria; Human Evolution and Archaeological Sciences - HEAS, University of Vienna) - Balasse, Marie (UMR7209 'Archéozoologie, Archéobotanique: Sociétés, Pratiques, Environnements', CNRS/MNHN) - Gál, Erika (Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Gorczyk, John (Dept. Anthropology, Cornell University) - Bălăşescu, Adrian (Institute of Archaeology, Romanian Academy) - Radu, Valentin (National History Museum of Romania, Bucharest) - Fiorillo, Denis (UMR7209 'Archéozoologie, Archéobotanique: Sociétés, Pratiques, Environnements', CNRS/MNHN) - Ivanova, Maria (Vienna Institute for Archaeological Science - VIAS, University of Vienna, Austria; Human Evolution and Archaeological Sciences - HEAS, University of Vienna)

**Abstract format:** Oral

In the Early Neolithic of South-eastern Europe, wild and domestic pigs were well-represented in coastal Mediterranean areas, but appear to have been much rarer in the more northerly interior areas. As highly adaptable omnivores, pigs are able to thrive in many different contexts and to develop various kinds of relationships with people. So, the decrease in the relative amount of suids in the faunal assemblages leads to questions of what the place of wild and domestic pigs was in these early Neolithic subsistence systems. Were domestic pigs kept intensively in villages in small numbers, or kept extensively in the surrounding area? To what extent did pig-human relationships and the relationships of pigs with their surrounding environments vary in space?

These questions can be addressed by studying past pig diets (via stable isotope ratios) and mortality profiles, and placing these in the context of human-animal relationships more widely (i.e. comparison to diets of domestic and wild herbivores and carnivores and the relative amounts of each species), while also incorporating existing knowledge about the local environmental and cultural settings at each site.

In this study, we present new bone collagen stable isotope ratio data ( $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ) for domesticated and wild pigs, cattle, sheep, dogs and wild herbivores from four early Neolithic sites in Hungary and Bulgaria, and compare these to data from later sites where pigs are more numerous, including a new dataset from Poduri, and published data from Vitănești-Măgurice, Bordusani-Popină and Hârșova-tell (all Chalcolithic Romania). A wide range of different pig husbandry strategies is apparent from the data: A large degree of overlap in isotope ratios for most domesticated and wild herbivores and pigs at some of the sites suggests pigs were not kept intensively, whereas significantly elevated  $\delta^{15}\text{N}$  values indicates a large degree of pig diet supplementation at others.

### 3 INTEGRATING STABLE ISOTOPE AND ZOOARCHAEOLOGICAL EVIDENCE TO UNDERSTAND HUMAN-ANIMAL-ENVIRONMENT RELATIONS DURING THE LATE PLEISTOCENE

**Abstract author(s):** Jones, Jennifer (University of Central Lancashire) - Marín-Arroyo, Ana (Grupo de I+D+i EVOADAP-TA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas, Universidad de Cantabria)

**Abstract format:** Oral

Climatic changes, and environmental shifts had a dramatic impact on humans and animal populations in the past. Being able to characterise the impact of these climatic changes on humans, animals and the ecosystems that they occupied, is integral in determining how they were able to survive during times of climatic fluctuation.

Stable isotope analysis of animal bone remains can be an invaluable tool for both reconstructing environmental changes on a regional and local level and for exploring changing faunal palaeoecologies during periods of climatic turbulence. When combined with wider environmental proxies and zooarchaeological evidence it is possible to determine how human hunting strategies were adapted in response to periods of climatic change.

This paper focusses on the Late Glacial Refugium of the Cantabrian Region in Northern Spain to understand how human and animal populations coped with the changing conditions associated with the Last Glacial Maximum and the subsequent climatic recovery. The Cantabrian Region was repeatedly occupied by hunter-gatherer groups throughout the Solutrean and Magdalenian despite this period of climatic instability. Stable isotope evidence from 500+ faunal specimens from sites with long chronologies was compared to other environmental and proxies available and demonstrated that large scale environmental shifts was observable across each site, showing the value of regional scale analyses. It was evident that individual animal species altered their niches and behaviour differently depending on the local microenvironments available. Zooarchaeological data complemented these studies showing increased resource pressure when environmental conditions improved, and humans adapted their hunting strategies, often widening their resource bases to exploit a larger range of ecological zones, and travelled larger distances to procure prey. This provides insights into how human and animal populations were able to survive in Southern Europe when other parts of the continent were inhospitable.

---

### 384 WOMEN'S STATUS AND AGENCY IN THE NEOLITHIC AND METAL AGES OF CENTRAL EUROPE [AGE]

**Theme:** 3. The Carpathian Basin: Integration, Mobility and Diversity

**Organisers:** Jaeger, Mateusz (Adam Mickiewicz University in Poznań, Institute of European Culture) - Kulcsár, Gabriella (Institute of Archaeology Research Centre for the Humanities) - Strózyk, Mateusz (Poznań Archaeological Museum) - Rebay-Salisbury, Katharina (Austrian Archaeological Institute, Austrian Academy of Sciences) - Melis, Eszter (Institute of Archaeology Research Centre for the Humanities)

**Format:** Regular session

Along with age, gender has been, and continues to be, an important category structuring societies all over the world, affecting access to resources, activities and the division of labour, as well as the social roles of individuals. However, the extent to which gender impacts upon opportunities for decision-making, self-determination and building one's own social and economic position is neither uniform in the modern world nor in the past. A number of factors, including the level of political, economic, as well as ideological and religious organization of particular communities, intersect with gender and influence the lives of individuals. Whereas the discussion of gender in Bronze Age archaeology has a long history and has produced specific results, both in the form of publications and targeted research projects, the study of sex and gender in the Neolithic is still in its infancy. Comparative studies that address the issue of sex and gender over a substantial period of time in order to capture specific changes, rather than simply observe their effects, are still lacking. Within the framework of the proposed session, we would like to discuss both the sources

and interpretations of women's agency in the context of economic, social, and ritual activities of Neolithic and Metal Age communities in Central Europe.

The session will address the following research questions:

- Do the archaeological sources indicate specific activities carried out exclusively by members of one sex?
- Has the history of archaeology in particular countries influenced the perception of gender roles in prehistory in a specific way?
- Do the archaeological sources confirm or contradict a binary gender concept in the prehistory of Central Europe?
- How can we situate female agency in the context of exogamous marriage practices and other interpretations of female mobility?

## ABSTRACTS

### 1 THE WOMEN OF THE GUMELNIȚA SITE (ROMANIA, 5TH MILLENNIUM BC): FARMERS, HUNTRESSES, PASTORALISTS? A STUDY ON STABLE ISOTOPES

**Abstract author(s):** García-Vázquez, Ana (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB, University of Bucharest) - Balasescu, Adrian - Vasile, Gabriel - Golea, Mihaela ("Vasile Pârvan" Institute of Archaeology, Romanian Academy, Bucharest) - Radu, Valentin (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB, University of Bucharest; National Museum of Romanian History, Bucharest) - Lazar, Catalin (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB, University of Bucharest)

**Abstract format:** Oral

The Kodjadermen-Gumelnița-Karanovo VI civilization occupied the Balkan area in the second half of 5th millennium BC. The Gumelnița site (also known as "Măgura Gumelnița" or "Măgura Calomfirescu") is probably the biggest tell settlement north of the Danube and is located in the northern area of the Balkan region, in the southeast of Romania, on the left bank of the Danube River floodplain, immediately south of the confluence area of the Argeș River. The site consists of a tell-settlement and an adjacent cemetery area where 10 skeletons were excavated in the 60s and 14 tombs were found in the archaeological campaigns from 2017 to 2019, with radiocarbon dates ranging from  $4448 \pm 10$  to  $4360 \pm 42$  Cal BC.

For this study, we analysed isotopically ( $\delta^{13}C$ ,  $\delta^{15}N$ ,  $\delta^{18}O$ ) 16 humans from the 14 tombs excavated in the 2017-2019 campaigns plus domestic and wild animals of the site. The results of  $\delta^{13}C$ ,  $\delta^{15}N$  show that all these humans had a very similar diet based mainly on domestic plants and animals, but among adults there are two clusters, one consisting of women (and an adolescent of unknown sex) with a slightly lower  $\delta^{15}N$ . Also this paleodiet cluster corresponds to the  $\delta^{18}O$  cluster of local individuals, which seems to indicate that while some individuals (of both sexes) spend part of the year elsewhere with sheep and dogs, these women remain in the settlement protecting it and working in the crops, taking care of the domestic animals and maybe also hunting. Furthermore, in some of the graves (both male and female), flints have been found, which could indicate that both sexes were related somehow with the use or production of flint tools.

### 2 TEMPORALITY AND GENDER RELATIONS DURING THE EARLY NEOLITHIC IN CENTRAL EUROPE: THE CASE OF "SCHWETZINGEN" CEMETERY (SOUTH-WESTERN GERMANY)

**Abstract author(s):** Masclans, Alba (Consejo Superior de Investigaciones Científicas – CSIC Institución Milà i Fontanals – IMF) - Bickle, Penny (University of York, Department of Archaeology) - Díaz-Zorita Bonilla, Marta (University of Tübingen, Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters) - Francken, Michael (Landesamt für Denkmalpflege) - Morell, Berta (Consejo Superior de Investigaciones Científicas – CSIC Institución Milà i Fontanals – IMF)

**Abstract format:** Oral

In this presentation, we will explore gender during the Early Neolithic in Central Europe by analysing one of the largest Linearbandkeramik funerary contexts: the Schwetzingen cemetery (south-western Germany). The site has previously been subjected to detailed anthropological, isotopic and grave good analysis in the framework of interdisciplinary studies, producing hints at variation between the genders and possibly other categories of identity. However, as only 6% of the 178 graves have been dated, whether these differences represent different identity classes or change over time remains uncertain. Here, we present the results from a new set of  $^{14}C$  dates, interpreted within a Bayesian framework, to assess a more robust and complete sequence for the cemetery. This new chronological model allows for a reassessment of the variations found in burial practices, diet ( $\delta^{13}C$  &  $\delta^{15}N$ ) and mobility ( $^{87}Sr/^{86}Sr$ ). Multiple correspondence analysis will be applied to explore dynamics in burial practices, social organization and gender relations.

### 3 GENDER ON THE MOVE: CHRONOLOGY AND EXOGAMIC PRACTICES AT THE BEGINNING OF FARMING. THE CASE OF NORTH CARPATHIAN BASIN

**Abstract author(s):** Morell, Berta (Milà i Fontanals Institution-Spanish National Research Council - IMF-CSIC) - Díaz-Zorita Bonilla, Marta (Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters. University of Tübingen) - Bickle, Penny (Department of Archaeology. University of York) - Tvrđý, Zdeněk (Anthropos Institute. Moravian Museum) - Mascians, Alba (Milà i Fontanals Institution-Spanish National Research Council - IMF-CSIC)

**Abstract format:** Oral

Patrilocality, suggested by both strontium isotope analysis and aDNA studies, has become the accepted and dominant kinship model for the Early Neolithic in Central Europe. Such exogamic practices are often implicitly linked to strongly gender-differentiated demographic and dietary patterns, a sexual division of labour, and interpersonal violence, leading to assumptions about women's status and male dominance. In this presentation, we will explore the presence of patrilocality, its possible consequences for women's quality of life and the construction of the female gender within the first farming communities of the North Carpathian Basin (Moravia, Czech Republic, and Slovakia). Specifically, we will present new strontium isotope and stable isotope data, to consider differences between the sexes, and how these may inform on gendered experiences. These data are analysed within the framework of a new chronology, based on Bayesian modelling of new <sup>14</sup>C dates produced in the course of the project. This allows us to assess whether variations seen in the osteological, funerary and isotopic data illustrate trends through time, or differences which shaped social organization and kinship amongst these early farmers. Overall, we suggest that although some general patterns can be identified, gendered identities were dynamic cautioning against assuming a uniform experience of gender and kinship during this time period.

### 4 IS IT A MAN'S WORLD? WOMEN BURIALS IN WESTERNMOST YAMNAYA REGIONS

**Abstract author(s):** Preda-Balanica, Bianca (University of Helsinki)

**Abstract format:** Oral

The Yamnaya migration to the west, in the first half of the 3rd millennium BC, has been in the past years one of the most hotly debated topics in archaeological and genetic research. The focus lies on the driving forces behind this event, its genetic, cultural, and even linguistic implications, as well as long-term consequences for the European continent. It is a general consensus that it brought along a shift in burial practices, the emergence of a warrior class, innovations in metallurgy, and for a while the theory of a dramatic increase in violence was very appealing, although the latter idea has been contested lately. Furthermore, it is now widely accepted among scholars that the migration was male driven for several generations, and a bias of 5 to 14 men for every migrating woman was advanced. The role of women in the initial migration process as well as their presence in the westernmost Yamnaya distribution regions is understudied. Yamnaya graves cover half a millennium at the western end of the Great Steppe, on the current territories of Romania, Bulgaria, Serbia and Hungary, and overall, women are largely invisible in current literature studying them. However, this invisibility does not derive from their actual absence from the archaeological record, but rather from the predominance of a specific focus in the interpretation of data. Taking as a starting point the burial practices related to women: funerary structures built for them, how their bodies were treated and laid inside the pit, what grave goods accompanied them, but also information from bio-anthropology about their health and activity patterns, this presentation is an exploration of their status and role in Yamnaya communities.

### 5 GENDER INTENSITY AT EARLY BRONZE AGE CEMETERIES IN AUSTRIA

**Abstract author(s):** Rebay-Salisbury, Katharina (Austrian Academy of Sciences)

**Abstract format:** Oral

In the Early Bronze Age, some Central European communities buried their dead in a gender-specific way, on different body sides and with differing orientation and grave good selections for men and women. Whereas cemeteries in Lower Austria south of the Danube are characterized by a high gender intensity, north of the Danube, the differences in the funerary ritual are less pronounced.

Advances of the third science revolution in archaeology brought unprecedented opportunities to investigate human remains in more depth. The analysis of sex-specific gene segments and sex-specific protein fragments in dental enamel have recently contributed to the accuracy of identifying the genetic sex of buried persons.

In this paper, I will use these findings to compare the gender intensity of cemeteries such as Franzhausen, Gemeinlebarn, Unterhautzenthal and Schleinbach, and investigate cases in which sex and gender expressed in the funerary ritual do not match. Exceptions to the otherwise strictly binary gender system will inform us about the scope of Bronze Age persons' actions and individual opportunities to transgress gender boundaries.

## 6 WOMEN'S IDENTITY AND STATUS WITHIN THE EARLY AND MIDDLE BRONZE AGE INHUMATION BURIALS FROM WESTERN HUNGARY

**Abstract author(s):** Melis, Eszter (Institute of Archaeology, Research Centre for the Humanities, ELRN)

**Abstract format:** Oral

The virtue of investigating burials signifies the multilevel archaeological examination of gender identities and their status. However, it raises several questions: on which level is the gender identity represented or its reflections to be ignored, and what conclusions could be drawn in relation to the deceased's status in the prehistoric community. Based on the simple statistical and correspondence analysis on more than 160 inhumation burials of ten Gáta-Wieselburg cemeteries dating on the turn of Early and Middle Bronze Age (2100/2000–1600/1500 BC) in Hungary the sharp distinction of male and female graves cannot be observed, after all, several patterns of gender differentiation in funerary practice could be suggested. There are no strict rules in body placement and orientation among the examined graves. Comparing the orientation and position of the analysed burials with the tendencies in the Central European Early Bronze Age cemeteries, the combination of burial traditions in the meeting zone of Únětice-, Nitra-, and Unterwölbling communities could be assumed. The representation of gender status could be established mostly on the level of grave furniture. Although the human remains under this study are relatively fragmentary, complex analysis of anthropological and archaeological results of the burials in Gáta-Wieselburg culture has not been investigated so far. In the future stable isotope and aDNA analyses on the osteological remains of several sampled burials included in this study may reveal the role of geographical descent and biological lineage in the burial tradition.

## 7 GENDER ROLES IN PREHISTORIC AGRICULTURE? – HARVESTING DURING THE BRONZE AGE IN CENTRAL EUROPE

**Abstract author(s):** Fejer, Eszter (Eötvös Loránd University)

**Abstract format:** Oral

Gender-based division of labour in prehistoric societies has long been presumed by scientific research on the basis of modern perceptions projected onto the past. Classical gender roles in agriculture vary by regions, but they usually implicate men participating in the heavy physical and productive activities on the field, while women assisting and/or processing of men's achievements. In case of harvesting activities, the harvesting technique, the crops to be harvested as well as the applied implements are generally thought to determine the gender of the person performing the activity. For instance, harvesting cereals with sickles in Europe is stereotypically associated with women's work, while using scythes for the same task is considered to be men's job.

This paper focuses on the issue of gender roles in Bronze Age agriculture by studying the evidence on Bronze Age harvest in Central Europe. The best-known agricultural implements of the period are the sickles which have been preserved in large quantities in the metal hoards of the Late Bronze Age, but they also appear in burials, albeit in much smaller proportions. Although grave goods may not reflect directly the everyday activities of the deceased, they can be useful tools for the investigation of hypothetical gender-based division in harvesting. Placing sickles in burials is not a general phenomenon in Bronze Age Central Europe: they were found sporadically in the area of the Tumulus and Urnfield cultures, and although more frequent, still only in a small number of the burials of the Píliny-Kyjatice and the Lausitz cultures. The paper evaluates the available archaeological data on these harvesting tools placed in graves and discuss whether they could have been associated with female or male agency. The results will be compared with historical and anthropological data on documented changes in gendered division of harvesting tasks.

## 8 A WOMAN AS THE REFLECTION OF HER MAN? TESTIMONY OF THE EARLY BRONZE AGE CEMETERIES IN KOLÍN AND MIKULOVICE (BOHEMIA)

**Abstract author(s):** Langova, Michaela - Papac, Luka - Šumberová, Radka - Brzobohatá, Hana - Ernée, Michal (Institute of Archaeology of the Academy of Sciences of the Czech Republic, Prague)

**Abstract format:** Oral

The question of women's role(s) in prehistoric societies has recently received increasingly more attention. The Early Bronze Age inhumation cemeteries in Central Europe offer a great source of data which directly link artefacts to a concrete person. Moreover, newly excavated cemeteries offer a valuable data source for scientific analyses which are shedding ever more light on the complexities of prehistoric societies.

This contribution focusses on two recently excavated Early Bronze Age Únětice cemeteries located in Kolín and Mikulovice, Bohemia. The large number of inhumations (103 skeletons from Mikulovice and 80 skeletons from Kolín) allowed for the direct comparison of female graves to one another and to male graves. The genetic sex determination of skeletons facilitated the observation of potential differences in grave goods starting already in the youngest individuals. Apparent links between sex/gender and specific artefacts or sets of artefacts were noticed in both sites as well as an obvious inequality between richly equipped female graves and poorer male graves. The comparison of

funerary treatment between two contemporaneous communities contributes to an understanding of social role and position of women within the wider Únětice Culture.

## 9 MEN MAKE THE WORLD GO ROUND? THE STATUS OF WOMEN IN THE LIGHT OF ANALYSES OF EBA CEMETERIES IN SLOVAKIA

**Abstract author(s):** Jaeger, Mateusz (Adam Mickiewicz University in Poznań) - Strózyk, Mateusz (Poznań Archaeological Museum) - Olexa, Ladislav (Institute of Archaeology Slovak Academy of Sciences)

**Abstract format:** Oral

The concept of warriors on the move presented by Kristiansen and Larsson has become a key element in the discussion of long-distance contacts and social development in Early Bronze Age Central Europe. According to the concept, male aristocratic warriors were to play a leading role in the communities that formed the extensive networks that encircled Bronze Age Europe. The figure of the man-warrior was closely associated with the spread of ideas, social institutions and elements of material culture across the vast expanses of the continent. The history of the development of Bronze Age societies thus presented leaves little room for consideration of the status and role of women. Meanwhile, in recent years detailed case studies have revealed a more complex picture. Studies supported by isotopic and genetic analysis have indicated that in addition to the rarely questioned model of the spread of innovations through male warriors, concepts in which women played an important role should also be considered.

In the course of detailed research on selected Early Bronze Age cemeteries, on the basis of statistical analyses of grave furnishings and using absolute chronology data, it was possible to establish regularities in the distribution of burials and their furnishing with grave gifts. The results of the analysis allow us to look at the dominant male-oriented narrative in a more nuanced way.

## 10 FEMALE MOBILITY IN A CHANGING BRONZE AGE WORLD: INVESTIGATING THE CONNECTIONS BETWEEN MOBILITY OF PEOPLE AND SHIFTING TRADING NETWORKS 1300BC

**Abstract author(s):** Noergaard, Heide (Moesgaard Museum, Department of Archaeology)

**Abstract format:** Oral

In recent years, isotope-related research has changed our view of the Bronze Age. Strontium isotopes have proven a great amount of mobility and lead isotopic investigation of metal artefacts revealed that Southern Scandinavia was not exploiting its copper sources; instead, it was importing metal via large-scale exchange networks from the establishment of the Bronze Age at 2000BC. Nevertheless, little is known concerning the organisation of these contact networks and the importance of females within.

This presentation wants to present the results of a project that applied a mixed-method approach, using qualitative classificatory mobility markers as quantitative data (LIA, Sr-isotopes) in a comparative and combined manner with scientifically detected mobility data (mainly of females), markers of social hierarchy and archaeological evidence of mobility (foreign costumes, styles, and techniques) to discuss the role of females in exchange networks. Based on southern Scandinavian case-studies, this presentation aims to suggest a future oriented way of investigating female mobility and the role of females in exchange networks by combining archaeological and scientific data. Further, this presentation wants to suggest a theoretical frame for future studies based on spheres of interaction, kinship relations and *evia* for determining the motivation behind female mobility in the middle Bronze Age.

## 11 BRONZE AGE 'PRINCESS' OF SÜKÖSD: CASE STUDY ON WOMEN'S STATUS AND AGENCY IN TUMULUS CULTURE IN THE CARPATHIAN BASIN

**Abstract author(s):** Pap, Evelin - Csuvár-Andrási, Réka - Pásztor, Emília (Türr István Múzeum és Bácskai Művelődési Központ)

**Abstract format:** Oral

When archaeologists find a special grave full of jewellery, they inadvertently place the deceased at the top of the social hierarchy. Is this really the case? Whether it is in fact the most prominent or 'just' a case of over-representation, a more comprehensive, comparative study over a larger area can only provide information.

A unique Bronze Age grave with rich goods belonging to the Tumulus culture was discovered in the outskirts of Sükösd at the end of 2020. The C14 analysis dated the grave between 1540 and 1430 BC. The deceased was presumably a prominent member of the community, however the social stratification of the Tumulus culture in the Carpathian-basin still needs research. It is difficult to determine woman status in a local society, which may be economic, social or spiritual. The grave at Sükösd can provide important details on these.

Artefacts indicating everyday activities were missing therefore the grave goods were not intended to emphasise everyday life. The 22-25 year old woman wore ceremonial or funerary attire.

No grave with similarly rich furnishings has been discovered in the cemetery. The precious jewellery, especially the amber from a far region, attest prominent status. Possession of such object indicates exceptional status. The presence

of special grave goods such as pierced seashells, snails, a stone egg, an amber pendant with solar symbol also reveals the social status of the deceased woman and her spiritual role in the community.

A woman's costume can provide information such as:

- regional groupings recognised in the costumes
- differentiation not only between gender and social position but also between age and social status
- movements and intermarriage among different geographical areas and cultural groups

Comparative analysis of the artefacts will add new details on the status and social role of women in the period.

## 12 THE ROLE(S) OF WOMEN IN SITULA ART

**Abstract author(s): Schaller, Clara (Ludwig-Maximilians-Universität Munich)**

**Abstract format: Oral**

The so-called "Situla Art" can be found from the 7th to 4th century BC in Northern Italy, Austria, Slovenia and Croatia. Its narrative style not only shows plants and animals but also humans at varying activities. In most cases they can clearly be identified as either women or men. Situla Art thus seems to be a great source for an analysis of gender roles and labour division. A lot of activities seem to be gender specific and women, in addition to being depicted less often than men, appear to have a smaller variety of activities attributed to them. The presentation will therefore take a closer look at the roles offered to women in Situla Art and furthermore investigate the regional and chronological differences among them across their area of distribution. It can also be shown that Situla Art does not in fact paint an objective picture of Iron Age daily life, as the style on the one hand is heavily influenced by Mediterranean depictions and on the other hand is used only by elite groups and even in this context only shows a limited scope of women's activities so that a merely idealized depiction of elite life seems plausible.

---

## 385 PLACE NAME AND ARCHAEOLOGY – NEW INTERDISCIPLINARY APPROACHES IN EUROPE

**Theme: 2. [Re]integration**

**Organisers: Ødegaard, Marie (Museum of Archaeology, University of Stavanger) - Albris, Laurine (National Museum of Denmark) - Heinonen, Tuuli (University of Helsinki)**

**Format: Regular session**

This session explores the potentials of place names in archeology, focusing on the methods of inter-disciplinary enquiry, how they are viewed and used in various countries, research environments and within different prehistoric and historic periods. The interdisciplinary use of place name studies and archaeology have long traditions in many countries. However, the preconditions of this type of research have been changing in later decades with new methods in archaeological surveying and natural sciences and with fast developments in metal detecting and archaeological excavations. Where do we stand today and how can we improve and renew our views on toponymy and on the methodological challenges we face when combining these linguistic remains with the material record?

Place names can offer unique insights into past peoples' perceptions of land and sense of place and thereby provide access to emic categories otherwise unavailable to archaeologists. Names are active elements in ongoing discourses about the landscape and there may be intimate connections between places, names and populations. Toponymy can reflect or invoke feelings on both individual and collective levels. Distributions of place names across Europe further remind us that the languages of the past did not follow modern day national borders.

The session aims to bring together scholars working on onomastics and archaeology in different parts of Europe to provide a forum for exchange of ideas and discussions on possibilities, perspectives and limitations of the use of place names. We particularly welcome case studies showing the use of place names as a resource in archaeological landscape studies and how this type of interdisciplinary work can contribute to our understanding of the roles of names in the landscape e.g. as links to the past, in creation of identities and in the organisation of settlement and society.

## ABSTRACTS

### 1 THE NAME OF THE PELOPONNESE AND RELATED ISLAND NAMES IN ANTIQUITY

**Abstract author(s): Patay-Horváth, András (Research Centre for the Humanities)**

**Abstract format: Oral**

All the extant ancient sources agree that the name of the Peloponnese was taken to mean the island of Pelops, a mythical ancestor of the Atréids. The problem is, however, that island names with a similar structure (noun + nesos) never contain the name of an important mythical person, but very often that of an animal.

Starting from this observation, it is argued that Pelops originally denoted an animal, the aurochs or wild ox, which became extinct already during the Early Iron Age. This idea is also corroborated by the comparative analysis of the

mythical tales concerning the human Pelops and by the archaeological finds from Olympia, the most important cult centre of Pelops.

An overview of ancient toponyms, especially those of Greek islands is also offered and some related personal names ending in -ops are also discussed. Special attention is paid to Merops and his island (Cos), but some medieval and modern parallels are also considered.

## 2 FINDING OLD SETTLEMENTS IN NEW WAYS? PLACE NAMES, DESERTED MEDIEVAL VILLAGES AND LIDAR

**Abstract author(s):** Heinonen, Tuuli (University of Helsinki)

**Abstract format:** Oral

In Finnish archaeology, deserted medieval settlement sites are typically located by studying historical maps in order to find place names or other indications of disappeared villages and farms. Although many of the settlements have left little traces on other historical sources like tax books, their names still often appear on the maps, making it possible to trace their location. So far, mapping the exact location of these sites has been based on fieldwork, and therefore many of the potential sites have not been surveyed because of the lack of fieldwork resources. However, the improving remote sensing methods may offer a solution for this in the future. In Finland, laser imaging data has already proven to be useful for locating new sites, and currently, more detailed lidar data is being produced enabling archaeologists to identify an increasing number of sites based on the new data. In this paper, I discuss the possibilities that combining lidar data with place names and historical maps may offer for the study of deserted medieval settlements with the help of examples from southern Finland.

## 3 DID THE URNE FAMILY CLEAR THE WOODS? WHAT DO THE PLACENAMES SAY?

**Abstract author(s):** Hartvig, Anders (Museum Sønderjylland)

**Abstract format:** Oral

During the last few years, the Museum Sønderjylland has excavated the remains of a now deserted village dating to the Early Middle Ages. The village lies south of the tribunal of Urnehoved. We know from written sources that the noble family Urne played a significant role in the area during the Early Middle Ages. The Urnehoved Forest or the Urne Forest used to cover the area. At some stage, the forest was cleared, and farms and settlements were established here. But who was behind the colonisation, and when did it take place? As late as 1543, the village of Torp, situated on the edge of the old forest, is referred to as Urnetorp. Whether the village is named after the forest or the Urne family is unknown, but there are indications that the Urne family established the village in an unsettled area during the Early Middle Ages. A number of villages with the suffix -bøl are known from the area. This suffix is usually related to a settlement or farms established in the outfield during the Viking and Early Middle Ages. Most of these -bøl settlements have a personal name as a prefix. Could this concentration of -bøl settlements indicate the clearance of the forest? Could the personal name refer to the person whom the Urne family had sent out to establish a new settlement? It is argued here that the recently excavated settlement should be related to the Urne family's colonisation of the area.

## 4 ARCHAEOLOGICAL-TOPONOMASTIC RESEARCH AND SPATIAL ANALYSIS OF EARLY MEDIEVAL BAVARIA

**Abstract author(s):** Janovská, Viktorie (Charles University)

**Abstract format:** Oral

Contact zones are attractive areas for the study of socio-cultural changes in the early Middle Ages. One of the best European examples is today's north-eastern Bavaria in Germany, where Slavic and Germanic-speaking populations lived side by side on the eastern border of the Frankish Empire.

A combination of archaeology and linguistics, using the tools of modern data sciences and statistical analysis, has revealed new opportunities for research in this area. The identification of spatial differences between place names of Slavic or Germanic origin and archaeological sources can illustrate various socio-cultural changes.

The evidence indicates that Bavaria was integrated into Frankish power structures gradually, a process that is reflected in the presence there of Carolingian-Ottonian cemeteries. This spatially restricted variable was chosen for our analysis because the Carolingian-Ottonian cemeteries are the only locally reliable archaeological diagnostic for tracing the development of and trends in settlement progression in the early Middle Ages.

Our toponomastic dataset consists of place names known through historical linguistic analysis to be of Slavic origin in comparison to German and Early Germanic place names. These place names help us to understand which populations lived in the study region and how the medieval settlement process took place there.

The landscape of Bavaria is diverse and, therefore, we focus on the question of how the distribution of toponymy and archaeological sites is related to the natural environment, altitude and climatic conditions. This poster presents the results of point pattern analysis involving a linear model and kernel density.

This study was supported by a project of the Grant Schemes at Charles University, reg. no. CZ.02.2.69/0.0/0.0/19\_073/0016935 – “Interlinking language and material culture – a study of European populations in time and space” (4EU+).

## 5 THE RELATIONSHIP BETWEEN ARCHAEOLOGY, PLACE NAMES AND ORAL TRADITION, IN PORTUGAL – AN INTERDISCIPLINARY APPROACH

**Abstract author(s):** Vieira, Alexandra (CITCEM - Transdisciplinary Research Centre «Culture, Space and Memory»; Instituto Politécnico de Bragança)

**Abstract format:** Oral

Our main goal is to analyze a set of data related to the place names associated with archaeological sites in Portugal, namely in the north of the country. The place names (toponyms) are used, in many cases, as names of the archaeological sites. Place names can be a good indicator of the presence of archaeological remains in a given place, but the Archaeology-Toponymy relationship should not be limited only to this point. The study of a toponym associated with a particular archaeological site can be quite significant for its analysis and interpretation, namely when we try to study the ways local communities explain certain archaeological remains. That is, the importance and pertinence of the study of Toponymy is here demonstrated as an element of interpretation and decoding of the Social Memory of a given community, based on Archaeology, in a process of continuous interdisciplinarity.

Toponyms may have “fixed” oral expressions, which have lasted through time by a process of “crystallization”. The process of decoding toponyms helps us to recover the memory of a place or an archaeological site. Basically, we would like to demonstrate that popular beliefs associated with archaeological remains may have persisted over time in a given geographic space, reaching out to us by the place name itself. There are several examples of the association between archaeological remains and the creation of myths and legends, which are perpetuated through place names, since communities have been, over time, interpreting the landscape that surrounds them. For example, the architectures of megalithic tombs were often interpreted as “houses” and “ovens”. But beyond that, it wasn't just any house, it was the “House of the Moorish” (Casa da Moira), the “Oven of the Moor” (Forno do Moiro), or the “Rock of the Moors” (Pedra dos Mouros).

## 6 PLACE NAMES AND PRE-CHRISTIAN RITUAL SITES IN SCANDINAVIA - HOW NEW ARCHAEOLOGICAL FINDS PUSH OUR VIEWS ON TERMINOLOGY

**Abstract author(s):** Albris, Sofie Laurine (National Museum of Denmark)

**Abstract format:** Oral

Place names were long the main source to understanding how pre-Christian Iron and Viking Age religion in Scandinavia was anchored in the landscape. However, it was not certain whether sacral place names referred to cult sites and sanctuaries or places connected with beliefs with no attached activities. Not much was known about the physical appearance of cult sites and concrete practices ritual. In the last 30 years, multiple types of sites have appeared in Scandinavia that in various ways seem to reflect religious organisation and practices. A growing number of sites are linked topographically to known sacral place names. Through archaeology, we begin to see a diversity of religious sites, even between those sites that we link with similar types of place names. We are now confronted with new questions. The challenge is to gain an overview of the types of ritual sites, their differences and similarities. This paper will particularly address how cult place terminology known from place names and Old Norse texts can be reflected in the material reality.

Pre-Christian religion may not have been so uniform as we could assume. What types of word related to what kind of site may have varied between regions and/or changed over time. Sacral place names could denote places with hardly any human activity or with centuries of continued sacrifices or other rituals.

Language and terminology changed over time, which means that intentions behind name giving could shift. For example, many topographical terms eventually became words for ritual places. Relating identified ritual activities in time to the coining of a place name may therefore provide important clues. Further, we need to understand the biography of places in a long-time perspective.

## 7 BEACONS AND MILITARY COMMUNICATION IN THE VIKING AGE. PLACE NAMES OF CIVIL DEFENCE IN WESTERN NORWAY

**Abstract author(s):** Ødegaard, Marie (Museum of Archaeology, University of Stavanger)

**Abstract format:** Oral

What can place names reveal of systems of civil defence in the Viking Age? Beacons, located at prominent positions in the landscape, were part of a warning system and ignited at the risk of attack and war. As such, beacons played a crucial role in alerting populations and mobilising military responses. A range of written, archaeological, and toponymical evidence confirms the importance of beacons and lookouts to the networks of local and regional communications that existed during the Viking Age in Scandinavia.

When beacons were lit, the population had to mobilise. However, little is known about how people from local and regional communities took part in the civil defence and mobilisation when facing attacks. How did this system function? Who took part and in what way? The aim of this paper is to discuss the local systems of communication and military organisation in the landscape of western Norway in the Viking Age through an analysis of several case studies. Documents, place names and landscape archaeology make it possible to reconstruct elements of the signalling and sighting systems and to define the spatial extents of these military networks. Of particular interest are place names of mobilisation that supported beacon systems, including mustering sites, and the territorial organisation of military units.

## 8 CAN'T SEE THE MONKS FOR THE TREES - TOPONYMS IN THE SERVICE OF PAULINE MONASTIC LANDSCAPE STUDIES

**Abstract author(s):** Peto, Zsuzsa (Hungarian National Museum / Magyar Nemzeti Múzeum; Central European University, Medieval Studies Doctoral Program)

**Abstract format:** Oral

Place names have complex historical and linguistic backgrounds in the Carpathian Basin, especially in present-day Hungary. Throughout the centuries, several ethnicities regarded the region as their home whilst they spoke different languages (Hungarian, Slav, and German names are usual); therefore a specific locality may have had two or three names, and frequently, even a detailed local historical study is not adequate enough to judge, which was the original name. In this complex space only a few attempts, usually regional collections and analyses were conducted by archaeologists and medievalists; therefore it is time to review these studies from methodological aspects, highlighting general and specific practices. Based on these studies, my first aim is to outline a methodological proposal for medievalists. But the proof of the pudding is in the eating.

The past attempts already revealed that besides medieval settlement studies, ecclesial topography and monastic landscape researches seem to be those areas, where toponyms represent the base for further studies (from localization to land-management studies).

In the past years, I studied the history and landscape archaeology of a specific monastic group, the Order of Saint Paul the First Hermit, which was founded in Hungary (mid-13th century) and until the fall of the medieval Kingdom (1526/41) were present in most mid-hilly areas of the country. Based on the written and archaeological data, ca. 60 monasteries operated in the territory of Hungary, and ca. 5000 charters survived that contain possible spatial data (medieval toponyms), regarding the Pauline properties. (Charmingly, sometimes modern stories of "the mysterious white friars" affected the toponyms.) In the second part of my paper, by applying (my hopefully) best practice, I attempt to localize some unknown monasteries, reconstruct past Pauline monastic areas, and identify properties.

## 9 PLACE NAMES AND THE LANDSCAPE OF THE NORDIC BEACON SYSTEM IN THE MEDIEVAL AND POST MEDIEVAL PERIOD

**Abstract author(s):** Nyttun, Arve (Møre og Romsdal county)

**Abstract format:** Oral

Place names have been an important part of the Scandinavian research on beacon sites since the late 19th century. Linguistics studies have identified three main categories of place names that most likely represent norwegian, danish and swedish systems that can be traced back in time, at least to the early medieval period.

This paper explores the potentials of an interdisciplinary collaboration, where archeology, place name studies and history is focusing on the methods on how to identify and investigate sites related to the coastal defence systems. I will focus on the norwegian beacon systems, and show how new methods in archaeology like geofysics, lidar data and GIS together with conventional archaeological excavations can provide new knowledge about the systems, the organisation of the coastal defence, and even identify times of war. What challenges does the use of place name provide, and how can we identify locations that dosent have a place name related to the function. What other place names, and futures related to the leavy system can be identified in the same way as beacons?

Place names offer insights into past peoples' perceptions of land and can reveal locations of interest, but through archaeological excavations and registration of these sites, material culture can give more information to change our perception of the place name also.

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Verhagen, Philip (Faculty of Humanities, Vrije Universiteit Amsterdam) - Daems, Dries (Institute of Social Sciences, Middle East Technical University, Ankara) - Romanowska, Iza (Aarhus Institute of Advanced Studies) - Hinz, Martin (Institut für Archäologische Wissenschaften, Universität Bern)

**Format:** Round table

Archaeologists are increasingly relying on computer simulations to reconstruct and understand past societies. They are successfully building and running simulations of agrarian production, trade, settlement development and movement, to name a few. The current state of the field, however, is characterised by idiosyncrasy and limited communication and integration of the community, hampering the ability of modellers to cumulatively build on each other's work. This is predominantly due to the lack of appropriate tools and platforms enabling closer integration.

To remedy this situation, the NAS2A project (Network for Agent-based modelling of Socio-ecological Systems in Archaeology) is developing an open library of model algorithms and code for modelling of socio-ecological systems in archaeology. It aims to redefine current practices in collaboration and synergy in modelling communities by developing an openly available and functional models library, offering a host of elements (modules, techniques, algorithms, how-to's/wikis etc.) as modular building blocks for elaborate and case-driven models and research questions.

In this first roundtable of the (proposed) EAA Community "Computational Modelling of Social-Ecological Systems (COMS)", we will present the results of the project's first results towards developing the necessary infrastructure and standards, and invite feedback from experts and the roundtable audience. In particular, we want to address the following questions:

- how can we ensure that model elements can be used for a wide range of research questions?
- how can we facilitate interaction, comparison and testing of models across platforms and programming languages?
- how can we achieve a sustainable infrastructure for this?
- and what more is needed to make simulation modelling accessible to a wider community of archaeologists?

Confirmed discussants:

- Felix Riede (Aarhus University)
- Maja Gori (Ruhr-Universität Bochum)

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Mitnik, Alissa (Department of Human Evolutionary Biology, Harvard University, Cambridge MA; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig) - Kroonen, Guus (Leiden University Centre for Linguistics) - Saupé, Tina (Estonian Biocentre, Institute of Genomics, University of Tartu) - Cavazzuti, Claudio (Alma Mater Studiorum, Università degli Studi di Bologna, Dipartimento di Scienze Umanistiche) - Molloy, Barry (UCD School of Archaeology, University College Dublin)

**Format:** Regular session

The ongoing Third Science Revolution in Archaeology brought with it a resurgence of migratory models of culture and inquiry into language changes in the past. This led to calls for a holistic integration of archaeological disciplines with the natural sciences and for a responsible formulation of interpretations harnessing the parallel growth of theoretical frameworks, from network modelling to post-colonial thinking, to exceed simplistic narratives of mass migrations and population replacements.

The Mediterranean region is rich in archaeological evidence for diverse interconnected cultures, settlement systems, and socio-political aggregations. The wide-ranging historical record attests to the presence of numerous languages and language families. The region has been relatively inaccessible to genetic research due to less favorable conditions for DNA preservation, however, recent methodological advances are bringing a wealth of new data. As with other, more thoroughly analysed regions of Europe, these data point to widespread changes in the genetic landscapes, associated with the Neolithic Revolution and, later on, the dispersion of ancestry related to pastoralists from the Eurasian steppes, which is commonly linked to the spread of Indo-European languages. Research on material culture and isotopes have revealed wide-ranging networks of interaction along maritime and land routes involving Europe, the Levant, North Africa, and regions beyond.

These developments promise to help identify many of the mechanisms that drove the formation of the Mediterranean linguistic landscape. Biomolecular evidence can be utilized to evaluate existing and formulate new hypotheses on the movements, interactions and social organizations of linguistically defined, past groups.

In this session, we invite participants from the disciplines of archaeology, genetics and linguistics to present research from pre-historic or early historic Mediterranean case studies, regional-scale theoretical frameworks for individual mobility, or methodological innovations for measuring who or what was mobile. We seek interdisciplinary contributions that engage with and lend inspiration to other disciplines.

## ABSTRACTS

### 1 THE TRANSFORMATION OF THE GENOMIC LANDSCAPE IN COPPER AND BRONZE AGE CAMPANIA

**Abstract author(s):** Mitnik, Alissa (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig; Department of Human Evolutionary Biology, Harvard University, Cambridge) - Cavazzuti, Claudio (Università degli Studi di Bologna, Dipartimento di Storia Culture Civiltà) - Coppa, Alfredo (Department of Environmental Biology, Sapienza University of Rome; Department of Genetics, Harvard Medical School, Boston; Department of Evolutionary Anthropology, University of Vienna) - Petrone, Pier Paolo (Dipartimento di Scienze Biomediche Avanzate, Università di Napoli Federico II) - Bondioli, Luca (Bioarchaeology Service, Museum of Civilization, Rome; Department of Cultural Heritage, University of Padua) - Catalano, Giulio (Dipartimento di Scienze e Tecnologie Biologiche Chimiche e Farmaceutiche, Università di Palermo) - Sperduti, Alessandra (Bioarchaeology Service, Museum of Civilization, Rome; Dept. Asia, Africa e Mediterraneo, University of Naples "L'Orientale") - Caramelli, David (Department of Biology, University of Florence) - Pinhasi, Ron (Department of Evolutionary Anthropology, Human Evolution and Archaeological Sciences - HEAS, University of Vienna) - Reich, David (Department of Human Evolutionary Biology, Harvard University, Cambridge; Howard Hughes Medical Institute, Harvard Medical School, Boston; Broad Institute of Harvard and MIT, Cambridge)

**Abstract format:** Oral

The expansion of different groups carrying genetic ancestry components originating in the European Steppe and in the Eastern Mediterranean and their admixture with local populations from the Copper Age onward has been well described for Central Europe and the western Mediterranean, but data from the Italian peninsula is still sparse, and samples from the Copper and Bronze Age southern Italian mainland are so far completely lacking.

Here, we present genome-wide data from 71 individuals from the southern Italian region of Campania on Italy's Tyrrhenian coast, dated to the Copper and Bronze Ages, ca. 3500-1000 BCE. Campania's central location facilitates maritime contacts to other parts of the Mediterranean, as well as exchange across the peninsula and beyond over land or coastal routes. It is therefore of special interest in addressing questions about the timing and persistence of cultural contacts and population movements. Furthermore, the region has also been subject to unique periods of depopulation and resettlement due to major volcanic activity, leading to 27 eruptions between 3600 and 1200 BCE.

We observe the first appearance of individuals carrying Steppe-related ancestry in the Early Bronze Age, 1900-1700 BCE, around two centuries after it is first attested in Northern Italy and Sicily. From this period onward, Steppe-related ancestry is ubiquitous in the population, and there is no evidence of recent admixture with or persistence of populations that remain genetically continuous with the preceding Copper Age. Contrary to the development in Sicily in the Bronze Age, Campanian populations do not experience major gene flow from an eastern Mediterranean source.

We describe changes in the Campanian genetic landscape and discuss them in relation to the complex population dynamics and cultural transformations in other regions of Italy and the Mediterranean.

### 2 MOBILITY OF PEOPLE, THINGS, IDEAS BETWEEN THE AEGEAN AND THE ITALIAN PENINSULA AT THE TIME OF CREMATION (LATE BRONZE AGE)

**Abstract author(s):** Cavazzuti, Claudio (Alma Mater Studiorum, Università degli Studi di Bologna; University of Durham) - Arena, Alberta - De Benedetto, Giuseppe (Università del Salento) - Pamela, Fragnoli - Jung, Reinhard (Austrian Archaeological Institute, Austrian Academy of Sciences) - Scarano, Teodoro (Università del Salento)

**Abstract format:** Oral

The Late Bronze Age is a crucial period for the dynamics that brought to ethnic formations and colonization processes of the 1st millennium BCE. In absence of linguistic evidence and considering the wide diffusion of cremation, which prevents population-scale biomolecular analyses, it is fundamental to explore economic and geopolitical relations, as well as cultural influences, by using an integrated and more complex approach.

Our contribution focuses on the maritime corridor between the Italian peninsula and the Aegean, along which tangible and intangible goods flew with unprecedented intensity during the period between the 16th and the 11th century BCE. The progressive increase of contacts between Mycenaean and the Italic communities along the Western

Adriatic coasts (up to the Po River delta) since Late-Helladic IIA is clearly indicated by the distribution of the (mostly) Mycenaean-type pottery; at the same time, copper imported from the Eastern Alps and several Italian-type objects (e.g. swords, ornaments) have been identified in Mycenaean contexts.

The last centuries of the 2nd millennium also saw the spread of the 'urnfield model' southward. In this regard, the freshly discovered cremation cemetery at Torre Guaceto (Brindisi) represents a keystone for analysing north-south, as well as west-east movements, not at a population level, but at the scale of individuals/small groups who played a prominent role in determining decisive cultural and social transformations.

### 3 THE GENETIC ORIGIN OF DAUNIANS AND THE PAN-MEDITERRANEAN SOUTHERN ITALIAN IRON AGE CONTEXT

**Abstract author(s):** Saupe, Tina (Estonian Biocentre, Institute of Genomics, University of Tartu) - Aneli, Serena (Department of Biology, University of Padua) - Montinaro, Francesco (Estonian Biocentre, Institute of Genomics, University of Tartu; Department of Biology-Genetics, University of Bari) - Scaggion, Cinzia (Department of Geosciences, University of Padua) - Carrara, Nicola (Anthropology Museum, University of Padova) - Kivisild, Toomas (Estonian Biocentre, Institute of Genomics, University of Tartu; Department of Human Genetics, KU Leuven) - Metspalu, Mait (Estonian Biocentre, Institute of Genomics, University of Tartu) - Scheib, Christiana (Estonian Biocentre, Institute of Genomics, University of Tartu; St John's College) - Pagani, Luca (Estonian Biocentre, Institute of Genomics, University of Tartu; Department of Biology, University of Padua)

**Abstract format:** Oral

The geographical location and shape of Apulia, a narrow land stretching out in the sea at the South of Italy, made this region a Mediterranean crossroads connecting Western Europe and the Balkans. Such movements culminated at the beginning of the Iron Age with the lapygian civilization which consisted of three cultures leaving their marks on the cultural heritage: Peuceceans, Messapians, and Daunians (first mentioned in 7-6th century BCE). However, their genetic origin has been lost to time and their genetic impact on the present-day gene pool is uncertain.

Therefore here, we present genome-wide data (average human coverage: 0.031 - 0.995x) of 16 ancient individuals collected from three archaeological sites geographically located in northern Apulia (Ortona, Salapia, San Giovanni Rotondo) and historically/archaeologically associated with the Daunian culture. We extracted DNA from human skeletal remains at the dedicated ancient DNA laboratory at the Institute of Genomics, Tartu (Estonia) and chose ten individuals based on their genetic proximity for radiocarbon dating to further identify their genetic ancestry influences (estimation between 1157 - 275 calBCE and 670 - 1156 calCE).

To investigate the impact of the ancient individuals dated to the pre-Roman times, we merged the genome-wide data with modern individuals from Italy, in particular from Apulia, and found that our newly generated individuals are still genetically distant from the genetic variability of present-day Apulian. Instead, we found a high genetic heterogeneity between the ancient individuals despite the close distance between the sites and suggesting a strong geopolitical contingency.

Besides the genetic heterogeneity, we used a multidisciplinary approach combining the osteological profile, radiocarbon dating and genetic relatedness to study the kinship between the ancient individuals. Interestingly, we found a possible 1st-degree relationship between two female individuals with different genetic ancestries confirming the genetic heterogeneity in Iron Age Southern Italian Peninsula.

### 4 INSIGHTS INTO THE GENETIC LANDSCAPE AND MOBILITY PATTERNS OF THE BRONZE AGE - IRON AGE TRANSITION IN SOUTHEAST EUROPE

**Abstract author(s):** Iraeta Orbegozo, Miren (Globe Institute, University of Copenhagen; UCD School of Archaeology, University College Dublin) - Fibiger, Linda (School of History, Classics & Archaeology, University of Edinburgh) - Mylopotamitaki, Dorothea (Globe Institute, University of Copenhagen) - Makarewicz, Cheryl (Institute of Prehistoric and Protohistoric Archaeology, University of Kiel) - Laffoon, Jason (Department of Archaeological Science, Leiden University) - Molloy, Barry (UCD School of Archaeology, University College Dublin) - Schroeder, Hannes (Globe Institute, University of Copenhagen)

**Abstract format:** Oral

The Late Bronze Age was a period of exceptionally high connectivity in Southeast Europe, both between lands surrounding the sea and their nearby inland neighbours. A much debated collapse of complex economic networks ca. 1200 BC was followed by several centuries during which regional connectivity declined yet internal reorganisation of societies was acute. If the Aegean is seen as a driving force in networks linking the East Mediterranean and Europe during Late Bronze Age, then the Carpathian Basin was a primary hub through which ideas and people flowed. Contemporary to the collapse of Mycenaean palatial society and the Terramare groups of the Po Valley, a horizon of massive fortified sites that had characterised the Late Bronze Age in the south Carpathian Basin was abandoned. In the Early Iron Age smaller and less centralised settlement networks emerged there. As societies throughout this wider

region became networked again in the earlier second millennium BC, cross-regional mobility played an important role.

This paper aims to explore changes in the south Carpathian Basin at this time of changing networks within the context of the Mediterranean communities they were engaged with. Specifically, we aim to shed light on the genetic landscape and patterns of individual mobility that can inform us about the spatial and temporal networks of these people. We present preliminary results of ongoing multidisciplinary analyses, including genome-wide data for 51 individuals ranging from Late Bronze Age to Early Iron Age from eight sites. Our study focuses on the mass-grave at Gomolava, including ancestry and relatedness among the analyzed individuals. Coupled analysis of new dietary and mobility isotope data, we provide a uniquely rich 'snapshot in time' of a community during this transitional period set within their regional genetic and social context.

## 5 MALARIA AS A SELECTIVE FORCE IN THE PREHISTORY OF THE MEDITERRANEAN BASIN

**Abstract author(s):** Gonzalez Fortes, Gloria (Universita di Ferrara) - Mira, Stefania - Perretti, Silvia - Antonica, Bianca (Università degli studi di Ferrara) - Trucchi, Emiliano (Università di Ancona) - Barbujani, Guido (Università degli studi di Ferrara)

**Abstract format:** Oral

Malaria is thought to have been a main selective force in human evolution. Indeed, it is still one of the main causes of mortality in developing countries in tropical areas.

It's caused by a protozoan Plasmodium, which is transmitted through the mosquito Anopheles. Its presence in the Mediterranean has been dated to ~10,000 yBP, following the agriculture expansion around the Neolithic.

The selective effect of malaria is associated to the persistence of deleterious alleles, which in turn confer resistance against the parasite. One of the best-known examples is the prevalence of thalassemia and sickle cell variants in malaria endemic regions.

But when did this selection start? And how strong was it in the Mediterranean basin? These questions have been object of intense research, with most of the studies being based on the observation of correlations between the distribution of the parasite and the resistant variants.

Here we present a direct approach, based on the analysis of DNA from ancient humans. We analysed the genomes of more than 300 ancient individuals from Italy and Central Europe, in a time transect of 12000 years (from UP to Medieval times). We studied the changes of allele frequency at loci related to malaria resistance in both datasets, to understand when and to what extent the malaria was an evolutionary force in Europe.

Unlike Central Europe, we found an important increase of malaria resistant alleles in Italy around the Bronze Age, especially in Sardinia. What's more, our analysis showed that the nature and prevalence of protective variants in the beta-globin gene in prehistoric Italy differed from those found in the current populations. Following the times and origins of the different trends in selection towards different resistant alleles, we are reconstructing the times and dynamics of malaria expansion in Italy and the southwest Europe.

## 6 THE SPICE THAT CAME IN FROM THE EAST: SAFFRON AND THE CHRONOLOGY OF LINEAR B TABLETS FROM KNOSSOS

**Abstract author(s):** Pierini, Rachele (University of Copenhagen)

**Abstract format:** Oral

The Linear B script encodes Mycenaean, the earliest written evidence of the Greek language. In particular, Linear B tablets from Knossos provide the earliest evidence for the Mycenaean language since the Palace of Knossos underwent several destructions: the tablets from the Room of the Chariot Tablets (RCT) date around 1400 BCE, the tablets from the North Entrance Passage (NEP) are later than RCT tablets but earliest than the tablets from the other deposits, and the tablets from the rest of archives belong to the final destruction (ca. 1200 BCE), thus being contemporary to the majority of tablets from the other main sites. Also, RCT tablets provide the closest similarities with Linear A tablets.

Saffron (*crocus sativa*) is a spice and a yellow-dyeing agent. It is etymologically identical with the Semitic word for 'saffron' but these Semitic words could be loans themselves. Saffron is a central motif in Minoan art and appears abundantly on RCT tablets but not on tablets from later deposits. However, later Knossos tablets record safflower (*carthamus tinctorius*), a yellow-dyeing agent not appearing on RCT tablets. Also, a broader analysis of the Knossos textile terminology highlights two elements: these terms do not have an Indo-European etymology, and there is a relationship between chronology and specific textile types.

This paper argues for a relationship between chronology and yellow dyes, too. Also, it explores hypotheses on the origins of saffron, its route to the Aegean area, its use by Minoans and Myceneans, and potential causes of its abandonment after 1400 BCE.

## 7 ISOTOPIC MOBILITY RESEARCH: LET US PAUSE AND REFLECT

**Abstract author(s):** Nafplioti, Argyro (Ancient DNA Lab, Institute of Molecular Biology & Biotechnology - IMBB, Foundation for Research and Technology - Hellas - FORTH)

**Abstract format:** Oral

Provenance, residential mobility and migration are recurrent themes in archaeological research. Since the 1980s, isotope analysis of archaeological skeletal remains has revolutionized research in this field. However, although more recent advances in research methodology and theoretical background have improved our ability to identify both short- and long-term residential mobility, and enabled us to move beyond the simple dichotomous classification of past individuals as either local or nonlocal, there are still shortcomings we need to overcome, particularly with regard to research planning, sampling, data analysis and interpretation.

In response to a surge of isotope studies on mobility, a critical review of the data in hand is ever so timely. This paper discusses the potential and limitations of isotope research. Taking into consideration shortcomings in recent published work, this paper identifies potential pitfalls and gives recommendations for most effective practices for research planning, sampling and data analysis, and for framing archaeological interpretation of past mobility and migrations.

Aiming at more effectively characterising past mobility and migration with a view to better understanding the complexity of these processes, the motivations and consequences to the people moving, the receiving communities and those staying behind, we need to combine a methodologically sound research with a theoretically informed social bioarchaeology of migration. The way forward is to move beyond a mere fingerprinting of migration or relocation episodes, towards an investigation of these themes through a different paradigm, wherein the individual is central and migration and mobility are studied themselves as multi-layered processes and socio-cultural phenomena.

## 8 EATING AND MOVING IN ANCIENT VERONA FROM LATE PREHISTORY TO MIDDLE AGES

**Abstract author(s):** Varalli, Alessandra (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra, Barcelona) - Dori, Irene (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Verona, Rovigo e Vicenza) - Mongillo, Jessica - Vescovo, Giulia (Department of Environmental and Prevention Sciences, University of Ferrara) - Lo Iacono, Ambra - Basso, Patrizia (Department of Cultures and Civilisations, University of Verona)

**Abstract format:** Oral

Since late Prehistory, the communities living in the Po Plain played a significant role in the development of the Southern European economic networks thanks to their strategic position in northern Italy. Particularly, the town of Verona and the surrounding areas were pivotal for the evolution of new trade, the exchange of raw material and the spreading of prestige objects. The aim of our study was to assess changes in subsistence strategies and to detect mobility events of the societies living in this area. We used multi-proxy biochemical investigations to explore how new people and different cultural traditions integrated and how the socio-economic systems of the local communities evolved over time.

We analysed anthropological, archaeological and isotopic data from 11 sites in Verona and surrounding areas dating to the period of pile-dwellings (early 2nd millennium BC), the Romanisation period (2nd-1st century BCE), the end of the Roman Empire (4th-6th century CE) and the Middle Ages (the 9th-11th century CE), to shed light on dietary choices, residential mobility and social practices from late Prehistory to the Medieval time.

Carbon, nitrogen and sulphur stable isotope analysis on bone collagen was conducted on 79 humans of different age and sex and 21 domesticated animals (pigs, cows, sheep, horses). These preliminary results show a wide variability in carbon and nitrogen values suggesting varying C3 and C4 plant consumption and diverse animal protein intake by humans. Three main outcomes are highlighted: 1) the consumption of C4 plants is well attested in all the periods analysed; 2) individuals of protohistoric and Roman times show higher mobility than the ones from the Middle Ages; 3) individuals from the urban and plain areas show higher mobility than the ones from the hills/mountains. Moreover, individual mobility seems more significant for women than men.

## 9 UNDERSTANDING THE PROCESS OF SKIN LIGHTENING IN EUROPEANS: A MIX OF SELECTION AND MIGRATION FACTORS

**Abstract author(s):** Gonzalez Fortes, Gloria (Universita di Ferrara) - Perretti, Silvia - Barbujani, Guido (Università degli studi di Ferrara)

**Abstract format:** Oral

As Homo sapiens spread out of Africa, it faced the challenge to adapt to new environments. One of the best-known adaptive features is the variation of skin pigmentation. Populations from equatorial regions have darker skin than those from higher latitudes, which is explained as an adaptation to different levels of UV radiation. In high UVR regions, a high melanin content is protective against the photolysis of folate, while in lower exposed regions, the loss of melanin was favoured to facilitate the synthesis of vitamin D.

However, to reconstruct the evolutionary process behind the observed pattern is not simple. The skin pigmentation is a complex trait influenced by genes involved in several aspects of melanin production, storage and transportation. From the analysis of modern populations, it seems that variants involved in skin lightening appeared at different times and geographic areas, but the combination of selective and migration processes that led to the current geographical distribution is not yet clear.

Ancient DNA studies have shown that only 10,000 years ago human populations living as high north as the British islands had dark skin, and the first genetic signals of lightening did not appear until the spread of Neolithic farmers, almost 3,000 years later. However, neither the pioneering farmers, nor the later Bronze Age migrants, showed the pale skin phenotype that nowadays is widespread in Europe.

Here we present an innovative approach based on the reconstruction of DNA haplotypes around the main variants involved in skin pigmentation. We are comparing the genetic information between modern populations and key ancient individuals, which are representative of the major prehistoric migrations into Europe. Based on the combination of state-of-art bioarchaeological approaches (aDNA, 14C dates and cultural information), we are tracking back the events that shaped the current distribution of human skin pigmentation.

## 10 HOW CAN ADNA BE YOUR FRIEND: PREDICTIVE CASE STUDIES FROM THE PREHISTORIC AEGEAN

**Abstract author(s): Ozturk, Huseyin (College Year in Athens; American School of Classical Studies at Athens)**

**Abstract format: Oral**

In the last decade, linguistics, genetics, and archaeology have had an increasingly fruitful yet equally troublesome relationship. The troubles are partially caused by the very dissimilar pasts of these disciplines: they have different scholarly conventions, they come from different worlds. Occasionally, multi-disciplinary efforts to fill in the chasms between them with theoretical substance give the impression of three hearing-impaired people trying to communicate using three different sign languages.

A big part of the issue seems to be the following: for many archaeologists, trying to figure out (pre)historical movements or the ethnogeneses of ethno-linguistic population groups is not a fundamental question at all, a relic of the culture-historical past, perhaps even considered unappealing. And, to many of them, it looks like that is exactly what archaeogenetics and comparative paleolinguistics are trying to achieve.

Archaeology's main aim, however, is, ultimately, understanding the human condition, and social change -of which language change remains an integral part- is undeniably a legitimate scholarly question. Rather than chasing grand narratives, establishing more small-scale, well-defined, high-resolution, testable hypotheses can help with the uneasiness felt by many. The solution may well lie in an archaeological predictive modeling, if you will, postulating what type of future aDNA and other biomolecular results can weigh in and hopefully illuminate such archaeological questions about social change detected in the material record, with the help of historical linguistics when relevant.

In this paper, I will try and create such testable hypotheses about case studies from the Bronze and Iron Age Aegean, on both sides of the pond. Studies on ethno-linguistic groups of the past and movements of population groups and their questionable archaeological traces do not need to be Kossinna-style culture-historical or serving any national agenda, there might be yet another way. After all, these questions are part of the human condition.

### A. A GENETIC HISTORY OF MOBILITY IN THE IRON AGE CENTRAL MEDITERRANEAN

**Abstract author(s): Moots, Hannah (University of Chicago) - Antonio, Margaret (Stanford University) - Sawyer, Susanna (University of Vienna) - Lucci, Michaela (Sapienza University) - Cherifi, Mehdi (Benyoucef Benkhedda University) - Gao, Ziyue (University of Pennsylvania) - Fantar, Mounir (Institut National du Patrimoine Tunisie) - Coppa, Alfredo (Sapienza University) - Pritchard, Jonathan (Stanford University) - Pinhasi, Ron (University of Vienna)**

**Abstract format: Poster**

The Iron Age saw the expansion of Phoenician and Greek colonies across the Mediterranean and the rise of Carthage as the major maritime power of the region. These events were facilitated by the ease of long-distance travel following major advances in seafaring. From the archaeological record, we know that trade goods and materials were moving across great distances in unprecedented quantities, but it is unclear how these patterns correlate with human mobility. To investigate population mobility and interactions directly, we sequenced the genomes of 30 ancient individuals from Carthaginian and Etruscan port cities around the central Mediterranean, in Tunisia, Sardinia, and central Italy. At all three locations, there is a meaningful contribution of autochthonous populations (from Bronze Age North Africa, Sardinia, and Italy, respectively), as well as highly heterogeneous ancestry including many individuals with ancestry from other parts of the Mediterranean region. These results highlight both the role of autochthonous populations and the extensive interconnectedness of populations in the Iron Age Mediterranean. By studying these trans-Mediterranean neighbors together, we explore the complex interplay between local continuity and mobility that shaped the Iron Age societies of the central Mediterranean.

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Baragona, Anthony (Freelance Conservation Scientist; University of Applied Arts Vienna) - Rodler, Alexandra (Austrian Archaeological Institute, Austrian Academy of Sciences; Department of Lithospheric Research, University of Vienna) - Tehrani, Rebecca (Dresden University of Fine Arts)

**Format:** Regular session

Four walls make a room, but what happens to them afterwards is what makes them “home”. During the Roman empire decorating wall-spaces was an integral part of ancient life and great effort, both technical and (often) financial, were made to transform a structural necessity into something that could uplift the spirit as well as communicate power and prestige through elaborate motifs and the use of expensive materials. Often this took the form of wall paintings, but decorative plaster, moldings, and tiles were used as well. Technological choices in ancient products and the provenance of resources are interesting meeting points for discussing cultural change and trade interactions in human history. Moreover, although it is a building-related art, the information we take from wall decorations is not always preserved in situ. Often, archaeological fragments are the only accessible resources, collections of which provide valuable information about their excavation, storage, conservation, and presentation history in addition to their archeological meaning.

An interdisciplinary dialogue between archaeologists, natural scientists, conservators, and curators is required to address the challenges of collection management and those related to the analysis of archaeological materials. We invite contributions that inspire this dialogue, and discuss their work on, e.g., the development of analytical instruments and techniques for cultural heritage research, production technology and provenance of materials used for wall paintings and other architectural elements. We also welcome contributions that address issues related to the conservation/restoration of wall paintings, representative and ethical sample selection, and storage, past and current display, and modern reconstruction of decorated wall surfaces.

## ABSTRACTS

### 1 FRAUD ON ROMAN PAINTED WALLS?

**Abstract author(s):** Becker, Hilary (Binghamton University, SUNY)

**Abstract format:** Oral

Occasionally, a mixture of pigments detected on a Roman wall painting, such as a cinnabar mixed with red ochre, is said to be adulterated. However, detecting that fraud happened in a particular instance on the walls is not possible. Being able to pinpoint the economic transactions behind the use of pigments used in a particular painting—and proving that fraud occurred in purchasing the pigments (and not a desire to save a denarius or to formulate a desired color blend) is not possible.

But such concerns raise a series of questions about the quality of pigments and whether pigments were adulterated in the Roman period. Fraud, adulteration, and substitution certainly did occur in the trade and sale of pigments and this paper will survey the evidence for such practices. At the same time, there were institutions in place that helped to safeguard patrons from being unwitting victims and purchasing poor materials.

### 2 TWO PHASES OF SECOND STYLE ADORNING THE DOMUS DEI BUCRANI (OSTIA ANTICA): THE TECHNICAL STUDY

**Abstract author(s):** Souris, Magali (University of Liège; Fonds de la Recherche Scientifique - FNRS) - Morard, Thomas - Defeyt, Catherine (University of Liège) - Frère, Géraldine (University of Namur) - Girard, Thibault - Herens, Élodie - Moffa, Lucie - Strivay, David (University of Liège)

**Abstract format:** Oral

The excavation and study led since 2010 by the University of Liège on the Domus dei Bucrani, a late Republican house situated on the parcel of the Schola del Traiano at Ostia Antica, delivered a very large amount of Second Style wall paintings found in situ and in a fragmentary state, both in excellent conditions of conservation. The stratigraphy of the site, the architectural context and archaeological artefacts make it possible to distinguish two decorating phases with an accurate chronology: a first phase dating from 60-50 B.C.E. was found in four rooms and a second one dating from 40-30 B.C.E. was adorning two other rooms. The stylistic study confirms clear differences between the two pictorial phases. The problematic which now has to be addressed is to determine whether distinctions also appear in the composition of the materials and in the pictorial techniques used for the production of the two groups of wall paintings. The technical study, initiated since the uncovering of the wall paintings in collaboration with the Parco Archeologico di Ostia Antica and currently being pursued within a doctoral thesis supported by the F.R.S.-FNRS, aims

to answer this question. The technological approach includes a thorough microscope examination and non-invasive archaeometric analyses such as punctual Raman and FT-IR spectroscopy, as well as punctual and mapping X-ray fluorescence spectroscopy.

The present contribution will describe the methodology and equipment developed to highlight the technical particularities of the pictorial production of the Domus dei Bucrani. It will discuss the features to consider in order to discriminate the two phases of Second Style and will present the preliminary results of the study.

### 3 INVESTIGATION OF THE EXTENT OF THE ROMAN WALL PAINTINGS IN THE AMBIENTE N. 40 OF VILLA ARIANNA (STABIAE)

**Abstract author(s):** Leitner, Simon Elio (Dresden University of Fine Arts)

**Abstract format:** Oral

This contribution concerns the investigation of the Ambiente n. 40 of the Villa Arianna at the archaeological site of Castellammare di Stabia, Italy. The villa dates from the Republican-Imperial Roman period (II-I Century B.C.), the room of concern was mainly used as a passageway to connect the representational part of the villa with the part reserved for servants. Nevertheless, the room was decorated with wall paintings in the IV style, of which the painting and plaster as well as later added conservation materials were studied. In addition to the material analysis, this contribution presents insights into the building history of the room as well new insights into the composition of the intonachino plasters and plastering technique.

Besides non-invasive optical investigations, micro-samples from selected areas were taken to both investigate the stratigraphy and characterise the intonachino plasters and its components, and thus better understand the historic painting technology. Polished cross-sections were microscopically investigated and SEM-EDS for qualitative analyses were applied. It was observed that the finishing plasters were given a specific colouring to enhance the saturation of certain colours, depending on the design of the wall paintings. The painting technique, also described in literature, was analytically verified. Besides the classical composition for white intonachino plaster, used in Vesuvian areas, generally prepared with crushed sparite and marble and pozzolanitic aggregates. An unfired ceramic aggregate was also added for an additional reddish intonachino plaster colour, which could be proven by scientific analyses (SEM-EDS) There is a presumption that the Romans deliberately used a reddish clay aggregate to exploit its technical properties.

Furthermore, the painting technique and the image representations in the room are detailed in the article, as well as the treatment of the archaeological architectural cultural property since its excavation is discussed.

### 4 BENEATH THE PICTURES, BEYOND THE BRICKS. USING WALL-PAINTING PLASTER AND MORTAR STRATIGRAPHY IN ARCHAEOLOGICAL INTERPRETATION

**Abstract author(s):** Baragona, Anthony (University of Applied Arts, Vienna)

**Abstract format:** Oral

Many tools can be used to establish the chronological development of an ancient building. However, the study of the plasters on which wall paintings are applied and the mortar from which walls are built is often overlooked. Dating a wall by the style of painting it bears is not without its risks – paintings can be touched-up, repainted or even completely removed and reattached. Likewise, bricks and ashlar that make up a wall are often recycled, and the reuse of these materials brings into question chronologies based on dating them. However, the mortars used in building a wall give a good idea of the latest date that the wall was assembled, and this information can be used to establish the chronological development of a building, how it changed over time.

This contribution discusses using the image-based methods of light microscopy, SEM/EDX and imaging FTIR, combined with digital image analysis, as applied to stratigraphic (transverse), polished petrographic thin sections of mortar samples from two structures at Ostia Antica: the Case a Giardino (painted plaster) and Taberne Finestrate (wall bedding mortar). In the case of the Taberne Finestrate, mortar analysis could be tied to several phases of development from the Hadrianic to Late Antique periods, while in the case of the Case a Giardino, building and rebuilding within the Hadrianic timeframe could be established.

This research made possible by and in collaboration with the project: "Archaeological context and virtual archaeology of a large roman housing complex – the Case a Giardino at Ostia Antica" (FWF P 31438-G 25) (FWF-Austria/ P. Ruggendorfer, ÖAI) and with Centro Studi Pittura Romana Ostiense (CeSPRo) (Ministero per i Beni e le Attività Culturali - Italy/ P. Tomassini).

## 5 BLUE WALLS: ON THE PROVENANCE OF EGYPTIAN BLUE PIGMENTS FROM ROMAN NORICUM

**Abstract author(s):** Rodler, Alexandra (Research Group Object Itineraries, Department Historical Archaeology, Austrian Archaeological Institute, Austrian Academy of Sciences; Department of Lithospheric Research, University of Vienna) - Arioli, Gilberto (Department of Geosciences, University of Padua) - Jansen, Moritz (Deutsches Bergbau-Museum Bochum) - Klein, Sabine (Deutsches Bergbau-Museum Bochum; Ruhr-Universität Bochum, Institut für Archäologische Wissenschaften) - Koeberl, Christian (Department of Lithospheric Research, University of Vienna) - Tepe, Nathalie - Hofmann, Thilo (Centre for Microbiology and Environmental Systems Science, Department for Environmental Geosciences, University of Vienna) - Fragnoli, Pamela (Research Group Object Itineraries, Department Historical Archaeology, Austrian Archaeological Institute, Austrian Academy of Sciences) - Dolenz, Heimo (Provincial Roman Archaeology & Field Research, Landesmuseum Kärnten) - Krajšek, Jure (Regional Museum of Celje)

**Abstract format:** Oral

Egyptian blue is a complex silica-calcite-copper multi-component material and indicator of both cross-craft interaction between pigment-, glass- and metal production technologies as well as an indicator of trade. This material was widely used as pigment for wall paintings throughout the Roman Empire – yet we know little about its production- and trade networks as only a few production workshops are known today.

Here, we investigate the provenance of copper that was used for producing Egyptian blue pigments sampled from Roman wall painting fragments. These fragments are from four sites in the peripheral province Noricum, which became part of the Roman Empire in the 1st century CE. New trace element and Pb-isotope data of Egyptian blue samples from the oldest Roman settlement at Magdalensberg (Carinthia) are similar to those from Pompeian wall painting fragments. Noric samples from later periods (2nd – 3rd c. CE) and the sites of Teurnia (Carinthia), Flavia Solva (Styria) and Celeia (Celje, Slovenia) form a slightly separated group. However, all match Hercynian-age deposits, for example, of the Southern Alps, Tuscany, Swiss and Slovakia.

An Egyptian blue production hub was established in the Bay of Naples in the 1st c. BCE that could have supplied Noricum with Egyptian blue. In turn, copper from various areas could have supplied this production hub. Large Egyptian blue finds at important trading cities in Noricum and without association to production workshops also attest to the role that this pigment had in trade. This work contributes to reconstructing economic networks that existed between Roman provinces.

## 6 SEEING RED WITHOUT FEELING BLUE: THE WALL PAINTING TECHNOLOGY OF ROMAN NORICUM

**Abstract author(s):** Baragona, Anthony (University of Applied Arts, Vienna) - Rodler, Alexandra (Austrian Academy of Sciences, Austrian Archaeological Institute; Department of Lithospheric Research, University of Vienna)

**Abstract format:** Oral

Most of today's Austria (as well as parts of Slovenia and Bavaria) was part of the alpine province of Noricum, formally incorporated into the Roman Empire in the first century C.E. This part of the Alps contained great mineral wealth and controlled many important mountain-passes; as trade flourished the area was quickly Romanized. This is reflected by surviving wall paintings exhibiting high proficiency in plastering technique and the typical pigments found throughout the Empire.

This contribution examines the differences that can be found in roughly contemporaneous Roman wall paintings from the Province of Noricum (e.g., Celeia (Celje, Slovenia) and Flavia Solva (southern Styria), Iuvavum (Salzburg) and Teurnia (western Carinthia)) and compares them to fragments found from more central parts of the Empire, e.g., Pompeii and Ephesus. Cross sections of painting fragments were examined by light microscopy, SEM/EDX and digital image analysis, while the chemical profile of the top paint layers was determined using in-situ, semi-quantitative elemental analysis by portable XRF. The sample fragments analysed used either Egyptian Blue, an artificial pigment that could be produced locally, or expensive Cinnabar/Vermillion (red), the ore of which is found in only a few places in the Mediterranean basin and therefore was extensively traded.

These methods were able to reveal the technical differences in how wall paintings were prepared, from arriccio to final paint application, e.g., differing methods of paint layer build-up. Areas painted with (widely traded) red cinnabar showed greater similarity in terms of plastering and paint layer build-up than those of (locally produced) Egyptian Blue, which tended to show more regional variation. This suggests a coupling of trade with technique, perhaps brought by the artisans themselves and are reflective of trade routes in the Alpine area.

## 7 FROM STORAGE TO EXHIBITION: CONSERVATION RESEARCH GIVES CENTRE STAGE TO 500 WALL PAINTING FRAGMENTS FROM A PROVINCIAL ROMAN STAGE THEATRE

**Abstract author(s):** Tehrani, Rebecca - Emprechtinger, Mara - Santner, Markus (Dresden University of Fine Arts)

**Abstract format:** Oral

Over 500 exceptionally well-preserved wall painting and stucco fragments can be assigned to the only known stage theatre (2nd century CE) in the Roman Province Noricum, in the Municipium Claudium Virunum. Once they decorat-

ed walls with various ornamental and figurative painting designs of high artistic and technical quality, comparable to the ones known from Pompeii.

After their excavation 150 years ago by the Carinthian Art Society, only some selected fragments were put on display in the 19th century but rejoined the others in storage after WWII.

Notwithstanding its archaeological significance, the former rich building decoration was thus kept withheld from the public display, until recently.

A bilateral research project, preparatory to the reopening of the Landesmuseum für Kärnten (LMK) now offers the chance to bring to centre stage the 500 wall painting fragments from Virunum. Since 2019 the collection has been investigated and conserved at the Dresden University of Fine Arts informing the fragments' display at the LMK in September 2022.

Through archival research, non-invasive optical, microscopic and multispectral investigations as well as various portable and analytical methods the painting technique was characterised, the fragments' condition surveyed, and altered conservation materials were detected. Thus, sister samples were identified, respective areas digitally reconstructed and an overall conservation approach with presentation concept developed and implemented.

This concept provides for the public display of most of the fragments demonstrating the complexity of the archaeological find in its fragmentary character. For its realisation a magnetic mounting system was developed and will be supplemented by digital resources to convey different stages in the fragments' life cycle. The contribution highlights the outcomes of the conservation research characterising the Roman painting technique and presents the conservation and mounting system. It further reflects on the handling of fragments and the selection for representative sampling, analysis and presentation.

## 8 THE HOUSE OF MEDUSA - EXCAVATION, INVESTIGATION, CONSERVATION AND PRESENTATION OF WALL PAINTING FRAGMENTS OF A LATE ROMAN VILLA

**Abstract author(s): Linke, Robert (Federal Monuments Authority) - Santner, Markus (Hochschule für bildende Künste Dresden) - Pintér, Farkas (Universität für Angewandte Kunst)**

**Abstract format: Oral**

Archaeological rescue excavations carried out by the Federal Monuments Authority Austria in Enns (Upper Austria) revealed remains of a Roman villa from the 3rd cent. A.D. which particularly were salvaged en bloc. In total, the find contained more than 2000 fragments of plaster, mainly covered with mural paintings from four different periods. Finally, an interdisciplinary project, which involved more than 25 archaeologists, conservators, scientists, art historians, curators and five different institutions gave interesting insights into cultural, social as well as technological and artistic aspects of that period. Finally, the project was presented in a special exhibition at the Kunsthistorisches Museum Vienna, which involved also the question of presenting mural paintings from different time periods and with joined layers.

This presentation focuses on the construction technique of the building as well as on the art technology of the mural decor. Microscopic analyses of the mortar show a sophisticated system of a combination of loam and lime binders. Further investigations identified pigments such as ochre, green earth, umbra and carbon black, which were applied in secco technique. For economic reasons, more expensive pigments, such as cinnabar and Egyptian blue, were used with a red base coat or with an organic binder. Comparisons with murals from Carnuntum and other archaeological sites in Austria emphasize the high artistic quality of the paintings and widen the knowledge on painting technology of that time.

## A. REDISCOVERING ROMAN ART TECHNIQUES: THE STUDY OF A PROVINCIAL ROMAN WALL PAINTING FRAGMENT FROM THE ANCIENT CITY OF VIRUNUM, AUSTRIA

**Abstract author(s): Stöcker, Eike (Dresden University of Fine Arts)**

**Abstract format: Poster**

In the 19th century more than 500 Roman wall painting and stucco fragments were excavated at the Municipium Claudium Virunum (Carinthia, Austria). One of the most convincing theories argues that these multifarious fragments belong of the only known provincial stage theatre in the ancient province Noricum.

In the scope of a multidisciplinary research and restoration project between the state museum of Carinthia called Landesmuseum für Kärnten (LMK) and the Dresden University of Fine Arts a diploma thesis contributed to the investigation and technical study of the Roman painting and stucco technique.

Due to its significance within the collection the inventoried wall painting fragment with stucco application, Object 41-1, from 2nd century CE was selected for the diploma in-depth study. It is one of only three examples of figural stucco designs preserved at the archaeological find of the stage theatre from Virunum. The Roman stucco half relief shows a woman dancing and holding an ancient musical instrument in her left hand. Her body is covered with a silk green blue garment contrasting the yellow ochre background. Shortly after its excavation, the fragment drew interest. Thus, in the 19th century Object 41-1 has been preserved, displayed, and a watercolour sketch was drawn. Therefore, the

fragment stands out today not only due to its filigree stucco relief but also because of its wooden frame, a testimony to the conservation and presentation practice in the 19th century.

This contribution focuses on the non-invasive multispectral investigations and analyses of micro samples which were used to investigate the material structure of the fragment. This process was supported by a photogrammetric survey and 3D printing of the figural stucco and allowed an authentic technical study and replication.

## **B. STUDY OF A SAMPLE OF EGYPTIAN BLUE FROM THE TOMB OF NEFERTARI (13TH CENTURY BC)**

**Abstract author(s):** Martín, Antonio - Martín, Alejandro (Universidad Internacional de La Rioja) - Ferré, Ivana (Universidad Nacional de Educación a Distancia)

**Abstract format:** Poster

Egyptian blue was the first colour pigment synthesised by mankind. It is a calcium copper phyllosilicate (CaCu-Si<sub>4</sub>O<sub>10</sub>), which in its natural form is the very rare mineral cuprorivaite. It is highly resistant to atmospheric agents and environmental pollutants including acids and alkalis. Hence, it has been used from Ancient Egypt and Mesopotamia, around 3000 BC, until the end of the Roman Empire.

The sample studied belongs to the tomb of Queen Nefertari-Meriemut, 19th Dynasty (13th century BC). The piece was embedded in resin, conventionally ground, and finally polished with  $\alpha$ -alumina (0.3  $\mu$ m). Without chemical attack, they were conveniently dried in a heat source at 35 °C for two hours. The samples were analysed by Optical Microscopy, and Scanning Electron Microscopy with EDX analysis. The identification of the pigments, and of the other compounds present in the binder and mortar support, was carried out by X-Ray Diffraction and EDSEDX analysis.

In the paint layer, we find quartz crystals, complex silicates of sodium, aluminium and calcium carbonates with magnesium as a minority. The presence of calcium carbonate is intended to give luminosity to the Egyptian blue pigment. The binder used was gum arabic, dissolved in water and added egg white.

The mortar layer is a stucco layer consisting basically of gypsum, with portions of lime and sand to give the background a greater consistency and luminosity.

The excavated limestone rock wall is a micro-fossiliferous limestone formed by the skeletons of coccoliths of the *Gephyrocapsa Oceanica* type.

## **C. EGYPTIAN BLUE FROM THE PALACE OF APRIES: ON THE PROVENANCE OF THE COPPER COMPONENT**

**Abstract author(s):** Rodler, Alexandra (Research Group Object Itineraries, Department Historical Archaeology, Austrian Archaeological Institute, Austrian Academy of Sciences; Department of Lithospheric Research, University of Vienna) - Brøns, Cecilie (Ny Carlsberg Glyptotek) - Tepe, Nathalie - Hofmann, Thilo (Centre for Microbiology and Environmental Systems Science, Department for Environmental Geosciences, University of Vienna) - Koeberl, Christian (Department of Lithospheric Research, University of Vienna) - Frei, Robert (Department of Geosciences and Natural Resource Management, University of Copenhagen) - Artioli, Gilberto (Department of Geosciences, University of Padua)

**Abstract format:** Poster

Recently, the geochemical provenance analysis of ancient colorants has opened new avenues in cultural heritage research and adds a new and important dimension to the analysis of ancient polychromy. In this study, we test a sampling method adopted from metal provenance studies. This is used for the provenance analysis of the copper compound of Egyptian blue pigments from a fragment of a painted relief from the Palace of Apries in Memphis, Egypt (26th Dynasty, ca. 589-568 BCE), which is part of the collection of the Ny Carlsberg Glyptotek, Denmark (inv. no. ÆIN 1052). Egyptian blue samples were collected and analyzed for their trace element- and Pb-isotope compositions. The rare earth element patterns suggest the use of similar raw materials for the analyzed Egyptian blue samples of this artifact. Based on Pb-isotope analysis, we propose that copper from the Arabian Shield might have been used for these pigments. Previous works have indicated the use of distant copper (Aegean) at an Egyptian blue production hub in Memphis, Egypt, as well as a similar copper source for Egyptian blue pigments from Bronze Age contexts from Egypt. This case study contributes to our growing understanding of trade in pigments and the organization of pigment production in the past.

## **D. MULTI-ANALYTICAL CHARACTERIZATION OF WALL-PAINTINGS FROM THE LATE ANTIQUE VILLA OF NEGRAR (VERONA, ITALY)**

**Abstract author(s):** Stella Mosimann, Federica - Dilaria, Simone (University of Padova, Department of Cultural Heritage)

**Abstract format:** Poster

The poster offers a preliminary characterization of mortars and pigments used in the making of wall-paintings of a 4th century AD Roman villa recently unburied near Negrar (Verona, Italy). In the course of the excavations, three pictorial

nucleii, originally constituting the ceilings and the wall revetments of the villa, have been uncovered. On the basis of their stylistic features and on stratigraphical relationships, the collapsed wall-paintings were credited to the original 4th century phase of the building.

Centimetre-sized samples were collected from representative portions of the painted nucleii, in order to get an adequate parameter of the number and thickness of the preparatory layers constituting the tectorium. Further micro-samplings were carried out on crucial areas (i.e. overpainted zones) of the decorations, in order to define the palette of the pigments, their microstratigraphy and the application technique (buon fresco, secco).

The analytical methods we adopted are those traditionally employed for the characterization of historical mortars and pigments: we used petrographic optical microscopy in transmitted light on thin sections to define the texture and the provenance of raw materials employed in the production of the mortars. This technique was corroborated by SEM-EDS semiquantitative analysis for the investigation of the chemistry of the binders.

Reflected light microscopy was useful to determine the microstratigraphy of pictorial patinas, whereas the mineralogical composition of the pigments was determined by X-Ray Powder Diffraction (XRPD) analysis, by mechanically scraping and analysing each pigment of the palette individually.

The multi-analytical approach we adopted for characterizing the materials and methods of production of the wall-paintings of the Roman villa of Negrar aims to constitute a new impulse for the knowledge of the Late Antique painting techniques, which were just marginally considered in the field of Roman Painting if compared with the traditional Four Pompeian styles so far.

---

## 392 THE ANTI-HABI TOOLKIT: PRACTICAL SOLUTIONS AND MEASURES FOR PREVENTING AND ADDRESSING HARASSMENT, ASSAULT, BULLYING AND INTIMIDATION IN ARCHAEOLOGY [AGE]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Coltofean-Arizancu, Laura (Archaeology and Gender in Europe - AGE - Community of the EAA) - Gaydarska, Bisserka (Durham University; Archaeology and Gender in Europe - AGE - Community of the EAA) - Hlad, Marta (Vrije Universiteit Brussel; Université Libre de Bruxelles; Archaeology and Gender in Europe - AGE - Community of the EAA)

**Format:** Discussion session

Recent research has shown that harassment, assault, bullying and intimidation (HABI) in archaeology can happen to anybody regardless of gender and age, in any archaeological setting and country. It has also shown that the spectrum of oppressive behaviours to which victims are subjected to is very broad and that, besides sexual harassment and assault, it also includes various other and even more frequently occurring forms of HABI, such as psychological harassment, power harassment, intimidation, gender- and age-based harassment, among others. This discussion session derives from the results of the 2020 and 2021 surveys on HABI in European archaeology, carried out by members of the Archaeology and Gender in Europe Community of the EAA and the Paye ta Truelle Collective. The session aims to take a step forward and bring together archaeologists, sociologists, anthropologists, psychologists, doctors, officers for equality, diversity and inclusion, as well as legal experts and social workers, among others, to discuss practical solutions for preventing and addressing HABI in archaeology. We welcome papers that examine various anti-HABI measures and actions that have been successfully or unsuccessfully implemented in various archaeological settings (e.g. fieldwork, universities, laboratories, museums, firms, conferences, etc.), as well as in other disciplines and non-archaeological institutions and organizations, both private and public. The session will end with a discussion in which the contributors' diverse expertise and multiple experiences will be put together in order to create an anti-HABI toolkit with basic safety principles and actions which archaeology students and practitioners can apply to prevent and address HABI regardless of the archaeological setting and country where they are.

## ABSTRACTS

### 1 POWER, PATRIMONY AND THE PRECARIAT IN ACADEMIC ARCHAEOLOGY: A CASE STUDY FROM IRELAND

**Abstract author(s):** Whitefield, Andrew (National University of Ireland, Galway)

**Abstract format:** Oral

This paper examines the impact of precarious employment on academic archaeology. It is argued that early (and some not so early) career academic archaeologists are especially vulnerable to discrimination and exploitation due to the huge power differentials that casualisation reinforces and maintains between colleagues. The wider archaeological profession is beset by low-pay and insecure employment, which may leave academic archaeologists more accepting of exploitative working conditions. Archaeology is a small and typically conservative discipline. Healthy academic debate and pluralistic research cannot flourish where a two-tier system leaves so many junior academics beholden to the patronage of the small cohort of tenured colleagues.

Remuneration in the academic 'gig' economy is often by the hour, and rarely recognises time spent preparing teaching materials or administrative and pastoral work, let alone training and career development. Women are disproportionately affected. The lack of women in senior academic roles inevitably restricts the availability of female role models and mentors. The predominantly male gatekeepers to the few secure junior academic positions are more likely to have followed a traditional career trajectory, and expect the same of junior colleagues. Caring responsibilities that typically coincide with career stages from post-doctoral work to tenure limit many women's (and some men's) capacity to follow uninterrupted career paths. Women that successfully navigate these obstacles, alongside colleagues that submit to precarious employment conditions, are likely to shoulder a disproportionate load of 'women's work'—teaching, pastoral and administrative duties. In either case, the volume of research outputs (the crucial metric in the male success model) will be compromised. How have such practises been contested, and what has been the outcome? Limited, though well-publicised, initiatives to increase the proportion of senior female academics perhaps offer some hope for the future. But what else can be done to stem the tide of casualisation?

## 2 #EXCAVATIONINPROGRESS – PRACTICAL EXAMPLES FROM THE SWEDISH MOVEMENT AGAINST SEXUAL HARASSMENT AND GENDER INEQUALITY

**Abstract author(s):** Bergerbrant, Sophie (Department of Historical Studies, Gothenburg University) - Aldén Rudd, Petra (Río Göteborg) - Berg, Ingrid (Centre for Integrated Research on Culture and Society - CIRCUS, Uppsala University)

**Abstract format:** Oral

As in many countries the #metoo-movement exploded in Sweden during the Autumn of 2017. Archaeologists gathered under the hashtag #excavationinprogress to protest against a historically situated culture of sexual harassment and discrimination at archaeological workplaces around the country. The paper aims to present the work done in Sweden over these past 5 years. The #metoo movement highlighted the need to actively work against both sexual harassment but also other types of bullying. We will highlight the importance of dealing with HABI when it occurs at workplaces, the work that has been done within the sector, and its outcomes. In order to do this we will bring up examples that worked and those that were less successful. We will show examples from different types of archaeological employers, from universities to contract archaeology. This in order to discuss the different needs and challenges facing the various branches of the diverse archaeological sector but also those that are the same.

## 3 WHERE DO WE DRAW THE LINE? LESSONS FROM WORKPLACE ANTI-HARASSMENT INTERVENTIONS

**Abstract author(s):** Hawkins, Kayt (Kathryn) (Institute of Archaeology, University College London) - Siddall, Ruth (University College London)

**Abstract format:** Oral

One of the best ways of preventing unacceptable behaviour is for people to know that they can report it when they experience or witness it, that their concerns will be heeded, and that they can find support and advice when it is needed. This paper looks at various initiatives undertaken in both academic and professional spaces by a single organisation. The institute of Archaeology at UCL has a world renowned academic archaeology department and also a very successful commercial archaeology section, Archaeology South-East. In 2018 the Dignity at Work scheme, which provides training alongside a suite of support measures to tackle unwanted behaviours became mandatory training for UCL staff. In addition to these measures, the Paye ta Truelle/Archeo-Sexism exhibition will be hosted at UCL in 2022, alongside a series of student-led seminars involving staff, students and archaeologists employed in commercial archaeology to explore the issues raised. How successful have these interventions been within both university and fieldwork settings? What lessons have been learnt? How can we further improve safety and ensure a safe, respectful work environment? These questions and more will be explored in this paper.

## 4 CHALLENGES FOR FOSTERING EQUALITY AND INTERSECTIONALITY AT THE UNIVERSITY OF BARCELONA: THE CASE OF THE INSTITUTE OF ARCHAEOLOGY (IAUB)

**Abstract author(s):** Pastor Pérez, Ana (Institute of Archaeology of the University of Barcelona - IAUB; Norwegian Institute for Cultural Heritage Research - NIKU; Research Group on Cultural Heritage Management of the Complutense University of Madrid - UCM.; Grup d'Arqueologia Pública i Patrimoni - GAPP) - Mas Florit, Catalina - Pecci, Alessandra - Plaza Conesa, Paula (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona - ERAAUB; Institut d'Arqueologia de la Universitat de Barcelona - IAUB) - Zarzuela Gutiérrez, Paloma (Grup d'Arqueologia Pública i Patrimoni - GAPP; Institut d'Arqueologia de la Universitat de Barcelona - IAUB)

**Abstract format:** Oral

Archaeological practice, both commercial and academic, in Spain and Catalonia, as in other countries, is embedded in patriarchy. Furthermore, the academic sphere is subject to a series of structural inequalities derived from tensions of power. This scenario limits the academic progression due to a number of gender or social class distinctions. In addition, more than ever, we are aware that verbal and sexual abuses of dominance are present in our ecosystem

(Voss 2021). From the recently formed Commission for Equality and Intersectionality of the Institute of Archaeology of the University of Barcelona (CII-IAUB) we work to generate safe spaces, both inside and outside the walls of our university.

In recent years, Catalan and Spanish universities and research institutes are activating harassment protocols and equality commissions. Their scope is the prevention of HABI and sexist attitudes (targeting women, gender dissenters, and members of LGBTQI+), but also pursuing some other claims including labour rights, parenthood, social kinship policies and wage gaps. The University of Barcelona is no exception, but its actions are limited by a lack of resources and skilled staff which means that there is no long-term sustainable investment. In contrast, our experiences show that non-institutional feminist associations are much more effective when it comes to preventing and acting against these situations. Our challenges as the Commission for Equality and Intersectionality (CII-IAUB) are focused on how and where to prioritise our actions, networking with other similar associations and assessing how effective official institutions are. In this paper we will try to present and discuss the roadmap and the tasks we have carried out to make this commission move forward and what are our challenges for the future.

Voss, B. L. (2021) 'Disrupting Cultures of Harassment in Archaeology: Social-Environmental and Trauma-Informed Approaches to Disciplinary Transformation'. *American Antiquity*, 3, 447-464. <https://doi.org/10.1017/aaq.2021.19>

## 5 WELFARE AND WELLBEING IN ARCHAEOLOGY – WHO IS RESPONSIBLE AND HOW CHANGE CAN BE GENERATED?

**Abstract author(s):** Coltofean-Arizancu, Laura - Gaydarska, Bisserka - Hlad, Marta (Archaeology and Gender in Europe - AGE - Community of the EAA)

**Abstract format:** Oral

Welfare and wellbeing are often used interchangeably, although they are not the same and have different understanding across disciplines and various parts of the world. Archaeology is not an exception and most often than not welfare means job security, fair pay and adequate working conditions. Wellbeing is more difficult to pinpoint but it is unquestionable that harassment-free studying and working environments would be a top priority. Yet, not only harassment, assault, bullying and intimidation (HABI) practices are widely spread but it is very unclear who is responsible for the uprooting of such practices.

This paper will share the difficulties of organizing a session aimed at practical solutions that can be offered to combat HABI practices. It hopes to open a discussion of who is responsible for the wellbeing of archaeologists and who has the power to bring structural changes if serious flaws in the wellbeing of students and professional archaeologists have been documented in various archaeological settings.

## SO MANY SETTLEMENTS SO FEW GRAVES? NEOLITHIC AND CHALCOLITHIC PRACTICES WITH THE DEAD IN CIRCUM PONTIC REGION AND SOUTHEASTERN EUROPE

**Theme:** 3. The Carpathian Basin: Integration, Mobility and Diversity

**Organisers:** Shatilo, Liudmyla (Institute of Archaeology NASU; Kiel University, Institute of Prehistoric and Protohistoric Archaeology) - Hofmann, Robert (Kiel University, Institute of Prehistoric and Protohistoric Archaeology; CRC 1266: "Scales of Transformation - Human-Environmental Interaction in Prehistoric and Archaic Societies") - Naumov, Goce (Goce Delcev University of Štip, Institute of History and Archaeology)

**Format:** Regular session

During the spread of the Neolithic and subsequent consolidation, adaptation, and further expansion of Neolithic and Chalcolithic communities into diverse landscapes of Anatolia, the Caucasus, Southeastern and Eastern Europe an extraordinary variety of practices related with death such as intramural depositions, kurgan graves, cemeteries, etc. can be observed. Some of these traditions, e.g. deposits in ditches or early burial mounds, create large distribution zones that usually extend far across the boundaries of 'archaeological cultures'. Many societies in this vast area are characterised by the absence of systematic burials and discoveries of 'practices' are rather an exception than a rule. Various explanations for this situation have been proposed which include the archaeologically invisible burial practices, or the use of other objects to build individual and collective identities. In addition, as recent discoveries suggest, this picture is partly the result of selective archaeological practice.

As session research questions, we would like to consider

- Types of burials and other practices with the dead, their spatial range (local, 'archaeological culture'-specific, trans-regional), their relationship to material culture and their qualitative and quantitative relation with the settlement record and total population.
- New discoveries in the study region in connection with the treatment of the dead; Are burials still under-recognised features?
- Methodological problems, new approaches and theoretical models that could explain better burials and practices associated with them.

- Modes of treatments of the deceased: Where and how the majority of population were buried and are there possible additional modes of treatment.
- How are the multiple practices with the death in general and the increasing frequency of regular burials (cemeteries, burial mounds) in particular connected to the historical processes of expansion, adaptation, and transformation; what role might the treatment of the dead have played in constructing group ideologies e.g. manifestation of identity?

## ABSTRACTS

### 1 NOT JUST ANOTHER BURIAL GROUND: THE EARLY NEOLITHIC DITCH BURIALS AT NOVA NADEZHDA IN UPPER THRACE

**Abstract author(s):** Bacvarov, Krum - Nikolova, Nikolina - Katsarov, Georgi - Tsurev, Atanas (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences) - McSweeney, Kathleen (School of History, Classics and Archaeology, University of Edinburgh)

**Abstract format:** Oral

Eighteen early Neolithic burial contexts containing the remains of 24 individuals were found at the prehistoric site of Nova Nadezhda in Bulgarian Thrace. The burial pits had been dug either in the fill of an enclosure ditch or along its inner edge or were directly associated with the intentional filling of the ditch. As this is the largest burial sample recovered from an early sixth millennium BC site in an area characterized by the absence of formal burial grounds and a scarceness of mortuary deposits, its analysis provides important insights into the social practices of the early farming communities.

This presentation will discuss the relevant contextual evidence from the site and will argue that the burials at Nova Nadezhda were part of a complex system of recurrent practices that seem to have been used by the local community to maintain social order and reproduction during a later phase of the settlement's life. Even though enclosure ditches and the practices related to them were integrated into the communal ideology on a regional and supra-regional scale, the evidence from Nova Nadezhda demonstrates a localized development which could also help to explain the patchiness of the early Neolithic burial record in the Balkans.

### 2 THE ABSENCE OF INTRAMURAL BURIALS IN NEOLITHIC PELAGONIA

**Abstract author(s):** Naumov, Goce (Center for Prehistoric Research; Museum of Macedonia)

**Abstract format:** Oral

Rituals associated with death are evident on various Neolithic sites in the Balkans. Burials of dead individuals are found inside settlements and rarely in organized necropolises while sometimes their remains, most frequently particular parts of the body, were deposited in various areas of the villages. Not rarely complete bodies or their parts were buried below house floors or very close to the buildings, but in several cases corporal relics were deposited in vessels exposed or dug within domestic space. The memorization of the dead was also accompanied by the production of human representations considering the principles of the embodiment and symbolic bodily hybridism. This variety of ritual practices and images associated with death indicate that the first farming societies in the Balkans essentially incorporated the idea of afterlife in their understanding of the world.

On other hand, there are regions in the Balkans where such demonstration of the ideas of death are not evident, at least in terms of burial practices. One of them is Pelagonia, a large elongated valley where first farming societies established hundreds of tells in various stages of the Neolithic. There are approximately 20 tells excavated so far and besides the impressive material culture and architecture there is total absence of burials. Although some of the tells were elaborately explored there was no evidence for any human remains or indications for deposition of body parts. Considering the number of funerary rituals in the Balkans such absence of burials on Pelagonian tells is surprising and therefore requires explanation in regard to material culture produced in these Neolithic villages. Also the environment of Pelagonia should be considered and particularly the funerary practices in later periods in order to understand better the notion of death among agricultural societies.

### 3 SO FEW GRAVES SO MANY SETTLEMENTS! THE CURIOUS CASE OF CHALCOLITHIC PEOPLE FROM SOUTHEASTERN ROMANIA (C. 5200-3900 BCE)

**Abstract author(s):** Covataru, Cristina - Toma, Andreea - Popescu, Gabriel - Petrache, Noria - Lazar, Catalin (ArchaeoSciences Division, ICUB, University of Bucharest)

**Abstract format:** Oral

The 5th millennium BC was the most flourishing period for the Chalcolithic civilization from Southeastern Europe, and it is known as the 'golden 5th millennium' because of the substantial progress made by human communities. However,

this development boom is probably due to a slow migration process of different human groups with a common origin in Southwestern Anatolia.

The current paper focuses on the cemeteries documented in Southeastern Romania between 5200-3900 cal. BC. The target area selected has been very populated in prehistory, with more than 200 settlements but less than 100 cemeteries documented.

This situation is curious, and various explanations have been given over time. However, over the past 15 years, our efforts have shown that the curious situation reflects only a lack of archaeological research, not a historical reality.

Consequently, we will focus on quantifying data related to graves and cemeteries in correlation to the indexed settlements to identify the actual dimension of the studied prehistoric populations. The funerary findings belonging to the Boian, Hamangia, Gumelnita and Salcuta "cultures" will be analyzed. The different types of data (e.g., cemeteries location, mortuary treatment, grave orientation, age/sex classes, genetic background, dietary models, natives vs newcomers, etc.) accumulated so far will be integrated, and different particular cases (e.g., Sultana, Gumelnița, Cernavoda, etc.) will be analyzed in detail.

This work was supported by a grant from the Ministry of Research, Innovation, and Digitisation, contract number 41PFE/30.12.2021, within PNCDI III.12.2021, within PNCDI III.

#### 4 DEATH IN FIRE? RECONSIDERING HUMAN REMAINS FROM THE TRIPOLYE SETTLEMENT KOSENIVKA, UKRAINE

**Abstract author(s):** Shatilo, Liudmyla (Institute of Archaeology of the National Academy of Science of Ukraine) - Fuchs, Katharina (Kiel University, Institute of Clinical Molecular Biology) - Hofmann, Robert (Kiel University, CRC 1266: "Scales of Transformation - Human-Environmental Interaction in Prehistoric and Archaic Societies")

**Abstract format:** Oral

In 2004, during excavations of a burned house structure in the Tripolye mega-settlement of Kosenivka (mid-4th millennium BC, near the modern city of Uman, central Ukraine), scattered remains of at least seven human individuals were discovered. This case is very important for Tripolye research, since only very few finds of human remains are known in this cultural complex. In Kosenivka, fragments of human bones lay in various places and showed different states of conservation: Bone fragments that were found within the house structure were calcined or burnt and those found in its immediate surroundings did not show traces of fire. The different locations and conditions of the bones led the excavators to the conclusion that these people had died during the burning of the house. Fifteen years after this discovery, our team re-examined the human remains based on an interdisciplinary approach including absolute dating, re-determination of sex, age and pathologies, stable isotope measurements and interpretation. In this paper we focus on the interpretation of the human deposits in the wider context of other Neolithic and Chalcolithic human deposits and communities in Southeast Europe.

#### 5 FUNERAL RITES AND RITUALS IN CUCUTENI CULTURE

**Abstract author(s):** Preoteasa, Constantin (Neamț National Museum Complex)

**Abstract format:** Oral

Usually famous by the quantity, quality and diversity of its remains, the Cucuteni culture is also distinguished by two other peculiarities: the burning of the buildings within the settlements and the lack of necropolises (cemeteries). This last aspect, corroborated with the high number of settlements and dwellings, raises a legitimate question: what happened to such a large population that lasted for ca. 1500 years on a territory of about 150,000 s.km?

Certainly, the few Cucuteni archaeological contexts with human bones cannot provide a satisfactory answer to this question.

Archaeological excavations carried out in the Cucuteni settlements (unfortunately sometimes lacking methodological accuracy) have led to the discovery of a very small number of human skeletons, parts of skeletons or bones (whole or fragmentary), intentionally buried, accidentally disposed or disparate, on which specialists have formulated various hypotheses, more or less credible, regarding the funeral rites and rituals.

Some of the burials, carried out exclusively within the settlements, were related to the sacralization of space (foundation rites), sacrificial burials to protect the community members, skull cult, ritual anthropophagy or having a symbolic commemorative role (cenotaph-graves, with generally rich inventory).

There are also skeletons with traces of medical procedures (trepanations) or the associations of human bones with deposits of ornaments and cult objects (the hoards of Cărbuna and Hăbășești, for example).

However, given the special importance of fire (through its purifying role) for the Cucuteni communities, we cannot exclude the possibility that the bodies of the dead may have been cremated and the ashes may have been spread in the field or in water, as an expression of humans beings communion with nature. We believe that such a hypothesis could explain in a more credible way both the absence of archaeological evidence on burial practices and the „disappearance" of the Cucuteni communities.

## GHOSTS AND ANCESTORS, PITS AND HOUSES: DIFFERENT APPROACHES OF THE RITE DE PASSAGE IN NEOLITHIC AND CHALCOLITHIC SOCIETIES

**Abstract author(s):** Mueller, Johannes (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

The difference between formal burials and missing graves is rooted in different ritual practices. They depend on the notion of death, which is linked to different socio-environmental approaches of past societies. As in domestic remains the difference between for instance permanently installed architecture and loose rubbish pits mark differences in domestic practices, presence and absence of Neolithic and Chalcolithic burial remains are of similar importance. Recently outlined difference between ghost and ancestor-approaches may play a role, which may be related to the basic economic conditions of societies. Thus, different aspects of transformation in ritual landscapes are visible.

These differences can be recognised exemplarily both in the Northern Pontic region and in South-Eastern Europe. A cyclical change in the worlds of imagination is certainly tied to different social transformation processes, the effects of which it indicates. Thus, structurally certain aspects of environmental development, demography, economy and technological change can be recognised with changes in settlement and burial behaviour. This might be linked to the interrelation between material worlds, landscapes and the human mind.

## MEDIEVAL STONE MONUMENTS: REUSE AND (RE)INTEGRATION

**Theme:** 2. [Re]integration

**Organisers:** Caval, Saša (University of Reading) - Busset, Anouk (Université de Lausanne)

**Format:** Regular session

Historical and artistic monuments made from stone are the most durable objects of our cultural heritage. Thus, the ideas of reintegration and reuse are truly relevant when it comes to carved stones – both from prehistoric stones reused or carved during the early medieval period and /or medieval carved stones built in religious and public buildings. These stone monuments relate to people's embodied experience and cognitive processing of their living environments. They materialize human mental representation of the past and promote respect for those who lived in prior times and different traditions. In that sense, carved stones participate in the formation of social memory.

For this session, in keeping with the general conference theme, we invite contributions about reintegration strategies, protocols and rituals, the reuse of stone monuments within landscapes and social environments, such as fortified settlements, roads and other infrastructure, and adaptive reuse in a historic urban landscape and further on.

### ABSTRACTS

1

## LOST, FOUND, AND REMADE: THE REINTEGRATION OF EARLY MEDIEVAL STONE MONUMENTS AS LOCAL HERITAGE ON INISHARK ISLAND, IRELAND

**Abstract author(s):** Lash, Ryan (University College Dublin)

**Abstract format:** Oral

As durable fragments of a valorized past, stone monuments from the early medieval period (c. 400-1100 CE) act as vital media for the commemoration and contextualization of ritual heritage in Ireland. Stone churches, huts, basins, grave-stones, eccentric pebbles, and variety of stone sculpture featured prominently in post-medieval pilgrimage traditions (18th-20th centuries) and in some cases still remain focal points of devotion and local identity. This paper examines how islanders of Inishark, off the west coast of Ireland, reintegrated the stone remnants of an early medieval monastery into local ritual and dwelling practices from c. 1650 – 1960 CE. These findings offer inspiration for contemporary heritage engagement strategies that focus on embodied experience and experimental archaeology.

Excavation of an early medieval stone hut, Clochán Leo, offers an exceptionally rich chronology of periodic re-engagement with a pilgrimage monument from the early medieval period until the 20th century. Post-medieval deposits in Clochán Leo provide evidence for the curation (and eventual loss) of carved cross-slabs, wall carvings, temporary hearths, and picnicking events within the hut. Adopting a sensory approach, this paper will argue that islanders gathered distinct ensembles of humans, stones, food items, and atmospheric conditions to create memorable and commemorative experiences that framed the present in relation to the past. Although Inishark was evacuated in 1960, the neighboring island of Inishbofin remains home to a vibrant community with a growing heritage tourism market. Inspired by findings at Clochán Leo, emerging research explores how heritage walking tours and experimental replication of carved stone objects offer means of exploring the sensory and commemorative dynamics of stone monuments in the past and in the future.

## 2 BUILDING WITH THE PAST. THE REUSE OF CARVED STONES IN EARLY MEDIEVAL GALICIA

**Abstract author(s):** Sanchez-Pardo, Jose Carlos (University of Santiago de Compostela)

**Abstract format:** Oral

This presentation will explore the different contexts for the intentional reuse of stone material in buildings (mainly churches) in Galicia (NW Spain) during the early middle ages. For doing this, we will base our work on an exhaustive revision of the archaeology of dozens of early medieval architectural remains in this region that we have conducted in the last 8 years. This has led us to a better knowledge of the chronology and productive process of many carved pieces. In a first part, we will focus on the practical reasons for the reuse of stone materials in this period in relation to the economic and technical context. Then, we will discuss the use of "spolia" (mainly roman stonework and reliefs) as a mechanism of social and political legitimization in churches. The final objective of this short presentation is to offer a first synthetic picture of the reuse of the past in early medieval Galicia in order to promote enriching comparisons and to debate it into the wider european scenario.

## 3 REDUCE, RE-USE, RECYCLE: THE MANY FATES OF MEDIEVAL STONE CROSSES ON THE ISLE OF MAN

**Abstract author(s):** Johnson, Andrew (Manx National Heritage)

**Abstract format:** Oral

The organisers' previous sessions have offered the opportunity to consider the carved medieval cross-slabs of the Isle of Man from a variety of perspectives, exploring both their geological sources and the landmark contribution of larger, intact stone monuments to the creation of special places – for instance the centres of later parishes.

By far the majority of the 200 stones so far found and identified are fragmentary however, and subsequent to their initial use as grave-markers and altar-fronts, have experienced a variety of fates which appear sometimes less glamorous than those which befell their more statuesque companions.

Cross-slabs have now been found in a range of secondary ecclesiastical contexts, including graves, shrines, chapels, churches, cathedrals and graveyard walls. Away from religious sites, they have been found put to use as secular landmarks and incorporated in the masonry of domestic and agricultural buildings.

The locations at which these monuments have been discovered, the circumstances of their re-use, and the degree to which they have been broken up and adapted for this have not been studied in great detail until now. The research that will be presented allows new interpretation both of the range of secondary uses to which the stones have been put, and implicit with these, the degree of respect that was accorded these objects, and how this has varied through time, down to the present day, when they are now objects of immense national pride and value.

## 4 THE HISTORY BEHIND THE STONES OF "OUR LADY

**Abstract author(s):** Hoxha, Zana (Institute of Albanology)

**Abstract format:** Oral

The medieval church "Our Lady of Ljevis" also known as "St. Friday" is a world heritage site. The history of the building can be divided into five main fazes. The first faze is the early Christian church of the 6th century. There stood a beautiful three nave basilica whose traces are still visible in the garden of the today's monument but also in the building itself. The second phase of this building is the church of King Milutin of the 13th century. The final architectural faze is the today's monument that still stand proud. The building was transformed into a mosque during the ottoman reign where a minaret was added but not altering the plan. In 1912, the church was brought back to its initial function. The reuse of the land and the materials serves as an evidence of the social life since late antiquity. This paper will give a detailed analysis of the building with an emphasis to the transformations that the building went through. Concluding, it will give an overview of the today's condition of the building and its usage.

## 5 THE CULTURAL AND RELIGIOUS RECYCLING OF STEĆCI

**Abstract author(s):** Caval, Saša (Scientific-research center of the SAZU)

**Abstract format:** Oral

The medieval funerary monuments known as stećci were raised in various parts of the Western Balkans between the 12th and 16th centuries. We can see them in Croatia, Montenegro, Serbia and particularly in Bosnia and Herzegovina. They are not attributed to any ethnic or religious group and have always been considered enigmatic, lacking a clear, explicit belonging. Their unique blending of traditions, religions, artistic and aesthetic expressions, as well as languages, characterizes a particular funerary phenomenon.

Over time, when communities lost their direct knowledge and practice of the stećci traditions, these tombstones were reused in many diverse ways outside of their original function. The present paper will address stećci in their secondary use: as architectural elements of the medieval and early modern roman-catholic, orthodox churches, as

well as in Islamic mosques and Jewish synagogues, and as supporters and communicators of folk beliefs, developed apart from the institutionalized religions in the area.

## 6 LOST AND FOUND, THE HISTORY OF EPITAPH SCULPTURES FROM THE CHURCH IN KONTOP, POLAND

**Abstract author(s):** Jasiak, Krzysztof - Gawroński, Jakub (Nicolaus Copernicus University in Toruń)

**Abstract format:** Oral

From the 16th century, the owners of Konotop (Lubuskie Voivodship) were the Dyrhem family, who were also founders of the local St. Anna's church. After their death, they were buried in brick crypts, and epitaphs with figures of the deceased were placed in the church. These epitaphs were the size of altars. Unfortunately, the events of the Second World War led to quite large changes in the interior of the church, including the aforementioned epitaphs. For a long time, it seemed that out of the two epitaphs 4 full-figure sculptures were lost. However, archaeological research of the outer northern crypt has revealed two of them. The fate of the others is still unknown. A kneeling figure of a woman in an adoring position was placed on the floor of the crypt, while the figure of a kneeling man in armor was thrown into a stone sarcophagus in which there was an earlier burial from around 1777. The discovered sandstone sculptures confirm the high craftsmanship of artists working in the Lubuskie region during the Renaissance. All elements of the man's armor were reproduced with great care. The spouse is depicted in a period dress with lots of haberdashery and a diadem on her head. After the excavation, the figures were secured and disinfected and then placed inside the church. Reintegration of the figures will be possible after the full conservation works of the sculptures along with the epitaph itself.

## 7 THE REUSE AND REVITALIZATION OF FORTIFICATIONS IN KOSOVO (CASE STUDY: THE FORTRESS OF PRIZREN AND THE FORTRESS OF VUSHTRRI)

**Abstract author(s):** Rama, Zana (Archaeological Institute of Kosovo)

**Abstract format:** Oral

One of the main characteristics of the late antique period in Kosovo, which in ancient times was known as Dardania, is the construction of fortifications. Those fortifications were located mainly on hills, with a dominant position, generally built on the remains of earlier settlements, from prehistory. These series of constructions came as a necessity for protection from the different tribe invasions and after a powerful earthquake in 518, which hit the region and destroyed 24 fortifications only in Dardania. Based on the descriptions of the scholar Procopius of Caesarea who left us the best data for the time, in his written "De Aedificiis" (On buildings), only during the rule of the emperor Justinian the Great, 8 fortifications were built and 61 others were rebuilt. A number of these fortifications have been rebuilt and used also during the Medieval Period or even later.

This paper presents the phases and the changes that occurred during the different periods of time in the Fortress of Prizren and the Fortress of Vushtrri, by giving a focus on the last conservation works and the revitalization and the reuse of the site and its architectural remains and structures for contemporary needs.

---

## 396 REENACTMENT AND LIVING MUSEUM – MAKE HISTORY ACCESSIBLE

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Abonyi, Zsannett (Budapest History Museum - Aquincum Museum) - Lenár, Vilmos György (Colonia Rosztallo Kulturális és Hadtörténeti Alapítvány; Eötvös Loránd University) - Burandt, Boris (State Office for Archaeological Heritage Protection, Rhineland)

**Format:** Regular session

Many museums today, while thoughtfully seeking after expanding the diversity and inclusivity of their interpretation, are often limited as object-dependent institutions with wonderful artifacts demonstrated in static displays. Instead of brooding over the lack of material culture to inform comprehensive interpretation, a people-centered approach can help to offer a more diverse exploration of the past. Giving a literal voice to historical events, rather than seeing only the museum items as things from a distant time is a strength of the living history approach from which museums of all kinds can learn.

Living history is an effective way to engage the public audience, while allowing for an interactive education which intrigues the minds of the audience both young and old. The interpretation of the past is not as simple as "emotional journeying" or "illusion". In fact it is embroiled in issues that museums and the wider field of archaeology also face — those of authenticity, authority, and reflexivity. Because historical reenactors are largely outside of the academic sphere, however, their responses to these issues provide a unique perspective. For most practitioners, there are two essential elements to living history: the pursuit of what is referred to as authenticity and the claim to make history accessible.

The historical reenactors and interpreters of historic sites receive the most mindful understanding of the past. They provide hands-on experiences and are also responsible for answering the public's questions, which at times can be very challenging. The professional field and reenactors have a lot to learn from one another, which contributes to reaching out the broader public with our cultural heritage and values of a higher standard.

## ABSTRACTS

### 1 BETTER TOGETHER - WAYS AND PATHS, HOW SCIENTIFIC APPROACH AND HISTORICAL REENACTMENT CAN GO HAND-IN-HAND

**Abstract author(s):** Abonyi, Zsanett (Budapesti Történeli Múzeum/ Budapest History Museum)

**Abstract format:** Oral

While at their beginning as cultural institutions the role of museums was to raise the public's level of education and culture, nowadays their role has become more diversified. To interpret material culture is more effectively, usually at a living museum; to test an archaeological thesis or to participate in an enjoyable activity that is also a learning experience. Learning about the past has increasingly come to include more engaging and multi-faceted activities. Historic interpreters can develop programming that gives the visitors a new and thought-provoking experience. The tangible elements, as well as the expert knowledge that reenactors provide, allow visitors to witness something truly unique and cannot be experienced anywhere else.

Many archaeological and historical museums choose to interpret history using the method of living history, or reenactments. For the visitor to have an informative and enjoyable experience, the historic interpreters need to make the information accessible, understandable, and be able to connect them to the historic site. With this in mind professional forum takes place as a regular event at the Aquincum Museum, which is a good opportunity for archaeologists and collection curators to present the reenactors such original artefacts and knowledge, which they can put to use later on. In return the reenactors can share their hands-on experience with museum professionals. The aim of the workshops is to create a personal platform for archaeologists in our and other institutions, as well as reenactors and museum education specialists.

This paper investigates aspects of opportunities for cooperation and presents its benefits.

### 2 REENACTMENT AS A PROJECT OF PARTICIPATION

**Abstract author(s):** Toulouse, Catherine - Lengyel, Dominik (BTU Brandenburg University of Technology Cottbus-Senftenberg)

**Abstract format:** Oral

Reenactment is often used with so-called reconstructions to convey archaeology in an emotionally appealing way. Accessibility takes precedence over authenticity. For architectural hypotheses, we have developed the method of visualisation of uncertainty, which through the design of abstraction allows archaeology to be communicated in a way that is both close to science and at the same time vivid. Thus we have visualised cultural heritage in close cooperation with archaeologists and cultural institutions, such as – for the German Archaeological Institute DAI – Pergamon, the Palatine, the baths in Pompeii and an Umayyad garden near Cordoba, for the Egyptian museums in Berlin and Munich the royal city of Naga, and for Cologne Cathedral its building history since Roman times. Reenactment is a special challenge here, since it involves the act of real people. In our actual research project we are dealing with an amphitheatre that requires considerable imagination and meaningful visualisations. Since it is located in a cultural area whose current cultural and political focus is precisely not on the Greco-Roman past, the claim of our people-centred approach to making history accessible is not only that of authenticity. A separate project funding by a private foundation for historical humanities serves to engage the public. Local workshops are to produce physical models of architecture as well as antique clothing, which are to serve as a means of communicating the ancient world. Instead of static displays, the local museum as an object-dependant institution will enable schoolchildren of the next generation to explore the past – via reenactment. Through interactive education, they should get to know architecture and clothing as a reflection of ancient society, in order to learn that there are alternative ways of life to their own: cultural heritage as a value of a higher standard.

### 3 REENACTMENT AND ACADEMIA - A RELATIONSHIP WITH OBSTACLES

**Abstract author(s):** Burandt, Boris (Archaeological Museum Burg Linn, Krefeld)

**Abstract format:** Oral

Since many years, reenactment enjoys increasing popularity and just like the number of events in museums or archaeological parks, also the number of groups dedicated to the representation of certain periods of time has grown continuously. In addition to TV documentaries, popular science publications and museums, reenactors are now decisively shaping the perception of a particular epoch in the general public. However, the responsibility that arises

from this is rarely seen in academia. And so is the massive potential of reenactment as a tool to impart archaeological and historic knowledge low-threshold. This rejection on the part of the professional world in turn causes various problems on the part of the reenactors. Mistrust and a still missing handout between reenactment and archeology stand in the way of the necessary professionalization of the community and solid quality management. The proposed contribution will focus on the different and difficult aspects of symbiotic potential of reenactment and academic archaeology, whereby the author can draw on his experience as a professional archaeologist and his now twenty years as a re-enactor.

#### **4 NEW POSSIBILITIES OF RECONSTRUCTIONIST APPROACH IN REENACTMENT AND MUSEUM PRESENTATIONS**

**Abstract author(s):** Lenár, Vilmos (Colonia Rostallo Kulturális és Hadtörténelmi Alapítvány; Eötvös Loránd University)

**Abstract format:** Oral

In reenactment, and more promptly in roman military reenactment there is a trend to use a broad periodization to describe what we see on display by a group or individual. With these big time intervals, the groups might give a false impression of roman equipment or clothing tradition. Choosing strict time periods and not whole centuries with focusing on one region (in our case for example a provincial), a lot of opportunities arise in displaying the evolution of romanitas (in terms of looks or fashion trends) or comparing different regions of the Empire, how the people of given provinces dressed. My opinion and experiences are, that if a group really tries a professional and thought out approach, it can represent the typical outlook of a roman civilian or military personnel of the principate in the time period of an emperor (or 20-30 years) with only small compromises or using a hypothesis regarding pieces of equipment. This strategy however seems still new and needs a lot more discussion to really take its footing in Hungary. The Colonia Rostallo Cultural and Military History Foundation is trying to advertise this approach (choosing the late-Flavian period in Pannonia provincia as the aim of the representation) working closely with the Aquincum Museum to create a living history experience, where the visitors of museum events can give themselves in to the immersion of a living, breathing environment in a specific moment in the past, where the details are also as authentic as possible due to close working relationship with the museum, archaeologists and reenactors.

#### **5 PROFESSIONALISING LIVING HISTORY: THE ROCKY ROAD TO RECOGNITION OF INHERENT EXPERTISE**

**Abstract author(s):** Frank, Geza (Living History)

**Abstract format:** Oral

As living history events and museums with reconstructed historic infrastructure steadily gain popularity with local and international audiences, we witness a parallel professionalisation of living history. This professionalisation is expressed not only through a rising number of specialised craftsmen and companies that provide historic replicas to a growing market, but also through the rise of specific methodology and expertise. Though this expertise is increasingly in demand in the fields of museology, experimental archaeology and heritage protection, primarily as means of outreach, there are inherent trust issues at the core of most relationships between living history initiatives and academic surroundings. More often than not these issues lead to mutual frustrations. In order to illustrate the inherent nature of these frustrations, three examples of cooperation between living history and museums, universities and project consortia will be analysed. The "Living-History Guidelines" of the Interreg DTP Project "Living Danube Limes" will serve as a starting point for an analysis of possible ways to formalise the interaction between living history insiders and outsider in order to understand and forestall systematic frustrations. The key to unlock the vast potential of passion and laymen driven living history for outreach and heritage preservation, lies with the recognition of its specific expertise and the understanding of the scope of current possibilities in regards to creating congruent and immersive experiences.

#### **6 THE HISTORICAL REENACTMENT IN HUNGARY**

**Abstract author(s):** Simó, Márton (ethnographer; museologist)

**Abstract format:** Oral

The Hungarian military tradition-preserving / historical replay/reenactment groups have a high social embeddedness both in Hungary and internationally. Among the Hungarians in the Carpathian Basin, the topic of preserving traditions is closely connected with the issue of national identity, a trend that can be observed from the first half of the 20th century to the present day. The phenomenon of historical repetition (reenacting, reenactment), which I present in more depth in my dissertation, began to unfold in the 1960s and 1970s, and today seems to be coming to an end. Everything that can be observed during the historical replay dates back thousands, hundreds of years, so the authentic reconstruction is based on archeological finds, historical data, art historical and ethnographic heritage. My dissertation aims to carry out a summary and overview study of the military tradition preservation / replay groups in the Carpathian Basin. With the aim of highlighting the real social role of the movement and the fact that historical replay is a subculture rather than a weekend hobby for the participants.

During the course of my research, I relied on Hungarian articles published abroad on the topic, mainly dealing with museum interpretation and experience theater. The source material of my work is provided by my personal experience, the data obtained during the participant observation, as well as the information of the questionnaire developed by me and filled out by one hundred and sixty people and several in-depth interviews.

My paper is also my dissertation written at the Institute of Ethnography of Eötvös Loránd University and successfully defended in 2021.

## 7 DANUVINA ALACRIS - MAKING HISTORY ACCESSIBLE THROUGH A ROMAN RECONSTRUCTED SHIP

**Abstract author(s):** Pálóczi, Réka (Kulturális Örökség Menedzserek Egyesülete)

**Abstract format:** Oral

How can a wider public, history enthusiasts, archaeologists, cultural institutions, touristic bodies, scientists, artists, and other stakeholders benefit from the presence of a rebuilt archaeological ship?

The Interreg project "Living Danube Limes" aims to further develop and enhance the connecting aspects of the Roman heritage sites along the Danube and to combine the tangible and intangible heritage by stressing the common history. As project partner, KÖME- Association of Cultural Heritage Managers is mainly involved in organizing activities in order to disseminate the universal value of Roman heritage through a reconstructed Roman lusoria ship, called Danuvina Alacris. The ship will be cruising along the Danube from Germany all the way to the Black Sea and each pilot site (in Hungary the auxiliary castellum of Matrica) and the whole country can benefit from the presence of this unique living historical object. The ship arrives in Hungarian territory at the beginning of August, 2022 and leaves the country at the end of the month. This lusoria ship is an opportunity to combine experimental archaeology, scientific research and social involvement, and to practically promote the values and accessibility of our common Roman heritage. In our presentation, we share our practical experiences, we show the benefits, unexpected results and possible obstacles as well of the organization of such an unparalleled cruise ship and event series to encourage the audience and similar initiatives to grow.

## 8 FAST OR SLOW FASHION APPROACH IN LIVING ARCHAEOLOGICAL INTERPRETATIONS AND NARRATIVES? A FROM-DATA-TO-INTERPRETATION EXPERIENCE WITH ROMAN TEXTILE-REFURBISHING WORKSHOPS

**Abstract author(s):** Pásztfókai-Szeoke, Judit (freelance archaeologist)

**Abstract format:** Oral

During their usage, garments get dirty and damaged. Every information concerning their cleansing, darning, mending or in one word: their refurbishing is extremely helpful in shedding light to their individual (hi)story or biography.

Two textile refurbishing workshops in Roman Pannonia (Savaria and Siscia) yielded an abundant corpus of textile tools and inscribed commercial lead tags. Tools in general are a very useful source for the textile technologies applied locally by the workers. The tags were used as ID-labels for valuable garments entrusted by clients to the care of these workshops for refurbishing them.

The archaeological finds from these workshops allow us a slow-fashioned interdisciplinary, from-excavation-to-experiential-archaeology approach to study the materiality of clothes, clothing; the everyday dress practices of the local wardrobes and to understand the everyday consumption of clothing in Pannonia. Under everyday consumption of clothing, beyond its acquisition and maintenance, cleanliness and disposal are also understood.

Beyond these archaeological wardrobe studies, our research also has an embedded humanistic approach to explore experimentally e.g. the tacit knowledge and work experience of the Roman craftsmen, the most probable chaîne opératoire and the sensory landscape (e.g. smellscape) of the textile refurbishing processes, etc.

This proposed paper would also argue the benefits of more sustainable, although slow-fashioned living Roman archaeology in Hungarian museums, besides spinning tales from patchy information sometimes creatively pinned together.

## 9 PRESENTING ROMAN GLASS VESSELS FROM THE AQUINCUM CIVIL TOWN

**Abstract author(s):** Kelemen, Zsófia (Budapest History Museum)

**Abstract format:** Oral

Although archaeological research has been taking place at the Aquincum Museum for more than a century, little attention has been paid to the presence of items made of glass. The only paper written specifically about the glass vessels in our collection was published in 1958. Since then, glass vessels have only been discussed from burial context, and only a few unique findings have been published. With the analysis of the glass fragments from the North-eastern quarter, it became possible to examine the use of glass in urban setting in the Roman era Aquincum for the first time. The surprisingly large quantity of vessel forms and everyday objects made from glass yielded a much needed insight

not only into the economical and commercial relations of the inhabitants of the city, but the important role glass played in the roman way of living.

In my presentation I would like to discuss not merely the results of my research but the opportunities it could bring forth in presenting roman glass to the wider audiences.

## 10 THE WAYS OF HISTORICAL RECONSTRUCTION IN THE XXITH CENTURY

**Abstract author(s):** Mestellér, János (Foedus Orientalis Cultural Association; Kazár Bazár)

**Abstract format:** Oral

During the past decade connection between the institutional scene (Archeological Institutes, Museums, various researchers) and the reenactor/living historian community strengthened. This is visible not only in Hungary, but countries all over Europe. A new committed society emerged from the reenactor world, who are generally well-trained in certain fields, has up-to-date information and deep knowledge in certain literature what is connected to their research field. In certain cases such individuals or groups could be great help to an institute not only propagating museum or institute activities for the public in certain events, but also in the field during excavations, find identification and reconstruction procedures, and bring in new ideas and approach to a certain field.

My presentation is about to demonstrate a few successful cooperations from the past few years when the reenactor community could successfully and effectively cooperate with institutes and achieve spectacular projects what results were viewed by thousands. Such as mannequin reconstructions for the World of Hunting and Nature Exhibition or Museums, or archeological item reconstructions like the making of the Zemplén cup or new ways of publishing significant objects, such as the documentation and 3D scanning of the Pécs helmet.

## 11 PERFORMING ETHNICISM? EARLY MEDIEVAL RE-ENACTMENT AS PART OF RADICAL RIGHT-WING SUBCULTURE IN CENTRAL EUROPE

**Abstract author(s):** Reichenbach, Karin (Leibniz-Institute for the History and Culture of Eastern Europe - GWZO)

**Abstract format:** Oral

The Festival of Slavs and Vikings at Wolin has been repeatedly discussed as being not only an annual re-enactment festival of international scale but also a meeting point for radical right-wing enthusiasts of the Pagan past. Thus, the paper aims to focus on the intersections of ethno-nationalist Neopaganism and related radical music scenes with the right-wing fringe of re-enactment culture. Based on examples from Germany, Poland and Hungary, it will draw attention to a problematic side of historical re-enactment when it does not serve as a means of history education, but rather as a performance of identity discourse and politics in front of a large audience. With different levels of official authorisation through institutional integration and governmental financial support, reflection and critical assessment of the potential and limits of re-enactment as an approach to the past is necessary. Even more important seems a discussion about authenticity concepts and societal ideas which in performances of Vikings, Slaves and Germanic tribes seems especially often related to essentialist concepts of culture and ethnicity or even racism. The paper will address these questions and provide a detailed insight into the darker dimensions of popular history culture.

## 12 FROM AN ARCHAEOLOGICAL SITE TO A NOBLE FEAST – HISTORICAL AND EXPERIMENTAL COOKING PRACTICE IN HUNGARY

**Abstract author(s):** Zay, Orsolya (Dobó István Vármúzeum)

**Abstract format:** Oral

There is no doubt eating is one of the most important and interesting topic in every culture. Everybody can easily talk about dining, and everybody has its own idea how, when and what to eat to be healthy or feel delighted. In Hungary the epochs before the 19th century have a stronger tone in the last few years among the researchers. Besides historical sources archaeology can help us to recreate food of the ancient times. Experimental archaeology completed our knowledge and dragged more information from other professional disciplines such as ethnology, botany, archaeozoology, pottery making or modern cuisine. Summarizing our experiences we gain better insight to the daily and ceremonial dining of past ages with written and visual sources, archaeological findings and historical tests.

I deal with the gastronomy of the 15-17th centuries in Europe and the Carpathian basin. We made menus and tried technical methods of this period during the last 10 years with researchers and volunteers at smaller historical festivals and at two major museum sites, the Mátyás király Museum in Visegrád and the Rákóczi Múzeum in Sárospatak. Both of these institutions are connected to the Hungarian National Museum and provided us historically correct locations for experimental cooking tests. The projects were timed to historical festivals, where both historical reenactors and museum visitors came to these cultural sites. In this way we were able to test a historically accurate process of cooking, arrange an authentic medieval feast and make a living history program for visitors.

**Abstract author(s):** Sebo, Béla (No)

**Abstract format:** Oral

Is there a chance that history, archaeology and social sciences can get a place on the market? Is there a chance that human science can produce profit? We see some examples here and there, but is there a rule, a system, what could be used to make education partly or fully profitable?

These were my questions, when i started my research. The first step was, to find a slice of the cake of education, which has no real representation on the market until now. I choose historical reenactment. I started to research the social and economic background of these groups and individuals. I started to map the resources and the behaviour on the market, and the different, alternative application possibilities of the special skill set of the reenactor.

I can show possibilities to make historical education profitable. The market areas, which can be open to use history, archaeology, social sciences to produce new possibilities to the world of reenactment.

### ARCHAEOLOGICAL PROSPECTION AND FIELD EVALUATION PRACTICE FROM BOLOGNA PROCESS TO CONVENTION OF LA VALETTA. DO WE PRACTICE WHAT WE PREACH? [ARCHAEOLOGICAL PROSPECTION]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Verhegge, Jeroen (Ghent University-Department of Archaeology; Ghent University-Department of Environment) - De Smedt, Philippe (Ghent University-Department of Environment; Ghent University-Department of Archaeology) - Sarris, Apostolos (University of Cyprus-Department of History and Archaeology) - Simon, François-Xavier (Institut national de recherches archéologiques préventives, Direction Scientifique et Technique; Laboratoire Chrono-environnement – CNRS – UFC - UMR 6249)

**Format:** Regular session

Over the past decades, prospection approaches using well-established techniques have been complemented by less invasive technologies according to the Valetta recommendations. Nowadays, integrating various complementary prospection methods are applied in academic research projects and often taught as such to archaeology students. However, the application of these methods in development-led archaeology is often challenging due to the differing finality. Development-led archaeology is usually required to investigate all archaeology of a place due to the threat of destruction, while academic archeological prospection or unthreatened archaeological resource management aims to resolve more targeted research questions. In addition, development-led archaeological prospection often does not focus on non-destructiveness, because in-situ preservation is not compatible with the expected endpoint (archaeological site destruction and new building construction), despite the Valletta convention's preference for non-destructive methods of investigation (article 3.I.b) and in situ preservation (article 4.II). Therefore, many European countries rely on e.g. systematic trial trenching and, to a lesser extent, less invasive techniques ahead of developments. Merging both approaches requires tailored approaches and is irregular depending on the local legislation.

This session aims to address topics such as:

- Teaching practices in archaeological prospection/field evaluation
- Relationships between academic and development-led archaeological prospection practices
- Differences in the implementation of less destructive methods of investigation. Is this related to legislation, the environmental context, research traditions, recent developments?
- The under- or over-application of less destructive methods in these contexts. What are the ensuing risks and opportunities for archaeological resource management?
- Novel research in invasive sampling designs and prospection strategies across Europe. Why are these (not) preferred to non-invasive methods?
- How do we deal with the unavoidable uncertainty of archaeological prospection methods, especially in development-led site evaluations?

We invite national, regional, landscape- or site- specific overviews or case studies in academic research; teaching and archaeological resource management, and particularly development-led archaeology.

**1 APPLYING NON-INTRUSIVE METHOD “WHENEVER POSSIBLE?” - THE VALETTA CONVENTION AND THE ICOMOS CHARTER AS SEEN FROM NORWEGIAN HERITAGE MANAGEMENT VIEWPOINT**

**Abstract author(s):** Stamnes, Arne (NTNU University Museum, Dept. of Archaeology and Cultural History; The National Museum of Denmark, Dept. of Ancient cultures of Danish and the Mediterran; Aarhus University, Dept. of Geoscience)

**Abstract format:** Oral

International Charters and Conventions are important documents that countries can choose to ratify. From a legal point of view, charters are political statements that are not legally binding but still ensure that the country agrees on a political obligation. Signing the ratification of a Convention, on the other hand, commits a country to include its content within the domestic legal system. Both the European Convention on the Protection of the Archaeological Heritage (The Valetta Convention) from 1992 and the ICOMOS Charter for the Protection and Management of the Archaeological Heritage from 1990 have statements encouraging the use of non-destructive methods. While it is not defined what these “non-destructive” methods are in practice, the explanatory report to the Valetta Treaty emphasises that “excavation is to be regarded as the ultimate step in seeking information – not the normal method. Non-destructive methods are to be used wherever possible”.

Similarly, the ICOMOS charter clearly states that “Non-Destructive techniques, aerial or ground survey, and sampling should therefore be encouraged wherever possible, in preference to total excavation”. These statements were made in the infancy of geophysical survey methods. In the last 30 years, geophysical methods had undergone enormous technical development and have proven a wide range of applications than demonstrated when they were drafted and ratified. Indeed, this then should have encouraged an increased usage of non-destructive methods? Has the Heritage Management fully committed to these Charters and Treaties? An analysis of all written public documents regarding Norwegian Heritage Management, has shown that this had not necessarily been the case, but developments have been made. This presentation will analyse what role these documents have had on the status, role and acceptance of geophysical methods within the Norwegian Cultural Heritage Management System, or the lack thereof.

**2 THE USE OF NON-DESTRUCTIVE METHODS WITHIN DEVELOPMENT-LED PROSPECTION. NEW EXPERIENCES FROM MØRE & ROMSDAL, NORWAY**

**Abstract author(s):** Dahle, Kristoffer (NTNU University Museum; Møre & Romsdal County)

**Abstract format:** Oral

As a regional cultural heritage authority, Møre & Romsdal County is responsible for conducting archaeological prospections prior to development according to the Norwegian Cultural Heritage Act. In line with the Valetta recommendations, the County has gradually complemented its toolbox with less invasive digital technologies such as LiDAR and GPR.

From 2021-2025 the County and the Norwegian Research Council have financed a PhD on the use, applicability and potential of non-destructive methods on sub-alpine shielings or summer farms. This is a common site category rarely subject to development-led archaeology, both due to its peripheral location and lack of threats as well as the general appreciation and in situ conservation of present-day mountains landscapes. As a consequence, however, our knowledge on prehistoric and medieval transhumance is sparse.

This paper will present some preliminary results from the PhD-study, regarding strengths and weaknesses of different non-invasive methods (drone, geophysics) in various outland terrains. It will further discuss some general and practical experiences, possibilities and challenges in using non-invasive methods within development-led prospection.

**3 LARGE INFRASTRUCTURE CONSTRUCTIONS - AN INTEGRATION OF ARCHAEOGEOPHYSICAL PROSPECTION IN TO THE DEVELOPMENT-LED ARCHAEOLOGY IN THE CZECH REPUBLIC**

**Abstract author(s):** Tencer, Tomáš - Milo, Peter (Masaryk University; Faculty of Arts; Department of Archaeology and Museology) - Hlas, Jindřich - Zezula, Michal (The National Heritage Institute, Regional Office Opava) - Šálka, David - Havelka, Jan - Vágner, Michal (Masaryk University; Faculty of Arts; Department of Archaeology and Museology)

**Abstract format:** Oral

A tight schedule, limited budget and human resources are the main characteristics of large infrastructure construction projects.

The application of archaeological prospection methods becomes necessary when planning such projects. Since a non-destructive approach to archaeological excavation is not enshrined in Czech legislation, neither the methods are unified. Estimating the cost of the excavation is usually the first reason for using non-destructive prospecting methods. In combination with GIS analyses, well-established approaches (field survey, aerial archaeology etc.) will

significantly improve the chances of the correct time and cost estimation. However, these methods often require a broader timeframe for their successful implementation, such as suitable vegetation or climatic conditions. Despite the undeniable advantages, the picture provided by these methods is often limited and is also time-consuming. It is usually impossible to systematically survey the entire area; thus, we create blank spots. Since development-led archaeology is usually required to investigate all archaeology due to the threat of destruction. These areas pose a potential risk from both an investor and heritage management perspective. At this stage, usually, archaeogeophysical prospection comes to help. In the infrastructure constructions environment, it is mainly magnetometry. Motorized magnetometry systems offer an effective approach to filling the map's white spots.

We did several such geophysical surveys on roads, highways or gas pipelines within the last couple of years. Cooperation with archaeological and heritage management bodies and investors demonstrates the advantages of archaeogeophysical prospection. It also points out the weaknesses of the traditional excavation and prospection method used in development-led archaeology. Our paper will present some infrastructure projects in the Czech Republic and the process leading to archaeological research.

The paper was supported by project No TL03000537 of the Technology Agency of the Czech Republic (TAČR). - Optimized archaeological prediction in the process of large-scale construction sites.

#### **4 ARCHAEOLOGICAL PROSPECTION IN THE NETHERLANDS VIEWED FROM A COMMERCIAL COMPANY**

**Abstract author(s): Orbons, Joep (ArcheoPro)**

**Abstract format: Oral**

From the mid 1990s, archaeology in The Netherlands opened up to commercial companies. An archaeological working standard was developed, a national database created and in 2007 a heritage law became active that fully implemented the Valetta convention. A zooming in system of research steps was created starting with a desktop study, a scouting phase, a mapping phase, a validation phase ending with an excavation. At the end of every step, a selection-deselection decision is made. A split was made with prospection and excavation work. To assist this process, archaeological predictive maps were made.

The commercial company ArcheoPro was set up in 2004 to provide specialist prospection services, only doing the prospection part of the archaeological steps. We experience the good and the bad parts of this method of working. This way of working resulted in many good surveys. In many projects there is a good cooperation with local people, developers who incorporate archaeology into their building projects and transparent decision processes when archaeology is deselected.

But not all is well. There is very little feedback down the steps in this process. What did the prospections miss when the site is excavated? Companies tend to stick to their known methods. Augering is the tool of choice for most Dutch companies. It is very hard to introduce geophysics, remote sensing and other new methods. New methods are either distrusted or overrated and shifted to the side if it doesn't work out as expected although the Dutch State Archaeological service promotes new methods. The complicated Dutch soil situation and the high level of urban landscapes do not help introducing these new methods. We work together to improve the prospection steps as it is the first selection in archaeology to arrive at the best archaeology.

#### **5 TARTARIA - PODU TARTARIEI VEST. IDENTIFYING A SITE BY DEVELOPMENT-LED ARCHAEOLOGY AND SETTING UP A SCHEDULED MULTI-ANNUAL RESEARCH PROGRAM**

**Abstract author(s): Bors, Corina Ioana (National History Museum of Romania - MNIR) - Asandulesei, Andrei - Tencariu, Felix ("Alexandru Ioan Cuza" University - Iasi) - Cocis, Horatiu (County Museum of History and Art - Zalau)**

**Abstract format: Oral**

This prehistoric site situated on Mureş river valley (Alba County, Central Transylvania, Romania) was discovered in 2012 by large-scale archaeological field researches occasioned by the construction of the A1 motorway. At that time non-invasive field investigations were still a pioneering matter for Romanian archaeology, even for the development-led one. Despite this, throughout an open area archaeological excavation was completely investigated an area of about 2 hectares (on the southern and eastern limits of the site), significant archaeological features and vestiges being discovered, providing major new data and finds for Middle Hallstatt period (9th -8th c. BC). The most important ones are two ditches (on the southern and eastern site's), two bronze hoards and a collective grave. Given the particular nature of the site, since 2016 was initiated a multi-annual archaeological research program, aiming both field excavations and geophysics surveys (a large-scale magnetic survey and aerial photography) for documenting the setting of the prehistoric site characterized by particular features. Moreover, in 2021, a new complex range of non-intrusive investigations were undertaken: aerial photogrammetry scanning, Graphic Target Imaging – detection, LiDAR scanning – Light Detecting and Ranging, as well as a new geophysics survey. Thus, were obtained highly accurate and complex sets of data, indicating new archaeological features on the northern part of the site (a ditch), but also outside the currently outlined Hallstatt period habitation. Rather unusual as phasing these research

stages, yet with significant sets of survey data, by analyzing the results of the 2012 campaign in relation with the ones from 2016 – 2021 ones, by a comparative multidisciplinary approach is possible to have a better understanding of the features of this archaeological site and the surrounding landscape, a very representative one, providing also a very interesting case study on the benefits of archaeological prospection in undertaking development-led archaeological projects.

## 6 INNOVATIVE GPR PROSPECTING ON CULTURAL HERITAGE

**Abstract author(s):** Persico, Raffaele (University of Calabria) - Catapano, Ilaria - Ludeno, Giovanni (IREA-CNR) - D'Amico, Sebastiano - Colica, Emanuele (University of Malta) - Giardino, Claudio - Zappatore, Tiziana - Auriemma, Rita - Coluccia, Luigi - Antonazzo, Antonella (University of Salento)

**Abstract format:** Oral

Two innovative methods for GPR prospection of cultural heritage will be shown, namely the shifting zoom [1] and the autostaking with stop-and-go [2]. With regard to the first one, inverse scattering is a branch of electromagnetism that studies the possibility to image the inner of opaque structures. The migration of GPR data is a kind of simple inverse scattering algorithm. More complex processing algorithms are in general avoided because of their computational burden. The shifting zoom is a procedure that allows to reduce meaningfully this computational burden. In particular, thanks to the shifting zoom, we have applied a linear inverse scattering algorithm to the investigation of several large areas.

With regard to the second method, the auto-staking is the way to gather GPR data exploited when the odometer of the instrument cannot be exploited. The innovation implemented with regard to this method consists in gathering the positions of the needed marker points just stopping the antennas in correspondence of them. This requires some extra-processing, but it allows us to avoid asynchronisms between the instants of the GPR passage on the marker points and the time of the marker point recording. Moreover, the stop-and-go strategy makes virtually impossible to miss a marker point.

Acknowledgments

The authors are grateful to the Cost Action 17131 SAGA.

## 7 PREDICTING DYNAMIC GEOPHYSICAL CONTRASTS OF ARCHAEOLOGICAL FEATURES AT VALTHER-TWEELING: A PATHWAY TOWARDS MORE ROBUST IMPLEMENTATION OF GEOPHYSICS IN DEVELOPMENT-LED ARCHAEOLOGY?

**Abstract author(s):** Verhegge, Jeroen (Department of Archaeology, Faculty of Arts & Philosophy, Ghent University; Department of Environment, Faculty of Bioscience Engineering, Ghent University) - Mendoza Veirana, Gaston - Cornelis, Wim (Department of Environment, Faculty of Bioscience Engineering, Ghent University) - Crombé, Philippe (Department of Archaeology, Faculty of Arts & Philosophy, Ghent University) - Grison, Hana (Institute of Geophysics of the Czech Academy of Sciences) - De Kort, Jan-Willem - Rensink, Eelco (Cultural Heritage Agency of the Netherlands) - De Smedt, Philippe (Department of Environment, Faculty of Bioscience Engineering, Ghent University; Department of Archaeology, Faculty of Arts & Philosophy, Ghent University)

**Abstract format:** Oral

The structural implementation of archaeological geophysics is hampered by various factors. Particularly for development-led implementation, the predictability of archaeological feature detection is often considered crucial. Modelling potential geophysical contrast of expected archaeological features in survey areas can provide valuable decision-making information. Such geophysical forward models are rarely used in archaeology because their reliability depends strongly on pedological and archaeological feature properties entered into the model. Quantifying relevant soil properties defining the targeted archaeology, along with their geophysical expression is a crucial but complex process in creating viable forward models.

Here, we present a sampling and modelling approach to support geophysical studies into Neolithic land use in the Low Countries. Especially in the sandy and loessic regions, archaeological soil features related to occupation, burial practices and other aspects of land use form challenging geophysical targets due to their age and potential homogenization with the soil matrix. Therefore, a series of natural soil profiles and archaeological feature profiles were measured, sampled and analysed to enable the conversion of traditional soil properties to geophysical soil properties through pedophysical model development. Additionally, in-situ sensors were installed to monitor dynamic soil prop-

erties (moisture content and temperature) and optimize survey timing. Using these in-situ measured and analytically derived soil and feature properties, geophysical contrasts are forward modelled throughout the monitoring period to assess feature detectability using different geophysical methods. The resulting pedophysical models and forward modelling procedures would be usable to predict geophysical contrast between natural soil profiles and (virtual) archaeological features as well, potentially removing a barrier to implement geophysical survey methods in development-led archaeology. In this contribution, we provide an overview of this approach, supported by its practical implementation at the megalithic monument of Valther Tweeling (NL). Alongside a methodological overview, we discuss the pitfalls and advantages, and its potential relevance for development-led applications.

## **8 SIMULATING TRENCHING FOR ARCHAEOLOGICAL EVALUATION: COMPARING THE VARIABILITY OF RESULTS AND DEALING WITH THE PROBLEM OF FALSE NEGATIVES**

**Abstract author(s):** Higham, Richard (University of Brighton; SEAHA - EPSRC Centre for Doctoral Training in Science and Engineering in Arts, Heritage and Archaeology) - Carey, Chris (University of Brighton) - Corcoran, Jane (Historic England) - Knight, David (Trent & Peak Archaeology) - Brolly, Matthew - Cole, James (University of Brighton)

**Abstract format:** Oral

Despite a diversification and increasing application of prospection methods within archaeology in recent decades, evaluation trenching is still the most commonly employed technique. Evaluation trenching across a percentage of the proposed site collects an excavated sample to gain information on, and prospect for, any archaeology in a given area. Across Europe, archaeological evaluation trenching is employed at different percentage coverages and uses different trenching configurations to gain this archaeological sample. However, with all evaluation trenching there is an issue of what we do not discover. In other words, if our trenches find no archaeology, is that because there is no archaeology present – the false negative? Or because the sampling strategy is flawed? By using GIS simulations of different evaluation trenching designs over archaeological sites, it has been possible to understand the types of archaeology we are likely to be missing and the types of archaeology we are more likely to find, demonstrating clear bias in the archaeological samples produced by evaluation trenching. The modelling approach presented here uses digitally reconstructed archaeological sites within a GIS. This modelled approach provides greater certainty and understanding about the results of the varying evaluation trenching practices that are currently employed in development-led archaeological evaluations.

## **A. ARCHAEOLOGICAL SURFACE PROSPECTION: FROM UNIVERSITY TEACHING TO FIELD PRACTICE. THE STATE OF THE QUESTION IN PORTUGAL**

**Abstract author(s):** Pereira Rocha, Leonor Maria (Universidade de Évora; CEAACP/UAlg) - Branco, Gertrudes (CHAIA/Universidade de Évora)

**Abstract format:** Poster

Archaeological surface prospection, as an legally recognised activity in archaeological work, is relatively recent in Portugal. Indeed, until the end of the 20th century, this work was not integrated into specific projects (scientific or rescue) and was not supervised by any state agency, so it was an activity with poorly defined methodologies and practices. However, when we analyse its antecedents, we realise that Portugal was a pioneer country, in European terms, in the attempt to protect heritage and in the creation of regional and national inventories of archaeological sites, initiated in the 17th century by King João V.

With the creation of the Portuguese Institute of Archaeology (1997) and the transposition of European legislation, namely the Valletta Convention, (also in 1997), this situation has changed due to the imposition of prospecting work in environmental impact assessment processes. These changes should have repercussions on the development of this activity, both in terms of the training of archaeologists and the definition of field methodologies.

With this work we seek to contribute to the knowledge of surface archaeological prospecting in Portugal, from teaching to field methodologies, with a critical approach to its evolution, starting from the principle that each archaeological work is a scientific production, which must ensure the production of knowledge and the preservation of our collective memory for future generations, as defined in the Convention of La Valletta (Preamble) and in the Portuguese Law of Cultural Heritage (Law nº 107/2001, updated by the Law nº 36/2021).

## **B. THE LEGAL THEORY AND PRACTICAL EXERCISE OF ARCHAEOLOGICAL HERITAGE CONSERVATION**

**Abstract author(s):** Branco, Gertrudes (CHAIA) - Rocha, Leonor (CEAACP/UAlg)

**Abstract format:** Poster

The European Convention on the Protection of the Archaeological Heritage (revised) held for the signature in Valletta (Malta), on 16 January 1992, and ratified by Decree of the Portuguese Republic President, on 16 December 1997, proposes, whenever possible, the use of non-destructive methods of investigation (subparagraph i), art. 3) and, when

feasible, the conservation in situ of elements of the archaeological heritage found during the development of works. (subparagraph 4, art. 5).

However, these principles are not evident in the Portuguese law which establishes the bases of the regime of protection and the valorisation of the cultural heritage (Law no. 107/2001, of 8 September). On the contrary, this law establishes that " the principle of conservation by the scientific record" to archaeological heritage shall be immediately applicable, under the terms of the law, (No. 1, Art. 75).

This principle overvalues the importance of the scientific record, to the priority preservation of archaeological assets in situ. It establishes a relationship of equivalence between knowledge and archaeological good, devaluing the various constraints inherent to the production of knowledge, and the fact that the archaeological heritage is a "fragile and non-renewable cultural wealth", as stated in the Lausanne Charter (1990)

The application of this principle supports the development of the so-called "preventive and safeguard archaeology" which, in Portugal, in the year 2021, represented 96% of all authorized archaeological activities, authorized in the national territory.

The use of innovative and non-intrusive methods, intended to act preventively, in order to guarantee the scientific reserve of archaeological elements and their in situ preservation, are supplemented by the use of intrusive methods, developed in the context of the work, facilitated by the legal concept that makes the good and its knowledge substantive.

---

### 399 LINKING DATABASES FOR COMPARING RESEARCH: DO WE NEED A EUROPEAN HILLFORT INFORMATION SYSTEM? [COMFORT]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Loy, Anna (ROOTS Kiel) - Whitefield, Hans (ZBSA Schleswig) - Bernard, Loup (Université de Strasbourg) - Ibsen, Timo (ZBSA Schleswig)

**Format:** Round table

The proliferation of web-based geographic interfaces for the investigation of archaeological phenomena naturally leads to the conclusion that super-regional perspectives can now be assembled for numerous archaeological phenomena. Hillforts or fortification are one of the clearest examples of this trend with numerous regional and national scale compilations being made available. The focus of these databases varies from heritage management catalogues, to curated academic and scientific collections and touristic information. We seek to discuss the possibilities for a pan-European database, in terms of both theory and practicality; as well as how such a system might be used to shape future research.

Since the monuments themselves are multifaceted is it possible to apply GIS as a reductive technique to these monuments on such a super-regional or European scale or does it unduly suppress unique analysis and interpretation? Is the shared terminology of "hillfort" appropriate for such a wide area or does it actively obscure a broader spectrum of phenomena in prehistory?

In practical terms for a data base, we ask: Can we provide standardized knowledge and data on hillforts, which would help scientists filter the tremendous amount of information scattered in thousands of articles, publications, excavation reports, and archives according to their specific questions? Does it make sense to combine and link smaller platforms into a monothematic platform to raise awareness, promote hillfort research, and offer easy access to the related data?

It is also necessary to consider how this dataset could grow and develop overtime. Would developing guidelines for documenting hillfort excavations or surveys enable us to unify research questions and make hillfort research comparable? How should we go about incorporating the growing body of both archival and grey literature at our disposal? The round table aims to connect specialist and interested scholars who use and moderate hillfort specific databases.

---

### 400 STEP BY STEP. THE ROUGH ROAD TOWARDS COMMUNITY ARCHAEOLOGY

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Wollak, Katalin (Independent heritage expert; Hungarian Association of Archaeology and Art History) - Mařík, Jan (Institute of Archeology of the CAS, Prague) - Rácz, Ákos (Ferenczy Museum Centre, Szentendre; Community Archaeology Association)

**Format:** Regular session

Although there is a long tradition of volunteering in archaeology across Europe, community archaeology requires a multi-scale approach from both the professional actors and the civil side, i.e. the committed contributors. Civil society rightfully demands direct access to information about historical and archaeological research, and actively seeks a connection with professionals. By introducing new, more nuanced forms of regulation and by channelling the

demand for cooperation from both sides, partnership programmes have been set up in many countries, which have accelerated the emergence of community archaeology.

The COVID situation has led to a particular increase in social demand for outdoor activities over the past two years, which has been reflected in the large number of projects based on participatory engagement of civilians into archaeological fieldwork

In this process, the metal detecting activity has played an increasing role, particularly in the Central and Eastern regions of Europe, where earlier only restrictive legislation existed because of the state ownership of archaeological finds. We are experiencing both the challenges and extraordinary results of the transition from illegality to science-led projects through engaging law-abiding metal detectorists.

It is time now to discuss the methodological, institutional background for the quickly changing and developing phenomenon. Can we keep pace with this growing demand from the civil society? What forms of public or state support could support this grassroots process?

The organisers of the session are primarily looking for representatives from countries where community archaeology has been reinforced in the last few years.

## ABSTRACTS

### 1 METAL DETECTING AS CITIZEN SCIENCE IN DENMARK

**Abstract author(s):** Dobat, Andres (Department of Archaeology, Aarhus University; Moesgaard Museum - MOMU)

**Abstract format:** Oral

Passionate detector users have re-written the history of Denmark many times since the hobby's early beginnings in the late 1970s. A hallmark of Danish metal detecting is the well functioning cooperation between detectorists and professional archaeologists at museums and universities. Responsible detector practice is widely endorsed among practitioners and professional archaeologists regularly include detectorists in excavations and research projects.

Private metal detecting has already challenged the classic division of roles in archaeology, with amateur finders producing finds but otherwise being more or less passive recipients of professional expert knowledge. Most members of the detector community are not only very committed to their hobby. They are also highly skilled and competent when it comes to recording, identifying and dating archaeological finds.

In 2018, the recording APP DIME was initiated as a means to facilitate this cooperation model. The ultimate goal was to empower metal detectorists to not only act as finders but to act as citizen scientists who contribute with data and knowledge. The DIME project is driven by a vision for how to do archaeology more responsible, more inclusive, and ultimately more democratic.

The paper will present the DIME project and its background, but it will also evaluate to what extent we succeeded in realising our vision and what unexpected obstacles we met on the rough road towards Danish metal detecting as citizen science.

### 2 METAL DETECTING AS PART OF ARCHAEOLOGICAL CIVIC SCIENCE IN THE CZECH REPUBLIC - CURRENT DEVELOPMENT, CHALLENGES, AND THREATS

**Abstract author(s):** Komoróczy, Balázs - Vlach, Marek - Kmošková, Michaela (Institute of Archaeology of the Czech Academy of Sciences, Brno)

**Abstract format:** Oral

Efforts to prevent the loss of common archaeological heritage – as well as the extraordinary amount of data without which the archaeological science would be severely damaged in many aspects – have led the authors to create a model of collaboration with the metal detecting community that is compatible with the current legislative framework, functional and acceptable from the point of view of archaeological science. In recent years, the government of the South Moravian Region has also been actively involved in this effort. It is a significant shift, as the Region is the legal owner of archaeological finds, the founding entity of seven regional museums with significant archaeological activities and collections, and the monument care authority. A long-term conceptual collaboration project called "Joint Forces in Order to Discover the Common Archaeological Heritage of the South Moravian Region" was launched. Its main idea is the positive approach to the public interested in responsible and moderated participation in discovering material shreds of evidence of our past. In 2020, this approach also became part of the regional government's political program. Last year, with the creation of the Portal of Amateur Collaborators within the Archaeological Information System of the Czech Republic, this activity acquired a unified digital scheme to register finds. The setting up of circles of citizen collaborators is in progress in several archaeological institutions of the Czech Republic; nevertheless, this process is far from over.

The data obtained by the metal detecting community contributes to scientific research and builds up an entirely new basis for research activities. On the other hand, it should be emphasized that this development requires considerable efforts from archaeology through investing material and immaterial resources. The authors outline some scientific, organizational, and societal benefits and numerous limits and threats arising from the current developments.

### 3 THE ROLE OF THE HUNGARIAN NATIONAL MUSEUM IN COMMUNITY ARCHAEOLOGY

**Abstract author(s):** Vida, István - Rózsa, Zoltán (Hungarian National Museum / Magyar Nemzeti Múzeum)

**Abstract format:** Oral

Community archaeology is still forming in Hungary. There are many isolated endeavours of the rural museums as well as of the Hungarian National Museum. In a few cases there is cooperation between the institutions, but there is no nation-wide standardized protocol.

The present legal environment is not favourable, it is further burdening the museums and the organizers of the community archaeology programs. In this year great changes are expected in the national organization of archaeology, which also affect community archaeology. The HNM is preparing for a nation-wide leading role in order to coordinate the field in cooperation with the local museums.

Reorganization on the level of the museum volunteers' teams also seems to be essential. It is very difficult to work with the large number of new volunteers, but it is necessary to integrate a larger community. As people feel their importance they are willing to dedicate themselves more to the causes, and they also involve their immediate environment. This larger community might also help the prevention of illegal activities and the protection of the sites in their environment.

### 4 NAVIGATING THE BUMPY ROAD: HUNDREDS OF HOBBYISTS, THOUSANDS OF FINDS, AND RELATED ISSUES IN ESTONIA

**Abstract author(s):** Kurisoo, Tuuli (Tallinn University)

**Abstract format:** Oral

The usage of metal-detectors is regulated in Estonia since 2011. All hobby searchers need a licence that can be applied after passing a specific training. The curriculum covers diverse topics from archaeological finds to WW2 explosives, which prepare hobbyists for a range of situations. The interest in metal-detecting is very high and the number of license holders increases rapidly every year. This has created a situation where the amount of finds collected and handed over to heritage specialists has completely overburdened the National Heritage Board of Estonia (NHB). Additionally, it causes long delays in providing feedback to hobby searchers and hinders the process of acknowledgements and rewards. Both aspects have a negative impact on cooperation between the hobby searches and archaeologists/ heritage specialists.

This paper discusses how two research projects (with acronyms MetDect and EDAO) on metal-detector finds have offered some solutions for the abovementioned problems. In the course of the MetDect, a database of metal-detector finds was created and now being used by the NHB. There is also a social media page where different finds are introduced that is popular among local hobbyists and general public. The core of EDAO project is the Atlas of the metal-detector finds, which is the first publicly accessible map application of the public finds in Estonia.

### 5 CURRENT ARCHAEOLOGY, THE PROTECTION OF MONUMENTS AND THE LAIC PUBLIC IN SLOVAKIA. PROBLEMS AND SOLUTIONS

**Abstract author(s):** Ruffkay, Matej - Pieta, Karol (Institute of Archaeology, Slovak Academy of Sciences)

**Abstract format:** Oral

The Monuments Law of 2002 in Slovakia has significantly limited the possibility of archaeological institutions to express their professional opinion on the organisation and quality of field research, which is decided by the administratively overburdened county monuments offices. The newly established Archaeological Council, as an advisory body of the Ministry of Culture, has not been given powers to inspect the quality and adequacy of rescue or thematic excavations, and its suggestions for changes to the system or sanctions for poor quality in the work of experts are not respected. The law was intended to prevent illegal excavations, but it blankly excluded all non-professionals from the process of controlled recovery of archaeological artefacts.

This proved to be ineffective in the campaign against illegal searchers and led to the disintegration of the traditional network of volunteers, amateur archaeologists, tied to regional or central museums, the Institute of Archaeology and Universities. Thus, we have lost the legal possibility of obtaining valuable information about new sites and finds. Attempts to change this critical situation in the law have not yet led to a remedy, despite two initiatives by the professional community in 2013 and 2018.

Related to monitoring the activities of illegal prospectors is the urgent need to control collectors. It is about the legalisation and registration of illegal private archaeological collections, which often hide objects of high museum and

historical value. They exist hidden all around us, without legal protection and especially without the possibility of their legal acquisition or use for scientific and other purposes. We are looking for ways to revive and activate contacts with the interested public, in accordance with the legislation, in order to gather information from the ranks of the finders and to guide their activities in favour of the preservation and protection of the archaeological cultural heritage.

## 6 COMMUNITY ARCHAEOLOGY IN FEJÉR COUNTY (HUNGARY) – PROTOCOL, ACHIEVEMENTS AND CHALLENGES

**Abstract author(s):** Szücsi, Frigyes - Kiss, Alexandra (Szent István Király Museum; Community Archaeology Association)

**Abstract format:** Oral

There are no laws and regulations relating to community archaeology in Hungary. Therefore, the cooperation of professionals with civilians has developed in different ways and with different intensities in each county. The authors of this contribution organized the Community Archaeology Programme at the Szent István Király Museum in Székesfehérvár (Fejér County, Hungary) in 2020 after six years of cooperation with „museum-friendly” civilian metal detectorists. After two years of operation, it has become one of Hungary's largest and most active community archaeology programs with about 100 registered volunteers.

Our main goal is to actively involve the widest range of society in the struggle to save our archaeological heritage by popularizing the full spectrum of archaeological work. The participation of volunteers with a metal detector is regulated by our community archaeology protocol, while without a metal detector, we accept volunteers for our activities without restrictions under the supervision of professionals. Although the epidemiological situation has made it difficult for us to operate, we hardly had any major excavations in the last two years where volunteers from our Programme would not have been present. Of these, we would like to highlight our excavations for the third year in the Avar age (6–9th century) cemeteries in Csákberény, which are carried out partly with community funding and mainly thanks to the work of volunteers. Partly for preventive purposes and partly for topographic research, the metal detecting surveys are also important, as well as the assistance of volunteers in unplanned rescue excavations.

However, in addition to the results and the successes, we also need to talk about the difficulties and the challenges that lie ahead (the issue of sustainability, the unresolved nature of archaeological processing).

## 7 SAVING A HUNGARIAN CASTLE SZADVAR, CIVILIANS BUILDING COMMUNITY FOR ARCHEOLOGY

**Abstract author(s):** Dobos, Janos (Friends of Szadvar)

**Abstract format:** Oral

The 15 years history of an internet-based association called 'Friends of Szadvar' and their activities to save the remains of an almost 'forgotten' medieval castle in northern Hungary provides a good example of a bottom-up initiative to use the power of community not only in cherishing the cultural heritage of a nation but also in building the foundations of a functioning community archeology project.

The main ingredients of a working model may be identified from the very beginning of the first cleanup activities up to the present situation, when the significance and the potential of the place were even recognized and supported by the Hungarian government in a nationwide program. We introduce the challenges and the roadblocks, and the way of finding the right answers, forming a learning curve for the organization and the whole community around it.

In terms of the archeological aspects the partnership and the support of the Herman Otto Museum, Miskolc and its archeologists were essential. We attempt to walk through the process, how after the first years of enthusiastic drive, the partners had to find a working model which matches with the available resources and brings the desired outcome for the professional and the civilian individuals and serves the interest of the people living in the area of Szadvar.

---

## 401 TO USE OR NOT TO USE: 3D DOCUMENTATION IN FIELDWORK AND IN THE LAB [3D-ARCHAEOLOGY]

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Hostettler, Marco (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Drummer, Clara (Orthodrone GmbH, Kiel) - Emmenegger, Lea (Freelancer) - Stäheli, Corinne (Institute of Archaeological Sciences, University of Bern)

**Format:** Discussion session

Excavating an archaeological site involves many decisions and trade-offs to be made. This is not only due to the limited resources on site but also has methodological roots. As excavations are destructive, decisions on the quantity and on which details documentation should focus must be taken. For documentation, a wide range of tools are available.

One such tool is 3D documentation. It brings with it many benefits like the possibility to move in a 3D space through the excavation, the generating of 'virtual' profiles, or high precision DEM's to name a few. 3D documentation of finds offers the possibility of fast unwrapping of complex features, fast drawings from different angles, or printing as a replica for different purposes.

However, when compared to conventional methods, more problematic issues arise as well. 3D models must be calculated before the excavation can proceed. The calculation either needs time or powerful hardware. The method also results in a vast amount of data, as, in contrast to a drawing, most details are recorded. The question here is how to balance and evaluate these pros and cons.

With this session, we want to ask: How and on which basis do you decide when choosing the documentation method? How do you evaluate the cost and time benefit of 3D documentation, also taking into account consequential costs such as data storage and curation over long periods of time? Is the time saved in the field doubled in the office? How much of the recorded data is used in the evaluation?

We aim to bring together archeologists, technicians, and restaurateurs concerned with the above stated questions, whether working in the field or the lab, or as decision-makers in managing positions. We highly encourage members of commercial archaeological enterprises and of heritage offices to bring in their points of view.

## ABSTRACTS

### 1 3D DOCUMENTATION OF MANY FACES

**Abstract author(s):** Janek, Tomáš - Souček, Josef (National Museum, Prague)

**Abstract format:** Oral

3D documentation is gradually becoming a standard in archaeology. Apart from capturing the exact shape, proportions and decorations of the artefacts, it also enables advanced visualisation and analyses. The presented artefacts were documented in the laboratory under optimal conditions. Photogrammetry was used for highly detailed models, 3D scanner for those with homogenous colour of the surface, where high quality texture was not necessary. The first method will show several examples of the generated drawing, showing that this approach is faster and more precise than usual drawing by hand. This tool might be useful especially for the publication purposes, when the number of coloured photos is strictly limited. Profile extraction is one of the essential digital tools used in documentation of archaeological material, with further advances of scaling, measuring and even basic seriation. Analyses of the surface and visual enhancements can uncover production details or techniques of decoration. Many of those details might not be visible with a bare eye, thus might be overlooked for example in standard photography. For a flat surface the reflectance transformation imaging might be used. Although it requires specific conditions, it does not require high computing power. In many cases the artefacts have decoration around the whole body, making it difficult to observe in complexity. Digital copy of the artefact makes it possible to unroll the decorative motives to a flat surface in order to increase the legibility of the ornament along with the workflow used to create it. With angle to plane and distance to plane function the deformation of the surface can also be shown. Most of these methods have been developed and known since a long time ago, but only recently with decreasing equipment costs and availability of open-source alternatives for commercial software, they become ever present even in archaeology.

### 2 FAST AND ACCURATE DOCUMENTATION OF COMPLEX ARCHAEOLOGICAL FEATURES. CASE STUDY: A CHALCOLITHIC DWELLING BELONGING TO CUCUTENI CULTURE, NE ROMANIA

**Abstract author(s):** Brasoveanu, Casandra (Arheoinvest Research Centre, Science Department, Institute of Interdisciplinary Research, Alexandru Ioan Cuza University of Iasi) - Brunchi, Radu (Doctoral School, Faculty of History, Alexandru Ioan Cuza University of Iasi) - Tencariu, Felix-Adrian - Asăndulesei, Andrei (Arheoinvest Research Centre, Science Department, Institute of Interdisciplinary Research, Alexandru Ioan Cuza University of Iasi)

**Abstract format:** Oral

Cucuteni culture is well-known for its fine painted ceramics, of great artistic refinement; just as spectacular are the remains of the dwelling structures. The constructions are generally destroyed by fire, often to the point of vitrifying the clay of the walls and floors. However, inside them important vestiges of everyday life and spiritual life are preserved. This generates difficulties, related to the correct methods of excavation and accurate documentation of the different layers of destruction.

Fortunately, due to the advance of 3D documentation methods, we are able to record the archaeological information from these sites much faster and also obtain an objective point of view over the archaeological context. An experienced archaeologist can document these archaeological features in 2-3 days and the result is a subjective technical drawing, while the 3D documenting using UAV takes around 15 minutes, with another 1-2 hours to process the data and provides a storage medium much more reliable, offering the possibility of replicating data on an offsite storage unit.

Thus, we chose as a case study a dwelling, investigated in the eponymous settlement of the Cucuteni culture, from NE Romania. It is a construction with heavily burned walls, collapsed over a suspended floor, which in turn overlapped the ground floor, where several features (an agglomeration of loom weights, numerous ceramic vessels, etc.) were identified. The ensemble was affected and partially mixed by various post-Chalcolithic disturbances. Under these conditions, without photogrammetry, the recording of the material in situ would have been difficult and time consuming. Also, the 3D models that we obtained allowed us their later usage for educational and popularization purposes. Although the utility of modern methods of recording the archaeological features is well-proven, we consider that the traditional ones cannot be neglected and, for now, a combined workflow can provide more accurate results.

### 3 RE-EVALUATING THE FRAGMENTARY CULT STATUE AT KLEONAI, GREECE THROUGH 3D DOCUMENTATION AND STUDY

**Abstract author(s):** Levitan, Rebecca (University of California, Berkeley) - Levine, Evan (Brown University) - Öztürk, Hüseyin (University of Cincinnati) - Nenova, Denitsa (Independent scholar)

**Abstract format:** Oral

The small, second century B.C.E. Temple of Heracles at Kleonai (Ναός του Ηρακλή Κλεωνέας) has long been a landmark in the Argolic Plain, known since the time of the early travelers in Greece and thoroughly studied and published, most recently by Mattern (2015). However, little scholarly attention has been paid to the extant in-situ fragmentary colossal cult statue of Heracles, and questions concerning the date, artist, and sculptural 'type' remain unsolved. The fragmentary nature, colossal scale, and unique context of the fragment have made this sculpture particularly difficult to study using traditional means of documentation.

This paper presents a novel restudy of the cult statue in its context, paying particular attention to the development and execution of our research methodology – drawing on recent innovations in digital object documentation with no need for specialist equipment. To overcome the primary factors that have inhibited detailed study of the fragment – namely its scale and imperfect preservation – we decided to create a high-quality photogrammetric model that could be easily scaled, manipulated, and compared to other examples of Herakles Epitrapezios. This research program, accomplished with only a single day of fieldwork, illuminates traces of fracture that are difficult to discern on-site, provides new evidence for the display context of the complete statue, and offers novel insight into its place within the corpus of seated Herakles sculpture. Moreover, the mindful application of new digital methodologies offers the opportunity to rethink how archaeologists have studied colossal sculpture and megalithic architecture, inviting new research questions and offering opportunities to more effectively document preservation and degradation of cultural heritage.

### 4 WHEN 3D DOCUMENTATION CREATES EXCAVATION SLICES

**Abstract author(s):** Tamba, Robert - Pujol, Angels (GIRA association)

**Abstract format:** Oral

This study is centered on the archaeological site of Puig Ciutat where the current hypothesis is that it is a Roman settlement with previous phases of occupation that was destructed and abandoned during the civil war between Julius Caesar and Gnaeus Pompeius. The site constitutes a perfect photo-finish of its destruction and abandonment where the documentation of the remains has been a continuous challenge.

Very quickly, 3D models were produced externally in order to document the constructive structures of the settlement. A real change came when 3D documentation was applied by team members as an answer to excavation needs. How can we have a complete description of a destruction when the first elements that come to the surface start their degradation and have to be quickly removed? How can the different layers of the destruction be compared and put into relation? The main challenge of the excavations has been to be able to obtain a picture as complete as possible of the destruction, including pottery, metal and burnt wood elements preserved by the abandonment but often retrieved partially and in fragments and which exact position and orientation are relevant to the archaeological interpretation.

Starting from 2019, the systematic use of photogrammetry during the excavations was the chosen solution. As processing time was not an issue, for each campaign, a total of 20 to 40 3D models were produced and used as ortho-photographs for the documentation of the remains.

The use of photogrammetry during the excavations is therefore mainly 2D. It enables through the production of georeferenced ortho-photographs a thorough mapping of all the elements that need to be documented which is done digitally on site during fieldwork and substitutes manual drawings. The 3D visualization of selected models are currently mainly used for dissemination purposes.

## 5 EXCAVATION IN 3D: CAN A 3D-VIEWER TOOL HELP TO UNDERSTAND AND PRESENT COMPLEX STRATIGRAPHY?

**Abstract author(s):** Pohl, Henrik - Dworsky, Cyril (Kuratorium Pfahlbauten) - Raab, Gerald - Wessling, Ronald (3D Studio Crazy Eye)

**Abstract format:** Oral

During an underwater archaeological excavation, only a few active scientific divers can take a direct look at the excavation area under water. So far, the uncovered excavation findings and finds have been documented mainly by means of sketches, drawings, and individual photos. Since the beginning of the underwater archaeological excavations at the pile dwelling settlements in Upper Austria in 2015, an image-based 3D scanning process has been an essential part of the documentation procedure. Each excavated documentation surface was systematically recorded using Structure-from-Motion (SfM) and Multi-View-Stereo (MVS). These methods yielded digital, photo-realistic, and three-dimensional copies of the respective excavation situations. Thus far, 2D plans, sketches and photos derived from orthophotos have been used for the scientific discussion. However, these struggle to convey spatial information of the excavation. Questions regarding the stratigraphy, recumbent timbers in complex positions and findings in general can ideally be answered in a combined 3D representation of existing information.

Since a comprehensive 3D GIS is still a desideratum not only in archaeological research, an independent analysis tool was developed in 2021. A 3D-Viewer for the excavation documentation of the pile dwelling settlement Weyregg 2 in Lake Attersee was created as part of the "Zeitensprung" project in cooperation between the Kuratorium Pfahlbauten, the Upper Austrian Landes-Kultur GmbH and the 3D studio Crazy Eye. This pile dwelling 3D-Viewer was crafted as an individual presentation, analysis, and discussion tool. Is it possible to use this tool to answer fundamental questions about an excavation, e.g. Can correlations within the different layers and profiles of the excavation area be better recorded? Can this 3D-Viewer support public relations through visualization? Does this tool permit statements about an improved excavation process?

## 6 FROM A PENCIL TO THE 3D MODEL

**Abstract author(s):** Miszk, Lukasz (Institute of Archaeology Jagiellonian University) - Ostrowski, Wojciech (Wars) - Papuci-Władyka, Ewdoksia (Institute of Archaeology Jagiellonian University; University of Warsaw)

**Abstract format:** Oral

Polish archaeological research of the Hellenistic-Roman capital of Cyprus, Nea Paphos, has been systematically introducing a 3D-based documentation technology since 2013. First of all, it began with 3D excavation documentation and experiments including UAV photogrammetry and terrestrial laser scanning, which were later replaced with close range photogrammetry. In addition, this 3D technology is applied to the documentation of parts of historic materials (Photogrammetry, RTI, HBIM) and non-invasive prospecting (GPR; DTM). In this presentation, we would like to focus on our experience with the introduction of 3D technology into the documentation of excavations.

We are currently using a workflow for collecting and processing data developed according to fieldwork conditions based mainly on photogrammetric models. The procedure used is based on several years of experience, which is time-efficient but also reasonably accurate. The procedure is based on the implementation of widely used Agisoft Metashape software, and its main assumption is that it can be used by archaeologists with a basic knowledge of photogrammetry.

Currently, our efforts are concerted on providing better access to 3D documentation deliverables (3D models and orthophotoplans) for all team members. Recent experience has shown that the creation of documentation by archaeologists in the field, constitutes a lesser problem - the main limitation remains its wide use by members of a broad interdisciplinary team, where not everyone has experience with GIS and 3D data.

## 7 STRUCTURE FROM MOTION PHOTOGRAMMETRY APPLIED TO ARCHAEOLOGICAL EXCAVATIONS: PERSPECTIVES FROM A DECADE OF WORK AT THE MEMOLAB

**Abstract author(s):** Rouco Collazo, Jorge - Romero Pellitero, Pablo - Ramos Rodríguez, Blas - Valencia Jiménez, Isabel M<sup>a</sup> (University of Granada)

**Abstract format:** Oral

The evolution of 3D documentation techniques in the last decades has brought about an on-going revolution in archaeological documentation, especially in excavation. In the MEMOLab – Biocultural Archaeology Laboratory of University of Granada (Spain), we have applied photogrammetry in archaeological interventions on a daily basis, both in university excavations and in commercial archaeology. We use both on-ground photogrammetry and aerial photogrammetry with UAV. Furthermore, having the 3D documentation of whole sites as a scientific objective, we apply SfM photogrammetry to each Stratigraphical Unit. This way we get a precise digital copy of the complete stratigraphic sequence that allows us to span the study and analysis of stratigraphy beyond excavation through the application of several other tools, such as GIS.

The aim of this paper is to explain the methodology and workflow of the MEMOLab in the application of photogrammetry and to discuss the advantages of the 3D documentation in speeding up the excavation process, its graphic and metric quality and the possibilities of further analysis and dissemination of 3D data. But also to discuss the disadvantages, such as the cost of the equipment, the work and calculation times of the models, the volume of data generated and, sometimes, the lack of further use of the 3D data generated for the archaeological interpretation of the sites. As well as the problems of the integration of 3D data with the decision-makers in charge of heritage protection. All of these will contribute to the general questions of this session about when and how to apply 3D documentation in archaeology.

## 8 HAND SCANNING ON THE SWEDISH WEST COAST: PROS, CONS, AND AN UNCERTAIN FUTURE

**Abstract author(s):** Skole, John (The Archaeologists, The National Historical Museums, Sweden)

**Abstract format:** Oral

As the technology for creating 3D models using handheld laser scanners develops, this form of documentation becomes ever more precise and economically viable. This presentation will look at how hand scanning has been successfully employed to document excavated shipwrecks from the west coast of Sweden to a degree of detail that otherwise would not have been possible. The 3D models created through this process are not only of great scientific value but can also be easily repurposed for public engagement and exhibition without much additional effort, and offer a more in depth experience with archaeological material than is usually otherwise available. The high quality-to-cost ratio of laser scanning can be used to the detriment of the archaeological record, however. A project has recently been proposed where Bronze Age rock art will be documented with a hand scanner and then destroyed to make room for industrial development. This is despite the fact that it is generally accepted that Swedish rock art should be interpreted in relation to the milieu in which it is found, something which the hand scanner cannot capture. Additionally, there is no national strategy in place for the long-term storage of 3D files. Currently the long-term accessibility of data from 3D models comes primarily through orthographic projections of models in reports and catalogues, or from being published in low resolution on privately owned websites. The preservation of detailed 3D models is therefore informally the responsibility of the archaeological company that commissioned them, who are under no obligation to preserve and maintain them, or even disclose that they have saved the models. How will researchers access our scans in 20, 50, or 100 years' time?

## A. 3D DOCUMENTATION METHODOLOGY IN ARCHAEOLOGY. BENEFITS AND PROBLEMS IN THE STUDY OF THE MEGALITHIC NECROPOLIS OF LA LENTEJUELA (TEBA, SPAIN)

**Abstract author(s):** Vijande, Eduardo - Becerra Martín, Serafín - Muñoz Muñoz, Alejandro - Fernández Sánchez, Diego (Universidad de Cádiz) - Moreno Márquez, Adolfo (Universidad de Almería) - Gómez Sánchez, Leticia - Cantillo Duarte, Juan - Ramírez Amador, José - Pavón González, Laura (Universidad de Cádiz)

**Abstract format:** Poster

Currently, new technologies for the collection of topographic data and graphic representation allow us to extract more precise data than the traditional methods used in archaeological sites. The creation of 3D models from images taken by Unmanned Aerial Vehicles (UAV) and the use of 3D laser scanners enable us to better understand archaeological features and facilitate the understanding of a wide variety of high-quality graphic information (plans, sections, elevation digital models ...).

These 3D models not only aim to create topographic images, but also are a valuable tool for the interpretation of construction techniques and for excavation planning. They also offer a wide variety of new instruments in terms of outreach through digital applications and tools.

Our work in the megalithic necropolis of La Lentejuela (Teba-Spain) has allowed us to refine our data collection methodology in this sort of sites. The aim of this presentation is to discuss the pros and cons of the use of these technologies in a site which comprises nine megalithic monuments with very different features.

---

## 402 SCALING BRONZE AGE SOCIETIES – BETWEEN THE MICRO AND MACRO

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Austvoll, Knut Ivar - Horn, Christian (University of Gothenburg) - Anfinset, Nils (University of Bergen)

**Format:** Regular session

With the recent surge of far-reaching mobility perspectives and implementation of 'big-data' modelling to understand patterns of contact, Bronze Age Europe seems more connected and integrated into reigning top-down narratives of the past. Yet, these models under-communicate how local adaptation and bottom-up organization undergird these overarching mobility patterns.

It is a methodological and theoretical challenge to merge these views. With a growing body of data made available in open-access publications and databases, as well as easily available computational tools for spatial and statistical

modeling we can begin to scale and compare local developments and interaction within over-arching mobility patterns. Interpretive explanations to help make sense of the accumulated data generally falter to traditional or lesser developed theoretical frameworks. Frameworks such as 'Collective Action Theory', 'Anarchism theory' and others hold the potential to integrate dynamic scaling between big-data and local polity organization but are often presented as generalized models for cross-cultural comparison, and less towards specific periods such as the European Bronze Age.

We welcome papers that explore the dynamics and interconnected perspectives between the local and interregional. In this, we encourage papers with either theoretical and/or methodological considerations that address scaling and modelling of quantitative data to compare and connect the heterogeneity of local polities within overarching interaction networks (e.g. trade, warfare, etc.) of the European Bronze Age. The aim of the session is to investigate how we can bridge the gap between qualitative interpretation and quantitative data collecting.

## ABSTRACTS

### 1 SCALING AND EVALUATING LATE NEOLITHIC AND BRONZE AGE SETTLEMENT SITES IN SOUTH-EASTERN NORWAY

**Abstract author(s):** Sand-Eriksen, Anette (Museum of Cultural History, University of Oslo)

**Abstract format:** Oral

In South-Eastern Norway, rock art sites and grave mounds have given indications of extensive networks and activity during the Late Neolithic and Bronze Age, stories and patterns which have been enhanced by studies of various stray finds and hoards. What we have had little knowledge about in this region, however, are the actual settlements and the daily way of life in and around them during the LN and BA. Since the first evidence of farm-based settlements in South-Eastern Norway were excavated in the early 2000s, the known number of buildings dated to LN and BA has increased dramatically.

A recent aggregation of the settlement material, mainly through reviewing unpublished excavation and survey reports, have resulted in a database of a little over 100 buildings from South-Eastern Norway. Based on this material, this paper has a two-folded purpose. Firstly, through in-depth analysis of the placement of the settlement material in GIS (overlay), I will present some preliminary results scaling the settlements' location type, placement, patterns and (likely) subsistence strategies. Secondly, based on these observations, I will evaluate if the settlements are results of elite authorities or cooperative polities, seeking to explore (overarching) interaction networks and examine the dynamics of organizational variability within human groups over time.

### 2 POPULATION DYNAMICS IN MIDDLE AND LATE BRONZE AGE BRITAIN FROM THE MACRO TO THE MICRO-SCALE

**Abstract author(s):** Armit, Ian - Bleasdale, Madeleine (University of York) - Büster, Lindsey (University of York; Canterbury Christchurch University) - Fischer, Claire-Elise (University of York) - Evans, Jane (British Geological Survey) - Reich, David (Harvard University)

**Abstract format:** Oral

Recent aDNA research has identified significant population movements across the English Channel during the Middle to Late Bronze Age. These seem particularly marked during the period from around 1000-800 BC. While some level of human mobility was already evidenced by similarities in material culture and the movement of metal ores across the Channel in this period, the scale of the genetic transformation in southern Britain was unexpected.

In this paper we consider the demographic changes of the Middle/Late Bronze Age at three different scales. At the inter-regional scale, using primarily aDNA evidence, we identify the movement of people, perhaps best viewed as population exchange, between southern Britain and Continental Europe. Focussing on the regional scale, with the use of multi-isotope analysis to complement aDNA evidence, we examine communities in Kent, comprised of individuals with diverse geographical origins. Moving to the local scale, where we also employ evidence from osteoarchaeology and funerary archaeology, we examine the funerary site of Cliffs End Farm to identify individuals directly implicated in the population movements of the time, and attempt to understand aspects of their life histories and their roles and treatment within the communities within which they died. We argue that it is only by addressing each of these scales of analysis, that we can begin to build detailed understandings of the dynamics of Bronze Age communities.

The work forms part of the COMMIOS project, led by the University of York, partnered with the University of Glasgow, UKRI (British Geological Survey) and Harvard Medical School which has received funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and grant innovation programme under grant agreement No 834087.

### 3 MODELLING LOCAL BRONZE AGE SOCIETIES IN SCANDINAVIA

**Abstract author(s):** Austvoll, Knut Ivar (University of Oslo) - Artursson, Magnus - Horn, Christian - Green, Ashely - Ling, Johan (University of Gothenburg)

**Abstract format:** Oral

Within the cultural sphere that is the Nordic Bronze Age, at the northernmost fringe of the European continent, one is confronted by one of the most diverse regions in Europe in terms of both landscape variation and ecological zones. Yet, the region produced such a marked uniform cultural expression within an area of well over 550 000 km<sup>2</sup> that the entire region is often summarized relatively homogeneously. The reasons for this are manifold, but a primary contributor was the successful import and control of metal in a complex exchange system of peer-polity interaction between local groups.

These local groups have tended to be presented as hypothetical constellations based on top-down narratives. Preliminary results from the project 'Modelling Bronze Age Societies' (2020-01097\_VR) will be presented, which incorporate publicly available databases and grey literature that are modelled through multiscale tools in GIS (i.e. Ripley's K-function and Kernel Density) in order to identify local constellations of Bronze Age societies.

By integrating these datasets this paper aims to provide a nuanced, tangible framework of identifying local polities and how their interaction may have contributed to the region's economic success.

### 4 THE MICRO, THE MACRO AND THE COMPLEX: THEORETICAL AND EPISTEMOLOGICAL CHALLENGES OF APPLYING MULTI-SCALAR APPROACHES TO PREHISTORIC SOCIETIES

**Abstract author(s):** Moyano Di Carlo, Julián (University of Gothenburg)

**Abstract format:** Oral

Merging micro and macro analyses of past human societies is the biggest theoretical challenge we face today. Computational methods and Big Data have provided an enormous amount of information at different levels, but to date, we lack a theoretical framework combining it in a coherent and effective way. The problem lies in how social processes scale over time and space, and in the epistemological barriers that hinder their modeling. In this paper, I will argue that Complex Systems Theory (CST) is the best framework for carrying out this task, because it has the potential capacity to model the particularities and the generalities of a system within a unique model. To understand the theoretical and epistemological challenges that this entails, I am going to focus on two key concepts in complexity sciences: emergence and self-organization. By analyzing these concepts philosophically, we can better understand the challenge of scaling prehistoric human societies. I will argue that we need to use recursive multi-scalar analytics to create scalable interpretations that we can validate and expand later using modeling techniques (e.g. agent-based modeling). Finally, I will show some preliminary examples of how this can be applied to the study of Bronze Age societies and their material culture.

### 5 ENCIRCLED BY STONES. POTTERY, DEATH, WOMEN, AND POLITICS ACROSS THE BALTIC SEA

**Abstract author(s):** Polanska, Weronika (University of Oslo)

**Abstract format:** Oral

How can traces of Bronze Age interactions beyond and within a prehistoric community be explored through archaeometry and a theoretical approach?

Ceramics dating to the Bronze Age period III-IV found at the site of Hunn in Eastern Norway can provide insight into this question. Both grave construction and ceramic material found on the site reveal some similarities with contemporary sites from Western Pomeranian Lusatian culture. I have chosen 10 ceramic sherds from Hunn and collected 3 clay samples from locations in Poland, Norway, and Germany. The archaeometric studies will contribute to the discussion on the social and material responses to both connectivity and separation as a result of the maritime connections within the Baltic Sea and beyond.

My discussion is based on my master's thesis in which I'm analyzing late Bronze Age materials from the site of Hunn, and comparing them with the available literary sources on the site of Dolice in Western Pomerania. By using ceramic petrography and analytical techniques such as pXRF, FTIR-ATR, and XRD, it is possible to identify potential correlations between ceramic materials and the source of raw materials and firing technology.

I will present theoretical approaches that consider mobility, pottery, and funerary traditions to discuss how different scales of social interaction may have been expressed in the ceramic material. I will mention the domestic producer and their choices of material against the backdrop of a mobile Bronze Age society and include an ethnoarchaeological example of women's expression of political alliances through pottery.

## WATER AND THE AFTERLIFE – WATER-RELATED RESOURCES IN THE BURIAL CONSTRUCTION OF THE NORDIC BRONZE AGE

**Abstract author(s):** Horn, Christian (Gothenburg University)

**Abstract format:** Oral

The sea, rivers, and lakes which formed a waterscape were highly important to communities living during the Nordic Early Bronze Age in southern Scandinavia (1800/1700-1100 BC). Waterways were the highways that facilitated journeys, contact, trade, and warfare, allowing maritime warriors and other actors to distinguish themselves. This is reflected in rock art and Early Bronze Age burials which were frequently placed directly by the sea, lakes, or waterways.

With this maritime world as the basic paradigm for our current understanding of the Nordic Bronze Age, it is surprising that the use of water-related resources in the construction of burials such as seaweed, beach pebbles, molluscs, etc. has drawn relatively little attention. This talk aims to summarize this material and model it by using GIS and network analysis. These methods of researching their distribution and relationships to other burial goods, construction, and the deceased will help to understand their significance in the beliefs of local societies during the Nordic Bronze Age.

## 403 DOMESTICATION OF SPACE: INTERNAL AND EXTERNAL DWELLING STRUCTURES IN MIDDLE AND UPPER PALAEO-LITHIC SITES [PAM]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** PEAN, Stéphane (Muséum national d'Histoire naturelle, UMR 7194 HNHP) - Shydlovskiy, Pavlo (Taras Shevchenko National University of Kyiv, Department of Archaeology and Museology) - Mester, Zsolt (Eötvös Loránd Tudományegyetem BTK Régészettudományi Intézet)

**Format:** Regular session

The structuration of the settlement area is a bright feature of Middle and Upper Palaeolithic campsites. Different occupation characteristics can be identified by the functional specifications of distinct archaeological structures, in relation to the palaeoecological framework and the dynamics of settlement development over time.

Dwellings and constructional materials, pits (storage or dumping), hearths, activity areas, such as workshops or butchering zones, demonstrate the spatial arrangement of residential practices in different sectors. Their study requires interdisciplinary research to establish their chronological and functional relationships and the insertion of the settlement in the surface microrelief and local landscape features. The analysis of separate structures with functional peculiarities from Middle and Upper Palaeolithic campsites allows to reconstruct the interaction of inhabitants with the surrounding landscape, to understand the links between different types of activity inside the settlement area, to establish functional and seasonal characteristics of occupation and to identify behavioural features of Palaeolithic settlers.

The session gives the opportunity to connect new researches on dwelling structures from Middle and Upper Palaeolithic sites through Europe, and interpretative studies of spatial behaviour, in relation with specific landscape, palaeo-ecological and cultural features.

## ABSTRACTS

### 1 STUDYING SPATIAL PATTERNS AT THE ABRI DU MARAS (SOUTH-EAST FRANCE, MIS 3): A GIS ANALYSIS AND 3D PALAEO-TOPOGRAPHIC RECONSTRUCTION

**Abstract author(s):** Guillemot, Pierre - Moncel, Marie-Hélène (Muséum National d'Histoire Naturelle - MNHN, UMR 7194 HNHP) - Jaillet, Stéphane (Laboratoire Environnement Dynamiques et Territoires de Montagne - EDYTEM, UMR 5204) - Chacón, M.Gema (Institut Català de Paleocologia Humana i Evolució Social - IPHES-CERCA; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili - URV; Muséum National d'Histoire Naturelle - MNHN, UMR 7194 HNHP) - Pois, Véronique (Université Perpignan Via Domitia - UPVD, UMR 7194 HNHP)

**Abstract format:** Oral

Intra-site spatial analysis of Middle Palaeolithic sites is among current debates regarding the complexity of the social organisation and the cognition of Neanderthals. These approaches make it possible to characterise how prehistoric groups occupied their living space and how they organised their activity areas, thus to describe their cultural and social behaviours. The Abri du Maras in South-East France is a major Middle Paleolithic site and has already shown its potential to characterise the cognitive and technological behaviours of Neanderthals. In this study, we carry out a high-resolution spatial analysis focused primarily on the lithic assemblages of levels 4.1 and 4.2, dated to MIS 3. The methodology combines two approaches: the use of innovative GIS tools from the free and open-source QGIS software, and palaeosurface reconstructions, using 3D software, allowing us to integrate palaeotopographic data to the spatial analysis. The results show a similar use of space for both levels, that is to say a structured spatial organisation, with main and peripheral activity zones. The densest areas were probably the remains of intense knapping

activities while some specific artefacts are used in the periphery. These spatial patterns are similar to those described by ethnoarchaeological studies and usually attributed to modern humans. They indicate a structured management of the space. Our analysis confirms previous results from other Middle Palaeolithic sites, attesting a complex spatial organisation and a social behaviour for Neanderthals. We also highlight the relevance of our methodology, both the used of GIS tools and the method of palaeotopographic reconstruction, as well as the complementarity of the 2D-3D tools, to perform high-resolution spatial analysis of Palaeolithic sites.

## 2 THREE LITHIC CLUSTERS – THREE DIFFERENT FUNCTIONS? LITHIC ANALYSIS OF THE ASSEMBLAGES FROM MOGYORÓSBÁNYA, N-HUNGARY

**Abstract author(s):** Markó, András (Hungarian National Museum - Budapest; University of Szeged)

**Abstract format:** Oral

The assemblages of the site complex at Mogyorósbánya yielding three spatially separated settlement units, securely dated to the LGM were documented. During the excavations more than 8000 lithic artefacts of the special Pebble Gravettian industry, more than one hundred Palaeogene and Neogene mollusc, coral and nummulite skeletons, a piece of fossil resin and numerous but poorly preserved animal bones and antlers were excavated.

At the central part of the site III lying around feature III/8 and III/9 the flaking of the quartzite cobbles, as well as the rejuvenation of burins and burin-cores are documented. The extensive refit studies (yielding more than 250 refit groups until now) show that this part of the locality can be connected to both the periphery of this units and to the settlement spots I and II.

In the paper the possible function of the investigated parts of the localities reflected by the lithic artefacts will be discussed.

The research is supported by the Bolyai János Kutatási Ösztöndíj (Bolyai János Research Fellowship Program).

## 3 LATE UPPER PALAEOOLITHIC DWELLING STRUCTURES FROM MOHELNO-PLEVOVCE (MORAVIA, CZECH REPUBLIC)

**Abstract author(s):** Bartík, Jaroslav - Škrdla, Petr (Institute of Archaeology of the CAS, Brno) - Nejman, Ladislav (School of Archaeology and Anthropology, The Australian National University) - Demidenko, Yuri (Ferenc Rákóczi II Transcarpathian Hungarian Institute; Institute of Archaeology NASU) - Rychtaříková, Tereza - Augustinová, Klára (Institute of Archaeology of the CAS, Brno)

**Abstract format:** Oral

The Mohelno-Plevovce site is located in the valley of the Jihlava River, which is deeply incised into the Bohemian-Moravian Highland. Due to its close proximity to a pumped-storage hydro-electric power plant, the site is continually eroded by water level fluctuations on a daily basis, and thus regularly monitored by archaeologists. Until now, rescue excavations have uncovered four spatially separated paved areas. These stone structures are associated with a peculiar lithic industry characterized by tiny microliths, produced on atypical carinated end scrapers/cores, and splintered tools/bipolar anvil cores. The artefacts were made from both local and exogenous rocks. The spatial distribution of finds follows the boundary of the pavement, suggesting a barrier effect. The structures are therefore interpreted as interior floor features of sheltered constructions. A different type of a possible dwelling structure was excavated recently – a concentration of artifacts and burnt bones partially delimited with large stones along its perimeter.

## 4 INTERNAL AND EXTERNAL STRUCTURES OF THE UPPER PALAEOOLITHIC DWELLING NO.4 FROM MEZHRYCH SETTLEMENT (UKRAINE)

**Abstract author(s):** Shydlovskiy, Pavlo (Taras Shevchenko National University of Kyiv; Muséum national d'histoire naturelle, UMR 7194 HNHP; Centre for Paleoethnological Research) - Péan, Stéphane (Muséum national d'histoire naturelle, UMR 7194 HNHP) - Tsvirkun, Ostap (National Museum of the History of Ukraine; National University of Kyiv-Mohyla Academy; Centre for Paleoethnological Research) - Chymyrys, Marharyta (Taras Shevchenko National University of Kyiv; Centre for Paleoethnological Research) - Dudnyk, Diana (Institute of Archaeology of the NAS of Ukraine; Centre for Paleoethnological Research)

**Abstract format:** Oral

Mezhyrich is a Late Upper Palaeolithic settlement in Middle Dnieper basin (Ukraine), which belongs to the Epigravettian cultural complex and dates to 15-14.4 ka 14C BP. Four mammoth bone dwellings have been discovered through long-term research since the mid-1960's.

In 2018, investigations of the interior space of unit Dwelling 4 were resumed. It was found that the bones that make up the structure form such elements as the basement (regularly dug in a circle of mammoth skulls and long bones), outer cladding (flat, long bones, and mandibles), cover bones (tusks and scapulae that fell inside the structure). A study of the interior space of the dwelling revealed differences in the lithic and faunal composition in different areas

of the filling. A lithic workshop was found in the north-eastern part. In the opposite SW part, relative to a central hearth, the remains of medium-sized mammals were found in anatomical order together with a series of tools for leather processing. The complexity of the internal filling of dwelling is complemented by the presence of at least three surfaces with a subhorizontal location of the findings. In previous years, two cultural layers were found in the adjacent area, as well as several functionally different structures surrounding the dwelling: pits, workshops, areas of dense cultural layer. Current research, together with the previously established multi-layered nature of the Mezhyrich site, proves the periodicity of the residents' stay in the settlement.

The whole settlement structure of Mezhyrich site consists of four spatial units. Each unit consists of functionally different structures located around a mammoth bone dwelling and in different archaeological horizons and should be considered as a complex dynamic structure that characterizes the interaction of a small social group with the local landscape.

## 5 LATE PALAEOLITHIC AND MESOLITHIC SETTLEMENT FEATURES IN THE CARPATHIAN BASIN

**Abstract author(s):** Király, Attila - Mester, Zsolt - Faragó, Norbert (Eötvös Lorány University Institute of Archaeological Sciences)

**Abstract format:** Oral

In situ Upper Palaeolithic dwelling structures have always been a scarce archaeological phenomenon in the Carpathian Basin, hence, only one PhD dissertation reviews this topic from the past 50 years in Hungary. Spatially fixed settlement features in Hungary are mostly dated to the second half of the Upper Palaeolithic period. The reports about them usually highlight the features themselves, less attention has been paid to the spaces between the features, the site structures, and their comparative study. We present three such sites from the late glacial and early post-glacial periods, the Younger Dryas Páli-Dombok and Szekszárd-Palánk, and the Preboreal Vác-Sződliget. Palánk and Sződliget have been unearthed during salvage excavations in the 1950-1960s. Following early reports, no detailed investigations of their features were undertaken, a task we just finished in the frames of a revision project. The Páli site was recovered under similar circumstances by us in 2014-2015. One site feature dwelling constructions (structures évidentes), the two other provided patterned distributions of combustion features and artefacts (structures latentes). These sites represent different spatial arrangements, ecological niches, and landscape use along successive periods of occupation lending a *longue durée* aspect to our study. Besides, we intend to reintegrate the somewhat „forgotten”, and recently acquired, unpublished archaeological evidence of this region to Central European research.

## 6 THE CORNERSTONES OF PALEOLITHIC DWELLING STRUCTURES: WHAT IS EVIDENT?

**Abstract author(s):** Chu, Wei (Leiden University)

**Abstract format:** Oral

The physical components of a dwelling structure—shelter, hearths, and other “furniture” are often cited as main examples of how humans modify their environment and influence sources of natural selection. Yet, the antiquity and past modes of shelters remains largely unknown because recognizing unambiguous archaeological examples and decoding how they were used may have been complicated by taphonomic processes. The absence of evident shelters before c. 20 kya therefore represents either a rapid, monumental shift in the ordered use of space or a gap in current knowledge that has yet to be verified. Drawing from patterns obtained from lithic taphonomy, pre-existing structures within karstic features and ethnographic sources, results show that the lack of evidence at magnificently preserved sites indicate that the absence of open-air shelters is not only the result of site formation processes but suggestive of highly ephemeral structures that would not have left obvious remains. This understanding of the physical building blocks of early societies prehistoric shelters has implications for theories of prehistoric mobility, culture, and evolution.

---

## 404 SOCIO-ENVIRONMENTAL SYSTEMS AND RESILIENCE TO DISTURBANCE REGIMES

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Solheim, Steinar (University of Oslo) - Kay, Andrea (MPI-SHH)

**Format:** Regular session

The increasing intensity and frequency of extreme climate events resulting from longer-term changes in disturbance regimes are among the most pressing policy issues facing the world today. By integrating archaeological and palaeoecological data we can learn from the past about what makes some socio-environmental systems more resilient to long term and periodic challenges than others. This allows for historical comparisons but also provides context for current and future management.

This session is part of the PEOPLE 3000 - Paleoclimate and the Peopling of The Earth. The P3k-working group aims to integrate paleo-population, paleoecological, and paleo-social records into co-evolutionary models to investigate the

properties of socio-environmental systems (SES) that may convey more or less resilience to changes in disturbance regimes.

What makes some socio-environmental systems more resilient to changes in disturbance regimes than others? In this session we welcome papers focusing on integrating different datasets such as archaeological radiocarbon and paleoecological data to provide examples of how changes in disturbance regimes may or may not influence socio-environmental systems, or papers that explain long-term patterns of energy consumption in socio-environmental systems and how these systems were impacted by changing climates and environments. We invite papers aiming at understanding the complex dynamics between society, technology and ecology during the Holocene either through empirical case studies or through theoretical approaches. Papers focusing on local, regional or larger scale case studies across Europe and beyond are welcome.

## ABSTRACTS

### 1 EXPLORING ENERGY REGIMES AS AN APPROACH TO CONTEXTUALIZING SOCIO-ENVIRONMENTAL SYSTEMS ACROSS DISCIPLINES

**Abstract author(s):** Vella, Emily - Hatlestad, Kailin (Uppsala University) - Martinez, Alexandre (Vrije Universiteit Amsterdam) - Lindholm, Karl-Johan (Uppsala University) - Nikulina, Anastasia (Leiden University) - Zapolska, Anhelina (Vrije Universiteit Amsterdam) - Svenning, Jens-Christian (Aarhus University) - Kluiving, Sjoerd (Vrije Universiteit Amsterdam)

**Abstract format:** Oral

The current climate crisis, along with biodiversity loss and pollution are a driving force for scientific research. Archaeologists contribute to this research by using the past to better inform the present and the future. This in turn has led to an increase in multi-disciplinary research between archaeologists, geologists, geographers, paleo-climatologists, palynologists, ecologists, policy makers, and beyond. Such studies can lead to important results on the topic of human-induced climate change since the theoretical frameworks on how to contextualize this research across disciplines has been lacking.

We propose Energy Regimes as a framework to facilitate discussions across relevant disciplines. Energy Regimes are a novel way to categorize archaeological sites, cultures, and landscapes based on their energy sources, resource use, and socio-environmental interactions. Energy Regimes are independent from time and space, which allows the framework to be highly flexible and adaptable to the variety of anthropogenic and natural activities. We believe that Energy Regimes is the optimal classification system for working across disciplines, at a variety of scales, and across time. In addition, by providing a common language and approach, Energy Regimes can aid in the integration of different datasets.

In this presentation, we will present the Energy Regimes framework and categorization system as well as how it can be implemented, with a focus on diversity and inclusion.

### 2 LUCKY LATITUDES: THE GEOGRAPHY OF PREHISTORIC HUMAN POPULATION GROWTH

**Abstract author(s):** Bird, Darcy (Washington State University; Max Planck Institute for the Science of Human History) - Gauthier, Nicolas (University of Florida) - Freeman, Jacob (Utah State University)

**Abstract format:** Oral

Human population growth impacts Earth's ecosystems more than any other mammal. It is therefore critical to identify the factors that drive long-term growth of human populations. In this paper, we ask to what extent long-term growth rates of human populations co-vary with geography. We test the role of geography, broadly construed, on the long-term growth rates of human populations via a global analysis of radiocarbon growth rates (and by inference, population), controlling for land use and climate. Regional analyses have found that climate change (Lima et al. 2020) and social, technological, and land-use change affect human population growth (Shennan et al. 2013; Freeman et al. 2021). As population densities increase, humans develop techniques in a positive feedback process that allow them to adapt to the trials of high population density (Shin et al. 2019; Sachs 2020). We therefore investigate whether geographic differences in climate and land use correlate with differences in population growth rates. Those living at the so-called "Lucky Latitudes" were closer to the optimum climate niche (Xu et al. 2020; Morris 2010), which increased their growth rates, especially if innovations were created to offset interpersonal difficulties. These innovations may have displaced human populations from demographic equilibrium, leading to decreased population stability but increased long-term population growth. Our initial results partly support these hypotheses and suggest differences in long-term growth rates between Eurasia, Africa, and the Americas.

### 3 **FLOODPLAIN STABILITY CONTROLS THE GROWTH AND RESILIENCE OF WESTERN NORTH AMERICAN DRYLAND AGRICULTURAL COMMUNITIES**

**Abstract author(s):** Finley, Judson (Utah State University) - Robinson, Erick (Boise State University)

**Abstract format:** Oral

Indigenous agriculturalists north of the Colorado River occupied the ecological margins of maize cultivation in western North America from 300-1300 CE. Fremont societies practiced diverse agricultural strategies designed to offset shortfalls in foraged foods caused by a dominant pattern of multidecadal precipitation variability. From this perspective, agriculture increased the robusticity of food sources leading to small but resilient local populations. Our previous work in northern Utah's Uinta Basin demonstrates that in the absence of the dominant multidecadal precipitation variability regime between 750-1050 CE, agricultural conditions improved, and populations expanded to form villages along the floodplains of northern Colorado Plateau dryland alluvial systems thus creating the capital necessary for incipient social complexity. But did the very same conditions (i.e., decreased precipitation variability) that allowed the growth of Fremont agricultural societies make them simultaneously vulnerable to arroyo formation, a key geomorphic risk to floodplain agriculturalists? In this study, we test the hypothesis that complex response in alluvial cycles limits the growth potential and resilience of dryland agricultural societies. We present preliminary results from Cub Creek in Dinosaur National Monument that shows rapid sedimentation punctuated by episodic arroyo formation characterized the last 2,000 years of the valley's history. We present stratigraphic and chronological evidence of an arroyo-forming event between 900-1000 CE that corresponds with the final decades of the Cub Creek agricultural village. We conclude that arroyo formation combined with the return of the dominant multidecadal precipitation variability regime at 1050 CE was a key ecological constraint on the growth potential of local Fremont populations. These findings have potential implications for early Indigenous dryland agricultural systems throughout the interior of western North America.

### 4 **PREHISTORIC FARMERS IN THEIR DIVERSITY. LAND USE, LAND COVER AND DEMOGRAPHY IN CENTRAL EUROPE**

**Abstract author(s):** Kolar, Jan (Institute of Botany, Czech Academy of Sciences; Masaryk University) - Macek, Martin (Institute of Botany, Czech Academy of Sciences) - Abraham, Vojtech (Charles University) - Tkac, Peter (Institute of Botany, Czech Academy of Sciences; Masaryk University)

**Abstract format:** Oral

Prehistoric farming in temperate Europe was diverse in time and space. Agro-pastoral communities at the beginning of the Neolithic had fewer crops than those in the Iron Age, and they differ also by technologies used in agriculture, land use or in general. The consumption of resources, especially fuel wood crucial for pottery production, or later for metallurgy, was also different. Additionally, their population density also dynamically fluctuated from reacting to environmental and/or social stimuli.

This paper will explore in detail the socio-environmental interactions of prehistoric agro-pastoral communities in Central Europe. Quantitatively analyzing large datasets of archaeological sites (tens of thousands of records), radiocarbon dates (thousands of records) and pollen data (tens of thousands of samples) covering the whole area of Czech Republic we want to answer several questions. Did the contemporary prehistoric farmers interacted with the vegetation differently in different regions? Did these diverse practices reflect their resilience? Did they transform the disturbance regimes? Why some regions witness significant population fluctuations? Were innovations and technologies crucial for coping with critical situations? For answering these questions we will demonstrate the importance of modelling procedures and a long-term perspective.

### 5 **ENVIRONMENTAL PROBLEMS AND SOCIAL PROCESS IN LATE ROMAN HISPANIA: THE CASE OF THE ROMAN PROVINCE OF BAETICA (3RD-5TH CENTURIES)**

**Abstract author(s):** Martín Casado, Juan Manuel (Universidad de Málaga)

**Abstract format:** Oral

The matter of natural disasters is a very current issue, with phenomena such as climate change or the CoV-19 pandemic becoming a clear threat to the security and stability of communities. However, environmental phenomena, as triggering forces of disasters and catastrophes, are being valued as a useful tool for historical analysis (Van Babel et al. 2020).

This contribution presents the results achieved so far in the framework of my PhD thesis project, entitled "The role of natural catastrophes in the historical process of coastal communities in the Iberian Peninsula in the first millennium BC". We have carried out an interdisciplinary study of the impact that ancient earthquakes, tsunamis and climatic changes had on the communities of the southern Iberian Peninsula, from the Late Bronze Age to Late Antiquity (Martín Casado i.p.). In particular, the Roman province of Baetica has proved to be an opportune framework for study by identifying an apparent concentration of extreme phenomena during the Late Antiquity chronological

horizon (Brown, 1971). Research in coastal environments is beginning to point to the occurrence of a horizon of destruction between the 3rd and 5th centuries AD associated with a high-energy marine event (Rodríguez-Ramírez et al. 2016; Campos Carrasco et al. 2015), while inland there is significant evidence of seismic episodes, to the extent that there is even talk of a Late Roman "seismic crisis" (Silva Barroso et al. 2016; Silva Barroso 2019: 61). To this must be added the documented incidence of a climatic change towards colder and drier conditions (Martínez-Cortizas et al. 1999). All in all, we intend to expose this reality and propose how it can be related to the current line of research that includes the effect of environmental shocks among the causes of the crisis of Roman power structures (McCormick et al. 2012).

## **A. SOCIO-ENVIRONMENTAL RESPONSES TO THE 1ST MILLENNIUM AD DISTURBANCES; A CASE STUDY OF BRANDENBURG, EASTERN GERMANY**

**Abstract author(s):** Alinezhad, Khadijeh - Doerfler, Walter (Institute of Prehistoric and Protohistoric Archaeology of Kiel University)

**Abstract format:** Poster

There is a consensus that disasters occur when raised hazards coincide with existing vulnerability. Societies that are resilient can diminish a hazard and adopt or rebound to the normal paradigm. Conversely, vulnerable societies that are already weak and fragile have the potential to fail. The first half of the 1st millennium AD is characterized by a time of disturbances and migrations (The Late Antique Migration Period). Three large volcanic eruptions occurred in AD 536, AD 540, and AD 547 with the effect that the following post-eruptive cooling triggered frost events, drought, crop failure, famine, disease, and the fall of civilizations. In our research a multiproxy approach including pollen, varve, XRF-geochemistry, and <sup>14</sup>C-AMS dating was conducted on an annually laminated sequence from Lake Kleiner Tornow, eastern Germany, to present a high-resolution record of vegetation and human dynamics and climate variability in the 1st millennium AD. The pollen diagram revealed that between ca. AD325 to AD425 arboreal pollen increased and anthropogenic pollen indicators (API) declined, which indicates the first phase of human abandonment in the given region (the beginning of the Migration period). From ca. AD445 to AD540 a dramatic expansion of hornbeam (*Carpinus*) and low values of APIs represent woodlands re-expansion and the movement of Germanic groups on the continent regions and Britain. The mid-6th century events have hit a small remaining population in a heavily reforested landscape that did not show further suffering but an increase in settlement indicators instead. The later invasion by Slavonic tribes after AD600 is represented by a further increase of APIs. The following centuries are characterized by Slavonic expansion and Germanic colonization in the region. Thus, the first millennium AD is a time of booms and busts of human populations in the Northern German plain with different internal and external forces pushing this development.

## **B. LANDSCAPE STABILITY OVER 1100 YEARS OF PASTORAL FARMING IN NORTH ICELAND**

**Abstract author(s):** Erlendsson, Egill - Eypórsdóttir, Elísabet (Institute of Life and Environmental Sciences, University of Iceland)

**Abstract format:** Poster

From the time when Iceland was colonised in the late 9th century CE, large scale degradation of vegetation and soils have left the country as one of the most eroded in Europe. Deforestation and exposure of soils to erosion by wind and water continue. The process of soil erosion may have undergone three stages of increase over the historical period: 1) Numerous studies demonstrate destabilisation of land surfaces soon after the settlement; 2) soil erosion escalated during the course of the Little Ice Age (LIA); 3) significantly increased numbers of sheep and change in emphasis from dairy to meat from the mid 19th century CE resulted in large-scale desertification, particularly in highland areas. However, many of the studies come from the volcanic zones of the island, where the bedrock is the most porous and erosion-susceptible volcanic soils are thickest. Here we examine landscape stability in Svarfaðardalur in North Iceland over the last c. 3000 years, out of which anthropogenic activity features as a contributing factor over the last c. 1100 years. Our examination works along the hypotheses that 1) the impact of settlement was swift and pronounced, 2) that the LIA facilitated enhanced levels of erosion and 3) that the levels of soil erosion escalated further from c. 1800 CE. We employ sedimentary/soil properties (bulk density and organic matter) and geochemical analyses (C/N and high-resolution XRF scanning) from five sites that form an altitudinal transect along the valley. Tephrochronological framework allows us to accurately isolate and date changes and periods of landscape destabilisation. Our results indicate that levels of soil erosion did not increase significantly during the medieval period or by the onset of the LIA. Increased sheep numbers and agricultural emphasis from the 18th century probably facilitated the greatest increase in soil erosion.

**Theme:** 3. The Carpathian Basin: Integration, Mobility and Diversity

**Organisers:** Szilagyi, Kata (Kiel University, Institute of Pre- and Protohistoric Archaeology) - Werra, Dagmara (Polish Academy of Sciences, Institute of Archaeology and Ethnology, Unit for Prehistoric Flint Mining)

**Format:** Discussion session

The session focuses on the local and regional importance of lithic raw material in the Carpathian Basin and its surrounding area during the Neolithic, Chalcolithic and Bronze Age. Provenance studies and multidisciplinary research have created a huge amount of data, which can provide an adequate basis of information and evidence to study the connections between prehistoric communities. The dynamic exchange pathways created wide networks between communities, which provide an excellent basis for research on chronological issues, social inequalities, diverse social and economic interconnections in past societies. Beyond the supra-regional scale, economically-minded research perspective, we would like to focus on the local or regional lithic materials, which were more or less constantly available for a community. We also would like to consider the same issue in the non-mountain area, where the communities probably had to have another connection, behaviour and value concept towards the lithic artefacts. We would like to consider what the local region could mean for the prehistoric communities from a lithic perspective, and what kind of skills and knowledge were important for the procurement activities. This session aim is to discuss the details of all kinds of lithic tools (chipped and polished stone artefacts, macroliths), compare the different periods and focus on diachronic changes from the social archaeological perspective.

We welcome contributions to the following questions:

- How can we identify the local, mesolocal and translocal regions and network-system of lithics?
- What is the significance of the different scale levels for lithic studies in Prehistory?
- How did lithic raw materials, new traditions, ideas and practices spread between the Carpathian Basin and adjacent regions?
- What social and economic significance could lithics have had over these millennia?

### ABSTRACTS

#### 1 PRESENCE OF CHOCOLATE FLINT AT THE NEOLITHIC ARCHAEOLOGICAL SITES SOUTH OF THE CARPATHIAN MOUNTAINS

**Abstract author(s):** Sudol-Procyk, Magdalena (Institute of Archaeology, Nicolaus Copernicus University in Torun) - Werra, Dagmara (Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Malak, Magdalena (Institute of Archaeology, Nicolaus Copernicus University in Torun) - Trela-Kieferling, Elżbieta (Archaeological Museum in Kraków) - Krajcarz, Maciej (Institute of Geological Sciences, Polish Academy of Sciences) - Mandera, Sara - Binnebesel, Hubert (Institute of Archaeology, Nicolaus Copernicus University in Torun)

**Abstract format:** Oral

Research on the occurrence and distribution of siliceous rocks is a useful method for the reconstruction of potential contacts between prehistoric communities. Attempts to describe these relationships (their purposefulness, scope and intensity) are among the most challenging issues in prehistoric studies.

Chocolate flint is one of the most widespread types of siliceous rocks materials used by prehistoric communities in Central Europe. The research on chocolate flint so far has been considered according to one model, which assumes obtaining this raw material from outcrops located in the north-eastern margin of the Świętokrzyskie (Holy Cross) Mountains, central Poland. However, a discovery of this raw material deposits in another region, Kraków-Częstochowa Upland (around 150 km to SW), has a significant impact on all previous interpretations regarding its use and distribution, both on a regional and European scale.

In the presentation, the authors would like to present the issues concerning the occurrence of chocolate flint in inventories at archaeological sites situated to the south of the Carpathians. The problem of the origin of this raw material will also be discussed in the light of the current state of knowledge, and the possibility to characterize chocolate flint from various sources (limitations and perspectives will be presented).

The chocolate flint items are registered outside Poland (in Bohemia, Moravia, Slovakia, Hungary and Austria). Therefore, it is extremely important to determine whether prehistoric communities obtained this raw material from the Świętokrzyskie Mountains region or Kraków-Częstochowa Upland.

Research on chocolate flint is carried out thanks to funding from the National Science Center, Poland, grant No 2018/30/E/HS3/00567.

## 2 TWO HUNDRED YEARS OF LITHIC RAW MATERIALS (DE-)VALUATION FROM THE MONS BASIN (4 200-2 200 BCE)

**Abstract author(s):** Collin, Jean-Philippe (Paris 1 University; Namur University)

**Abstract format:** Oral

Far away from the Carpathian Basin, the Mons Basin (Western Belgium) is located at the northern margin of the Paris Basin. It is a very small geostructural unit (ca 520 km<sup>2</sup>) with a singular geology characterized by an important diversity and a well preserved flint-bearing deposits.

The author proposes to focus the question of network scales analysis on the basis of the geostructural unit as a reference unit and to confront this approach with the more classical one based on distance. While the latter allows the easy identification of highly valued product throughout the network (integration in a social landscape), the former allows for fine reading of the economy of lithic resources practiced by communities, in relationship with their environment (exploitation of terroir / natural landscape).

Within the Mons Basin and the surrounding areas, the economy of raw materials evolved throughout the Neolithic period. Focusing on the period from the end of the 5th millennium to the end of the 3rd millennium, changes in acquisition strategies are highlighted. The valuation of lithic materials and productions varies according to the resources available locally, according to the periods and according to the success of other highly valued productions within the exchange networks of northwestern Europe. The scale of the lithic networks seems, as a reflection of the relationships between human communities, in constant motion.

## 3 PRELIMINARY RESULTS OF PROVENANCE STUDIES ON THE POLISHED STONE MATERIAL AT THE NEOLITHIC SITE OF ALSÓNYÉK

**Abstract author(s):** Szilágyi, Kata (Kiel University) - Szakmány, György - Sági, Tamás - Józsa, Sándor (Dept. of Petrology and Geochemistry, Eötvös Loránd University) - Szilágyi, Veronika (Centre for Energy Research) - Oláh, István (independent researcher) - Oszlász, Anett (Institute of Archaeology, Research Centre for the Humanities)

**Abstract format:** Oral

The polished stone assemblage from the settlement features and burials of Neolithic (ca. 5800-4500 cal BC) Alsónyék-Bátaszék site were started to be subject to macro- and microscopic petrographic and instrumental analyses. It is our aim to integrate the entire lithic assemblage into a comprehensive database, and apply archaeological and geological approach with equal importance. The majority of the raw materials of the polished stone tools originates from Mecsek Mountains in the vicinity of the site (Lower Cretaceous alkaline igneous rocks, variegated marl, bituminous limestone, spiculite). In addition to the local lithic types, many stone tools made from long-distance raw materials: mainly serpentinite, contact metabasite (so-called Železný Brod type), hornfels, 'white stone', and the less frequent Na-pyroxenite, eclogite and nephrite, which indicate the Czech Massive, Transylvania, Banat and the Alps as raw material source areas.

The primary tool types are variable axes, adzes, chisels, and maces. We have observed correlations between the main lithic types and the axe's shape in several cases. The import stone tools made from extremely high-quality raw materials (e.g. contact metabasite, hornfels or 'white stones') are significantly smaller sized than stone tools made from local raw material. The working traces of axes recovered from the graves shows great variability. Many of them are finely crafted and perfectly polished, with no signs of wear visible to the bare-eye, while others show wear, re-sharpening, chipping and cracks from use.

A further aim of our work is to refine the raw material groups and supply zones by means of mostly non-destructive petrographic and geochemical analyses. From an archaeological point of view, in addition to the reconstruction of the technological sequence of the axe-making process, we will gain new insights into the environmental use, knowledge on the surroundings and lithology, stone tool-making and burial customs of the Neolithic communities of Alsónyék.

---

## 406 ANCIENT AND TRADITIONAL CRAFTS IN CHANGING ENVIRONMENTS: ADDRESSING THE NEEDS FOR TEMPORAL PERSPECTIVES

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Radini, Anita (BioArCH and York JEOL Nanocentre, University of York) - Demarchi, Beatrice (University of Turin) - Beach, Alison (St Andrews University)

**Format:** Session with precirculated papers

It has become clear that the way our modern society lives is no longer sustainable, environmentally and socially. The production of material culture, just like with food, can have huge human and environmental costs (e.g. inequality of living conditions, pollution, biodiversity loss). There is growing interest in the role that ancient/traditional crafts and the materials that they use can play in human and environmental health and in how we can preserve them in changing environments. Traditional and ancient crafts are used as poverty relief strategies in many regions of the world but

face enormous challenges stemming from climate change and political and social unrest within the regions in which they are still widely practiced. They are also increasingly important in the economies of the industrialised world, for example as a hobby and small scale business. Although Archaeology is incredibly well placed to provide important temporal perspectives on material culture, the impact of ancient/traditional crafts on people and the environment and their adaptations to past and current climate shifts are still little discussed by scholars. Our session aims to initiate a new multidisciplinary and novel dialogue on the challenges and potential solutions that the study of ancient crafts/crafters can provide to 1. inform decision-making in material culture production in the future; 2. reduce the impact human industries have on the environment, people and climate; 3. adapt to changes that are coming in our modern world. We are proposing the creation of a 'multi-scalar' perspective, from the biomolecular point of view (e.g. improving the visibility of organic materials such as fibers/dyes), through to landscape archaeology, as crafting activities shape places through. We thus welcome papers to explore the role of the study of ancient and traditional crafts as a means of improving the health of modern people and our planet.

## ABSTRACTS

### 1 TRADITIONAL CRAFTS AND FUTURE HEALTH: WHY WE NEED THE PAST

**Abstract author(s):** Radini, Anita (Centre For Human Palaeoecology)

**Abstract format:** Oral

Ancient and traditional crafts are becoming an important economic resource in many countries, however little is known about their impact on human health and on the natural resources. Ancient workshops and archaeological artefacts exemplify crafters' skills, technologies employed, trades and more, while the crafters themselves often remain invisible. Our understanding of occupational health in ancient times is limited both by a paucity of historical texts, as well as the lack of specific 'occupational' markers on ancient skeletal remains. Studies focused on linking skeletal pathologies with specific occupations are notably few, due to the limitations of current osteoarchaeological methods for reconstructing activity patterns from human remains. As such, skeletons can rarely be associated with specific crafts, preventing a full understanding of how divisions of labour and associated inequality of living conditions and health experiences have developed and perpetuated in past and current societies. This paper aims to provide an overview on why we need to develop new ways of tracking ancient crafters in the Archaeological record. It presents potential ways forward by means of Osteoarchaeology and Experimental Archaeology. Finally, it discusses the role that such areas of Archaeology can play in future decision making policies on the preservation of traditional and heritage crafts.

### 2 CRAFTS AND ARCHAEOLOGY OF NORTH AFRICAN ETHNIC MINORITIES

**Abstract author(s):** Leone, Anna (Department of Archaeology Durham University) - Radini, Anita (York University)

**Abstract format:** Oral

North Africa is home to an extraordinary cultural and archaeological heritage, resulting from complex and long term environmental changes and population dynamics.

Today, ethnic minorities (such as the Amazigh and Tuaregs) survive, often in remote and unforgiving areas of North Africa, from Morocco to Egypt, perpetuating traditions that are millennia old. Threatened by environmental change (e.g. desertification and flash floods) and sociopolitical unrest, both the archaeological remains as well as the cultural heritage that has survived for centuries, is now disappearing fast. While such traditions have been an essential part of the history of this region, their history is almost exclusively oral or visible in archaeological record, while written texts referring to them have always been written by their conquerors. Therefore, protecting both oral history, living crafting skills and their archaeology are key aspects of saving their tradition. In order to successfully preserve the archaeological and crafting heritage of the ethnic minorities we need synergistic approaches and collaborations between researchers and the local communities that are effectively the perpetrators and protectors of a non-renewable cultural heritage that can be considered by all means an economic resource for the future. This paper presents a comprehensive overview of the current situation in Libya and Tunisia and discusses a research agenda for the future.

### 3 SMOKING HABITS IN A CHANGING WORLD: REVIEWING THE FIRING PRACTICES OF WEST BALKAN POTTERS

**Abstract author(s):** Jackson, Mark - Carlton, Richard - Shillito, Lisa-Marie - Rogers, Abbie (Newcastle University)

**Abstract format:** Oral

This paper will focus on the firing of calcite-tempered cooking pots in the village of Malešići, north-west Bosnia where the decision by potters 40 years ago to alter a long-standing tradition of open-firing is being reassessed in the light of health hazards it has created. The traditional method of open-firing is now carried out in an enclosed space which, whilst providing shelter from wind and rain, has the unintended consequence of trapping smoke in the shelter, cre-

ating an unsafe working environment and presenting health hazards to the potters, who carry out firing as a family event. Learning from this experience, the potters now wish to create a more sustainable and safer firing environment closer to their original system, but sited outside the built environment of the village core. Issues complicating their decision concern absolute cost, cost-benefit, community acceptance and, perhaps most significantly, potential technological repercussions, since any aspect of technological change risks upsetting the delicate equilibrium of the chaîne opératoire and may affect product quality. Kiln firing, for example, while potentially more controllable and likely to be safer, may not be suited to firing calcareous pottery fabrics. In our paper we will investigate the environmental impact and health hazards of the current firing system by measuring fuel consumption and smoke generation. These will be compared with other firing systems in the area, such as open-air bonfire-firing and kiln-firing, allowing the merits of the various systems to be evaluated in terms of health and environmental benefits. The results of this analytical evaluation feed into discussions with potters to inform their decisions about potential future firing strategies, thereby contributing to the longer-term sustainability of the tradition.

#### 4 **INCORPORATING ARCHAEOLOGY IN THE FORMAL TRAINING OF PHDS IN SUSTAINABILITY: THE CASE OF SUSTNET, TURIN (ITALY)**

**Abstract author(s):** Demarchi, Beatrice (Universita` di Torino) - Giacomina, Cristina (University of Turin)

**Abstract format:** Oral

The importance of a deep-time perspective in addressing the challenges of the Anthropocene is widely recognised, and archaeology enables the reconstruction of human ecodynamics through time as well as the assessment of past human impacts on the environment. Archaeologists are also acutely aware of the wealth of information preserved in legacy collections, of their fragile nature, and of the threats faced by the archaeological record in a time of rapid environmental change. However, using academic knowledge to foster a more sustainable future requires the active engagement of key stakeholders. This can only be achieved when research is co-designed, not simply communicated (e.g. Richer et al 2019, *Internet Archaeology* 53, <https://doi.org/10.11141/ia.53.2>).

Here we report on the efficacy of a preliminary step undertaken by the Teaching Board of a new interdisciplinary and international PhD Programme in "Sustainable development and cooperation" (SUSTNET). The first year of the programme has been exceptional, as we have recruited 24 Early Stage Researchers thanks to funding devoted to "Green" research by the Italian PNRR (Piano Nazionale di Ripresa e Resilienza - designed to respond to the Next-GenerationEU Plan). None of the students have any background in archaeology and all of them must spend several months working in a local firm/industry as a condition of their funding. We included archaeology among the compulsory training sessions the PhD students have to attend. The aim was to encourage the students, who must co-design their research with local stakeholders, to include a historical perspective in their research. We monitored their level of awareness and engagement before and after the module, using short questionnaires, and here we will present and discuss the preliminary results of this experiment.

#### 5 **PRESERVING CRAFTSMANSHIP IN MODERN IRAQ: A HISTORY OF BOAT CONSTRUCTION IN MESOPOTAMIA DURING THE UR III PERIOD**

**Abstract author(s):** Girardi, Virginia (University of Oxford)

**Abstract format:** Oral

This study analyses boat construction during the Ur III period, in particular riverine boats, identifying all products and raw materials employed for watercraft manufacturing in southern Mesopotamia. The contribution also focuses on how the communities accessed these resources, and how boat construction was organised in the mar-sa, the facility assigned to this activity.

Most consistent knowledge of boat construction during this period, is achieved by the study of the administrative documents concerning the supply of materials for this activity.

The Ur III documents support the understanding of how Mesopotamian communities managed boat construction, and how this activity was carried out by highly specialised craftsmen, working in the mar-sa. The texts mention the construction and repair of different types of boats, called ma2 in Sumerian, mainly made of wood, reeds and bitumen, and employed for the transport of both high-bulk low-cost commodities, such as cereals, and high valued products, throughout the Ur III state canals and watercourses.

Although southern Iraq has been affected by slightly significant environmental and climate shifts, boat construction materials and techniques have been preserved until modern times, allowing craftsmen to access the same resources, especially organic materials. Modern boat builders have preserved an ancient tradition, with low environmental impact and obtaining excellent results for the different watercrafts.

The textual analysis is combined with most relevant experimental archaeology projects and ethnographical instances of modern Iraqi boats craftsmanship, and provides information concerning boat construction materials and techniques, and how these have been preserved until today.

With the support of ethnographical observations from modern Iraqi craftsmen, this contribution shows new preliminary results of the study concerning boat construction, explaining how boats were employed and manufactured, and how boat construction techniques have been preserved until modern times, in response to all of the changes that are coming in our modern world.

## 6 PEOPLE, PLANTS, AND CRAFTS: WEAVING AND TWISTING PLANT-BASED MATERIALS IN THE WESTERN MEDITERRANEAN DURING IRON AGE

**Abstract author(s):** Martin Seijo, Maria (Universidad de Cantabria) - Azorín, Marian (Institut Català de Paleocologia Humana i Evolució Social-IPHES)

**Abstract format:** Oral

Traditional forms of ecological knowledge and craft practice should be at the centre of the current debates about biodiversity preservation and circular economy. The INTERTWINED project will reclaim crafters' experience both as a framework for interpreting archaeological crafts and as a way of rethinking our relationship with materials. By focusing on these craftworks, we will try to deepen our understanding on the intertwined relationship among people, plants, and crafts. This project is focused on direct and indirect archaeological evidence of basket- and cordage-making using plant-based materials from Western Mediterranean, dated between Iron Age (IA) and Early Roman Empire (ERE) - c. 9th-8th centuries BCE to 4th century CE-. By focusing on these craftworks, we will try to deepen our understanding of the intertwined relationship among people, plants, and crafts. This multi- and interdisciplinary project integrates archaeological, ethnographical, and ethnobotanical evidence with the experimentation developed by artisans. Traditional craft skills, knowledge and practice should be at the centre of the debate about our relationship with the environment and about our current 'take-make-waste' model of production. This project seeks to promote research, development and innovation applied to the conservation and sustainability of the important archaeological, historical, cultural and social heritage of the Iberian Peninsula, with the specific focus on crafts and plant material. This investigation will contribute to the social and economic development of the territories under study, mostly rural areas affected by ageing and depopulation, by combining archaeological and ethnobotanical research, experimentation and artisanal work.

## 7 WORKING WOMEN: A NEW INTERDISCIPLINARY APPROACH TO CRAFT AND ARTISTIC PRODUCTION IN PRE-MODERN FEMALE RELIGIOUS COMMUNITIES

**Abstract author(s):** Beach, Alison (University of St Andrews)

**Abstract format:** Oral

This paper discusses a new approach to investigating the lives of medieval religious women that combines traditional historical research with cutting-edge experimental archaeology, bioarchaeology, and cutting-edge micro- and biomolecular analyses of human remains. The ongoing interdisciplinary studies of women's work presented offer a valuable new window on the craft and artistic activities of pre-modern women that challenge deeply rooted assumptions about gender in monastic contexts and illuminate vital female contributions to sustainable circular monastic economies. The paper presents evidence for female participation in parchment preparation and repair, book copying and decoration, activities often thought to be primarily the domain of male monastics, as well as for cloth production and the production of precious liturgical textiles, activities more commonly associated with medieval women. The collaborative research presented here brings together experts in the humanities, social sciences, and biological and physical sciences to create new knowledge about the role of women in the medieval past, pioneering new methods for recovering individuals, activities, communities, and economies previously less visible to us, or visible mainly through written sources authored or authorized by men.

## 8 FROM MICRO-ARCHAEOLOGY TO MICRO-ECONOMY: A CASE STUDY FROM THE ITALIAN PIEDMONT REGION

**Abstract author(s):** Sandron, Sarah - Boano, Rosa - Cinti, Alessandra - Spiteri, Cynthia - Demarchi, Beatrice (University of Turin) - Beach, Alison (University of St Andrews)

**Abstract format:** Oral

Ancient crafts are an important part of the heritage of a population: each craft carries the strong identity of the community they originated from and helps us to understand the history of the people who practiced them, as well as the significance of the items they produced. However, with the development of industries and mass production we are losing connections with our tradition and heritage. This is problematic not only from a cultural point of view, but also because traditional crafts are the results of centuries or even millennia of adaptations and adjustments in human-environment relationships. Furthermore, ancient sustainable crafts can fuel the transition towards a greener economy.

Archeology can make a fundamental contribution to restoring connections between past and present: in this paper we present the case study of the 18th century monastic community of S. Maria della Stella (Saluzzo, Italy), in which historical documents and bioarchaeological analysis of dental calculus can provide a valuable record of ancient crafts

of the Piedmont region, such as chocolate production and textile manufacturing. We wish to start a discussion on possible approaches by which we can not only trace back the ancient roots of local traditions, but also reconstruct typical crafts of a territory, preserving ancient know-how for future generations as well as helping the micro-economy, by revitalising the local handicraft market.

## 407 DIGITAL RELIGIOSCAPES: CURRENT METHODOLOGIES AND NOVELTIES IN THE ANALYSIS OF SACR(ALIZED) SPACES

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Lätzer-Lasar, Asuman (Max Weber Center, University of Erfurt) - Lamesa, Anaïs (French Institute for Anatolian Studies)

**Format:** Regular session

The study of ancient religions – their materiality and practices – was subject to enormous changes, especially since different approaches from other disciplines, such as sociology, cultural studies, or anthropology, were made fruitful for the archaeology of ancient religions and subsequently enabled a qualitative approach to the research questions. This led to an understanding of religious spaces on the one hand as an outcome of social interaction (Lefebvre; Hofmann/ Lätzer-Lasar), and on the other hand as a shared space with its own locally produced identity (Hayden/ Walker 2013). However, the digital humanities have yet to find a meaningful way to integrate the resulting qualitative data into existing digital infrastructures and correlate it with quantitative data.

The session therefore aims to bring together experts working with different methods of gathering, modelling/visualising, presenting, and analysing data to discuss the diverse ways in which heterogeneous methods and tools can be usefully combined. Approaches that use mixed data (qualitative and quantitative), such as Story Maps or Deep Map(ping) (Bodenhamer et al. 2015) are just as welcome as the presentation and discussion of the advantages and disadvantages of various individual tools and applications, such as network models, cartograms, modelling of movement patterns, temporality or sensoriscapes (soundscapes, smellscapes, viewsheds), etc.

Since we are concentrating on the methodological approaches and applications for investigating religious spaces, we invite case studies from any chronological period, as well as from any geographical region.

## ABSTRACTS

### 1 CREATING A DEEP-MAP OF THE ASKLEPIEION OF PERGAMON: PROCESS AND PITFALLS IN DIGITIZING A RELIGIOSCAPE

**Abstract author(s):** Williamson, Christina - Katevaini, Alexandra (University of Groningen)

**Abstract format:** Oral

Sanctuaries are ambiguous spaces – they are the primary memory banks of their communities (Haake et al. 2011), yet are at the same time constantly being produced through human interactions and religious practices (Lefebvre 1974). The density and overlap of their continuous rewritings makes these religioscapes a minefield for localized stories of political power, social display, personal salvation and divine intervention. More than any other public space in the ancient world, sanctuaries embody the consciousness of their communities. But how can we access their wealth of stories, when the material culture is often haphazard and biased?

The concept of 'deep-mapping' provides a way forward as it focuses on the temporal layering of spatial narratives (Bodenhamer et al. 2015; <http://deepmappingsanctuaries.org>). Our project examines the Asklepieion of Pergamon. In use for some 600 years, this shrine developed from a natural shrine in a spring-fed basin to a cult of healing to a regional center of gravity that attracted the attention of kings and emperors. Across this timespan, visitors left an entangled trail of votives, ceramics, coinage, sculpture, architecture, inscriptions and literary accounts. This documented material is mapped in place using Geographic Information Systems, allowing comparative analyses of patterns,

anomalies, and their intersections over time, ideally leading towards an identification of diverse localized narratives and a better understanding of how past, present, and future interoperated in these spaces.

But our deep maps are not unproblematic. Can a metrical tool adequately assess data that is inherently inconsistent in quality? How can we do justice to those whose voices largely went unheard? How do we visualize both the accumulation of meanings over time, as well as their erasures in this dynamic and contested space? In our paper we sketch the outlines of our approach while discussing these issues along with some initial results.

## 2 FEMALE ANGLO-SAXON SAINTS: IMMERSIVE STORYTELLING THROUGH INTERACTIVE WEB MAPS

**Abstract author(s):** Tenzer, Martina (University of York)

**Abstract format:** Oral

Female Anglo-Saxon saints are venerated across Britain and are still an inspiration in modern times. While the Anglo-Saxon Christian world is mostly seen in the light of kings and bishops, research of the lives, workings, and places of veneration of female saints offer new perspectives for the research of religious places and aspects of veneration in Britain. Scientific projects, such as 'Finding Eanswythe' (Canterbury Christ Church University), draw the spotlight on this subject.

The challenge in research nowadays is to bring the vast amount of information and data together in a comprehensible form to inspire further research and foster appreciation of the rich history in the wider public. Heritage experts and researchers benefited from the development of the Geographic Information Systems (GIS), which enabled the visualisation of data and interrogation of maps through a graphical interface. Additionally, the internet, open access sources, and public web mapping have improved connectivity, accessibility, and availability of information.

This paper will present the outcome of a project aimed to extend the 'Finding Eanswythe' project and map female Anglo-Saxon saints across Britain, which forms a side project of an AHRC/UKRI funded PhD research on place attachment. The aim of the project was to combine spatial, quantitative, and qualitative data on one platform, creating a deep map. The interactive web map allows an overview of the network and distribution of female saints and gives deep insight and understanding of the lives, workings, places, and legends of this rather neglected but important part of history. Integrating historical data, spatial data, photographs, and videos combine quantitative and qualitative data in a deep map for immersive storytelling.

## 3 DESCRIBING HERMION/ERMIONI WITH PAUSANIAS, A DEEP MAP

**Abstract author(s):** Witmore, Christopher (Texas Tech University)

**Abstract format:** Oral

This talk presents an experiment in descriptive visualization. Through the juxtaposition and comparison of two very different descriptions of a peninsula known successively as Hermion, Kastri, and Ermioni, Pausanias's *Periegesis*, and a collage of maps and other images, we hope to reveal not so much a common space, but a diversity of spaces. In attempting to suggest something of these spaces, we push our descriptions to the edge of oversaturation and disruption, where too much information teeters on the verge of noise. By calling our attention to some of the most basic characteristics of both texts and maps (legibility, organization, consistency, fungibility, etc.) as modes of manifestation, we aim to challenge these forms, shift our bearings, and open up other descriptions for archaeologists. In designing our text and imagery topologically we aim to accentuate pleats and rifts where different connections may be formed and for other spaces to emerge. We aim to make the reader aware of different modes of engagement, between reading a text, viewing various digital media, and observing a deep map. Differences arise out of designed difficulties; without the aid of a magnifying glass or digital translation, the printed text is almost too small to read; the map and aerial imagery disrupt the notion of homogeneous space across the whole and, as such, sparks heterogeneity. Overall, our project lends itself to two very different engagements. As a reader, one may follow along page by page sequentially, as with reading a book, so that portions of the description are revealed in step with the progression; or by assembling each page on an open, flat surface one may choose to engage with information as one wishes. Forge associations. Rework the arrangement of narratives. Enter into the work as a participant observer and different spaces will emerge.

## 4 DIGITIZATION FOR THE RECONSTITUTION OF AN ALTERED COLONIAL CULTURAL HERITAGE, THE SAINT MONICA CHURCH TODAY IBN BADIS MOSQUE IN ALGERIA

**Abstract author(s):** Bousnina, Monia (Université el Bez Sétif I)

**Abstract format:** Oral

Today, the mastery of technological processes has enabled the digital tool to become a support for research, communication and heritage preservation. This work is the result of a reflection within the Laboratory of Mediterranean Architecture on the different applications of digitization on the cultural heritage built in Algeria. This work concerns a heritage object built in 1867. Our mission as an architect is to consider the city as a palimpsest where different layers

of history, architecture and sociology are superimposed to be safeguarded. This approach is part of the problem of reconversion by safeguarding and restoring an altered heritage. The case of the Ibn Badis mosque ex Saint Monica church in the city of Setif (colonial city in the highlands of eastern Algeria), questions the strategies for preserving and enhancing the colonial heritage in Algeria. Legacy of a painful colonial past, the Sainte Monica church is an edifying example, since it was transformed into a mosque after independence. Buried under rehabilitation works, it has been transformed into a religious symbol of the nation. Deviated from its primary function and immersed to respond to the new post-independent socio-cultural values that it had to represent. In order to find its traces and reconstruct the original object, digitization work carried out in situ by combining the technical processes of photogrammetry and lasergrammetry (terrestrial laser scanning) was carried out. The entire process generated a model that will serve as a support for the study and archiving of the monument. Digitization has made it possible to show the evolution over time and above all the architectural and architectonic transformation that the building has undergone from 1867 to the present day. Since many rehabilitation works have been undertaken in the meantime.

## 5 RELIOSCAPE AND CAPPADOCIA, A NEW APPROACH FOR AN OLD RESEARCH SUBJECT

**Abstract author(s):** Lamesa, Anaïs (IFEA) - Üçbaşaran, İdil (Ortahisar Belediyesi)

**Abstract format:** Oral

Cappadocia is a region located in the centre part of Anatolia (Turkey). Well-known, the region was mainly studied for its rock-cut churches. But less attention has been brought to its necropolis, mosques (whether they are built or carved) nor to its old houses and the relative chronology of the rock-cut sites themselves. These two research lacks mainly highlight that the history of the Cappadocian landscape was most often ignored by researchers except for some renowned sites such as Göreme.

To start a project crossing geography and archaeology, calling digital tools and traditional field working, we will focus on one area: the town of Ortahisar and its surroundings. Ortahisar is in the touristic heart of Cappadocia, located in the centre of the Nevşehir province. It has 39 churches and seven mosques known across its old village and agrarian areas.

Thinking this village on the long-term, through the religioscape concept will be the first step of our project. We understand religioscape as "the distribution in spaces through time of the physical manifestations of specific religious traditions and of the populations that build them" (Hayden & Walker 2013). The cartographic study will aim to analyse the spatial distribution of the different monuments and buildings according to their religious, architectural, and artistic characteristics. By crossing relative chronology databases and maps, the study will give a visual of the spatial extent of the different populations, their evolving area. Given so, we ambition to delineate the boundaries between the sacred and profane spaces through time.

## 6 MAPPING THE SACRED LANDSCAPE OF CHALCIDICE

**Abstract author(s):** Denk, Olivia (University of Basel)

**Abstract format:** Oral

This paper represents a digital approach to visualize the ancient religioscape of Chalcidice, a microregion in northern Greece. The unlocking of the peninsula's sanctuaries and cults is a desideratum of archaeological research and is investigated within the framework of my doctoral project funded by the Swiss National Science Foundation (SNSF) at the University of Basel (Switzerland). By using ArcGIS to map the ancient sites and cult places it was achieved to create the sacred landscape of Chalcidice. As a result, the significance of the sanctuaries' spatial location in relation to the god's characteristics was revealed. The map was embedded to ArcGIS StoryMaps where selected archaeological, literary, numismatic, and epigraphic evidence will be added. Regarding the numismatic data linked open data principles will be used which connects the project with the international numismatic community. Additionally, own photos taken during the research stay abroad in Greece will gradually complement the online presentation. The aim of this paper is to discuss the status of ArcGIS as a digital tool for the investigation of ancient religious spaces. Therefore, the digital ArcGIS map will be compared with the visualization in nodegoat.

## 7 FROM MIKRO TO MAKRO MAPS: A CASE STUDY OF A RURAL SACRIFICIAL SITE IN THE ALPINE REGION

**Abstract author(s):** Waldhart, Elisabeth - Gridling, Stefan - Stadler, Harald (Department of Archaeologies, University of Innsbruck)

**Abstract format:** Oral

This detailed study of a rural sacrificial site in the west of Austria (Heiligkofel, Oberleibnig, East-Tirol) explores two different approaches to mapping and how they could be brought together. In 2020 metal detectorists, undertaking a survey project in the area, discovered more than 150 objects. The range of objects discovered – fibulae, coins, militaria, and miniature objects – and the results of initial excavation work support the theory that a rural sanctuary dating from early Iron Age to Roman Imperial period was located there. The results of these first studies point to a so

called "Brandopferplatz". This type of sacrificial site is known in the inner alpine area from the Bronze Age to the Iron Age and is characterised by burnt offerings and animal sacrifices. The range of objects indicates a continuous use after the Roman conquest.

Since the place in question can be classified as a natural sanctuary with little to none built structures, other sources and methods are used to determine the sacralised space. Therefore, we aim to combine a micro-perspective on objects with a visualisation of the distribution of these objects. The first approach maps possible traces of manufacturing, use and potential marks of sacrificial practices on selected small findings from the survey. This information is then linked to the distribution of objects, while also considering other features.

Understanding the sacred site not only as built space, but also as a space created through sacrificial acts and rituals, these mappings of the sanctuary are expected to provide new insights into its various patterns of use. The continuous worship at this sanctuary, despite political and religious (?) changes in the region, raises questions about the relationships between the local population and the Romans expressed at this site.

## 8 RECONSTRUCTING SACRED LANDSCAPES: TOWARDS A PHENOMENOLOGY OF STONE PILLARS IN THE LEVANT

**Abstract author(s): Pappalardo, Chiara (University of Catania)**

**Abstract format: Oral**

Large-scale stone pillars (menhirs) standing in rows at open-air sites have been recently considered as a feature that characterizes Palestine and Transjordan especially during the late third millennium BCE. It seems that, due to their unknown function, these upright megaliths were located at some distance from the proper dwelling area of nearby settlements, and, despite being associated to 'high places' after Macalister's interpretation of the Gezer complex as a Canaanite *bāmāh*, purportedly not at the highest altitude available. Through the analysis within a 3-D GIS environment of the material data from the Central Coastal Plain, the Lisan Peninsula, the Kerak Plateau, the Madaba Plains and the Wadi 'Araba, this contribution attempts to trace a phenomenology of Levantine stone pillars within their original landscape. In particular, it will assess the potential of combining a site location analysis with the least-cost path and the viewshed analysis to shed light on the spatial relationship of these monuments with reconstructed routes, with the shift in settlement patterns that characterized the complex phase of the so-called Intermediate Bronze Age, and ultimately with coeval socio-economic actors. Such a phenomenological and cognitive approach will prove beneficial to extract new information from legacy data, and to promote a fresh and holistic interpretation of the widespread phenomenon of monolithic pillars and its significance.

## 9 MAPPING THE IRON AGE MORTUARY LANDSCAPES OF THE INNER TIAN SHAN, KYRGYZSTAN: SURVEY, DIGITAL MAPPING, AND LANDSCAPE APPROACHES

**Abstract author(s): Chang, Claudia (Independent scholar; Research Associate, Institute for the Study of the Ancient World, New York University) - Tourtellotte, Perry (Independent Scholar)**

**Abstract format: Oral**

In 2019 and 2021 archaeological surveys were conducted on the south side of Lake Issyk kul in the upland gorges of Juuku, Sutti Bulak, Chichi Khan and Chong Kizil Suu. We mapped the locations of over 500 burial mounds or graves by using GPS readings placed on satellite maps from Google Earth, Nakarta, and Zoom.earth. We used these digital maps to examine topographic features such as ridges, terraces, river banks and their relationship to the mortuary remains. Over 90 percent of the large inventory of archaeological features were burial mounds (kurgans) associated with Iron Age to early Medieval periods. These mounds, identified as Saka (eastern variants of the Scythians), Wusun, Kenkol, and Early Turkic cultures, date from the 8th century BCE to the 9th century CE and document sacred mortuary landscapes. Many of the burial mounds, robbed in antiquity and in the present, symbolize status, power, and territory as well as follow certain sociological and cosmological principles associated with notions of the divide between every day life (habitations) and the sacred world of the dead. In this paper we present preliminary results of these mortuary palimpsests and explore their religious and cosmological meanings in these valleys of north-central Kyrgyzstan. Although our approaches are mainly quantitative, we invite qualitative interpretations as to the religious meaning of these mortuary-scapes in creating memories, sacred materiality, and cosmological principles. The relationship between sacred spaces and the natural landscapes of mountains, ridges, terraces, and the saline lake below is an important aspect of ritual and cosmology of Central Asian pastoral/nomadic groups.

## 10 DIGITAL DEATHSCAPES OF REPUBLICAN ROME

**Abstract author(s): Lätzer-Lasar, Asuman (Max Weber Centre, University of Erfurt)**

**Abstract format: Oral**

The Twelve Table Laws from the 5th century BCE state that a dead person may not be buried or burned in the city. Even though this can generally be assumed for the city of Rome, the city dwellers were confronted with the conse-

quences of urban growth due to the successive expansion of the metropolis. Graves and tombs that had previously been on the outskirts of the city suddenly found themselves in the midst of a heterogeneous and lively urban fabric. Furthermore, space became a resource to be carefully negotiated due to the scarcity of space and the increasingly dense building development. Empty spaces, such as the underground quarries that were converted into catacombs, had to be used efficiently.

In this paper, I bring together these diverse strands of development in order to more clearly depict and evaluate the urban embeddedness of the tombs, as well as the intertwining of the world of the living with the world of the dead. Therefore, I focus on the location of Republican tombs within the territory of the 'experienced' city of Rome, their accessibility, visibility and use for religious practices such as commemoration. The visibility of the tombs, investigated through viewshed analysis, provides further information on the perception and urban embeddedness of these monuments. Whereas the diachronic and praxeological approach enables to sketch specific biographies of places as well as allows for a closer look at the changing identities of these monuments.

---

## 416 CHALLENGING ISLAND ARCHAEOLOGY WITH THE THIRD SCIENCE REVOLUTION

**Theme: 5. Climate Change and Socioenvironmental Perspectives**

**Organisers: Santana-Cabrera, Jonathan (University of Las Palmas de Gran Canaria) - Speciale, Claudia (University of Gothenburg) - Surera-Torres, Pau (Incipit - Instituto de Ciencias del Patrimonio - CSIC)**

**Format: Regular session**

Islands in archaeology were traditionally analysed in terms of isolation and connectivity through time as well as how these phenomena affected the structuration of specific cultures and social structures. Such approaches have now declined because they could not easily deal with the diversity and variability that island worlds present to us. These include: the level(s) of geographical constraints, their size and/or availability of primary resources, with human colonization creating even greater complexities. Examples of the latter involve peculiar processes of adaptation, long-term lack of contacts, specific agro-pastoral systems and management of limited resources. Bio-molecular archaeology and the third science revolution are now opening new horizons in the analysis of islanders' human-environmental diachronic relationships. At times, they have challenged previous concepts, interpretation, and established archaeological theories.

In this session, we will deal with, not only the role of remote/limited islands as possible nodes of network, but also their bridging roles in cultural or biological bottle-neck processes and the challenges that human colonization (or re-colonization) faced. We will also discuss concepts of isolation and connectivity in relation to archaeological contexts or materials, landscape and insular identity and how contemporary trends in archaeological research can support original interpretations. Papers regarding all geographical contexts and chronological spans are welcome.

### ABSTRACTS

#### 1 CHRONOLOGY, SITE FORMATION PROCESSES, PALEOENVIRONMENTAL CONTEXT AND THE SEASONALITY OF HUMAN OCCUPATIONS AT LAS ESTACAS CAVE, TENERIFE (SPAIN)

**Abstract author(s):** Hernández Gómez, Cristo (Departamento de Geografía e Historia. Universidad de La Laguna; Instituto Universitario de Bio-orgánica Antonio González. Universidad de La Laguna) - Jambrina Enríquez, Margarita (Departamento de Biología Animal, Edafología y Geología. Facultad de Ciencias. Universidad de La Laguna; Instituto Universitario de Bio-orgánica Antonio González. Universidad de La Laguna; Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour - ICArEHB, Universidade do Algarve)

**Abstract format: Oral**

The aboriginal settlement and socio-cultural evolution of the Canary Islands have been the object of much scientific debate. At present, the amount of chronometric, archaeological, bioanthropological, and paleoenvironmental information is significantly increasing thanks to a growing number of interdisciplinary studies on different sites through-

out the archipelago. However, the existing datasets are still scanty and fragmentary. Here, we present the results of a multiproxy, geoarchaeological study of Las Estacas Cave, in Buenavista del Norte, Tenerife (Spain), an aboriginal archaeological site with some of the oldest radiocarbon dates of the archipelago, thus representative of early human settlements in the islands. Previous excavations reported material evidence of long-lived pastoralist, fishing, and shell gathering activity at the cave and its surroundings. Our data, which includes new radiocarbon dates, micromorphology, lipid biomarkers, palynology, and sclerochronology, shed light on site formation processes and their timing, as well as on seasonality and the paleoenvironmental context. We strongly encourage future collaborative work to build upon these results and advance in our understanding of the Canary Islands aboriginal societies.

## 2 CHALLENGING CONCEPTS OF REMOTENESS IN THE OUTER HEBRIDES

**Abstract author(s): Rennell, Rebecca (UHI Archaeology Institute) - Gal, Emily (University of the Highlands and Islands)**

**Abstract format: Oral**

Our research investigates prehistoric activity on the 'remote' Roisinis peninsular on the east-coast of the small island of Benbecula in Scotland's Outer Hebrides. The area is of unique archaeological and palaeoenvironmental research value. Investigations in the 1960s/70s revealed complex Bronze Age activity (Crawford, 1977; Shepherd & Tuckwell, 1977). Ongoing erosion continues to uncover prehistoric material. Roisinis is characterized by windblown, calcareous sands (machair) - typically a west-coast Atlantic environmental phenomena. Despite research potential there has been little academic interest over the last fifty years. The site's perceived 'remoteness' and related fieldwork challenges have been barriers to further research. Since the 1990s, archaeological research across the Hebrides has been defined by a west-coast research bias. Prioritization of west-coast archaeology has rendered the Hebrides' east-coast poorly understood and woefully under-explored. Our research seeks to redress this imbalance and challenge concept of 'remoteness'. The assumption is often that islands are by their very nature 'remote'. We challenge this and at the same time explore how remoteness varies across island landscapes and environments. Furthermore, we consider how archaeological research can serve to establish remote landscapes through research bias, research constraints and research methods. Our research seeks to improve our understanding of east-coast prehistoric settlements and more specifically to explore the role of windblown sand in the formation of archaeological sites in varying landscapes.

## 3 NEW PERSPECTIVES ON THE COLONIZATION OF THE CANARY ISLANDS

**Abstract author(s): Santana-Cabrera, Jonathan - Morquecho-Izquier, Aarón - Brito-Mayor, Aitor (University of Las Palmas de Gran Canaria)**

**Abstract format: Oral**

The Canary Islands were settled 2,000 years ago by farming populations from North Africa. Archaeological narratives support the idea that the first colonists remained isolated until the arrival and colonization of Europeans in the 15th century AD. When Europeans arrived, Canarian populations spoke distinct dialects and did not have the seafaring skills needed to navigate between islands. These ethnohistorical texts and the archaeological evidence indicate that the inhabitants of the Canary Islands shared a similar cultural and technological background but showing significant diversity between islands in terms of social organization, material culture, subsistence practices and demography. Most archaeologists have interpreted this variability as consequence of the ecological constraints of the island environments and the isolation of the island societies through time. A key question is to determine when the first archaeological indicators of diversity appeared in the island societies and what extent island ecologies, anthropogenic impact and isolation influenced on this diversification. New archaeometric approaches have provided new clues to understand this process, yielding new hypothesis that challenge previous knowledge.

## 4 UNDERSTANDING SMALL ISLANDS DYNAMICS FROM MULTIDISCIPLINARY AND MULTI-PROXY ANALYTICAL APPROACHES. THE CASE OF FORMENTERA (BALEARIC ISLANDS, WESTERN MEDITERRANEAN)

**Abstract author(s): Sureda, Pau (Instituto de Ciencias del Patrimonio - Incipit-CSIC)**

**Abstract format: Oral**

The Balearic Islands (Western Mediterranean, Spain) were the last islands of the Mediterranean Sea to be colonized. This happened at the end of the III millennium cal BCE by settlers related to the Bell Beaker phenomenon. During most of the II millennium BCE, during the Bronze Age, they were settled by groups more or less homogeneous, known as Naviform (boat-shaped) societies. In the isle of Formentera, prehistoric human occupation is associated with insularity factors, including an extreme environment. Cap de Barbaria II is one of the biggest open-air naviform villages occupied during this period in Formentera, where different funerary sites such as Ca na Costa or Cova 127 have been also investigated. Recently, multidisciplinary and multi-proxy archaeological research conducted within these sites revealed specific trends and suggested an adaptation of the economic behaviour of these settlers to an environment poor in resources. In this sense, aspects such as innovation, diversification, and intensification in the use

of resources characterized the subsistence and technological patterns developed by the prehistoric inhabitants of Formentera. Here, I will present new data from different archaeological and paleoenvironmental analytical studies in order to reveal subsistence patterns and social practices from this particular archaeological context in comparison with the rest of the archipelago.

## 5 HUMAN-ENVIRONMENTAL INTERACTION ON A SMALL ISLAND: A PRELIMINARY MODEL OF FRESHWATER SUPPLY IN HELLENISTIC AND ROMAN USTICA (ITALY)

**Abstract author(s):** Vinci, Giacomo (Dipartimento di Scienze Storiche e dei Beni Culturali, Università di Siena) - Foresta Martin, Franco (Laboratorio Museo di Scienze della Terra Isola di Ustica; Istituto Nazionale di Geofisica e Vulcanologia, Sezione di Palermo) - Furlani, Stefano (Dipartimento di Matematica e Geoscienze, Università di Trieste) - Dawson, Helen (Dipartimento di Storia Culture Civiltà, Università di Bologna; Institut für Prähistorische Archäologie, Freie Universität Berlin)

**Abstract format:** Oral

Recent work carried out by the authors on the volcanic island of Ustica (Palermo, Italy) based on the integration of geomorphological and archaeological data has led to a preliminary reconstruction of the ancient water supply system on the island, highlighting the interactions between communities and the insular environment and the paramount importance of efficient hydraulic systems to tackle the lack of fresh water sources through the island's history.

To understand this general picture, we recently carried out a topographic survey using drone and LiDAR acquisitions at the Rocca della Falconiera, the main Hellenistic and Roman settlement of the island (around III c. BC - III c. AD).

The site is located in the north-eastern part of the island – on a 140 m high promontory modelled by weathering and erosion– and later became the seat of an eighteenth-century fortress erected by the Borbone kings. The Hellenistic and Roman settlement features dozens of square dwellings laid out on three terraces linked by stairs. The dwellings are flanked by numerous channels and circular cisterns dug into the volcanic tuff and coated with mortar, some were excavated in 1975 and 1980. Rainwater collection, coupled with stillicide or dripping water found in caves, was still in use as recently as the 1970s and supplied sufficient water to the island community.

Volume calculation of the water cisterns at the Rocca della Falconiera settlement has allowed us to design a preliminary model of freshwater supply at the site which provides new insight on the modes of extraction, storage and consumption of water. Our study underscores how the islanders were able to deal with natural constraints and limited resources in historical times up to the present day, and has potential to shed light on earlier adaptations, which enabled island settlement even during prehistoric times.

## 6 BEYOND FARMING, SHEPHERDING AND RECOLLECTION: ISLANDER SUBSISTENCE STUDIED THROUGH STABLE ISOTOPE ARCHAEOLOGY DURING THE PREHISPANIC PERIOD OF THE CANARY ISLANDS

**Abstract author(s):** Cañadillas, Elías (University of La Laguna) - Santana-Cabrera, Jonathan (Universidad de Las Palmas de Gran Canaria)

**Abstract format:** Oral

The prehispanic period of the Canary Islands is defined by the arrival of North African settlers to the archipelago and their continued existence on it until the European conquest and colonization of the islands. This 1500-year occupation appears to be based on the reliance on the same dietary sources across time, which were a mixture of foods brought from the continent and wild vegetable and animal species collected, albeit with different distribution of said resources depending on regional and seasonal variations. Current archaeological work developed in the archipelago gravitates towards identifying specific differences between islands and time periods, and whether the inhabitants of each island relied on a specific main food source or there is actually a mixed diet.

Carbon/nitrogen stable isotope archaeology has provided useful in the past to shed light on the aforementioned questions. However, since the Canarian environment and the species consumed by the islanders do not differ drastically until the colonial period, in with other animals and vegetables are introduced, isotopic analyses allow only for general conclusions in this approach. Therefore, linear mixing models provide inefficient and insufficient to address specific questions, hence the introduction of Bayesian modelling and multi-proxy analysis along with traditional isotopic studies.

The present communication evaluates and contextualises the isotopic information available to archaeologists for the prehispanic period of the Canary Islands, along with recent and unpublished data, to suggest new ways of interpreting diet and subsistence patterns on Island environments.

## 7 ONE IN A FLEET OF A THOUSAND: ADRIATIC SMALL ISLAND ARCHAEOLOGY AND THE CASE STUDY OF THE ISLAND OF IST

**Abstract author(s):** Domines Peter, Pio (University of Zadar)

**Abstract format:** Oral

The island of Ist belongs to the group of small outer islands of the northern Dalmatian archipelago. The poor state of research, caused mostly by inaccessibility and the harshness of the island karst landscape doesn't deviate from the rest of similar islands which, despite all research potentials, have not been explored enough, neither have yet been a case of systematic study. Following that situation, the student project „Archaeological Landscape of the Island of Ist – Archaeo.IST“ was initiated in 2020 with the aim of collecting qualitative and quantitative data for understanding how insularity affected human interactions in the landscape of small island at the edge of the Adriatic archipelago. The basis of landscape research was the application of extensive field survey followed by test excavations on chosen sites from different periods. Preliminary results provided the insight into dynamics of anthropogenic transformation of island landscape seen as a process considerably determined by scarce natural resources which presumably challenged the idea of permanent colonization. Archaeological records are mostly related to the late prehistoric periods, Bronze and Iron Age, a time when intensive land use occurred and the island proved to be an oasis of small community integrated into a broader network of interactions with nearby islands and short-distance land as a part of the Adriatic cosmos of coherence.

## 8 LET'S TALK ABOUT DEATH. SOCIAL CHANGES THROUGH THE STUDY OF FUNERARY ARCHITECTURE AT THE MINORCA ISLAND (6TH-2ND CENTURY BCE)

**Abstract author(s):** Carbonell Pastor, Sonia (University of Alicante)

**Abstract format:** Oral

Throughout the last century, periodization proposals flourished in relation to the prehistoric and protohistoric development of the Balearic Islands (Spain). These essays focused on the uniqueness of the Balearic archaeological record and thus assumed the exclusion of the islands from the rest of the socioeconomic dynamics that were taking place at that time in a much larger geographical space. This reductionist vision of treating an island as a delimited space, closed, and totally isolated in terms of contacts leads to biases and interpretive errors. Based on the theoretical principles of Social Archaeology, my study focuses on the funerary practices of the island of Menorca throughout the 1st millennium BCE with the aim of understanding how funerary activities were inserted into the productive framework of the specific Menorcan society. The study cases that we will present consist of a series of rock-cut tombs necropolis whose archaeological context is unknown to us as they have been looted since ancient times. As a result, our consideration starts from treating the "artificial caves" or rock-cut tombs as an object in itself, that is, as a result of a productive activity that is part of a certain social standardization. In this consideration, we tend to consider the socioeconomic context in which the Balearic Islands were inserted, especially the commercial contacts with Punic groups from the island of Ibiza.

## 9 SAME SPACE, DIFFERENT PEOPLE: RADIOCARBON DATES AND THE INDIVIDUALS FROM TWO DIFFERENT NECROPOLES FROM POLLENTIA (MALLORCA, BALEARIC ISLANDS)

**Abstract author(s):** Ordóñez, Alejandra (Universidad de Las Palmas de Gran Canaria) - Cau Ontiveros, Miguel Angel (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona - ERAAUB, Institut d'Arqueologia de la Universitat de Barcelona - IAUB, Universitat de Barcelona - UB; ICREA; Chercheur associé, Aix-Marseille Univ, CNRS, Centre Camille Jullian, Aix-en-Provence) - Chávez Álvarez, Esther (Universidad de La Laguna) - Mas Florit, Catalina (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona - ERAAUB, Institut d'Arqueologia de la Universitat de Barcelona - IAUB, Universitat de Barcelona - UB)

**Abstract format:** Oral

The archaeological site of Pollentia hosts remains from different periods of Mallorcan History, from the Romans up to medieval times. Its use, first as a city and later as a Necropolis, are evidence of the changes through time in the relationships between different populations and this insular landscape. Furthermore, the geographical emplacement of Mallorca, in the middle of the Mediterranean routes, has meant the presence of many different societies, all of which have left their cultural footprint reflected in the archaeological record.

The extent of the contributions of each new colonizer to the population as a whole is fundamental to assess their impact on the preexisting societies and to evaluate changes, permanences and mixtures over time. For this analysis, Radiocarbon dates and their precise interpretation are fundamental to understanding diachronic processes.

This research focuses on some of the remains from two burial sites excavated in Pollentia. The first one is the necropolis located above the Forum of the Roman city, with more than 300 inhumations. Recent Radiocarbon dates have provided chronologies that fall into the late Byzantine (534-902/903AD) and early Muslim period (902/903-1229AD). A chronology more recent than those previously proposed. Nevertheless, the inhumations follow the Christian ritual,

showing the persistence of Christianity long after the arrival of the Muslims. The second one is the Necropolis of Sta. Ana, with dates from the end of the Muslim period to after the Catalan Conquest (1229). We present the osteobiography of five individuals, three from the Forum Necropolis and two from Sta. Ana, to show differences and similarities in living conditions of populations from different chronological periods, but from the same environment. Thanks to the new chronological data, this diachronic analysis was possible, showing that Radiocarbon dating could provide valuable tools for historical analysis beyond traditional ones.

## 10 IDENTITY AND LONGUE DURÉE: REVISITING THE PREHISTORY OF MENORCA

**Abstract author(s):** Díaz-Zorita Bonilla, Marta (Eberhard Karls Universität Tübingen; SFB1070 "Ressourcenkulturen" Eberhard Karls Universität Tübingen) - Timm, Monice - Marciales, Mauricio (SFB1070 "Ressourcenkulturen" Eberhard Karls Universität Tübingen) - Baten, Jörg (Eberhard Karls Universität Tübingen) - Alarcón García, Eva - Moreno Onorato, Auxilio (University of Granada) - Escudero Carrillo, Javier (University of Granada; Eberhard Karls Universität Tübingen) - Arboledas Martínez, Luis (University of Granada)

**Abstract format:** Oral

The prehistory of Menorca is well-known for its monumental architecture and the vast amount of prehistoric sites throughout the island, but although many research has been carried out, there are still some missing links in the Menorcan past regarding their social organisation and funerary behaviour. Therefore, we present here some results from our recently excavated funerary cave located within the necropolis area of Cales Coves (Alaior). Since its discovery, the Biniadrís cave has provided exceptional all kind of well-preserved archaeological material. This represents a unique funerary context without any human disturbance for over 3000 years. In order to investigate identity and to reconstruct the social organisation of the population who inhabited Biniadrís during the Late Bronze Age and the Iron Age in Menorca, we have applied bioarchaeological methods in combination with state-of-the-art biomolecular analyses.

This paper discusses the latest bioarchaeological results like the radiocarbon chronology  $^{14}\text{C}$  to explore some concepts, such as the *longue durée* of this context with complex funerary behaviour in relation to the isolation but also connection towards the Mediterranean. Additional concepts such as island sustainability are also explored to better understand the husbandry management.

## 11 STEROIDS AND BILE ACIDS IN DUNG: BIOMOLECULAR APPROACH TO A RECENT INDIGENOUS FUMIER DEPOSIT IN LA PALMA (CANARY ISLANDS)

**Abstract author(s):** Fernández-Palacios, Enrique (UDI de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers - AMBI, Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Jambrina-Enríquez, Margarita (Departamento de Biología Animal, Edafología y Geología, Facultad de Ciencias, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers - AMBI, Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Égüez, Natalia (UDI de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers - AMBI, Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Herrera-Herrera, Antonio (Archaeological Micromorphology and Biomarkers - AMBI, Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna; Departamento de Química, Facultad de Ciencias, Universidad de La Laguna) - Mallol, Carolina (UDI de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers - AMBI, Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna)

**Abstract format:** Oral

Lipid biomarker analysis focused on steroids has shown to have great potential for discriminating animal faecal input in archaeology, i.e., between human, pig and ruminant. This is particularly interesting when applied to stabling deposits to assess animal diet, herding strategies, and livestock composition. Here, we report preliminary results from a faecal biomarker study of sediment samples from Belmaco Cave, a pastoralist archaeological site (fumier) in La Palma (Canary Islands). The site was occupied by pastoralist communities over the course of five centuries prior to the first arrival of Europeans in the 15th Century. Previously obtained soil micromorphological data indicates livestock penning and periodic burning in the central area of the cave such that the stratigraphic sequence is made up of three recurrent, interstratified facies: 1) unburned sheep/goat dung, 2) charcoal-rich sediment, and 3) sheep/goat ash. We selected samples from each of these differentiated sedimentary facies, as well as a control sample, and performed faecal biomarker analysis focusing on sterols, stanols, and bile acids. Our preliminary data shed light on the origin of the faecal matter at the prehispanic pen, as well as on the effect of burning on archaeological sedimentary steroids.

12

## LIVING ON THE EDGE: LANDSCAPE, SUBSISTENCE, AND NETWORK DYNAMICS ON USTICA ISLAND (SICILY) DURING THE BRONZE AGE

**Abstract author(s):** Dawson, Helen (Università di Bologna; Freie Universität Berlin) - Mannino, Marcello (Aarhus University) - Spatafora, Francesca ("Polo di Palermo per i Parchi e i Musei Archeologici/Museo Archeologico A. Salinas")

**Abstract format:** Oral

This paper explores the dynamic interplay between prehistoric communities and landscape in the context of Ustica, a small volcanic island located at the heart of the central Mediterranean, some 50 km north of Palermo, Sicily. In particular, we present new data from recent excavations at the Bronze Age "Faraglioni" village (ca. 1400-1200 BC), including the results of stable isotope analysis conducted on animal remains, which allow us to offer a preliminary reconstruction of subsistence strategies and environmental conditions at the site. We also consider possible links between the Faraglioni village and contemporary sites, both on Ustica itself, Sicily, and the neighbouring Lipari islands, assessing the extent and role of cultural connections. Our ongoing research on Ustica sheds light on issues of isolation and connectivity, resource exploitation, place attachment and islander identity, focusing on this seemingly marginal island's occupation during a time of heightened interaction in the Mediterranean, and highlighting the challenges and solutions adopted by this Bronze Age community.

13

## THE WHO, WHY, AND WHEN. PEOPLING OF THE CANARY ISLANDS AND THE CHALLENGES OF ARCHAEOOMETRY

**Abstract author(s):** Cuello del Pozo, Paloma (Texas A&M University)

**Abstract format:** Oral

The debate of the peopling of the Canary Islands has continued since European explorers arrived at the region during the Age of Discovery. Indeed science, technology, and interdisciplinarity have provided archaeology with significant bodies of data contributing and bringing light to questions on insular occupation. Or do they? This paper examines some of the main postulations put forward in regard to island peopling with a focus on the Mediterranean landscape and how these frameworks translate to the Canarian case. With archaeometry taking precedence in the hypothetico-deductive approach of archaeological research, theoretical models that help make sense of overwhelming bodies of quantitative results need not to be left behind. Stable isotope analyses, radiocarbon measurements, and paleogenetics are helpful and necessary tools to understand ancient human activities. In the Canary Islands, these methods are being refined and increasingly applied every year; however, the prevailing questions of who, why, and when did the archipelago become first occupied are still standing. Canarian archaeology has gathered considerable quantitative bodies of data from radiocarbon measurements and ancient DNA (aDNA); yet processes of occupation, and social network systems generally modelled for island chains are still fully unidentified. The decontextualized nature of the archaeological landscape in the Canaries, and a lack of consensus surrounding radiocarbon dates are some of the circumstances contributing to heated debates among local scholars. In this communication, the author reviews most current literature on aDNA for the Canary Islands considering the diversified and dynamic interactions that gave rise to Iron Age civilizations. Furthermore, this paper discusses Canary Islands settlement theorems, the chronological evidence used for such arguments, and how such postulations align with current literature on island colonization. Finally, the author presents a modest perspective on such controversies aided by preliminary stable isotopic data.

14

## THE PEOPLING OF THE CANARY ISLANDS FROM A PALEOGENOMIC PERSPECTIVE

**Abstract author(s):** Serrano, Javier (Universidad de La Laguna) - Ordóñez, Alejandra - Santana, Jonathan (Universidad de Las Palmas de Gran Canaria) - Arnay, Matilde - Fregel, Rosa (Universidad de La Laguna)

**Abstract format:** Oral

A North African origin for the indigenous population of the Canary Islands has been determined thanks to the contribution of multidisciplinary research, including the analysis of ancient DNA. Although most of the research interest has been centred on determining their exact geographic origin, the analysis of the Canarian indigenous population also offers a unique opportunity to understand how human populations are affected by isolation, migration and/or adaptation to a new environment. In order to understand the colonization process and evolution of the indigenous people of the Canary Islands, we obtained nine indigenous low-coverage genomes and genome-wide data from 36 additional individuals. Comparisons between islands indicate that the genetic composition of the indigenous populations was variable, with some populations showing the effects of strong genetic drift processes. This result implies that, after the peopling of the archipelago, every island experienced their own evolutionary path, determined by the environmental conditions and the limitations of insularity. The islands with greater resources were able to maintain relatively high population sizes, while strong genetic drift processes affected the smaller islands. We also detected differences in the genetic composition of eastern and western islands, reinforcing the idea of a heterogeneous colonization process in the archipelago.

15

## PALEOGENOMIC ASSESSMENT OF THE IMPACT OF THE EUROPEAN COLONIALISM ON INDIGENOUS POPULATIONS: THE CANARY ISLANDS AS A PROXY

**Abstract author(s):** Fregel, Rosa - Díaz-Pérez, Clara (Universidad de La Laguna) - Ordóñez, Alejandra (Universidad de Las Palmas de Gran Canaria) - Serrano, Javier (Universidad de La Laguna)

**Abstract format:** Oral

The Age of Discovery (13th - 14th centuries) and the subsequent establishment of European colonies across the world triggered the European dominance of the global economy. It also had important cultural and ecological consequences, because for the first time it brought together distant civilizations and environments. Historically, island ecosystems have been used as natural laboratories to address the study of ecological processes and speciation. In the same vein, islands can be used to understand the impact of complex migratory movements, such as those derived from European colonialism. The current population of the Canary Islands is the result of the admixture of the indigenous people of North African origin and European colonizers, but it is also influenced by additional migratory flows due to the importation of African slaves for sugar cane cultivation or to the intense commercial contact with the American continent. Given the complexity of these admixture processes, the ancient DNA analysis of historical sites of the Canary Islands is crucial to understand how the genetic composition of the human populations changed over time. In this presentation we will review how the paleogenomic analysis of historical sites in the Canary Islands is shedding light on the complex demography of this region.

16

## CHALLENGING ISLAND ARCHAEOLOGY WITH THE THIRD SCIENCE REVOLUTION: NEW DATA FROM THE TWO LIMESTONE ISLANDS OF MALTA AND LISMORE.

**Abstract author(s):** Stoddart, Simon (University of Cambridge) - Ariano, Bruno - Bradley, Daniel (Trinity College Dublin) - Cologne, Anders (University of Cambridge) - Esposito, Carmen (Cardiff University) - Kaljee, Colin (University of Cambridge) - Madgwick, Richard (Cardiff University) - McLaughlin, Rowan (Queen's Belfast) - Nafplioti, Argyro (Independent) - Reimer, Paula (Queen's Belfast)

**Abstract format:** Oral

Recent analysis has been undertaken of materials from two limestone islands, one in the southern Mediterranean, the other on the western flank of Scotland: respectively Malta and Lismore. These two very different examples, contrasting in chronology and distance from their mainlands, raise a range of interesting questions about island archaeology in the light of scientific work, principally using radiocarbon, isotopes and aDNA. The Maltese data are primarily from human remains dating to the fourth and third millennia BC. The Scottish data are primarily from animal remains dating to the late first millennium BC and the early first millennium AD. The Maltese archipelago is some 80km from its nearest mainland of Sicily, itself an island which contains similar geology. Lismore is a mere kilometre from its nearest mainland, albeit across a tidal race and an area of potentially contrasting geology. Both have been placed in their chronological context by substantial radiocarbon modelling and have been subjected to recent isotopic analysis. In the case of Malta this has been supplemented by work on aDNA. We debate the underlying qualitative and quantitative issues, some first raised over ten years ago by one of us in Prince Edward Island at the Institute of Island Studies and at the Dublin World Archaeological Congress with a similar comparison of these two islands focused on risk, identity and connectivity, by combining old and new data, seeking to address weaknesses and strengths of our current knowledge and methodology, and pointing to ways forward in future research.

17

## FUNERARY RITUALS AND MOBILITY ON A SMALL MEDITERRANEAN ISLAND. THE CASE OF USTICA (SICILY, ITALY) DURING THE NEOLITHIC

**Abstract author(s):** Speciale, Claudia (Gothenburg University) - Arienzo, Ilenia (National Institute of Geophysics and Volcanology, Naples) - Micciché, Roberto (University of Palermo) - Prillo, Vito (University of Padua) - Battaglia, Giuseppina (Cultural Heritage Department, Palermo) - Larosa, Nunzia (UNE - University of New England, Armidale) - de Vita, Sandro (National Institute of Geophysics and Volcanology, Naples) - Rickards, Olga - De Angelis, Flavio (UniRoma 2, Tor Vergata, Rome)

**Abstract format:** Oral

Ustica is a small volcanic island, 60 km away from the Northern coast of Sicily. The new investigations of the first human colonization, happened in the mid-5th millennium BCE, allow to give light to the way these communities were organized and used local and imported resources. The megalithic funerary structure, present in the area of Piano dei Cardoni, on the southern coast of the island, preserves the secondary depositions of multiple individuals and was used for a span of several generations. The combined  $87\text{Sr}/86\text{Sr}$  and DNA analyses are giving deeper information on the mobility during these phases, including animal resources. The archaeological context was analyzed also in terms of mobility of raw resources and the results of the comparison of these data is here presented. A wider insight on mobility during the same phases is given to understand how Ustica is located in the Central Mediterranean network during the Middle and Late Neolithic.

## A. MITOGENOMIC ANALYSIS OF THE DOMESTIC ABORIGINAL SPECIES OF THE CANARY ISLANDS

**Abstract author(s):** Díaz Pérez, Clara (Universidad de La Laguna) - Ordoñez, Alejandra (Universidad de Las Palmas de Gran Canaria) - Serrano, Javier - Vacas-Fumero, Emilio - Fregel, Rosa (Universidad de La Laguna)

**Abstract format:** Poster

Genetic analysis on the origin of the indigenous people of the Canary Islands has been mainly approached focusing on human populations. However, the study of their domestic fauna has received less attention. In this study, we use for the first time next-generation sequencing and enrichment technologies to analyze indigenous Canarian domesticates (goats, sheep and pigs). Conservation of faunal endogenous DNA is good, finding differences between species, but not between types of samples (bone vs. teeth). Enrichment techniques produced high-quality data, even for poorly conserved samples. We were able to obtain complete mitochondrial genomes for all species and carry out a more in-detail phylogenetic study of goats. All goat samples belong to clade A, a haplogroup that is widespread in Eurasia. Lineages similar to those of the ancient samples from the Canary Islands have been observed in North Africa, in Europe, and in the Near East, confirming that they belong to sub-haplogroups of clade A with a wide distribution around the Mediterranean basin.

---

## 417 AS FAR AS VASES GO: STUDIES ON ANCIENT GREEK POTTERY TRADE AND ITS CONTEXTS

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Gares-Molero, Alejandro (University of Valencia) - Rodriguez-Perez, Diana (University of Oxford) - Diez-Castillo, Agustin (University of Valencia)

**Format:** Regular session

This session aims at analyzing and shedding light on the role of trade, distribution and (re)contextualization for research on Greek pottery (Early Iron Age - Hellenistic period). The first Greek wares to be ever studied came from Italian soil, and, since then, these ceramic productions have been documented in as distant regions as present-day Galicia, the British Isles or the Crimean Peninsula. Scholarship has shown that this dispersion of materials seems to unveil large-scale trade dynamics, which would be effective thanks to the role played by numerous agents: well-based ceramic industries, dynamic markets, and consistent maritime and terrestrial commercial networks. As a result of these overseas enterprises, Greek pots became part of the material culture of different autonomous societies, which sometimes implied changes in the significance, functionality and value of these objects. Hence, this session calls for communications that contribute to the study of ancient Greek pottery outside its production area by addressing one or various of the previously mentioned aspects. Special attention will be paid to those proposals which either 1) focus on commercial contexts (i.e. ports and shipwrecks); 2) analyze the presence and distribution of Greek imports in a given area; 3) define trade routes of specific series or productions; 4) explore the resignification of Greek pots among non-Hellenic peoples and contexts (i.e. Etruscans, Iberians or Scythians).

The session is sponsored by El Sec Shipwreck Re-excavation Project (University of Valencia).

## ABSTRACTS

### 1 RELIEF WARES IN THE ARCHAIC MEDITERRANEAN: A TRANSCULTURAL AND DECENTRALIZED NETWORK

**Abstract author(s):** Ward, Andrew (Indiana University)

**Abstract format:** Oral

While generally understudied compared to painted fine wares, pottery decorated with impressed relief decoration offers a unique opportunity to understand the complex networks of exchange and adaptation that connected the Archaic Mediterranean world (700-480 BCE). A particular style of continuous figural relief, impressed onto large ceramic forms like lustral basins with cylinder rollers, is attested archaeologically across a number of non-contiguous regions during the sixth century BCE. Past scholarship has tended to see these regional traditions, in places like Ionia, the north Aegean, western Sicily, and Etruria, as originating in Archaic Corinth, the style's diffusion framed in terms of a center-periphery model of exchange and cultural adaptation.

The results of a multiyear project funded by the American Council of Overseas Research Centers reveals instead that this and other styles of Archaic relief wares followed a more decentralized system of exchange, their uneven attestation across the Mediterranean best explained by the itinerancy of craftspeople and the importance of existing demand in local communities. Rather than evidence of Hellenization when discovered in Etruscan, Phoenician, and other non-Greek communities, contextual analysis reveals that Greek relief wares proved popular where they could be adapted to conform to traditional ritual practices. Rather than evidence for Hellenization or Globalizing processes, the spread of Archaic relief wares across the Mediterranean demonstrates the adaptability and transcultural

tural resonances of figural ceramics, and the ingenuity of Greek traders and craftspeople in finding new markets for their wares.

## 2 IMAGINED CREATURES AND THEIR TRAVELS: ARCHAIC VASES AS ENACTORS OF GEOGRAPHIES

**Abstract author(s):** Neill, Liz (Boston University)

**Abstract format:** Oral

Imagined creatures, and the real vases that carried them to various parts of the Archaic world, served as enactors of overlapping geographies. Certain creatures (i.e., the Lernean Hydra), though not physically real, were alive in the Archaic imagination and inherently tied to a real place. Others (i.e., griffins or sea monsters) connoted non-Hellenic or transitory locations – defined by their dangerousness and non-Hellenicness in opposition to a Greek center. But what happened when the vases carrying these creatures traveled outside of that “center”?

The high level of invention and artistic choice in crafting imagined creatures, the productive interplay between the physical geography of production and use sites and the imagined Archaic geographies of creatures, and the range of provenance(s) all establish imagined creatures as a fruitful corpus for a geographically-based study. This case study will map both locations recognizable today (production sites, the earliest provenanced appearances of selected creatures on vases, findspots) and “imagined” locations (those enacted by ancient artists’ and storytellers’ depictions of creatures of the oikoumene).

I will focus on excavated creature vases, examining the physical presence of creature vases as Archaic commodities and delving into regional trends in findspots. I will juxtapose these geographical contexts (far from their original sites of production) with literary evidence, interrogating whether these ancient findspots and the distribution of Greek imports correlate with, respond to, or push back against literary descriptions and perceived geographies of imagined creatures. I will conclude by highlighting how these vases served as enactors of geography and introducing future possibilities for mapping the creature corpus.

## 3 THE CHANGE IN THE ROUTES OF ATTIC POTTERY IN THREE CENTURY OF ITS PRODUCTION

**Abstract author(s):** Giudice, Filippo (University of Catania) - Zisa, Flavia (Università Kore di Enna)

**Abstract format:** Oral

The production of figured Attic pottery covers roughly three centuries (from the last quarter of the sixth century to the end of the fourth century BC). Already in the last quarter of the sixth century BC, and even more so in the first quarter of the sixth century, thanks to Solon’s prudent policy aimed at favoring handicraft activities, Attic pottery reached Egypt (Naucrati in particular), Libya (Tocra) and timidly Sicily. Gradually, subsequently mainly under Cimon, and partially under Pericles, exports to external markets increased.

The defeat of Egospotami marks a clear ceasura in the production and export of Attic pottery. The defeat of the Athenian army in Lamia and the occupation of Piraeus by the Macedonian army gradually close the production and export of Attic pottery.

Only a decade later, when Konon returned to Athens to put the structures of Piraeus back on their feet, the ceramic industry resumed production and distribution on a large scale in external markets, towards the Black Sea area, towards the Po Valley and toward the Iberian area.

## 4 LONG DISTANCE TRADE NETWORKS AND IONIAN-INSPIRATIONS IN THE WORKSHOP OF AMASIS

**Abstract author(s):** Attout, Antoine (Université Libre de Bruxelles)

**Abstract format:** Oral

In the context of the session “As Far as Vases Go” I would like to shed new light the controversial link between the workshop of Amasis and Ionia by integrating an examination of the distribution of the vases produced by the Amasis workshop and their archaeological contexts.

For a long time, the question of the link between Ionia and the workshop of Amasis has been widely discussed with highly debatable or unfounded arguments. Today, a much better knowledge of the East Greek pottery allows to identify a series of truly Ionian-inspired elements on several vases from the Workshop of Amasis. Naturally, these elements raise questions about the role played by the workshop of Amasis in athenian pottery. The distribution of these vases and their archaeological contexts bring an new angle to the problem and probably offers a first part of the answer.

First of all, most vases of the workshop of Amasis are concentrated in a few very specific sites such as Naucratis, Miletus, Samos and Gravisca. These sites include sanctuaries where the Ionians systematically play a preponderant role throughout the 6th century and operate as communication nodes in a vast network of exchange involving Ionian merchants. Interestingly enough, some vases attributed to Amasis bear a votive inscription clearly connected with this Ionian long trade network.

This distribution and contexts suggest that the Workshop of Amasis supplied decorated vases to a network of travelers, probably Ionians themselves if not in close contact with Ionian circles, who disseminated its productions throughout the Mediterranean and especially in sanctuaries settled near important ports of long distance trade where the Ionians played a predominant role. It therefore seems clear that the Amasis workshop integrated a series of Ionian elements into its production in order to meet the particular demands of this network.

## 5 (RE)DEFINING THE TRADE ROUTES AND THE DISTRIBUTION PATTERNS OF A SIGNIFICANT ATTIC POTTERY WORKSHOP OF THE LATE ARCHAIC PERIOD

**Abstract author(s):** Kathariou, Kleopatra (University of Ioannina, Greece)

**Abstract format:** Oral

The Euphiletos Painter was one of the most prolific painters of Panathenaic amphorae, active in the last third of the 6th century BC. There are also reported neck-amphorae of standard type and a few amphorae of type A and B by his hand, as well as hydriae of standard shape, a few oinochoai and two plaques from the Athenian Acropolis.

Since Beazley's times the number of vases attributed to his hand has increased, and many more additions have been made possible. Interestingly, there is a considerable number of vases painted by his hand with known provenance. Therefore, it was a real challenge to try to reconstruct the commercial network of the particular pottery workshop and to define the different routes that the cargo ships followed.

The most dense and easy to follow network was the one to the Western part of the Mediterranean. Unexpectedly, we were able to locate fragments of vases by the Euphiletos Painter among the material that came to light in the 1930's in the excavations held by W. Lamb in the ancient city of Antissa on the island of Lesbos as well as among the finds from the old excavations of the Italian Archaeological School on the archaeological site of Hephaestia on the Lemnos' Island. In this way, it was made possible to trace a new commercial route that the traders carrying vases of the Euphiletos Painter's Workshop followed, towards the Aegean Islands and the East.

Furthermore, issues related to the customers' preferences that differed from region to region were examined as well as the role of the traders in the choice of vase shapes and their decorative themes.

## 6 AS FAR AS ATTIC VASES GO: STUDYING THE PRESENCE OF ATHENIAN KERAMEIKOS IN ANCIENT THRACE

**Abstract author(s):** Tsiadaki, Despoina - Mourthos, Ioannis - Michailidou, Natasa - Karta, Meliana (Culture & Creative Industries Dpt, Athena Research Center, Xanthi Branch)

**Abstract format:** Oral

Attic Pottery in Thrace (AtticPOT) is a three-years program of the ILSP/ATHENA RC studying the Attic pottery found in the vast geographical area known as ancient Thrace, now divided among many Balkan countries. The whole project revolves around a digital repository (AtticPOT repo), where published Attic pottery is recorded. Being a product of an interdisciplinary team of researchers, it transcends the boundaries of modern nation-states (Greece, Turkey, Bulgaria, Romania).

The purpose of this paper is, based on the accumulated in the AtticPOT material, to record the general distribution of numerous Attic vases scattered around various sites of ancient Thrace, as well as to examine them using a variety of variables. Preferences on shapes and iconography will be seen within their contexts. The contribution of specific painters of Athenian Kerameikos will be measured. Another issue that will be explored is the relationship between pots, their contexts and the more than 200 sites of ancient Thrace where Attic pottery was found, according to the AtticPOT repository. Tracing axes through which Attic pottery infiltrated inland Thrace will allow us to discuss if we can also trace ancient routes. Finally, pottery's contribution to practices and representations concerning complex social phenomena, will enable the exploration of the contribution of Attic pottery on the formation and transmission of various aspects of social memory of both Greek colonists and locals within broad geographic areas.

## 7 IMPORTATION AND FUNCTION OF ATTIC RED-FIGURE POTTERY IN RUVO DI PUGLIA IN THE LATE 5TH AND EARLY 4TH CENTURIES B.C.

**Abstract author(s):** Giudice, Elvia (University of Catania) - Giudice, Giada (Munich University, Gerda Henkel Stiftung)

**Abstract format:** Oral

Within the framework of the theme "As Far as Vases Go: Studies on Ancient Greek Pottery Trade and its Contexts" we would like to focus our attention on the imports of red-figure Attic pottery in Ruvo di Puglia, an indigenous site of Peucezia, in the last decade of the 5th and the beginning of the 4th century BC. If, in fact, it may be considered an established fact that there was a strong decrease in the export of figured Attic pottery from around 420 BC in all Magna Graecia and Sicily, an exception seems to be represented by Ruvo di Puglia, where the quantity of imported pottery, in contrast, seems not only to increase in the last quarter of the 5th and, even more so, in the first quarter of

the 4th century BC, but document a direct link between the Athenian Kerameikos (or at least the trademen) and the Peucetian city. The significant number of vases is an indication of the phenomenon, including the kantharoi (a special native Peucetian shape) of the Class and Group Bonn 94A, the rhyta and the figure vases of different shapes of the W Class and Persian Class, the askoi and the several cups, almost all of the stemless type, which have not yet been compared in any other site of Magna Graecia, but also of Tyrrhenian Etruria and along the mid and high Adriatic coast. Our aim is to investigate the reasons for this trade trend and to explain the function of Attic imports in the reconstructed contexts.

## 8 A WOMAN'S SHAPE? GREEK VASES AND LOCAL IDENTITIES IN CENTRAL APULIAN TOMBS

**Abstract author(s):** Peruzzi, Bice (Rutgers State University of New Jersey)

**Abstract format:** Oral

The increasing use of osteological analysis in Mediterranean archaeology in the last few decades has shown the pitfalls of gendering burials on the basis of their grave assemblages. Yet, the association of specific artifacts or types of pottery with male or female tombs still persists in scholarship. This paper analyzes the presence of traditionally "feminine" Greek pottery shapes in Central Apulian tombs as means to investigate the relationship between the consumption of specific objects and the construction of identity in antiquity.

Central Apulia was inhabited by a non-Greek population, conventionally known as the Peucetians. Between the 6th and the 3rd century BCE, Peucetian tombs were furnished with assemblages that included large quantities of Greek vases, imported from Attica or from the nearby colonies of Taranto and Metaponto. Traditionally, these imports have been seen through the lenses of hellenization; yet, the study of the necropoleis shows that the Peucetians were using Greek vases very differently from their Athenian contemporaries. This is illustrated, for example, by the presence of sympotic sets in female tombs, or of vessels traditionally connected with the "female sphere" (e.g., kalathoi, hydriai, lekanides) in male ones.

Adopting a context-based approach, my paper discusses how these "women" shapes" were appropriated by the local populations and imbued of new meanings, to reflect the complex nexus of personal, social, and cultural identities that the deceased had maintained in life. As tombs remains our largest source of emic information for Central Apulia, a more nuanced reading of this pottery provides an important step toward a deeper understanding of Peucetian society.

## 9 ATTIC POTTERY IN UNPUBLISHED CONTEXTS OF THE NECROPOLIS OF VALLE PEGA IN SPINA

**Abstract author(s):** Vendrell Cabanillas, David (Autonomous University of Madrid)

**Abstract format:** Oral

At present, the Etruscan necropolis of Valle Pega in Spina (in the currently Italian city of Comacchio) remains practically unpublished. The excavation journals deposited in the National Archaeological Museum of Ferrara (Emilia Romagna, Italy) allow a preliminary study of the burial goods of almost 2700 graves that cover a chronology spanning from the middle of the 5th century to the end of the 2nd century BC. Among its notable graves are the tombs 323B and 30C, which are two female burials from the end of the 5th century BC. Their rich assemblages suggest that these graves belonged to two spinetic women of high socioeconomic status. They were not only buried in a necropolis characterized by presenting a higher level of wealth than that of the Valle Trebba necropolis, but they were also accompanied (for their journey to the afterlife) by previously selected funerary material (Attic and local) previously selected that perhaps may respond to a local burial funerary ritual. Furthermore, in both tombs there is an Attic red-figure column krater representing a female bathing scene, respectively; a visual theme uncommon in Spina's figurative repertoire, but whose interpretation would easily adapt to spinetic funerary ideology. Therefore, our speech proposal is to present an archaeological and iconographic analysis of the grave goods of these tombs with the objective aim of i), on the one hand, identifying and defining existing commercial and distribution patterns between continental Greece and Padan Etruria and, on the other hand, ii) understanding their own ideological and identity discourses.

## 10 THE REACH OF AN ATTIC WORKSHOP: TRADING HAIMONIAN VASES IN THE WESTERN MEDITERRANEAN

**Abstract author(s):** Gares Molero, Alejandro (Universitat de València) - Chidioglou, Maria (National Archaeological Museum of Athens) - Macian Fuster, Alejandra (Universitat de València)

**Abstract format:** Oral

Originally characterized by professors C. H. E. Haspels and J. D. Beazley, the Haimon Group constitutes one of the latest but most prolific Attic Black-Figure productions. The vases of this workshop have been widely documented across the Mediterranean basin, especially, in peripheral territories. Nonetheless, there are few studies centered on the commercialization of these products in distant areas. This paper discusses the presence and trade dynamics of the vases attributed to the Haimon Group in the Western Mediterranean.

The complete process of production, commercialization and consumption in the West of these ceramics is studied. To this end, we characterize the Haimonian series, contrasting established attributions on artistic grounds with the archeological record of its production center, Athens. In this way, we identify production groups and phases. Secondly, we analyze the vase-trading process itself, establishing supply routes and areas. For this purpose, we follow series distribution in western territories and consider both relevant archeological contexts (i.e. coetaneous shipwrecks) and pan-Mediterranean trade dynamics. The reception process is also considered, as we distinguish consumption patterns and demand indexes of Haimonian series, shapes and iconographies among different cultural –and commercial– areas.

The exposed study has revealed significant results that will be presented in this paper: 1) the vases of the Haimon workshop were traded in serial groups as they tended to be conjunctly used in western territories; 2) There existed a demand for specific shapes depending on reception areas (market-driven production hypothesis); 3) local buyers showed a particular interest in Haimonian figural programs, using them to construct various social and identity discourses.

## 11 SETTING CORINTHIAN AMPHORAE IN THE WESTERN MEDITERRANEAN: PRODUCTION, TRADE(S), AND DISTRIBUTION ROUTES

**Abstract author(s):** Sanchez Conde, Francisco Javier (Universidad de Salamanca) - Gutierrez Soto, Itziar (Universidad de Alcalá) - Gares Molero, Alejandro (Universitat de Valencia)

**Abstract format:** Oral

Amphorae of Corinthian type are one of the main indicators of Greek pottery trade in the Western Mediterranean between the 7th and the 4th century BCE. This typology of transport vessels was initially studied by Dr C. G. Koehler, who elaborated a compelling classification and defined Corinth as the main production centre. Later literature has provided new insight, for example, defining Western production places. Despite these facts, studies on the commercialization of these series are not frequent.

This paper discusses the trade of Corinthian transport amphorae in the Western Mediterranean. To this end, in the first place, we characterize the studied material based on archaeometrical features (i.e. paste composition and shape). Thus, we establish clear production series. Secondly, the distribution of Corinthian amphorae in the Western Mediterranean is analyzed using GIS software. Patterns and material concentrations are defined. Lastly, specific archaeological contexts are taken into account, especially those of commercial nature (i.e. storage spaces, shipwrecks and ports).

In this way, this study contributes to defining the production and trade of amphorae of Corinthian type in the Western Mediterranean. As a result, we have been able to successfully define the commercial routes (maritime, fluvial and terrestrial), Western distribution points and the transport and reception processes of this material in the study area. Apart from that, the driven analysis has allowed us to both sequence chronologies for different production phases and define the associated material these amphorae were traded with (i.e. specific types of Attic fine ware).

## 12 DISTRIBUTION OF GREEK POTTERY IN THE WESTERN MEDITERRANEAN DURING THE SECOND HALF OF 6TH CENTURY BC: NEW EVIDENCE FROM EMPORION

**Abstract author(s):** Santos Retolaza, Marta - Castanyer Masoliver, Pere - Tremoleda Trilla, Joaquim (MAC Empúries)

**Abstract format:** Oral

Recent excavations in the Phocaeen port enclave of Emporion (Empúries) are providing a significant volume of ceramic assemblages corresponding to the initial stage of the nucleus of the so-called "Neapolis" during the second half of the 6th century BC. Complementing the results of the excavations carried out previously in the first archaic establishment of the Palaiapolis (Sant Martí d'Empúries), the study of the archaeological contexts corresponding to the later implantation of the new colonial nucleus to the south of the natural port allows us to characterize the different categories of Greek ceramics that compose them: different productions of Western Greek tableware, made locally or imported from Massalia, as well as other categories of imported Greek pottery, fundamentally originating from Magna Graecia and from Attic workshops.

Considering also the remarkable variety of amphorae categories, of Iberian, Greek, Etruscan and Phoenician-Punic origin, these ceramic assemblages are also a proof of the deployment of Phocaeen maritime trade on the Mediterranean coast of the Iberian Peninsula from the last third of the 6th century, in which the role of the Emporion port enclave was essential. In the same chronological context, the Greek shipwreck of Cala Sant Vicenç, at the north-eastern coast of the island of Mallorca, also constitutes a valuable testimony of the mechanisms and strategies of Greek commercial navigation and of the distribution of Greek pottery and amphorae during the Late Archaic period.

### 13 **ATTIC POTTERY IN IBERIA (LATE 5TH-4TH CENTURY BC): THE LONG PATH FROM PRODUCER TO CONSUMER**

**Abstract author(s):** Dominguez, Adolfo (Universidad Autonoma de Madrid)

**Abstract format:** Oral

The arrival of Greek products to the Iberian Peninsula has always been shrouded in controversy from the very beginning of their presence, since it has been considered almost an undisputed fact that they arrived in Iberia as part of the cargoes of Phoenician ships, even though today, and thanks to archaeological finds in some sites such as Huelva in the 6th century BC, some (but not all) have begun to be convinced of the reality of Greek trade with Iberia at that time.

However, when we look at other historical phases, such as the one we want to analyse here (late 5th-4th century BC), the debate about distribution mechanisms and who was in charge of them is once again reproduced. The weight of ideas formulated in the past, sometimes based on a weak evidence and a view of distribution mechanisms that is not free of prejudice, has led to the widely held idea that the marketing of Attic ceramics during this period was in the hands of "Punic" traders, although it is not always clear who these "Punics" were (Carthage?, Ibiza?, Gadir?). On the other hand, the possible involvement of Greek agents in their distribution is downplayed because it is concluded (without decisive arguments) that the role of the main Greek centre in Iberia, Emporion, has been overshadowed by that of other agents.

In this paper we intend to explore the different data available to us (and, among them, the wreck of El Sec plays a fundamental role) to revisit the issue of who transported Attic ceramics from their place of production to their recipients in the Iberian Peninsula.

### 14 **WAVES OF IMPORTS IN A DISTANT TERRITORY, THE IBERIAN EDETANIA: ATTIC SUPPLY, TRADING ROUTES AND LOCAL MARKETS**

**Abstract author(s):** Macián Fuster, Alejandra - Garés Molero, Alejandro (Universitat de València)

**Abstract format:** Oral

During the last decades, relevant studies on the presence of Greek imports in the Western Mediterranean have been published. However, few works focus on the trading process of these imports in specific socio-political areas. This paper examines the commercialization of Attic pottery in Edetania, a protohistoric Iberian territory defined by the rivers Millars and Xuquer (present-day València and Castelló provinces). From mid-6th to late 4th century BCE, Attic ceramic imports were introduced to the Edetanian territory via maritime trade by exogenous agents, first Greek, later Punic. These traded goods reached indigenous ports, such as Grau Vell (Arse - Saguntum), and, from there, they entered into inner commercial circuits controlled by Iberian oppida. Edetanian commercial circuits for Attic pottery are yet to be established. Defining these -outer and inner- trade dynamics is the central focus of our study.

To this end, we analyze the Attic ceramic record documented in the study area. Both published and unpublished materials are considered. Aspects such as vase dating, functionality, technique and, most importantly, production, are taken into account and used to establish series. In the second place, obtained data are evaluated in context: spatially, series dispersion and concentration are estimated in relation to geopolitical features (i.e. coast proximity and territorial organization). Chronologically, importation phases are considered. The co-existence of the given series onsite is also tested.

As a result, the trading process of Attic pottery in the Edetanian region is unveiled. Three waves of imports are established, with clear trading lots and groups. Ports of entry and both terrestrial and coastal distribution routes are also outlined. Eventually, this study has allowed us to prove the existence of different commercial circuits for Attic vases inside Edetania that may correspond to distinct local markets with their specific consumption patterns.

### 15 **TO BE OR NOT TO BE. THE DIALOG BETWEEN GREEK VESSELS AND IBERIAN POTTERY IMITATIONS IN THE UPPER GUADALQUIVIR (SPAIN)**

**Abstract author(s):** Moreno Padilla, María Isabel (Instituto de Investigación en Arqueología Ibérica. Universidad de Jaén)

**Abstract format:** Oral

The main objective of this proposal is to review certain contexts and material assemblages of the Iberian societies of the Western Mediterranean during the fourth century BC. Specifically, it focuses on an aspect barely studied in Iberian Archaeology: the dialogue established between Greek potteries and its Iberian imitations in the Upper Guadalquivir. In this territorial area, the entry of Greek products and their association with the Iberian elites generated a profound change in the production models of Iberian pottery. This change was accompanied by a growing specialization of pottery production to cover a demand for products that, with greater or lesser fidelity to the original model, imitate Greek forms or adopt certain characteristic elements of them. The duality established between the original model and the copy acquires, in the Iberian world of Alto Guadalquivir, some interesting perspectives for reflec-

tion. The analysis of necropolises such as Baza (Granada), Castellones de Céal (Hinojares, Jaén) and Toya (Peal de Becerro, Jaén), together with the review of krater imitations such as that of Atalayuelas (Fuerte del Rey, Jaén), show interesting relationships between the imported form/image and the local form/image. Both, the Greek vases and the Iberian imitations, complement each other and are part of the ideological mechanisms linked to power. In the case of Greek vases, the iconographic re-reading of their themes becomes an essential element of Iberian aristocratic mythology. Regarding Iberian pottery imitations, the formal and iconographic ellipsis that is established encourages new forms of social status representation. In these cases, while the pottery forms underline the social difference, the geometric decoration- characteristic of the Iberian area- shows the need to establish symbolic links between the elite and the rest of society.

## 16 **A LANDLOCKED EMPORION. AN UPDATE OF THE DISTRIBUTION OF GREEK POTTERY IN THE MIDDLE VALLEY OF GUADIANA RIVER**

**Abstract author(s):** Pulido, Guiomar (Universidad Autónoma de Madrid) - Miguel-Naranjo, Pedro - Rodríguez González, Esther (Instituto de Arqueología de Mérida-CSIC)

**Abstract format:** Oral

Previous research has shown that the Middle Valley of Guadiana river, situated in the inland territory of the Iberian Peninsula, was a consolidated point of attraction and distribution of the Mediterranean commercial circuits during the Protohistoric period. Thereby, the Mediterranean trade routes linked the Greek world to the Iberian Peninsula following diverse courses through the eastern coast of the peninsula and the western coast across the Strait of Gibraltar. Despite its remote location from the coast, the findings of Greek pottery have continued to occur in Guadiana's sites, as part of a trade activity process which takes place between the beginning of the sixth century B.C.E. and the end of the fourth century B.C.E. when Attic vases stop appearing. This meant as well the standstill of the connections with the agents who provided those imported materials from the harbours and a change in the contact networks between the diverse areas.

Our investigation is inserted in that chronological and spatial frame, attempting to supply an update of the Greek pottery catalogue, most of them come from Attic workshops, found in the zone. This labour will consist in adding the last findings to the rest of the Greek vases already documented, along with a description of their archaeological contexts. The ultimate goal is to determine the concentration of the Greek imported material in order to define its spread patterns in the Middle Valley of Guadiana river during the sequence between the beginning of the sixth century B.C.E. and the end of the fourth century B.C.E.

Thanks to that, we will be able to reconstruct the changes which happened in the trade networks referring to both the trade routes and the arrived vases shapes, based on the demand, the product's availability and the dynamism of the commercial activity.

## 17 **SAILING FROM THE ATTIC PORTS TO THE COAST OF OPHIUSSIA. THE TRADE ROUTES OF ATTIC VASES TO THE WESTERN HESPERIDES**

**Abstract author(s):** Morais, Rui - Ferreira, Daniela (Faculty of Arts and Humanities of University of Porto) - Mauro, Chiara (Complutense University of Madrid)

**Abstract format:** Oral

Between the end of the 7th and the 4th cent. BC, Greek pottery—mainly Attic—reached the Iberian Peninsula, eventually arriving at settlements located in what is currently Portuguese territory. This paper aims at reconstructing the travel of these pots from its very beginning (i.e., the ports of departure) up to their final destinations. In particular, it will analyze from what ports the pottery was possibly shipped, what routes it followed and how, when and where it was introduced into the local realities. The shipped products are not the result of a direct trade between ports but rather the result of the redistribution of products among different ports trying to obtain the best benefits. In the current Portuguese territory, the impact of the commercial presence of the Phoenicians and the Greeks in the first Iron Age societies was felt in a scenario characteristic of societies in transition. The arrival of these goods, their acceptance and reappraisal varied according to both each community and the space-time coordinates.

---

## 419 **USING FORENSIC ARCHAEOLOGICAL APPROACHES TO INFORM THE PAST**

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Fry, Megan (University of Florida, Department of Anthropology) - Welty, S. (University College London, Institute of Archaeology) - McCrane, Samantha (University of Florida, Department of Anthropology) - Andersson, Karina (University College London, Institute of Archaeology)

**Format:** Session with presentation of 6 slides in 6 minutes

Forensic archaeology utilizes bioarchaeological methods to inform modern legal forensic casework. However, forensic archaeologists are better equipped to test emergent methodologies due to increased available funding, larger

accessible datasets, and better sample preservation than bioarchaeological researchers. Therefore, these advancements in forensic methods can be used to inform past populations, thus, allowing for insights that were impossible previously. This session highlights recent developments and challenges in forensic archaeology method and theory, and their applicability to both modern forensic approaches as well as archaeological samples. We encourage open discussions on isotopic analysis, aDNA, osteological analysis, spatial/GIS analysis, geometric morphometrics, taphonomy studies, and other related areas of research. Although the themes listed are not comprehensive, we encourage any research that is innovative and potentially collaborative which may be tangentially related to this topic, including pilot studies. Papers with diverse theoretical schools and viewpoints are encouraged and welcomed.

Collaborative efforts can be especially helpful in the development of more robust research questions and standardized analytical techniques. We hope this session will provoke future inter-institutional and interdisciplinary collaboration through open dialogue, as well as promote novel research designs. Although we do not expect all authors to have already participated in such labors, we do encourage authors to include a question or statement about future directions within their research project that will contribute to open discussions with this idea in mind. How can this work benefit from collaboration? Would my research benefit from cross-institutional data collection and/or analysis? Is this research technique applicable to both modern and past populations? What modifications can make my research more broadly applicable or rigorous?

## ABSTRACTS

### 1 VIABILITY OF AI AND MACHINE LEARNING IN FORENSIC ANTHROPOLOGY

**Abstract author(s):** Andersson, Karina - Rando, Carolyn (UCL)

**Abstract format:** Oral

Estimating sex from skeletal human remains is one of the primary goals while developing a biological profile in a bioarchaeological or forensic anthropological setting. Additionally, many techniques for establishing other aspects of the biological profile, such as stature and age, are reliant on an accurate sex estimation. Following the pelvis, the skull is viewed as one of the most accurate skeletal elements for sex as it displays differences in size and morphology. However, ascertaining sex from the cranium is often based on a visual evaluation of morphometric traits such as glabellar and nuchal crest prominence, size of the mastoid process, and gonial angle on the mandible. Unfortunately, recent studies have demonstrated that these visual methods are prone to inter- and intra-observer error and are highly subject to practitioner bias. In addressing these inherent shortcomings, artificial intelligence (AI) and machine learning are proving to be viable tools for minimizing bias and standardising visual sex estimation methods.

Machine learning is a type of AI that identifies patterns in large amounts of data in order to make decisions or predictions. Deep learning is a more advanced form of machine learning which uses neural network architectures that are based on the human brain, essentially consisting of layers that are organised into interconnected nodes. The input is fed through these increasing layers of complexity and learns the image features in order to produce a desired output. In the past few years, deep learning models have advanced to the point that they now routinely surpass human accuracy when performing tasks such as image classification. Therefore, this presentation will look at the validity of a multidisciplinary approach combining machine learning and established visual methods of sex estimation in bioarchaeology.

### 2 THE UTILITY AND APPLICABILITY OF PXRF ON COMMINGLED ARCHAEOLOGICAL SAMPLES

**Abstract author(s):** Fry, Megan (University of Florida, Department of Anthropology) - Welty, S. (University College London, Institute of Archaeology)

**Abstract format:** Oral

Abstract: Portable x-ray fluorescence (pXRF) spectrometry is a non-destructive multi-element analytical technique that provides chemical composition results instantly. This elemental analysis is also used archaeologically on material culture to source manufacture and is routinely employed in modern forensic contexts to separate comingled human remains, often in mass-grave or multiple burial scenarios. Less routinely, bioarchaeological material has also been examined, namely in the analysis of pathological conditions with varied results. Although its utility has been demonstrated regarding comingled remains, these individuals generally do not come from a single population, thus the affect homogeneity has on these readings has not been thoroughly explored. Here, these authors examine the Early-Medieval site of Worlabby, UK (W066) to assess what extent individual identities can be discerned from homogeneous archaeological populations. Nuanced explanations for the observed variation (e.g., age, health, sex, etc.) which might obfuscate individual identities are also explored. Worlabby has both known graves and comingled charnel remains for which to test the extent of pXRFs utility in multiple archaeological contexts. Several readings from each of the known graves were taken and averaged together in order to reduce the amount of possible inter-individual error. Because the charnel remains consist of over 900 individual elements, a subset was included here. Each sample was taken using standardized settings and a bone standard was used intermittently to ensure proper calibration. The

elemental composition of bone is reliant on physiological, environmental, and sociocultural factors. Careful consideration of these factors in a nuanced analytical approach can allow individual and group identity as well as mobility and community to be investigated.

### 3 THE EFFECT OF EDENTULISM ON DENTAL ARCH SHAPE ANALYSES

**Abstract author(s):** McCrane, Samantha - Meloro, Raphaela (University of Florida, Department of Anthropology)

**Abstract format:** Oral

Metric and nonmetric osteological shape analyses of the midfacial skeleton are often employed in forensic anthropology to estimate the ancestry of a decedent. These same techniques have also been applied within bioarchaeology to estimate the ancestry of individuals to inform facets of life such as community makeup, population admixture, and potential factors involved in status differences observed among burials. One feature that is commonly utilized for ancestry estimation is the shape of the dental arcade. However, pathology and normal age-related changes to the dental arch, most commonly antemortem tooth loss, have the potential to introduce additional error into ancestry estimation since remodeling of the bone, and the resultant altered biomechanical strains, can change the overall shape of the dental arcade. In this study, the shape of the maxillary and mandibular arcades of 50 individuals of known sex, age, and ancestry from the Terry Collection (25 edentulous individuals and 25 dentulous individuals) are evaluated nonmetrically from CT scan data collected by Dr. Lynn Copes using methods outlined in Gill 1998. These nonmetric assessments are utilized to estimate the ancestry for each individual, which are then compared to the known ancestry for each individual. Each individual in the sample is independently assessed by two forensic anthropologists, each working in the blind to minimize bias, and interobserver error is calculated for both groups (edentulous and dentulous). Although there is increased error whenever one utilizes a singular feature for ancestry estimation, this may often be necessary when examining bioarchaeological assemblages due to the high potential for taphonomic damage obscuring or obliterating features. As such, it is necessary to determine the reliability of individual methods. Our results inform how edentulism affects the reliability of this methodology, and suggest a need for broader studies on how ancestry, age, and pathology intersect to influence dental arcade shape.

### 4 PARAMETRIC MODELLING OF HUMAN CRANIA FROM POST-MORTEM HEAD CT DATA

**Abstract author(s):** Welty, S. (Institute of Archaeology, University College London) - Davidson, Marion (Institute of Archaeology, University College London; Department of Security and Crime Science, University College London) - Morgan, Ruth (Department of Security and Crime Science, University College London; UCL JDI Centre for the Forensic Sciences, University College London)

**Abstract format:** Oral

Open source computed tomography (CT) databases are increasingly used in both archaeological and forensic studies to obtain modern skeletal population data and reconstructions for osteological studies. These CT data are a useful tool to obtain 3D virtual models of contemporary human osteological specimens. While 3D virtual modelling has been used in the biomedical fields for years, applications of these methods in forensic and archaeological research is relatively new with few standardised workflows. In particular, adjustments to a number of variables has the potential to impact the morphology of the final model. By testing these variables, optimal parameters for model creation have been identified, taking into account the need for these models and the expected computer specifications available to in a professional practice setting.

This paper presents a comparative exploration of key parameters required in converting CT image stacks into 3D virtual models using 3D Slicer. Different parameter values are investigated to study their effect on reconstruction accuracy, reconstruction and rendering time, the number of vertices and faces, and file size. Multiple models were created using one fleshed head CT dataset from the New Mexico Decedent Image Database (NMDID), adjusting for threshold range, voxel size resampling, and smoothing. The models produced were compared using Cloudcompare to examine the extremes of each variable. Differences in parameter values result in models which may be more or less useful in different settings, depending on the intended analysis. It was identified that fine and thin areas of the osseous structures are subject to shape variation between model parameters, including psuedofoamina and difference in maximum boundary of cranial features. When using these modelling techniques, it is necessary to account for these parameters for an optimal pipeline.

## 5 OPEN ACCESS CT DATABASES: VALUE AND LIMITATIONS IN FORENSIC ARCHAEOLOGICAL AND ANTHROPOLOGICAL RESEARCH

**Abstract author(s):** Davidson, Marion (Institute of Archaeology, University College London; Department of Security and Crime Science, University College London; Centre for the Forensic Sciences, University College London) - Welty, S. (Institute of Archaeology, University College London)

**Abstract format:** Oral

Data availability is fundamental to advancing scientific methods, and anthropological methods applied to forensic archaeological contexts are no exception. The development and validation of forensic anthropological methods requires the examination of known and contemporary skeletal assemblages. However, these data are limited in number and will, over time, no longer accurately reflect the changing populations. To solve this problem, forensic anthropologists have begun exploring the employment of radiological data as a proxy for real human remains. Studies have already investigated the accuracy of measurements taken from three-dimensional models when compared to their physical, osteological counterparts, as well as assessed the application of non-metric methods when applied to human skeletal remains and their virtual three-dimensional bone model counterparts. However, the small number of existing datasets and the difficulties in accessing these data poses a barrier to methodological advancements.

This presentation discusses the existing computed tomography databases that can be examined to develop, validate, and improve forensic anthropological methods. By examining these databases, gaps and limitations in the existing data have been identified. Additionally, this presentation discusses the necessity of open source and easily accessible radiological datasets as a way to improve forensic anthropological methods, specifically in forensic archaeological contexts. Improving and expanding these databases has the potential to accelerate forensic archaeological and forensic anthropological research.

## 6 APPLICATIONS OF DIFFERENTIAL BURNING IN FORENSIC AND ARCHAEOLOGICAL CREMATIONS

**Abstract author(s):** Monetti, Lisa (UCL Institute of Archaeology; Drew University) - Rando, Carolyn (UCL Institute of Archaeology)

**Abstract format:** Oral

An integral component of the analysis of burned bone from forensic contexts is the consideration of differential burning. Through the observation of areas that are less affected by extreme heat, juxtaposed with those expressing greater degrees of heat-induced changes, information such as the directionality of the fire, the position of the body, or extracorporeal materials that increase or deflect heat can be realized. Forensic fires are more likely to produce differential burning with visual observations sufficient to distinguish levels of heat exposure, whereas archaeological funerary cremations are typically fully calcined, lacking outright differences in colour or burn pattern. This presentation will introduce a new method which considers differential burning in archaeological cremations, using computational morphometric analysis to identify more subtle changes across the body and between individuals. The first application of this methodology has revealed insight into differences in funerary practice between two geographically and likely culturally distinct regions of South-eastern Britain during the Roman period. The method is accessible, utilises open-access software, requires no specialized laboratory equipment, and could also be employed in contemporary forensic cases.

The statistical analysis for this method utilises an artificial intelligence algorithm to identify differences and find commonalities between and within groups. Because of this, it will benefit immensely from a larger dataset compiled through cross-institutional collaboration. The future application of this method more broadly could produce a larger-scale project, with an open-access dataset of morphometrics for burned bone across time and geography that researchers could access when considering smaller samples. This creates an opportunity for collaboration with the possibility of researchers re-investigating cremations in their institutional collections which may have already been analysed through traditional methods. Further, experimental cremations could improve the overall outcome of future directions as differential burning could then be linked to specific burning conditions and become less speculative.

## 7 TRIAL BY FIRE. OPEN-FIRE CREMATION AND STATE OF REMAINS PRESERVATION IN PREHISTORIC CREMATION GRAVES

**Abstract author(s):** Slusarska, Katarzyna (Uniwersytet Szczeciński)

**Abstract format:** Oral

As a ritual and process of bone tissue change, cremation is still not fully understood yet, despite much research. Some changes, e.g., bone color, recrystallization, shrinkage, can be understood as a result of specific temperatures affecting the tissue. This knowledge results from an experimental study on burning bones in a strictly controlled condition of the cremation furnace. However, the process of open pyre cremation is far from controlled experiments. The temperature ranges vary in different pyre areas resulting in uneven burning of the bones.

The Universities of Szczecin and Warsaw launched the "Trial by fire" project. The project aims to analyze the temperature distribution with an experimental open pyre with variables change: type of fuel (seasoned or dry wood), combustion duration, air temperature, air humidity, disturbed or non-disturbed cooling process. I want to present the outline of the project and preliminary experiments with open fire cremation.

The defleshed long bones with hooves were cremated on three birch wood pyres during the first one. We checked the temperature every 20 minutes at the base of the pyre and under the remains. The pig's fleshed front legs were cremated on two pyres during the second one. One was left without intervention, but we corrected the remains' position during the process and added some wood in the second one.

The samples are sent to FTIR ATR analysis (crystallinity index, microCT scanned (microstructure heat alteration). Preliminary results suggest that abrupt combustion or cooling phase interruption results in increased fragmentation. The collagen content will be checked within not fully mineralized fragments.

The same analytic methods are implemented to examine human remains from the Drawsko burial ground, site 1.

## **8 THE NEED FOR METHOD VALIDATION IN TAPHONOMY AND ARCHAEO-ANTHROPOLOGY: LESSONS FROM THE AUSTRALIAN FACILITY FOR TAPHONOMIC EXPERIMENTAL RESEARCH (AFTER)**

**Abstract author(s): Knusel, Christopher (Université de Bordeaux) - Schotsmans, Eline (University of Wollongong; Université de Bordeaux)**

**Abstract format: Oral**

Archaeo-anthropologists require understanding of human decomposition, material degradation and factors that influence decay and bone movement. Over the past 35 years, post-mortem decay has been studied at decomposition facilities to support forensic investigations. Unfortunately, to date, these facilities have not often been used for archaeoethanatomical research. Based on experiments at the Australian Facility for Taphonomic Experimental Research (AFTER) this 6-min presentation will highlight the following: (1) that human remains should be analysed in their broader depositional context; (2) that experimental research is highly valuable; (3) that methods should be validated before being applied and (4) that hypotheses and interpretations should be treated with caution. Therefore, it is important to gather data from burials and depositions of known form and context to support methodological studies as well as interpretations. The aim is to emphasise a critical use of terms and methods, and the importance of integrating interdisciplinary approaches such as forensic experiments.

## **9 ADVANCING THE ANALYSIS OF HUMAN REMAINS IN BOTH TRADITIONAL AND FORENSIC ARCHAEOLOGY THROUGH CONTROLLED HUMAN DECOMPOSITION EXPERIMENTS**

**Abstract author(s): Mickleburgh, Hayley (Linnaeus University; Forensic Anthropology Center Texas State University) - Kootker, Lisette (Vrije Universiteit Amsterdam; Co van Ledden Hulsebosch Center)**

**Abstract format: Oral**

In this presentation we will discuss the results of an ongoing forensic taphonomic research program that aims to improve the interpretation of human remains in both traditional and forensic archaeological contexts. This interdisciplinary program seeks to advance the analysis of (forensic) archaeological burials by collecting actualistic data on human body donors (obtained with consent) at the human taphonomy facility managed by the Forensic Anthropology Center at Texas State University (FACTS), and focuses on different variables affecting grave formation processes and human tissues (hair, nails, bone, teeth). The program includes two distinct medicolegal/archaeological burial contexts - individual and mass graves - in a series of experiments.

To date, the program has revealed new information on the processes of joint disarticulation and bone displacement, which are fundamental features used in the interpretation of past funerary practices in the field of archaeoethanatology. It has also provided new insights into the deleterious effects of diagenesis on the isotopic composition of different body tissues, the potential of biomarkers in bone to estimate time since death and biological age at death (proteomics, metabolomics, lipidomics), how the human microbiome changes throughout decomposition, and how microbial data can help with human identification. Furthermore, the program tests remote sensing and geophysical methods for detection of clandestine human graves.

While the body donors are studied throughout decomposition of the soft tissues during relatively short timeframes (up to three years), the results are promising for both older archaeological contexts and more recent medicolegal cases. In this presentation, we will highlight the value of such interdisciplinary approaches with two examples: 1) the effects of individual variation and insect activity on bone displacement patterns, and 2) the effects of diagenesis on the isotopic signatures in different body tissues collected from the same bodies.

## HOW CAN NECROSOL HELP TO FORENSIC ARCHAEOLOGY? A METHODOLOGICAL APPROACH

**Abstract author(s):** García-López, Zaira - Martínez Cortizas, Antonio (Cretus, EcoPast - GI-1553, University of Santiago de Compostela) - López-Costas, Olalla (Cretus, EcoPast - GI-1553, Archaeology, Faculdade de Xeografía e Historia, Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University)

**Abstract format:** Oral

The interaction between human remains and sediments/soils starts just after inhumation. Body decomposition and the latter diagenesis of the skeleton result in physical and chemical changes that lead to the development of a particular type of soil known as Necrosol. Although soils from burial environments have been studied since the 1990s, little attention has yet been paid to their physico-chemical properties. Most investigations focus on few chemical properties such as pH and the organic matter (total C and N) content; when inorganic chemical constituents are analysed only a few elements (P, Ca, Sr, Fe, K, Mg, Al) are discussed. To date, Necrosol characteristic pedogenesis is scarcely known and there is not a standard protocol for its study – however, quite often the soil is key in Forensic Archaeology, especially when other remains are bad-preserved or missed.

In the present work we propose a methodological approach to the biogeochemical properties of Necrosol by combining Archaeology and Soil Science. This approach integrates the study of physical (grain size, colour) and chemical (pH; LOI; FTIR-ATR, XRF-32 elements, C and N) properties through a multi-sampling study. We present two examples from the Iberian Peninsula: 1) an archaeological context: Post-roman burial area in A Lanzada, Pontevedra (NW Spain) and 2) a forensic context: a Spanish Civil War mass grave from Barranco Viznar, Granada (S Spain). We identified similar pedogenetical processes: decalcification, melanization, acidification, neoformation of secondary minerals and enrichment in phosphorus. The latter is the most important and unique to Necrosol. Despite the chronological span between the two case studies, they share common processes, which seem to be more related to body decomposition and early diagenesis of bones. We conclude that Necrosol study can help us to understand aspects of past societies and provides valuable information in the context of forensic studies as well.

## WHAT HAPPENED IN KL TREBLINKA I? UNRAVELING WORLD WAR II ATROCITIES WITH THE USE OF INTERDISCIPLINARY FORENSIC SCIENCE METHODS

**Abstract author(s):** Drath, Joanna - Parafiniuk, Mirosław - Ossowski, Andrzej (Pomeranian Medical University) - Jarzęcka-Stąporek, Joanna (Museum of the Second World War)

**Abstract format:** Oral

Millions of people died in concentration camps as a result of the Second World War genocide. Most of those victims, who were buried in mass graves, have neither been exhumed nor identified and the reason for that is, among others, the hidden location of their burial places.

In the autumn of 2019, using non-invasive forensic archaeological methods, a clandestine mass burial was found on the grounds of a former forced labor camp, KL Treblinka I. Upon the decision of the National Institute of Remembrance's prosecutors, the exhumation process began. The burial pit contained the commingled remains of a minimum of forty-nine people. The forensic anthropological analysis was performed and the results showed that all the victims were males, aged from Infans II (6-14 years of age) to senilis (over 60 years of age), with stature between 145 to 180 cm, and of European ancestry. The majority of examined skulls had visible signs of perimortem trauma. The detailed trauma study showed that various weaponry had been used in the killing process or as body mutilation after the killing. The detected trauma types include gunshot trauma, blunt-force trauma and sharp-force trauma. The concentration of blunt force trauma on facial bones can indicate beating in the time surrounding the victims' death. The location of sharp-force trauma marks can indicate decapitation, which could have happened as a result of assassination method or as a dead body mutilation.

Before the mass grave exhumation, the only evidence of what had happened in the KL Treblinka I camp was the survivors' testimonies. Now, thanks to the collaboration between forensic archaeologists and anthropologists, the written testimonies are supported by osteological proof.

## A. FIRST TAPHONOMIC EVIDENCE OF PEDESTALING PHENOMENA MADE BY RODENTS ON ARCHAEOLOGICAL HUMAN REMAINS FROM EL MIRADOR CAVE (ATAPUERCA, SPAIN)

**Abstract author(s):** Marginedas, Francesc (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV) - Rodríguez-Hidalgo, Antonio (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; IDEA - Instituto de Evolución en África; GIAP - Research Group in Prehistoric Archaeology - 970949, Department of Prehistory, Ancient History and Archaeology, Complutense University of Madrid) - Saladié, Palmira (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV; Unit Associated to CSIC. Departamento de Paleobiología. Museo Nacional de Ciencias Naturales)

**Abstract format:** Poster

Rodents (order Rodentia) gnaw bones to wear down their upper and lower incisors, which grow continuously. These gnawing marks are conspicuous and have long been identified in the fossil record. Archaeological taphonomy studies link modifications made by rodents to weathered and dried bones. Forensic taphonomy studies indicate that rodents also act on fresh corpses, consuming flesh and other tissues as well as fresh bones. Although these two approaches are complementary, there is a lack of information on how rodents modify bones in states other than dry or fresh. This experimental study aims to fill this gap in the research, to describe modifications made by rodents (*Mus musculus*) to fresh, boiled, carbonized, calcined, and dry bones. Our results indicate that rodents modify bones regardless of their state, and that the most intense gnawing occurs on bones containing fat (fresh and boiled bones). During the study, the pedestaling phenomena emerged as a characteristic modification produced only on fresh and boiled samples. We applied our results to the study of the human remains from El Mirador Cave (Atapuerca, Spain) and identified pedestaling for the first time in the archaeological record. This modification may have been favored by the presence of fatty bones laying exposed on the surface of the site from two different contexts: a mass burial and boiled human bones consumed by other humans.

## B. CHARACTERIZING THE BUTCHERY PROCESS OVER THE NEW CANNIBALIZED HUMAN REMAINS FROM EL MIRADOR CAVE, ATAPUERCA, SPAIN

**Abstract author(s):** Marginedas, Francesc (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV) - Saladié, Palmira (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV; Unit Associated to CSIC. Departamento de Paleobiología. Museo Nacional de Ciencias Naturales) - Rodríguez-Hidalgo, Antonio (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Institute of Evolution in Africa - IDEA; GIAP - Research Group in Prehistoric Archaeology - 970949, Department of Prehistory, Ancient History and Archaeology, Complutense University of Madrid)

**Abstract format:** Poster

Human cannibalism is the act of consuming flesh, fluids, or other tissues from the human body by other humans. Taphonomic studies of prehistoric archaeological sites help us to identify and characterize this behavior. At El Mirador Cave (Atapuerca, Spain), during the excavation of a test pit in the center of the cave, 166 Bronze Age cannibalized human remains belonging to six individuals were found. These specimens showed cut and percussion marks, and peeling, along with human tooth marks and pot polishing. In addition, six skulls were found with signs of manipulation resulted in bowl shape-like, interpreted as ceremonial objects. New excavations in two other pits (SEC100 and SEC200) have contributed to a large sample of human remains found in several levels, most of them belonging to a Chalcolithic collective burial. The complete assemblage of human remains (NISP= 5,098) was examined using an OPTHEC HZ stereomicroscope with intense oblique light. Butchery activities were identified through the localization of cut marks and anthropogenic bone breakage. Among the specimens analyzed from the test pit, SEC100, and SEC200, 333 (6.6% NISP) exhibited at least one butchering mark. Long bones, ribs and vertebrae displayed abundant cut marks associated with defleshing, disarticulation and evisceration. Anthropogenic breakage can be related to marrow profit and the removal of the brain. Localization of butchery signals showed that these modifications display patterns consistent with the butchery of the bodies for consumption, instead of a funerary treatment of the cadavers, differentiating those specimens that belong to the cannibalism event that were buried without leaving any sign of manipulation.

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Biehl, Peter F (University of California Santa Cruz) - Dalen, Elin (Norwegian Directorate of Cultural Heritage - RA) - Vandrup Martens, Vibeke (Norwegian Institute for Cultural Heritage Research - NIKU)

**Format:** Round table

Archaeology and cultural heritage are important to both human understanding and management of crises. Interdisciplinary research on responses of previous societies to similar crises can help us to develop resilience, mitigation and adaptation strategies to tackle these global big challenges in early 21st century. We have as background the results from the recently completed COP26 in Glasgow (November 2021), as well as statements on climate change and heritage released by the EAA 2021, Social Archaeology of Climate Change Summit (SACC 2021), and the Society for American Archaeology (SAA) (in progress, to be released Spring 2022), which all point to different important aspects on how archaeology and archaeologists can contribute.

This sixth roundtable organized by the EAA Community for Climate Change and Heritage (CCH) builds on the success of the previous ones and hopes to focus further on: (1) Internationalization, (2) Prioritization, (3) Strategies, and (4) Policies.

We will also invite representatives of key archaeology associations as well as specialists in climate change and heritage research as a sounding board for the CCH activities. In addition, the roundtable session will provide an update on the work done in and by the community since the previous meeting and discuss next steps for the Community to grow and extend its network and activities in a global climate crisis.

**Theme:** 2. [Re]integration

**Organisers:** Füzési, András (Hungarian National Museum) - Mesterházy, Gábor (Várkapitányság Nonprofit Zrt.) - Bánffy, Eszter (Römisch-Germanische Kommission) - Raczky, Pál (Eötvös Loránd University)

**Format:** Regular session

The integration of communities was played out against a complex background, a mesh of social, economic, technological, and cultural elements. The shifting perspectives in theoretical approaches led to the integration of overlapping studies, one of these being Bill Hillier's space syntax theory. In his view, creators and builders work under various types of control, and the created spaces also have a visible impact on their users. The behavior of communities, their social structures, subsistence and ritual practices are encoded in these culturally determined spaces, which are in turn reflected in spatial patterns. Through the application of GIS, the spatial information encapsulating various practices and processes can be integrated into a single interpretational framework.

Spatial analysis has a long history in South-East European prehistoric studies. John Chapman's article, 'The early Balkan village', can be regarded as the result of processual archaeology. His model was based on the dichotomy of natural space and familiar place. He interpreted the built environment through the ratio of built and unbuilt space and identified the primary structuring principles of the built environment both in the vertical (superimposed settlement layers) and horizontal dimensions, as well as on the intrasite and microregional level. Although archaeological scholarship has since moved beyond the general validities of the spatial patterns reflected in settlement networks and structures, the original goals are still relevant.

As Chris Gosden and Lambros Malafouris re-created the P-Arch, the archaeology of the built environment has gained a fresh perspective, aided by GIS and geophysics. Extensive and well-grounded research has confirmed the multicolor nature of unique cases; yet, we can discern a certain measure of uniformity in diversity. We look forward to receiving prehistoric case studies from Central and South-East Europe, which focus on intra-site and microregional analyses based on the spatial patterns of archaeological finds and features.

## ABSTRACTS

### 1 SPACE SYNTAX ON LANDSCAPE-SCALE: UNDERSTANDING SPATIAL CONFIGURATION OF IRON GATES

**Abstract author(s):** Mlekuž Vrhovnik, Dimitrij (University of Ljubljana; Institute for the protection of the cultural heritage of Slovenia)

**Abstract format:** Oral

Space syntax is a method of investigating spatial complexity to identify its particular structure that resides at the level of the entire configuration. Space syntax has developed techniques that allow the environment to be considered as an independent variable.

Space syntax is helpful in describing and analyzing the configuration at both the building and the urban level. It is thus concerned with various spatial problems such as: how can we measure the configurational properties of spatial systems? What is the role of configuration in movement, co-presence and higher-order social phenomena? What is the nature of the relationship between social organization and spatial configuration?

This paper is an attempt to apply the space syntax concepts for the study of larger spatial scales entire landscapes. Although traditionally developed and used on a building or urban scale, I argue that the same conceptual apparatus and tools can be applied on a landscape scale in order to understand the landscape as a spatial configuration and measure its topological properties. I argue that tools developed by space syntax can help us to better understand the cognitive import of physical properties of the landscape like complexity, visibility, legibility, and intelligibility.

The case study is focused on the Iron Gates Mesolithic-Neolithic transition as the specific character of the material culture and is often attributed to the particular geomorphological, ecological and spatial features of the Iron Gates gorge. I explore the role of landscape configuration in the understanding of complex social processes during the Mesolithic-Neolithic transition in the region, discussing the visual connectivity, legibility of the landscape and the role of spatial configuration in aggregation patterns and movement during the Mesolithic-Neolithic transition.

## 2 THE USE OF SPACE AND INTERNAL ORGANIZATION OF THE LATE NEOLITHIC SETTLEMENT AT DRENOVAC, SERBIA

**Abstract author(s):** Dimitrijević, Ivana - Obradović, Djurdja - Perić, Slavša - Bajčev, Olga - Savić, Ružica (Institute of Archaeology, Belgrade)

**Abstract format:** Oral

The site of Drenovac in central Serbia has been extensively researched through several projects from the 1970s to present. In recent years, application of geophysical survey significantly changed a course in the investigation of the use of space and spatial patterning. It provided means for targeted excavations and research of specific features – houses, non-domestic buildings, ditches, etc. Comparing different lines of evidence obtained through recent systematic excavations and geophysical surveying, we will present the complex history of the settlement and its internal organization.

Drenovac is a large and long-lived settlement inhabited in the Early (6100-5900 BC) and the Late Neolithic (5300-4700/4500 BC), with thick cultural deposits and complex stratigraphy. Detecting changes in size and internal organization of the settlement during this long occupation proved to be a difficult task. While data on the earlier phases of occupation are still limited, extensive research of the latest building horizon (Vinča-Pločnik phase) provided valuable data for research of the settlement's spatial organization and architecture. Thus the focus of this presentation will be on this phase. On the macro level, we will discuss the settlement's size, layout and internal organization. We will evaluate both natural and cultural factors that could affect the specific patterning of different features. On the micro level, we will turn to the individual houses and their immediate surroundings, and make some observations about space division and use.

## 3 BUILDING THE VILLAGES, BUILDING THE SOCIETY- LATE NEOLITHIC SETTLEMENT NETWORK IN SLAVONIA (EASTERN CROATIA)

**Abstract author(s):** Kalafatic, Hrvoje (Institute of Archaeology, Zagreb) - Šošić Klindžić, Rajna (University of Zagreb) - Šiljeg, Bartul (Institute of Archaeology, Zagreb)

**Abstract format:** Oral

Neolithic settlements (6th/5th millennium BC) encircled by ditch were widespread throughout Europe, including eastern Croatia, on which there is an extensive bibliography. Research conducted over the last several years have confirmed the existence of thus far unrecorded settlement types in eastern Croatia – twin enclosure settlements and multiple enclosure settlements. This new type of settlements was ascertained by means of remote sensing and magnetometry, while the results of field surveys of the sites so discovered have confirmed that they were generally multi-layered, long-term and attributed to the Sopot culture, so that they may be generally dated to the 5th millennium BC.

Recent progress in research last year which combined several methods that include the use of predictive modeling in GIS, remote interpretation and field survey, several settlement structures from the late Neolithic of circular and oval layout were discovered south of Bračevci village. The newly discovered settlements were observed in the context of the hitherto known network of late Neolithic settlements in eastern Croatia.

The settlement is located 6 km away from the complex of the circular Neolithic settlement in Preslatinci. The Ražište site in Podgorač is about 6.5 km away. It is about 10 km away from the complex of Neolithic settlements Gorjani Kremenjača and Topole.

All mentioned settlements have been determined as part of the network of settlements in which the mutual distance is from 3 to a maximum of 6 km. This network was in the north of the Đakovo region, and it was hypothesized that such a network also existed in the wider area.

#### 4 **MORE TO TELL: SPATIAL ANALYSIS OF THE LATE NEOLITHIC HERPÁLY SETTLEMENT COMPLEX OF CSÖKMŐ-KÁPOSZTÁS-DOB (EASTERN HUNGARY)**

**Abstract author(s):** Riebe, Danielle (University of Georgia) - Mesterházy, Gábor (Hungarian National Museum) - Gyucha, Attila (University of Georgia) - Argyriou, Athanasios (GeoSat ReSeArch Lab, Institute for Mediterranean Studies, Foundation for Research and Technology Hellas) - Sarris, Apostolos (The Archaeological Research Unit, DigHumanities GeolInfo Lab, Department of History and Archaeology, University of Cyprus) - Dani, János (Déri Museum) - Stibranyi, Máté - Pethe, Mihály (Hungarian National Museum)

**Abstract format:** Oral

The use of magnetometry has transformed the archaeologists' ability to investigate prehistoric sites. In some instances, magnetometry results have been used to dispute previous site delineations or notions about settlement complexity, or as seen with the case of Csökmő-Káposztás-domb, both aspects have been challenged. In 2013, the Prehistoric Interactions on the Plain Project (PIPP) began work at this Late Neolithic Herpály site, with more intensive investigations continuing from 2019 to present. Analysis of the multi-phase magnetometry results, combined with aerial imagery, LiDAR, and various surface collection, have produced new insights regarding the extent, layout, environmental setting, and growth/development of the site. This paper presents the data collected thus far and contextualizes these results within a broader regional framework. With a sprawling settlement complex covering more than 80 hectares to date, Csökmő-Káposztás-domb is becoming one of the largest Late Neolithic settlements on the Great Hungarian Plain and the new data from the site is providing both new questions and new theories about prehistoric settlement development and aggregation in the region.

#### 5 **IMPRINTS OF SOCIAL PROCESSES AND PRACTICES AT SZEGVÁR-TÚZKÖVES - SPATIAL ANALYSIS AND THEORETICAL INTERPRETATION OF A LATE NEOLITHIC SETTLEMENT**

**Abstract author(s):** Mesterházy, Gábor (Eötvös Loránd University; Hungarian National Museum) - Füzési, András (Hungarian National Museum; Eötvös Loránd University) - Szilágyi, Katalin (Christian-Albrechts-Universität zu Kiel; Eötvös Loránd University) - Bánffy, Eszter (Römisch-Germanischen Kommission des Deutschen Archäologischen Instituts) - Raczky, Pál (Eötvös Loránd University)

**Abstract format:** Oral

In 2019, the archaeological research project "Neolithic tells and their landscape along the Tisza River between 5000 and 4500 BC" was launched by the Römisch-Germanische Kommission des Deutschen Archäologischen Institut (RGK-DAI) and the Eötvös Loránd University (ELTE) to gain a better understanding of the Neolithic archaeological heritage of the southern Hungarian Plain. As part of this major project, new investigations were undertaken on the Late Neolithic tell settlement of Szegvár-Tűzköves.

In the light of the new results, the goal of this presentation is to examine intra-site patterns by focusing on the site's spatial layout and space utilisation. The large-scale geophysical survey of the single-layer settlement combined with coring, "excavation" and the analysis of earlier excavation datasets on the mostly destroyed tell was aided by a GIS-based assessment.

The findings of the spatial analysis will be interpreted within the theoretical framework of space syntax theory and process archaeology. By integrating the diverse expressions of multilevel human interaction with the environment, the social and cultural imprints of a Neolithic community can be contextualized on a wider environmental scale. In our case study, our goal is to reconstruct the scales of human activity on the Szegvár settlement complex, which resulted in a specific contingent development in the Late Neolithic of the Great Hungarian Plain. One of the most distinctive local manifestations of this development is the presence of burnt buildings in a centripetal arrangement on the settlement and the enclosure system ringing and bounding the entire lived space.

#### 6 **NEOLITHIC KNAPPING ACTIVITIES THROUGH THE LENS OF INTRA-SITE ANALYSIS FROM HUNGARY**

**Abstract author(s):** Farago, Norbert (Eotvos Lorand University, Institute of Archaeological Sciences)

**Abstract format:** Oral

Following the pioneering research of André Leroi-Gourhan, Palaeolithic archaeology has been investigating the social principle behind the spatial dispersal of stone tools for half a century. Although Leroi-Gourhan did not consider his results to be generalizable, only to be individual, localized traces of activities (témoins), since then numerous works have appeared which have sought to find the residential and economic units reconstructed at Pincevent on their sites and assemblages. Even his greatest critic, Lewis R. Binford, has attempted to develop a more general model of spatial organization for hunter-gatherer communities.

In recent decades, in the wake of Ulrich Boelicke, Jens Lünning attempts have also been made to develop a unified model of spatial organization for the first farmers of the Neolithic LBK communities. Interestingly, it is only in recent decades that we have witnessed contributions that have approached the problem from the point of view of individual observations made at individual Neolithic sites. Despite the obvious difficulties of the subject, such as the palimpsest nature of the long-standing sedentary lifestyle, the size of the excavated surfaces, or the feature-bound nature of the finds, we have been able to find intra-site studies from several sites in Western Europe. In more than one case, perhaps not coincidentally, the focus of investigations has been on knapped stone tools. The aim of this presentation, in line with recent intra-site investigations, is to provide further contribution for a future comprehensive framework through a few individual cases. The Hungarian examples presented here are spatially (Transdanubia and Great Hungarian Plain) and temporally (5400-4600 BC) representative of the greater part of the Neolithic. According to these results, the spatial organization of the knapping activity shows great variability from site to site, which suggest a strong local adaptation and makes any generalization rather problematic.

## **7 CONSCIOUSNESS, COMPLEXITY, SYMMETRY. SPATIAL ANALYSIS OF A BRONZE AGE SETTLEMENT**

**Abstract author(s): Szabó, Nóra (ELKH BTK; ELTE BTK)**

**Abstract format: Oral**

The basic concept of artificially manipulated space has an evolutionary explanation, reflecting on the creation of comfort zones, protection and conditions for group maintenance, in addition to environmental factors, representational and belief elements. These spaces are not simply places where social life unfolds, but also channels where relationships are formed and developed.

In the dimension of the internal structure of settlements, we can distinguish two significantly distinct units: the spaces inside and outside of the buildings, which are demarcated by a clear physical boundary, the structural elements of built structures. Alongside positive structures, negative phenomena such as ditches, which are often an integral part of the settlements, or networks of streets connecting spaces within settlements also have a boundary-marking function. Outside-and-inside, near-and-far, right-and-left directions and positions could all have had meaning for the daily life and functional operation of a prehistoric community.

The interpretation of Bronze Age settlements in the Carpathian Basin has undergone a major transformation in the last decade. The new results from excavations, remote sensing, and geophysics have not only led to a reinterpretation of the hierarchical relationships between settlements, but have also highlighted the complexity of the internal structure of settlements. The aim of this paper is to present a settlement with a complex, symmetrical structural system (double ditch, buildings, radial street network), which was found in the last year in the outskirts of Kunszentmárton, based on geophysical and field survey, and to interpret its internal spatial structures using GIS data analysis.

## **A. ORGANISING A NEW WORLD: EARLY ALFÖLD LINEAR POTTERY COMMUNITIES IN THE NORTHERN PART OF THE GREAT HUNGARIAN PLAIN**

**Abstract author(s): Füzesi, András (Hungarian National Museum / Magyar Nemzeti Múzeum) - Faragó, Norbert (Eötvös Loránd University, Institute of Archaeological Sciences) - Kalli, András (Hungarian National Museum / Magyar Nemzeti Múzeum) - K. Tutkovics, Eszter (Rétközi Múzeum)**

**Abstract format: Poster**

In addition to the main routes of European neolithisation through the Balkans and the Carpathian Basin, alternative paths have emerged in nearby regions that have led to the formation of distinct cultural groups. In this way, the Alföld Linear Pottery Culture (ALPC) developed in the Carpathian Basin, which were linked to the evolution of LBK in several ways. Although for historical reasons, archaeological research of the two cultural units could not be carried out in parallel, f.e. the pit-house concept has remained much longer in Hungarian research than in international research, that could relate to current European settlement archaeology. The first major breakthrough came with László Domboróczki's discovery at the Füzesabony-Gubakút. Large-scale excavations revealed contiguous settlement sections that fundamentally changed our perception of early ALPC communities. The settlements with a linear structure now form a network in the foothills of the North Hungarian Mountains.

Bill Hillier interpreted space as the result of the interaction of social actors and physical phenomena, strengthening the link between structure and process. This approach is well suited to archaeological investigations through the aspects of differentiated spaces, the pathways between them and the degree of spatial integration. Although the structure of several early ALPC settlement units has been published, the analysis and dissemination of the excavated assemblages, which are essential to study the processes, is currently at various levels. In this presentation Bük-kábrány-Bánya VII site will be examined based on the structure and the spatial distribution patterns of artefacts. Our observations suggest the cooperation of the local community in subsistence and ritual practices, moreover, they suggest long-term organized conditions, which were necessary for the development of the ALPC style. In the life of pioneer communities, the ordered settlement and the differentiated ceramic decoration were linked and reinforce each other as a physical base and communication message.

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Busset, Anouk (Université de Lausanne) - Sawicki, Jakub (Academy of Sciences of the Czech Republic)

**Format:** Session with presentation of 6 slides in 6 minutes

This now traditional session is aimed at postgraduate students and early career researchers whose interest focuses on Medieval Europe. They will have the opportunity to present their ongoing research during this session proposed by MERC. It offers a platform for speakers not only to present upcoming projects, but also connect with a wider community of early career researchers. Furthermore, it offers opportunities to discuss new and promising research avenues that will shape tomorrow's medieval archaeology, through short and dynamic talks of six minutes. The presentation of experimental or unprecedented work is also explicitly encouraged. We welcome papers tackling a wide variety of currently pressing as well as innovative themes, crucial concerns for the field, potential of new technologies, unexplored avenues, and new work on old subjects/materials. We aim to bring together a diverse group of early career scholars, therefore participants from all geographical backgrounds are encouraged to submit a proposal.

## ABSTRACTS

### 1 NEW METHODOLOGICAL PERSPECTIVES FOR THE STUDY OF THE MEDIEVAL PEASANTRY IN NORTHERN IBERIA

**Abstract author(s):** Rebollar Flecha, Luis (University of Oviedo)

**Abstract format:** Oral

The aim of this research is to study the medieval peasantry from the Early and High Middle Ages (eighth to thirteenth centuries) in the Northern Iberian regions of Asturias and Cantabria using an anthropological approach for its definition and characterization. However, the historiography on this subject matter suffers hitherto a series of problems, namely a lack of archaeological sources and a slanted reading of the written ones due to a historiographical praxis skewed towards the institutional, legal, and upper-class sectors of society. Thus, this research proposes to carry out a reread and reinterpretation, from an anthropological approach, of the written sources, continuing a line threaded by authors like Wendy Davis or Robert Portass for the Northern Iberian Peninsula focused in social and material aspects of the medieval peasantry. This new approach must be driven by questions posed by the archaeological record, which in turn can be itself the subject of reinterpretation.

This process entails the development of a new theoretical research frame and its application to our experimental setting by rereading the written sources, and the archaeological record carried out by our research team in Asturias, to reflect on the analytical tools and concepts used in the study of the medieval and general peasantries, and ideally further develop new ones in the process.

We can find previous examples of these theoretical tools that can be helpful in the 'anthropological history' works of E. P. Thompson and his 'moral economy of the crowd', the anthropological work of James C. Scott and his 'weapons of the weak', and specifically on the medieval, in the works of Rosamond Faith and Susan Kilby. Assessing the contributions and fitting of Archaeology in our task, we seek to coin new analytical-theoretical concepts like these to help in the task of rethinking the medieval peasant subject.

### 2 RECONSIDERING PEASANTRY AND LOCAL COMMUNITIES IN THE EARLY MIDDLE AGES THROUGH A GENDER(S) PERSPECTIVE

**Abstract author(s):** Carballido González, Elías (University of Oviedo)

**Abstract format:** Oral

The last decades marked a relevant step forward in the studies of the Early Medieval peasantry. The development of new methodologies, like the agrarian archaeology, facilitated a new approach that left behind the traditional consideration of this group as a homogeneous or without agency, following the elitist discourses.

However, it is still left to implement new approaches that could be able to explain how these communities were organized in terms of gender(s) and how difference was understood and produced within them. Focusing on two European areas in the Early Middle Ages, Northern Spain and Southern Scandinavia, we aim to explore the nature of gender in the peasant communities, deconstructing these groups as built on complex intersections of social status, races and genders and redefining the limits of the community as a space where gender difference might, as in other contexts, have been daily expressed and lived.

This research takes into account the last critiques to the use of gender as an analytical category and tries to complicate it stressing its fluidity, historicity and the unstable nature of the concepts formerly taken for granted. Thus, the Early Middle Ages, as a time marked by the fragmentation of the Roman World, the desegregation of the European

space and the absence of state structures that could ensure the imposition of normativities, become a site to explore disruption and alterity as well as other forms to produce, understand and live difference in the peasant communities.

### 3 RECONSTRUCTION OF MEDIEVAL FOREST DEVELOPMENT USING MINING TIMBERS FROM THE ORE MOUNTAINS

**Abstract author(s):** Ahlgrimm, Svenja (University Greifswald)

**Abstract format:** Oral

The Ore Mountains are one of the most important medieval mining areas in Europe. During excavations of 12th and 13th century mining complexes, thousands of construction timbers (*Abies alba* M., *Picea abies* L.) were collected and partly dendrochronologically dated. Permanent settlement in the mountain complex only started during this period. Thus, the numerous wood finds form a unique archive with the potential to provide information about a natural mountain forest before and during the first intensive human interventions.

Using a subset of these historical wood samples and samples of living silver fir and spruce from different elevation, our study will investigate the forest development of the medieval Ore mountains. Furthermore, the aim is to examine to what extent the use of the maximum latewood density (MXD) can thereby support the analyses. Not only tree ring width (TRW), but also the parameter MXD will be used for (i) cross-dating of tree ring samples, (ii) dendroprovenancing, (iii) detection of disturbance events and (iiii) investigation of climate-growth relationships and potentially climate reconstruction.

Since MXD is strongly dependent on summer temperatures, it is likely to provide a more robust signal than TRW and thus allow cross-dating of undated series. Considering the climatic differences along the altitudinal gradient, the use of MXD should also improve the accuracy of dendroprovenancing. Therefore, it can be assumed that the MXD parameter increases the reliability and informative value of the data set and provides further insights into the development of the forest in the medieval Ore Mountains.

### 4 NEW WORK ON OLD EXCAVATIONS. BRINGING TOGETHER RESULTS FROM OLDER AND YOUNGER EXCAVATIONS TO ENLIGHTEN WATER AND WASTE MANAGEMENT

**Abstract author(s):** Swensen, Elisabeth (NTNU University Museum)

**Abstract format:** Oral

In my PhD, I am working with water and waste management in medieval and early modern Trondheim, Norway. As a great number of archaeological excavations have been conducted in this town, it is interesting to use both old and new archaeological documentation to enlighten such infrastructure. In my studies, I work with a set of excavations spanning from 1928 to 2016. Using ArcMap and Microsoft Access I sorted and visualized qualitative and quantitative information to aid the archaeological analysis. Georeferencing old and new excavations results together can problematize modern assumptions and add to the understanding of the town. The old excavations have contributed to an added understanding of the location and construction of wells, drainages, and waste pits, even though they are not C14 dated, or stratigraphically dated. Not up to modern standards (still everchanging), the older excavations can still add useful information to present archaeological analyses. This is especially true when the material on certain constructions is scarce, as on drainage constructions, and the old excavations more than double the material to work with. In this session, I present some of my material and how the methods described have made a difference to the understanding of past practices in Trondheim.

---

## 424 ACTORS, NOT SPECTATORS. COMMUNITY REPRESENTATION IN ARCHAEOLOGY AND CULTURAL HERITAGE IN THE 21ST CENTURY

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Beaulieu, Kiara (University of Antwerp) - Thomas, Suzie (University of Antwerp) - Axelsen, Irmelin (University of Oslo) - Jamieson, Jordan (Mississaugas of the Credit First Nation)

**Format:** Regular session

A shift in public and community archaeology and the way communities are engaged has resulted in numerous publications on how to actively involve various citizens in the entire research process. Despite the increased focus on participatory archaeological research and citizen science worldwide, projects are still often aimed at the "comfortable" audience. The dutiful spectator that obliges with "official" definitions, legislations, and heritage practices, such as "responsible" metal detectorists in many countries. Yet, detectorists and other parts of the public are still routinely by-passed in the citizen scientist realm because of the way they choose to engage with heritage; often hands-on, not within the museum setting nor in the passive role as a spectator. Due to this, they are frequently denied access to the archaeological field, and painted as a potential threat. In addition, there are the individuals who do not always conform with the normative views of an archaeological participator: the non-white, disabled, Indigenous, neurodi-

vergent, LGBTQ+, those of ethnic and religious minorities. Specifically, people who are commonly denied access to their past and to be an actor in this narrative.

Across the world, individuals, communities, stakeholders, knowledge keepers and other members of the public are demanding to be allowed to not only view the end process of archaeology. They want to have access; to be actively involved in the heritage-making process and have a say in how the archaeological heritage is displayed and used. This session welcomes those who seek to challenge our view of what true participation can or should be. We particularly encourage individuals from the LGBTQ+ communities, citizen scientists, Indigenous persons, and people who can present on case studies, offer practical examples or theoretical approaches to these exclusionary practices in archaeology and heritage studies.

## ABSTRACTS

### 1 COMMUNITY-PARTICIPATORY ARCHAEOLOGY IN THE MATANUSKA WATERSHED, ALASKA

**Abstract author(s):** Krasinski, Kathryn (Adelphi University) - Seager-Boss, Fran - Wade, Angela (Chickaloon Village Traditional Council)

**Abstract format:** Oral

Here we present a case study of collaborative community-participatory archaeology where the descendant community members are active in research design from the inception of a research question to managing grants, project personnel, and interpreting discoveries. Our recent fieldwork in the Talkeetna Mountains within the Matanuska Watershed has provided physical evidence corroborating Dene Native Alaskans oral history that the mountains were an integral part of Dene life for millennia. The discovery of new archaeological sites shows a positive correlation with Dene place names. Fieldwork has also promoted recalling oral history and Dene place names that were previously not recorded. Further, fieldwork corroborated how nexus points within the Talkeetna Mountains facilitated subsistence, trails, and social networks. While the alpine zone continues to be poorly inventoried our collaborative fieldwork indicates the Talkeetna mountains were an integral part of Dene past and current life. These results would have been impossible to achieve without relationship building and the collaborative approach guided by culture bearers.

### 2 THE GOOD CREDIT INDIANS: ARCHAEOLOGY FROM AN INDIGENOUS PERSPECTIVE

**Abstract author(s):** Jamieson, Jordan (Mississauga of the Credit First Nation)

**Abstract format:** Oral

I look to share from personal experience the difficulties and obstacles of becoming involved in the archaeological process, as well as the benefits and tremendous upsides it brings. For many indigenous communities there is an unseen cost of entry when trying to become involved in their cultural materials, and it comes in the form of compromising on their values from a cultural perspective.

To begin I will outline some of the foundational differences between the indigenous perspective and the western perspective. I examine how heavily influenced the outlook on cultural materials are viewed through that western lens, supported by legislation that stems from colonialism. Next, the importance of building relationships to the descendant communities, in whose cultural materials we work in. Not only that but pushing to evolve the relationships into meaningful change and building the capacity in which communities can become in control of their cultural materials.

As we look to better understand the past through archaeological materials, it's imperative that we begin to recognize the disparity and open the conversation of how we view, curate and interpret those cultural materials and remains."

### 3 DECOLONISING ARCHAEOLOGY IN THE SCHOOL CURRICULUM

**Abstract author(s):** Godfrey, Evelyne (Uffington Heritage Watch)

**Abstract format:** Oral

Decolonisation and anti-racism are a major issue of our time. It is important that professional archaeologists who are doing research on the subject of decolonisation and culture, place, identity and migration, have the opportunity not just to contribute to the discussion, but to take the lead in formulating an archaeology curriculum for the 21st century.

The status that we still see today associated with the more 'important' Roman and Anglo-Saxon periods was framed in Victorian times and served to justify and normalise British colonial activity. The narrative reinforced in the primary school curriculum in England today remains one of the Romans bringing "civilisation" to Britain. British prehistory is held by convention to have ended at a precise point in time, 43 AD, the year of the incorporation of most of southern England into the Roman empire.

This concept is paralleled in North America, with the British in turn bringing civilisation to a savage new world; the truism in Canada and the United States is 'History begins when the Europeans turn up'. Classical Greek and Roman art and archaeology are taught at secondary school through university level in North America as part of the history

of Western Civilisation, perceived as the inheritance of the majority white European descent population, while Indigenous cultural heritage remains marginalised.

An approach to decolonising the school curriculum will be outlined briefly, with examples drawn from archaeology teaching in England and in Mi'gmaq land in south-eastern New Brunswick, Canada.

#### 4 ARE WE ASKING THE RIGHT QUESTIONS? LEARNING FROM METAL DETECTORISTS AND OTHER HOLDERS OF PORTABLE HERITAGE OBJECTS

**Abstract author(s):** Thomas, Suzie (University of Antwerp)

**Abstract format:** Oral

It has been the case in many countries already that the potential of metal-detected finds has been realised (e.g. Oksanen and Lewis 2015) or at least recognised (Beaulieu 2020), for enhancing the amount of data available to scientists for creating the archaeological record. Yet the archaeological life of objects is only one part of their long history, and what happens to them once they have been found is also potentially very interesting, especially for questions about heritage and social values, senses of identity and questions of stewardship of these remains of the past.

Building upon a small pilot ethnographic project carried out in 2022 in the Flanders region of Belgium, in this presentation I explore the values associated with archaeological heritage, especially small portable heritage objects. I present my results and impressions from object-based interviews with Flemish metal detectorists, and suggest that there are more facets available for what we can learn from portable heritage objects discovered through, and kept because of, metal detecting. In this way I aim to shed light on the multitude of perspectives that objects inspire in non-archaeologists (see also Axelsen 2021), and challenge the received wisdom that the archaeological knowledge production is the most important informational potential that such objects (and their stewards) hold.

#### 5 MATERIAL CULTURE IN A DIGITAL WORLD - ARCHAEOLOGY IN 280 CHARACTERS OR LESS

**Abstract author(s):** Jaffe, Gali (Freelance Lecturer/Researcher)

**Abstract format:** Oral

In this presentation I will present a personal story about how my individual Twitter account grew into a much-followed archaeological community mini-blog.

It began when I posted interesting archaeological anecdotes on Twitter to let people know who I am and come hear my archaeology lectures. From there it snowballed very quickly.

One tweet led to another, and then they grew into threads (a number of connected tweets which allow writing longer posts on Twitter, bypassing the 280-character limit of a single tweet). Then the threads became a daily event and I found myself researching more and more archaeological topics, sites and finds in order to write threads.

Then I understood, the Twitter format, and the way Twitter works is an advantage. Utilizing these limitations forced me to write short, understandable posts, which in turn led to the content being highly accessible even to people who knew nothing about archaeology before.

One of the most popular reactions to my threads was, and still is, "I never knew archaeology could be so fascinating", as a woman who is dedicated to bringing archaeology to the masses, there is no bigger compliment.

I will use my story as an example of how digital humanities can help to remove academic layers and jargon from our research, in order to make archaeological finds and discoveries much more accessible to the masses.

In the end we must ask ourselves one simple question, if we found an amazing find, but have not brought it to the public light, have we actually fulfilled our purpose and mission as archaeologists? Whose intention is, at the end of the day, to expose the past? Social media offers a unique opportunity to speak directly to an interested audience. Here, we will discuss some examples of good practice for archaeological engagement.

## 6 THE DISCREPANCY IN THE ONLINE AND REAL-LIFE RELATIONSHIPS BETWEEN ARCHAEOLOGISTS AND METAL DETECTORISTS

**Abstract author(s):** Bjerga, Ingvild (University of Oslo)

**Abstract format:** Oral

When researching the history and current state of public archaeology in Norway, a somewhat unexpected detour was the many archaeology-focused Facebook posts and plethora of exchanges and unfiltered opinions between certain parts of the public and a few archaeologists. The discussions made it evident that there is a discrepancy between what researchers conclude in academic studies of the heritage management's interactions with certain parts of the public, and how some professionals actually interact with them online.

In Norway, there are seemingly two factions that actively participate in a majority of the digital debates: those who are positive toward metal detecting and those who focus on the negatives. Both frequently misinterpret interactions and statements as attacks. There is a knee-jerk reaction of always assuming the negative, even if the intent of the author, of either the academic paper or the online post, was likely neutral, or even positive.

Survey and excavation reports indicate that the attitudes of (some) archaeologists in Norway is shifting towards a more positive attitude to including amateurs on their projects. In some parts of the country, hobby metal detectorists are routinely invited to take part in the uncovering of the physical remains of the past. So, why do the online forums seldom reflect this collaboration? Is the generally blunt behaviour of people on Facebook the cause for the sometimes-toxic online relationship? And do these opinions stay where they were formed: online? Are these interactions doing more harm than good by upholding or even creating mistrust? In this paper, I explore and answer these questions by utilising comparative and textual analyses to investigate the relationships between the country's hobby metal detectorists and parts of its archaeological heritage management, and the difference in their online relationships versus the one presented in academic studies.

## 7 WHERE ARE THEY, WHO FOUND THEM, WHERE DID THEY GO AND DOES ANYONE CARE?: TWO INDIGENOUS COPPER ARTIFACTS IN ONTARIO

**Abstract author(s):** Beaulieu, Kiara (Universiteit Antwerpen)

**Abstract format:** Oral

The study of citizen scientists (metal detectorists) in Ontario, Canada and their role in heritage is very new, and as such very controversial. When compared to countries who have been inundated with detectorists for decades, our investigation of their role, the legalities, their position in the heritage landscape and ethics is very grassroots. One thing that Canada has that most European countries do not is the Indigenous presence and their rights over their own ancestral heritage. Best practice when an Indigenous artifact is found in Ontario, Canada is to bring it to the closest Indigenous nation—a practice unknown to much of the general public. There can be some challenges as some members of the public want objects to be visible for future generations of Canadians—something they believe may not happen if they are given to an Indigenous nation.

In order to explore these concerns this paper will examine two very similar copper Indigenous artifacts which were located within a few months of each other by two separate detectorists near Sault Ste. Marie. These finds were uncovered in two different locations; one on Crown Land (government held land) and the other in a stream (public/private land). This paper will examine how they were found, and what were the outcomes and attitudes surrounding them. These objects, the lack of knowledge on what steps should be taken, the question of who owns such heritage, and what is the ethical responsibility in their activity of detecting and encountering Indigenous artifacts will be explored. By examining these two finds and the many issues that arose this paper will show how citizen scientists can directly affect heritage policy and how their contribution to archaeological knowledge can help change it to be more inclusive—if heritage professionals will open the door.

## A. THE IMPORTANCE OF COMMUNITY ENGAGEMENT WHILE RESEARCHING CILLÍNÍ (IRISH UNCONSECRATED CHILDREN'S BURIAL GROUNDS) IN RURAL COUNTY FERMANAGH

**Abstract author(s):** Mundt, Courtney (Queen's University Belfast)

**Abstract format:** Poster

Community archaeology and engagement are becoming more common across Ireland in the 21st century as archaeological research expands out of the larger cities and into less urbanized areas. Rural communities are the keepers of knowledge that often cannot be found without speaking directly with community members, especially when it comes to lesser-known archaeological monuments. One such monument type in Ireland are cillíní, unconsecrated burial grounds for unbaptised and stillborn children used from the late medieval period into the mid-20th century. These sites are often found in older archaeological monuments, such as ringforts/raths, abandoned ecclesiastical sites, deconsecrated burial grounds, and megalithic tombs, the locations of which are often only known of by locals. While there are about 1700 cillíní recorded across Ireland, these sites are not well researched due to a lack

of information regarding their locations and usage. Given the complicated emotions associated with these sites, this knowledge tends to stay within local communities until it fades out of memory, which make cillíní more vulnerable to destruction by agricultural and development activities. The main goal of the fieldwork conducted in summer 2021 across County Fermanagh in Northern Ireland was to discuss potential unrecorded or misrecorded cillíní locations in order to properly record these sites and preserve them. Potential sites were identified by analysing Ordnance Survey (OS) maps and through information calls posted in Fermanagh newspapers and Irish magazines before fieldwork was conducted over a two-week period. With the knowledge and help of Fermanagh locals, the sites and history of six new cillíní were recorded, showing how important community engagement is for the research and preservation of rural Irish archaeology.

---

## 426 FROM ISOTOPE RATIOS TO NARRATIVES: EXPLORING THE WAYS THAT BIOGEOCHEMICAL STUDIES ARE IMPACTING EURASIAN ARCHAEOLOGY

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Kiss, Viktória (Institute of Archeology, Research Centre for the Humanities) - Pospieszny, Lukasz (School of Earth Sciences, University of Bristol) - Cavazzuti, Claudio (Department of History and Cultures, University of Bologna)

**Format:** Regular session

As biogeochemical applications in archaeology have increased dramatically over the years, isotopic studies are being used to address a wide range of questions related to prehistoric human (and animal) behaviour. Larger, multi-isotope and multi-site/cemetery datasets have shifted the focus from site-level analyses to much broader narratives related to trade patterns, subsistence strategies, migration, and social organization. These studies are often collaborative, multidisciplinary, and integrated with several other lines of data (such as aDNA, skeletal data, material culture, radiocarbon dating, etc.). This integration of scientific techniques at large scales has been associated with a 'Third Scientific Revolution' in the field of Archaeology whereby theoretical paradigms (i.e. processual and post-processual approaches) may be reexamined and reimaged.

In this session we invite papers that reflect on the ways that isotopic studies are currently being used in archaeological interpretations and narratives in Eurasian prehistory. Specifically, we seek studies that have used isotopic data to go beyond local versus non-local dichotomies, and either generate or test models of prehistoric human behaviour at regional or multi-temporal scales. Questions to consider include: in what ways can isotope data uniquely contribute to our current understanding of human movement and interaction in the past? How have these data been successfully (or unsuccessfully) coupled with other lines of evidence? What are the continued challenges and limitations to biogeochemical approaches? In what ways have isotopic studies impacted the theoretical orientation of Eurasian Archaeologists?

### ABSTRACTS

#### 1 WILD WOMEN OF THE HILLS OR CHATELTS FOR MARRIAGE? INTERPRETING FEMALE MOBILITY IN THE LINEARBANDKERAMIK (LBK) THROUGH STRONTIUM ISOTOPES

**Abstract author(s):** Bickle, Penny (University of York)

**Abstract format:** Oral

This paper will explore the complex interplay of interpreting environmental and social factors on our understanding of LBK mobility. Strontium isotope analysis has suggested that women were more likely to have moved during their lifetime than men. The favoured interpretation to date has been patrilocal, though the implications of this both in terms of the bioavailable strontium variation in the environment and for the social lives of women have not been fully explored. Despite this, patrilocal is now widely accepted for much of prehistory, and models of social change through the period based on an assumptions about how patrilocal, and indeed patrilineal, societies are organised. I will argue that we need to be critical of this approach from two perspectives. First, anthropology demonstrates that marriage and kinship rules are far more complex and cannot be reduced to a simple hierarchy between the genders. Second, such data need careful consideration in light of multiple sources of Archaeological evidence. In conclusion, the paper proposes an integrated approach, which does not separate environmental context from social practices. It argues this is necessary in building interpretative models of strontium isotope ratios that do not unthinkingly repeat modern perceptions of binary gendered lifeways.

## AN ISOTOPIC PERSPECTIVE ON “MOBILITY” DURING THE 3RD AND 2ND MILLENNIUM BC IN HUNGARY

**Abstract author(s):** Giblin, Julia (Quinnipiac University) - Dani, János (Déri Múzeum) - Fábíán, Szilvia (Hungarian National Museum) - Hajdu, Tamás (Eötvös Loránd University) - Köhler, Kitti - Kulcsár, Gabriella - Melis, Eszter (Institute of Archaeology Research Centre for the Humanities ELRN) - Szabó, Géza (Wosinsky Mór Museum) - Szeverényi, Vajk (Déri Múzeum) - Kiss, Viktória (Institute of Archaeology Research Centre for the Humanities ELRN)

**Abstract format:** Oral

A growing number of isotopic and archaeogenetic case studies have identified high percentages of non-locals in European Bronze Age burial contexts leading to a renewed interest in the importance of migration for understanding prehistoric cultural changes. Moreover, the combination of isotopic, archaeogenetic, radiocarbon, and archaeological data at micro-regional scales has allowed for researchers to model smaller scales of mobility that can reflect social and kinship patterns such as residence and marriage customs across multiple generations.

In this paper, we present isotopic data (strontium, oxygen, and carbon) from inhumation burials from 14 archaeological sites from Hungary that represent several phases and regions of the Early and Middle Bronze Age in Hungary – a period of one thousand years, between 2500 and 1500 BC. These sites are associated with the Bell Beaker, Kisapostag (or the earliest Transdanubian Encrusted Pottery culture), Vátya, Füzesabony, and Tumulus Grave archaeological traditions. This region, situated within the Carpathian Basin, sits at a crossroad between Western, Northern, Eastern and Southern Europe, and the origins of many of these groups has been attributed to newcomers from surrounding areas due to similarities in material culture.

Using a multi-isotope dataset, we will address to what extent human movement (versus local processes) contributed to Bronze Age patterns of social organization in Hungary and will compare these patterns to contemporaneous groups in other regions of Europe. Finally, we will reflect on the ways that isotopic research influences our understanding and interpretation of archaeological narratives about mobility and culture change in Bronze Age Hungary.

## 3 SUBVERTING GRAND NARRATIVES? STRONTIUM ISOTOPES, ADNA, AND EQUESTRIAN MOBILITY IN THE BRONZE AGE

**Abstract author(s):** Kanne, Katherine (University of Exeter; Northwestern University)

**Abstract format:** Oral

This paper presents the results of a comparative study of equestrianism of the Bronze Age of Hungary, which integrates strontium isotope analysis of horses from seven tell settlements, with the analysis of human and horse remains and their bridle bits. Strontium isotope analysis was a key component in establishing mostly regionally local horse production, but a that few horses were either ridden or traded into tell societies far from their birthplace. This supports increased equestrian interconnectivity at a supra-regional level, which is discussed in light of the most recent horse ancient DNA (aDNA) results. Used alone, this could support existing theoretical models of the European Bronze Age. However, when included with all lines of research, the isotope evidence supports local use, travel on, and trade in horses that was not under the auspices of an elite class of warrior rulers. In this case, the methodological integration of stable isotope analysis with multiple lines of evidence forces a re-examination of Bronze Age narratives of human-horse relationships that have particular consequences for expressions of political authority. This confirms the need to have a detailed comparative and contextual understanding of the animals and humans involved in biogeochemical studies when used in the formation of broad narratives of European Prehistory.

## 4 TRANSFORMATIONS OF POPULATIONS AND LIFESTYLE IN THE 2ND MILLENNIUM B.C. IN THE GREAT HUNGARIAN PLAIN - A BIOARCHAEOLOGY PROJECT

**Abstract author(s):** Hajdu, Tamas (Eötvös Loránd University) - Szeniczey, Tamás (Department of Biological Anthropology, Faculty of Science, Eötvös Loránd University) - Fülöp, Kristóf (Research Centre for the Humanities, Institute of Archaeology) - McCall, Ashley (Independent Researcher) - Horváth, Anikó - Palcsu, László - Major, István - Molnár, Mihály (Isotope Climatology and Environmental Research Centre, Institute for Nuclear Research, Debrecen) - Dani, János (Déri Museum, Debrecen) - Kiss, Viktória (Research Centre for the Humanities, Institute of Archaeology)

**Abstract format:** Oral

Archaeological research of the material culture of the Hungarian Late Bronze Age in the Carpathian Basin has revealed several examples of transitions from one culture to another. The appearance of the Tumulus Grave Culture around the end of the Hungarian Middle Bronze Age and the beginning of the LBA (1500-1450 B.C.) is particularly important, as it is a rare example of a Bronze Age period in Transdanubia and the Great Hungarian Plain when a relatively unified archaeological culture can be observed in both areas.

It is not yet entirely clear whether the expansion of the Tumulus Grave Culture is a consequence of immigration, or it is a cultural transition of the local populations, or maybe the combination of both. According to traditional archaeological interpretations the appearance of the Tumulus Grave Culture, however, resulted in the abandonment of the

former system of tell-settlements as well as a gradual increase in the number of horizontal settlements. It has not yet been clarified whether preference was a shift from farming to animal husbandry or the changes of the settlement system is not related to the transformation of subsistence strategy.

The aim of our study is to show our newly started multidisciplinary project – and the preliminary results – on human skeletal remains from the Middle and Late Bronze Age from the territory of Hungary. The planned investigations will seek to answer the above questions and will also attempt to elucidate what everyday circumstances or difficulties Bronze Age populations were faced with, what diet or lifestyle, and health condition they had.

This paper was supported by the Hungarian Scientific Research Fund (OTKA FK 128013) and the Momentum Mobility research project (Institute of Archaeology, Research Centre for the Humanities) granted by the Hungarian Academy of Sciences (Project Nr. LP 2015-3).

## 5 MOBILITY IN THE EARLY/MIDDLE BRONZE AGE COMMUNITIES ALONG THE DANUBE IN CENTRAL HUNGARY BASED ON ISOTOPE DATA OF CALCINED BONES

**Abstract author(s):** Cavazzuti, Claudio (University of Bologna; University of Durham) - Csányi, Marietta (Damjanich János Múzeum, Szolnok) - Vicze, Magdolna (Hungarian National Museum) - Horváth, Anikó - Palcsu, László (ICER Centre, Institute for Nuclear Research) - Hajdu, Tamás (Eötvös Loránd University) - Lugli, Federico (Università di Bologna, Alma Mater Studiorum) - Cipriani, Anna (Università di Modena e Reggio Emilia) - Kiss, Viktória (Hungarian Academy of Sciences)

**Abstract format:** Oral

Thanks to recent methodological advances, strontium isotope analyses can now be applied to cremations. Successful tests on the technique have also been performed in the framework of extensive  $^{87}\text{Sr}/^{86}\text{Sr}$  analyses on Bronze Age urnfields in Italy and Hungary. These achievements allow us to explore the theme of human mobility among Hungarian Bronze Age groups, which practiced cremation as their funerary ritual at large. Our paper will present the first results of isotopic analyses from two sites of the Vátya culture (c. 2100-1500 BC, Szigetszentmiklós-Úrgehegy, Százhalombatta-Belső-Újföldek), complemented by two other cemeteries from Kelebia (Vátya culture) and Jánoshida (Tumulus culture) in cooperation with J. Giblin. The sampling strategy has targeted cremations and (few exceptional) inhumations at Szigetszentmiklós and Százhalombatta, also individuals of different sex, age and social status in order to investigate human mobility within their social context. The case of the richly furnished grave n. 241 from the Late Nagyrev/Vátya urnfield of Szigetszentmiklós is of particular interest. The urn contains the cremated bones of an adult woman and two 7 to 8-month-old foetuses, as well as remarkably prestigious goods. Using  $^{87}\text{Sr}/^{86}\text{Sr}$  analysis of different dental skeletal remains, which form in different life stages, we were able to reconstruct the potential movements of this high-status woman over almost her entire lifetime, from birth to her final days.

This paper was supported by the Hungarian Scientific Research Fund (OTKA FK 128013) and the Momentum Mobility research project (Institute of Archaeology, Research Centre for the Humanities) granted by the Hungarian Academy of Sciences (Project Nr. LP 2015-3).

## 6 CHALLENGES AND LIMITATIONS OF THE BIOARCHAEOLOGICAL STUDY OF BELGIAN CREMATIONS FROM THE NEOLITHIC TO THE EARLY MEDIEVAL PERIOD

**Abstract author(s):** Snoeck, Christophe (Vrije Universiteit Brussel - VUB) - Capuzzo, Giacomo (Université Libre de Bruxelles - ULB) - Dalle, Sarah (Ghent University; Vrije Universiteit Brussel - VUB) - Hlad, Marta (Vrije Universiteit Brussel - VUB; Université Libre de Bruxelles - ULB) - Sabaux, Charlotte (Ghent University; Université Libre de Bruxelles - ULB) - Saesle, Kevin (Masaryk University, Brno) - Stamatiki, Elisavet (Vrije Universiteit Brussel - VUB; Université Libre de Bruxelles - ULB) - Veselka, Barbara (Vrije Universiteit Brussel - VUB) - Vercauteren, Martine (Université Libre de Bruxelles - ULB) - De Mulder, Guy (Ghent University)

**Abstract format:** Oral

More than 2000 human cremations are being investigated within the CRUMBEL project (Cremation, Urns and Mobility – Ancient population dynamics in Belgium) to investigate changes in demography, migrations patterns and landscape use as well as variations in funerary practices in Belgium from the Neolithic to the Early Middle Ages. This project combines osteoarchaeological analyses with a wide range of analytical techniques (isotope analyses, infrared spectroscopy, radiocarbon dating, etc.). New developments in osteoarchaeology allow for an increase in the success rates of sex and age assessment of cremated human remains (which are currently very low, around 20%). Strontium elemental concentrations and isotope ratios are combined to look at changes in landscape use and mobility while carbon and oxygen isotope ratios are used, together with infrared analyses, to reconstruct funerary practices.

This presentation addresses the challenges and limitations encountered in this project from the acquisition of the samples to the interpretation of the results and discusses how large-scale projects can provide new opportunities for understanding past populations.

## 7 ANIMAL ISOTOPE NARRATIVES AND THE MORE-THAN-HUMAN PAST

**Abstract author(s):** Brusgaard, Nathalie (University of Groningen)

**Abstract format:** Oral

Stable isotope analysis has become a staple of zooarchaeological research, providing increasing insight into past animal diet, mobility, ecology, and human management. However, often these insights into the lives of individual animals in the past still serve primarily as a proxy for human behaviour, with limited focus on animal narratives. This paper discusses the potential of stable isotope research for exploring animal agency and the more-than-human past, in particular when used in multi-proxy approaches. It does so through the discussion of two case studies from prehistoric Netherlands. The first centres on the transition from hunting-gathering to animal husbandry in the Dutch wetlands in the fifth millennium BC. This paper discusses how the study of animal diet in this period through stable carbon and nitrogen isotope analysis can shed light on animal behaviour and interactions with humans. The second focuses on the exchange of cattle in the Bronze Age (2000 – 800 BC), examining the use strontium isotopes in the study of the socio-economic significance of livestock. Through these two case studies, this paper debates the use of stable isotope research for exploring animal narratives in human-animal interactions, contending that understanding these is essential for reconstructing a more-than-human past.

## 8 NEW INSIGHTS INTO LONG-TERM DIET IN NEOLITHIC SOUTHERN ITALY. A STABLE CARBON AND NITROGEN ISOTOPE APPROACH

**Abstract author(s):** Tafuri, Mary Anne - Soncin, Silvia - Panella, Sofia (Sapienza University of Rome) - Robb, John (Cambridge University)

**Abstract format:** Oral

The introduction of domesticated plants and animals in Southeastern Europe from Southwestern Asia is bracketed between the 7th and 6th millennia calBC, following a known longitudinal dispersal. In Italy, the earliest appearance of domesticated crops and ungulates outside their natural climatic zone concentrates in the southeastern regions and corresponds to a progressive increase in human occupation along the Adriatic coast. Stable carbon and nitrogen isotope studies in prehistoric Italy have relatively grown in the past decade improving our understanding of dietary practices throughout the Peninsula. However, this is hardly systematic, with some geographical areas and chronological phases dramatically understudied. In particular, what is hard to reconcile is the generally homogenous economic background of Neolithic Southern Italy with its corresponding fragmented cultural environment. There is a general consensus on a widespread model of exploitation of recently introduced domesticated crops and animals, but we appear to maintain a clear separation in the patterns of exploitation of raw materials or pottery traditions. One way to overcome this conflict is to explore food practices as further evidence of cultural complexity. In this direction, here we attempt to provide an exhaustive neolithic isoscape of Southern Italy using stable carbon and nitrogen analysis of human and animal collagen from a large number of Neolithic sites, of early, middle and late phases. A general picture of "local" traditions within a larger model appears to be confirmed for Neolithic southeastern Italy. Here, the heterogeneity of dietary habits between communities living in similar environments suggests that socio-cultural factors might have played a key role in food choices and/or farming and herding practices regardless of local availability and proximity to other communities.

## 9 CHILDREN'S NUTRITION AND LIFESTYLE IN THE NEOLITHIC ACCORDING TO THE STABLE ISOTOPE ARCHAEOLOGICAL EXAMINATION IN THE EASTERN PART OF HUNGARY

**Abstract author(s):** Somogyvári-Lajtár, Eniko (Institute of Archaeological Sciences, Eötvös Loránd University; Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences) - Demény, Attila - Gugora, Ariana (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences) - Hajdu, Tamás (Department of Biological Anthropology, Faculty of Science, Eötvös Loránd University) - Nagy, Emese (Déri Museum) - Pap, Ildikó (Department of Biological Anthropology, Faculty of Science, Eötvös Loránd University; Department of Biological Anthropology, Faculty of Science and Informatics, University of Szeged) - Anders, Alexandra (Institute of Archaeological Sciences, Eötvös Loránd University)

**Abstract format:** Oral

Children have long been an invisible part of human communities in archaeological research. With the development of bioarchaeology, biosocial archaeology, and stable isotope archaeology in recent decades, we have been able to answer a number of important questions about the lifestyles of children who once lived. In this study, we searched for answers to questions related to nutrition and lifestyle by isotope chemistry of non-adult members of the populations of three Middle and Late Neolithic (5500-4500 BCE) sites in the Eastern part of Hungary in the Great Hungarian Plain (Hajdúnánás-Eszlári út, Polgár-Ferenci-hát, Polgár-Csőszhalom). The main questions were: How long did the breastfeeding last and when did the weaning begin? What was the general nutrition of the children like? Where was the children's place in the community based on their dietary habits? Finally, we had the opportunity to observe the burials in a complex way which is based on the comparison of the results from the archaeological, isotope chemistry,

and anthropological studies. Stable carbon and nitrogen isotope data from bone and tooth dentin collagen and stable carbon and stable oxygen data from tooth enamel apatite were used to determine breastfeeding signals and weaning ages. For juvenile stable carbon and nitrogen isotope data from bone and tooth collagen and stable carbon and oxygen isotope data from bone and tooth enamel apatite were used to examine the dietary habits. The present work is the first to systematically address the lifestyle of children in the Neolithic in the Carpathian Basin. Furthermore, the three sites cover about 1000 years in time, and thus we were able to observe both temporal and spatial changes. The project is financed by a grant from the National Research, Development and Innovation Fund (Grant K124326).

## 10 **NEW RADIOCARBON DATES FROM THE USATOVO CULTURE SUGGEST A RE-EVALUATION OF THE CULTURE'S CHRONOLOGY**

**Abstract author(s):** Nikitin, Alexey (Grand Valley State University) - Lillie, Malcolm - Budd, Chelsea (Umeå University) - Potekhina, Inna - Ivanova, Svetlana (Institute of Archaeology, National Academy of Sciences of Ukraine) - Patterson, Nick (Broad Institute of Harvard and MIT) - Reich, David (Harvard Medical School; Harvard University)

**Abstract format:** Oral

Usatovo is one of the kurgan cultures of Eneolithic southeast Europe, occupying a strategic crossroads between the eastern Balkans and the Ponto-Caspian steppe. Usatovo is considered to be related to the farming cultures of southeastern Europe as well as to the pastoralist groups of the North Pontic. Usatovo currently dates to the second half of the 4th millennium BCE, based on C14 measurements obtained on pottery and charcoal using the scintillation method, as well as through ceramic typologies. Recent AMS radiocarbon dates obtained on human remains from the Usatovo site of Mayaki fall within the second half of the 5th millennium BCE. Stable isotope values ( $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ) obtained on human remains are atypical for farming or hunter-gatherer communities of southeast Europe and imply a heavy input from freshwater and/or marine resources in diet. Stable isotope ratios suggest the presence of Reservoir Effect (RE) potentially offsetting the dates from the human remains, although its quantification is difficult to establish due to the lack of contextual faunal remains. Even with the RE taken into account, the discrepancy between the scintillation C14 dates/ceramic typology and absolute AMS dating may still remain. Both anthropological and ancient DNA data are consistent with Usatovo being an admixture of farmer and steppe ancestries. The timing of this admixture may help refine the Usatovo chronology.

## 11 **NEOLITHIC DIETARY PRACTICES: COMPARISON OF STABLE ISOTOPES AND DENTAL MICROWEAR**

**Abstract author(s):** Kvetina, Petr (Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Dřtikolova Kaupova, Sylva (Department of Anthropology, National Museum) - Jarosova, Ivana (Anthropos Institute, Moravian museum) - Hrnčíř, Václav (Department Linguistic and Cultural Evolution, Max Planck Institute for Evolutionary Anthropology, Leipzig) - Tvrđy, Zdenek (Anthropos Institute, Moravian museum) - Pokuřta, Dalia (Department of Archaeology and Classical Studies, ARL Stockholm University) - Trampota, František (Institute of Archaeology of the Academy of Sciences of the Czech Republic)

**Abstract format:** Oral

The aim of the paper is to reconstruct Middle and Late Neolithic dietary practices in the area of today's Czech Republic and Lower Austria with a help of complementary evidence of stable isotope and dental microwear analysis. From a total of 171 individuals, carbon and nitrogen isotopic values were measured in bone collagen of 146 humans, accompanied by 64 animals, while 113 individuals were included into buccal dental microwear analysis. The samples were divided into two newly established chronological phases: Neolithic B (4900–4000 BC) and Neolithic C (3800–3400 BC) based on frequency occurrence of radiocarbon data. A small but statistically significant shift in human carbon isotopic values to higher  $\delta^{13}\text{C}$  was observed during the Neolithic C, reflecting probably the underlying change of plant growing conditions. Based at dental microwear result, a tendency to higher meat consumption could be observed in adults during Neolithic C, which was however not reflected in nitrogen isotopic values. The positive correlation between nitrogen isotopic values and dental microwear characteristics of meaty diet observed in adult sample suggest meat rather than milk was a dominant source of animal protein. We believe that the documented shift represent change between the early Neolithic way of live and the new economy and new social structures of the later period.

**Abstract author(s):** Varkuleviciute, Karolina (Institute for Pre- and Protohistory, Christian Albrechts University, Kiel; ROOTS Cluster of Excellence) - Makarewicz, Cheryl (Institute for Pre- and Protohistory, Christian Albrechts University, Kiel)

**Abstract format:** Oral

Central Asia was a crossroads for ancient east-west exchange of plant cultivars and animal domesticates, a process facilitated by mobile pastoralists who engaged in seasonal transhumance to meet the dietary needs of their livestock. We present new stable isotope data of over 300 humans and animals from Bronze Age and Iron Age contexts across Kazakhstan, adding to the large corpus of isotopic data already available in order to further trace the regional and temporal differences in human dietary dynamics – especially the consumption of millet, as well as animal herding strategies – including pasturing and/or foddering practices of caprines, cattle and horses. We identify regional differences in human dietary intake throughout the steppe regions, which is likely associated with variation in the consumption of millet as well as species-specific livestock herding strategies. When this isotopic data is considered in a wider zooarchaeological, archaeobotanical and archaeological context we begin to outline a more complex intersection between environmental dynamics, livestock husbandry and human subsistence that moves beyond the reconstruction of individual dietary choices.

**Theme:** 2. [Re]integration

**Organisers:** Polanyi, Tamas (Sandbox Archaeology) - Szeverényi, Vajk (Déri Múzeum)

**Format:** Regular session

Archaeology is well equipped to study history either as sequences of transformative events, or as a continuous process of everyday life where time serves as a function of cultural persistence. On a macro-scale, sweeping reconfiguration of human-material relations marked by events and interpreted as cultural change have been at the center of archaeological practice since the first descriptions of 'cultures' as convenient analytical and spatio-temporal units for the analysis of past societies in the early 20th century. Wars, migrations, far-reaching effects of economic innovations have been considered the primary motors and signatures of change at the center of archaeological narratives, marked by an overwhelming focus on socio-economic and political systems. Alternatively, the archaeology of everyday life to study the material residues of cumulative and repetitive action became a central topic of archaeological practice in the 1980's. Within narratives of everyday life, emphasis shifted to the mundane, to the multivocality and multidirectionality. Corresponding to the decreasing scale of analysis and interpretive context, the struggle became to present the ways in which people's repetitive day-to-day practices mattered and figured into great chains of historical events. With no attention paid to their complementary character, these approaches developed to involve different interpretative strategies, necessitate different narrative modes, rely on different properties or analytical assessment of material evidence, require different methodologies, and are linked to different spatio-temporal scales.

The aim of our session is to facilitate a discussion focusing on processes of becoming, the ways in which the messiness of humanity unfolds, and leads to recognizable patterns of historical transformation. Whether using fractal replication, eventful history, theories of structuration, or iterations of the Annales School, we invite participants that seek to establish a connection between agency and structure, and bridge the scalar gap between micro- and macro-levels of observation and interpretation in their case studies.

## ABSTRACTS

### 1 INTERREGIONAL INTERACTION IN THE EARLY BRONZE AGE CARPATHIAN BASIN: A BOTTOM-UP APPROACH

**Abstract author(s):** Szeverenyi, Vajk (Déri Múzeum)

**Abstract format:** Oral

Interregional interaction – the mobility of people, objects and ideas – was a major force of social change throughout the Bronze Age in western Eurasia. The study of such contacts is coeval with the study of prehistory in Europe. However, while such contacts have been studied intensively in the past as well, they were usually embedded either in a traditional culture-historical approach, where the focus was on chronology or on interpretations involving migrations or some form of untheorized diffusion, or in top-down approaches such as world-systems theory or wealth finance in chiefdoms. While these latter approaches are theoretically much more elaborate, they still fail to take into account the actions, practices and agency of people during such cross-cultural encounters. The aim of the present paper is the bottom-up study of the impact of interregional interaction on local social development in the Early Bronze Age of the Carpathian Basin. The main questions are 1) how people during their everyday life encountered such cross-cultur-

al impacts – foreign objects, people and ideas, 2) how through these personal interactions, reactions and decisions they adopted, rejected or reinterpreted according to local cultural logic such foreign elements, and 3) how these elements in turn led to local social changes.

## 2 **CIRCUITS OF REPRODUCTION: THE OPPORTUNITIES AND POWER TO CHANGE IN BRONZE AGE SOCIETY**

**Abstract author(s): Polanyi, Tamas (Independent scholar)**

**Abstract format: Oral**

How does macro-level change come about in society? What role do individuals play in such transformations? What is the efficacy of human agency? These are critical questions anthropologists, historians, political scientists are grappling with. These are questions lurking behind most archaeological narratives of past societies framed in ideology and theory that rarely become clarified. Various models of change have been described and employed generally categorized as top-down or bottom-up approaches. Practice theory, habitus, theories of structuration are important avenues for constructing bottom-up narratives of how societies are organized and change over time, but the context, visibility, and mechanisms of scalar effects of the everyday are often assumed but not explored rigorously. In this paper I outline an approach centering on the politics of death and Anthony Giddens' largely overlooked 'combustion engine' of social change, the circuit of reproduction. I use the example of central Hungarian Bronze Age to develop the argument linking the local, the contingent, the interpersonal with scales of the regional and supra-regional, where transformations become visible and detectable in archaeological narratives. I then conclude that as a context of interlaced structural domains populated by conscious and intentional actors engaging in public processes of materialization, funerals are indeed circuits of reproduction, where the efficiency of human agency becomes traceable and visible marking the trajectories of social change.

## 3 **TRANSFORMATIVE CHANGE IN BRONZE AGE TRANSYLVANIA**

**Abstract author(s): Quinn, Colin (Hamilton College)**

**Abstract format: Oral**

Every transformative change in social organization emerges out of the constant small-scale changes in daily lives. What distinguishes transformative change from other kinds of change, and what are the consequences for archaeologists seeking to understand social dynamics in the past? I employ a framework that centers the recursivity between human action and institutional organization to better understand how transformative changes occur. As a case study, I focus on emergent inequality in Bronze Age Transylvania (2700-1320 BCE). Through an examination of settlement, mortuary, chronological, and artifactual evidence, I argue that inequality became institutionalized only during the Late Bronze Age, centuries later than previously assumed. Throughout the Early and Middle Bronze Ages, there was dissonance across multiple institutions in how inequality was made, marked, and masked. Many institutional changes that occurred throughout the Early and Middle Bronze Age set the stage for Late Bronze Age social transformations. In particular, the expansion of long-distance trade, diversification of burial rites that emphasized intra-community difference, and an increase in the venues for signaling provided the opportunities for Late Bronze Age communities to reorganize hierarchically. These institutional changes were incremental and unintentionally set the stage for events to precipitate transformative change.

## 4 **CONTRASTING EXAMINATIONS OF THE FUNERARY ARCHAEOLOGY OF THE EVERYDAY AND THE ATYPICAL AS A SOLUTION FOR THE STRUCTURE: AGENCY IMPASSE**

**Abstract author(s): McSparron, Cormac - Murphy, Eileen (Queen's University Belfast)**

**Abstract format: Oral**

For several decades archaeology has oscillated between materialist studies of society and its structure and studies of individuals and their agency. Funerary archaeology has perhaps typified this debate with many archaeologists taking entrenched positions: processualist versus post-processualist. This lecture will suggest that archaeologists must be able to talk about both structure and agency when discussing ancient societies. It will examine six unusual burials of children and adolescents of the single burial tradition of the Irish later Chalcolithic Period and Early Bronze Age, in the context of a wider study of social structure of that era. It will use these atypical burials to give nuance, and as a counter balance, to the results of larger statistical studies which, by definition, look at typical practices, and focus on structure, at the expense of personal agency and the individual. These burials, which may witness unexpected, uncommon or possibly even tragic events, add texture to an era about which we know more at a societal level than at the level of the individual.

## “HANDS-FREE”! A NOVEL EMBODIED EXPERIENCE LED TO A COGNITIVE REVOLUTION – FINGERS!

**Abstract author(s):** Lindstrom, Torill Christine (University of Bergen, Norway) - Zubrow, Ezra (University at Buffalo; University of Toronto)

**Abstract format:** Oral

Our cousins, the big apes as well as monkeys, have hands with fingers as well as opposable thumbs. They also have large smart brains, and some of them use and make simple tools. Yet, they do not have the human culture. There are many general theories regarding what triggered human evolution. Some are: bigger brains caused better tools; better tools caused bigger and better brains; material engagement caused both; environmental crises caused or forced development; affluence caused or gave room for development. All are relevant, but none of them are conclusive. We suggest that “The Hands-Free hypothesis of human evolution” is most productive and inclusive. We propose a cascade hypothesis for the development of hand free hand use. Initially, the tree orientation facilitated the use of hands for a “holding” preference. Next comes a preferred hand use for visually guided object acquisition. The preference for acquisitions concatenates into a preference for uni-manual and then bi-manual manipulation. Free hands on the ground increases accessibility to various materials. Free hands can do many more manipulations (shaking, hammering, squeezing, to-mouth actions, even transfer actions to the other individuals). Thus, sensori-motor circuits of hands use, become circuits of acquisition, and become circuits for acting on, or transferring objects. This move, to become grounded and hands-free, was risky, challenging, and exciting. This paper explores the consequences of that novel “hands-free” situation.

## PERCUSSIVE OSSEOUS INDUSTRY A HUMAN REVOLUTION BETWEEN PRE-FORMATION AND WASTE SELECTION [PAM]

**Theme:** 6. A Decade after the ‘Third Science Revolution in Archaeology’

**Organisers:** Thun Hohenstein, Ursula (University of Ferrara) - Veffese, Delphine (IPH. Museum national histoire naturelle Paris) - Marín Hernando, Juan (IPHES)

**Format:** Regular session

Archaeologists have developed a growing interest in the study of the bone industry related to percussion, particularly for Palaeolithic periods. This type of industry became frequent, notably such as the manufacture of bone retouchers, but not only, and recent papers highlight the possible use of some bone fragments as hammer or anvil. Most of these tools were originated from herbivore long bones, although some specific elements as tusk fragments, teeth or antlers were common too. The cross-application analyses with new methodologies and more classical ones specific to archaeozoology allow to bring answers to essential questions about this type of bone industry:

1. the origin of the bone tools and pseudo bone tools;
2. the place in the technical equipment of the hunter-gatherers;
3. the blank selection: pre-formation of the blank during the butchering process or selection after, among the butchery waste;
4. the in situ used or possible transport, regarding the delay after butchery process and use and finally the abandonment.

In this session, we wish to bring together researchers working across the broad field of the osseous industry. We propose studies from different points of view:

- Morphometric and geometric analyses (blanks);
- Statistical analyses (blanks and marks);
- Archaeological experiments (neo-taphonomy);
- Functional and use analyses (traceology over bones);
- Raw material (teeth, tusk, bone);
- Typology and nomenclature of the marks;
- Proteomic and DNA (taxonomy).

Instead of focusing on one method, this session aims at exploring how different methodologies may complement each other within and between case-studies and projects to provide a more nuanced understanding of the technical behaviours related to the bone industry through the Palaeolithic and the diverse humanities. Papers may focus on case-studies, theoretical frameworks and the development of specific methodologies related to the percussive osseous industry.

## 1 BONE FRAGMENTS OR NEANDERTHAL BONE TOOLS? INTERDISCIPLINARY RESEARCH ON FAUNAL ASSEMBLAGE FROM ABRIC ROMANÍ (CAPELLADES, SPAIN)

**Abstract author(s):** Mateo Lomba, Paula (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Cáceres, Isabel (Universitat Rovira i Virgili, Departament d'Història i Història de l'Art; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Ollé, Andreu (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Marín, Juan (UMR-7194-Histoire Naturelle de l'Homme Préhistorique - HNHP, Museum National d'Histoire Naturelle; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Chacón, M. Gema (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art; UMR-7194-Histoire Naturelle de l'Homme Préhistorique (HNHP), Museum National d'Histoire Naturelle) - Vallverdú, Josep - Saladié, Pamira (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art; Unit Associated to CSIC, Departamento de Paleobiología. Museo Nacional de Ciencias Naturales)

**Abstract format:** Oral

Bone breakage by human groups during the Middle Palaeolithic was an activity aimed at the exploitation of their nutritional resources and, eventually, at the manufacture of bone tools. However, taphonomic studies have also highlighted the presence of pseudo-tools accidentally originated by different agents in faunal assemblages. Certain morphologies, the presence of removal scars, some bone surface modifications in specific areas, among other features, can mimic some minimally modified bone tools.

Abric Romaní is a Middle Palaeolithic rock-shelter with a sequence in which different types of occupation and subsistence strategies are documented. Specifically, level J (ca. 50 ka) shows intense exploitation of ungulate carcasses during seasonal occupations and a high degree of intentional anthropic bone breakage. In addition, some bone tools have been identified, but up to now they had not been the subject of a detailed study. This work aims to analyse these elements and to identify new tools within the assemblage. The study method employed consists of an interdisciplinary approach. On the one hand, the fracturing patterns of the bone remains are taphonomically analysed, incorporating geometric morphometry to the classical methodology. In addition, the tools are described from a technological and traceological perspective. This information is compared with an extensive experimental program that reproduces: (1) the obtaining of the raw material through the intentional fracturing of long bones, (2) the manufacture of the tools and (3) their use in different activities.

The results obtained allow us to present an assemblage of bone tools and pseudo-tools, but also complement the knowledge about the management of faunal resources performed by these Neanderthal groups.

## 2 FRESHNESS OF BONE-RETOUCHERS: AN EXPERIMENT TO DISCRIMINATE USE OF BONE WITH DIVERS DEGREE OF TIME EXPOSURE TO RETOUCH LITHIC TOOLS

**Abstract author(s):** Vettese, Delphine (Muséum national d'Histoire naturelle, Paris; University of Ferrara; Grupo EvoAdapta, Santander) - Arzarello, Marta - Muffillo, Brunella - Thun Hohenstein, Ursula (University of Ferrara)

**Abstract format:** Oral

Long bones fragments were used as retouchers during the middle Palaeolithic. Their morphology and the characterisation of the marks left by the work of lithic tools are well studied. Some studies focus on the use of fresh or dry bone fragments to retouch lithic tools to highlight the dry bone have lost the elasticity and seem to be less efficient. This problematic of the use of fresh bone as retouchers is important because it influence the identification of intentional and controlled production of blank or the use of butchery waste.

We performed an experiment using shaft fragments of long bones to manufacture and retouch lithic tools. To test the freshness of the bone fragments, we expose to the weather one sample during one year and one sample used a few times (one week) after the animal death. To avoid an inter-individual variation, only one lithician used all the bone tools. We would like to verify the hypothesis of the lesser efficiency of the dry blanks than the fresh ones. Besides, as the typology of the retouch marks are well known, our study focus on the morphology of the traces depending on the freshness of the blank. Our preliminary results show main differences regarding the retouch marks and areas, both on morphology features and traces numbers. We observe more scaled areas on the dry bone fragments. In this study, we attempt comparing our results on experimental retouchers with archaeological ones from Riparo Tagliente, Italy (MIS 4-3) to identify if retouchers used were fresh or dry. This comparison could bring some evidence of the specific cognitive behaviour regarding bone tools and probable preformation of the blank.

### 3 A USEFUL TAXON. THE EXPLOITATION OF CERVIDAE LONG BONES AS RETOUCHERS IN THE MOUSTERIAN LEVELS OF RIPARO TAGLIENTE

**Abstract author(s):** Perez, Andrea (University of Trento) - Vettese, Delphine (IPH - Museum national histoire naturelle Paris) - Thun Hohenstein, Ursula (University of Ferrara)

**Abstract format:** Oral

Bone retouchers are one of the first bone tools used during the Lower and Middle Palaeolithic. Their presence highlights a complex human behaviour showing the reuse of bone waste or a predetermination of the support. In this study, we focus on bone retouchers identified in the Mousterian levels 40–42 of Riparo Tagliente, a rock shelter in the Northeast of Italy (MIS 4-3). According to the relative abundance of these bone tools in the assemblages (2%), our work aimed at understanding if the supports of these retouchers had been selected in a particular way according to the species available and the element transported into the site. After both anatomical and taxonomical determination of each support, we characterized each modified area recording the features of marks. Our results show that bone retouchers are mainly long bones diaphysis fragments (85%) manufactured with *Cervus elaphus* and *Capreolus capreolus* bones. Regarding the unidentified remains, the middle and small sized ungulates were preferred. These species dominate the faunal spectrum of the levels studied. This similarity could show an opportunistic reuse of the butchery waste remains to manufacture retouchers. We identified a selection of tibias (6%) and metapodials (9%) due to the morphological features of these bones, with straighter plane surfaces. Our results show both a use of the butchery waste regarding the taxa and the selection of specific long bones, to obtain specific raw material useful for the production of retouching tool. The comparison of our results, with the analyses of the other Mousterian levels of Riparo Tagliente highlights a wide range hunting, technical and economical behaviours of Neanderthal groups throughout the Mousterian stratigraphic sequence.

### 4 RETOUCED BONE TOOLS IN MIDDLE PALAEOOLITHIC LAYERS AT COMBE-GRENAL (DORDOGNE, FRANCE)?

**Abstract author(s):** Bernard, Emma (Doctorante, TRACES - UMR 5608) - Costamagno, Sandrine (Directrice de Recherche CNRS, TRACES - UMR 5608) - Discamps, Emmanuel (Chargé de recherche CNRS, TRACES - UMR 5608) - Faivre, Jean-Philippe (Chargé de recherche, PACEA - 5199) - Tartar, Élise (Chargé de recherche CNRS, TRACES - UMR 5608)

**Abstract format:** Oral

Although the last decades have been a prolific period for research on Neanderthal's technical systems, our knowledge of their bone industries remains limited. While some retouched tools are recorded, the origin of some scars is particularly difficult to identify. If they could stem from butchering activities or taphonomical processes, there is a possibility that they were produced intentionally by flaking the bones. A better knowledge of Neanderthal material culture is essential to this issue, which can only be resolved through an exhaustive and diversified approach of technical systems.

An interdisciplinary approach associating archaeozoology, microwear analysis and experimental archaeology has been developed since the discovery of bone flakes with enigmatic removals during new excavations at the Middle Paleolithic site of Combe-Grenal (Dordogne, France). In the framework of a PhD project, the examination of Discoid levels has revealed the presence of nearly 200 pieces with series of removals. Each fragment is recorded by the criteria classically acknowledged in archaeozoology (TIPZOO database; Discamps, 2020) with the addition of specific informations on removal scar (e.g. size, depth, position on the support, notch and termination description). Each lateralized fragment is then drawn on a bone template using "QuantumGIS" (version 3.16.16). The location of cortical and medullar flakes and common impact points are recorded to reach quantitative data of these marks. In this communication, we will present the first results of the morphometrical and technological study of archaeological pieces, as well as preliminary analysis of experiments designed to test whether removals on bone flakes were produced intentionally or as a consequence of bone fracturation for marrow extraction. In the future, microwear analysis will offer complementary data for a better understanding of the nature of these particular bone remains.

### 5 BEYOND DIET: THE ANALYSIS OF BONE AND ANTLER TOOLS AND THE ROLE OF DEER IN HUNTER-GATHERER GROUPS FROM SOUTHERN BRAZIL

**Abstract author(s):** Martinez Okumura, Maria Mercedes (University of Sao Paulo) - Mingatos, Gabriela (Federal University of Rio de Janeiro)

**Abstract format:** Oral

The Tunas site (PR-WB-16), located in Parana state (Brazil), is dated from 11,158 - 10,752 cal. B.P. cal. to 7836 – 7666 cal. A.P.. In addition to human remains and lithic materials, the excavation of the site also yielded artifacts made of bones and antlers. Such artefacts have interesting specificities related to the choices of raw material and their manufacture by ancient human groups. The technological and typological analysis indicates a preference for the use of a specific part of the metapodials of deer to make the tools. The remains of anatomical parts transported to the site, especially long bones of the upper and lower limbs, represent a potential selection of these anatomical parts to be used as raw

material for making tools. The analysis of such bone artifacts using an experimental archaeology approach revealed part of the stages of debitage and façonnage of these instruments. The use of flint, previously observed as a raw material for the manufacture of lithic points, was also inferred in the raclage technique to make bone tools. The antler fragments were found in the early Holocene layers where lithic points were also observed, suggesting the use of such antlers as tools for pressure flaking of lithic points. The use of deer bones and antlers as raw material for making tools suggests a role of such animals beyond the diet, permeating the economic and symbolic spheres.

## 6 THE EARLIEST OCCURRENCE OF ANTLER HAMMERS IN THE EUROPEAN PALAEOLITHIC RECORD. NEW DATA FROM SOUTHERN ITALY

**Abstract author(s):** Thun Hohenstein, Ursula - Muffillo, Brunella - Arzarello, Marta - Peretto, Carlo (University of Ferrara)

**Abstract format:** Oral

The use of tools made of animal hard tissue, such as bone, antler, tooth and ivory – generally labelled 'bone tools' or 'osseous tools' – represents a key issue for research on human cultural evolution.

Bone tools were used as both raw materials to be shaped or as tools for shaping, mostly deer antlers or distal epiphysis used as hammers or percussors.

Among the earliest bone tools, antler hammers are known to have played a key role for the manufacture of finely-flaked handaxes.

The bone tool technology is now well defined and described in European Middle and Upper Palaeolithic assemblages. However, evidence for the use of antler hammers is generally rare. Among others, a reason could be envisaged in the difficulties of identifying knapping damage on antlers.

For this reason is essential to integrate the taphonomic and zooarchaeological studies with the results of lithic analysis.

In this paper we discuss the state of the art of the earliest evidence for antler hammers in Palaeolithic Europe, in the light of the new data recovered in the acheulean site of Guado San Nicola (southern Italy).

## 7 SMALL NEEDLE PRODUCTION AND USE DEVELOPMENT DURING NEOLITHIC PERIOD IN JORDAN

**Abstract author(s):** Abuhelaleh, Bellal (Al Hussein Bin Talal University)

**Abstract format:** Oral

Jordan Neolithic farming villages present evidence of human development during the Neolithic period. These sites reveal complicated social life system organization and daily demands.

Researcher classified bone industry regarding to the shape and size of these tools and many of them have been unfortunately remain without any particular analysis or experimental work to explain their use or production technique.

We have new particular discovery of small needles which rear found in the middle east as well, maybe in the world during the Neolithic period which go far of 6000 BC. It has a sophisticated work and not only for clothes industry as many researchers thought that was one of its main use only.

Our paper takes attention for needle production and classification and new possible use regarding to typology and shape, size and presence of perforation (EYE). As well to open new possible discussion about human demands during the Neolithic period.

---

## 432 LOGISTICS AND NATURAL RESOURCES: SUPPLY AND TRANSPORTATION THROUGH TIME (5TH CENTURY BC – 5TH CENTURY AD)

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Vanderhoeven, Timo - Kars, Eva (EARTH Integrated Archaeology) - Bongers, Toon (SDEP - Ghent University) - Kienzle, Peter (Landschaftsverband Rheinland - LVR – Xanten) - Delencre, Florent (University of Tours / UMR 6298 ARTEHIS)

**Format:** Regular session

Research on logistics and distribution is a tool to unravel the organization of ancient economies and trade relations. Unfortunately, research on logistics is often restricted to the distribution of small finds like pottery, glass and metal objects. They show exceedingly long and far trade links for small and precious goods. However, the scale of the trade in heavy building goods, such as timber, stone, lime and ceramic building material, has always been way bigger in volume as well as in financial turnover. Because of the bigger impact of this trade, it requires a higher organizational level and an extensive infrastructure. Therefore, to understand the organization of logistics it is important to look in particular at heavy goods such as stone and timber. Above all settlement sites, which were not conveniently located close to quarries, forests and building lime sources required a constant supply of materials, not only for building purposes but also for alterations and repair work. The way, logistics is organized reflects the internal organization of a society and, thus, is never static or universal. As societies change, the organization of trade and logistics will change

as well. This session will discuss the logistics of bulk transport and the organization of the construction of roads, forts and public buildings. The focus will be on trying to highlight the differences of this organization within Northern Europe and its changes through time (5th century BC - 5th century AD).

This session is co-organised by the "Structural Determinants of Economic Performance in the Roman World" (SDEP) Scientific Research Network, funded by the Research Foundation Flanders (Belgium) (FWO).

## ABSTRACTS

### 1 LONG-DISTANCE TIMBER TRADING IN THE ROMAN EMPIRE

**Abstract author(s): Bernabei, Mauro (National Research Council)**

**Abstract format: Oral**

Throughout antiquity wood was the most important raw material and energy source. In contrast to other archaeological finds e.g. pottery, stone tools and metal, the in general poor preservation conditions for organic material make archaeological records of wood very rare. It is preserved over a long period of time only in very humid or very dry locations. Hence archaeological wooden remains are of particular interest for research: they provide insight into former environmental conditions, wood technology and ancient economic history. In addition yield annually resolved dendrochronological data that allows precise dating of archaeological features. During an archaeological excavation in the center of Rome 24 oak (*Quercus* sp.) planks were found as part of the foundation of a richly decorated portico, in a vast and wealthy property. Due to waterlogged conditions wood was remarkably well-preserved and the processing traces are still clearly visible. Most of the material belongs to a single lot of timber and shows no signs of reuse. Dendrochronological analyses were performed in order to date the structure. Further researches regarding the wood provenance were possible through statistical cross-dating. Our results demonstrated that the oak trees had been felled between 40 and 60 CE in the Jura Mountains of north-eastern France. It is most likely that the wood was transported to the Eternal City on the Saône and Rhône rivers and then across the Mediterranean Sea. This rare dendrochronological evidence from the capital of the Roman Empire gives fresh impetus to the ongoing debate on the likelihood of transporting timber over long distances within and between Roman provinces. This study reconstructs the administrative and logistic efforts required to transport high-quality construction timber from central Europe to Rome. It also highlights an advanced network of trade, and emphasises the enormous value of oak wood in Roman times.

### 2 LONG-DISTANCE TRANSPORTS OF ROMAN MILITARY BUILDING CERAMICS

**Abstract author(s): Schmidts, Thomas (Römisch-Germanisches Zentralmuseum)**

**Abstract format: Oral**

The Roman military units which were stationed in the Germanic provinces were particularly involved in the production and transport of building materials. This production and logistics primarily served to supply military installations, but governmental and civic construction projects were also supported. The most common evidence of military building material is brick and tile stamps. Also, they can be assigned to troop units and often to brickyards.

For the private sector, the transport of bricks over long distances is only rarely verifiable in Roman times, which is quite understandable due to the weight and the transport costs involved. Military bricks, on the other hand, were delivered over relatively long distances. Rivers, especially the Rhine, played a special role as transport routes. This is already indicated by the position of the army brickworks. However, there are clear differences in the distribution of military bricks in the two Germanic provinces. The lecture focuses in particular on the involvement of the Roman army in the build-up of cities and residences. Examples are the provincial capital Colonia Claudia Ara Agrippinensium-Cologne and the late antique imperial residence Treveris-Trier, where governmental building projects were realised with a high proportion of military bricks.

### 3 (INTER)NATIONAL LOGISTICS OF ROMAN BUILDING MATERIAL: A CRITICAL REASSESSMENT OF OUR RESEARCH

**Abstract author(s): Vanderhoeven, Timo - Kars, Eva (EARTH Integrated Archaeology)**

**Abstract format: Oral**

Since 2000 the authors have been investigating Roman heavy goods (ceramic and stone building material) deriving from about 40 commercially excavated sites in the Netherlands. From every site reference samples are collected, documented and stored. The ultimate aim of the project is to connect fabrics with producers and ascribe stones to quarries and discern the provenance of the natural resources. Through the years a large reference collection has been built up. The research has revealed various production regions and distribution patterns. In recent years, the authors have published a large number of studies and given presentations at various national and international conferences about their groundbreaking research. In this presentation a critical reassessment of the research will be given and discussed. The authors will discuss how the research should be conducted and who should conduct the

research. How should this investigation be continued? And how can the research be conducted in an international context?

#### 4 **BUILD LOCAL – THINK ROMAN. THE DESIGN OF THREE CRAFTSMEN’S HOUSES AT THE LVR-ARCHAEOLOGICAL PARK AT XANTEN, GERMANY**

**Abstract author(s): Kienzle, Peter (LVR-Archaeological Park Xanten)**

**Abstract format: Oral**

The Colonia Ulpia Traiana was the second most important settlement in the Roman province of Germania Inferior (lower Germany), located a 100 kilometres north of Cologne at the banks of the river Rhine in the Lower Rhine flatlands. There are no local quarries for building stone and lime. In the open landscape, used for pastoral herding since iron-age, few trees grew and these trees were irregular and bended in the windswept landscape.

For major official building projects financed by the government or individual donors stone, building-lime and straight timber was shipped on the river Rhine. This was expensive and, consequently, local inhabitants had to draw upon the resources available on site. Thus, the houses of local residents within the city walls of the colonia were made of rammed earth and timber framing. The foundations were made of broken roof tiles, reused from the abandoned military camp close by, and only few stones were used at particularly places. Furthermore, the ground plan of the dwellings indicate structural systems employing short timbers.

Obviously, the bulk materials to build walls, floors and the roof were taken from local sources but all the houses were plastered and painted. The roofs were covered with tiles which were made locally or slate imported from the middle Rhine area. It was left to some details, such as limestone doorsteps or glazed windows, to show the owners prosperity. Thus, the outer appearance of the houses was distinctively Roman and hardly distinguishable from stone buildings but archaeological evidence shows, that the prohibitive cost of bulk transport determined the local design.

#### 5 **EPIGRAPHY AND SUPPLY LOGISTICS: FIRST ANALYSIS OF INSCRIBED STONES OF BESANÇON-VESONTIO, CAPUT CIUITATIS OF THE SEQUANI**

**Abstract author(s): Delencre, Florent (UMR 6298 ARTEHIS) - Delferrière, Nicolas (Université de Bourgogne-Franche-Comté) - Janin, Marie-Anaïs (Université de Bourgogne-Franche-Comté; UMR 6298 ARTEHIS)**

**Abstract format: Oral**

Stone appears to be a material support of prime importance for Roman epigraphic inscriptions, most of which came to us more or less fragmented. A thorough inventory of these inscriptions, as part of project I-Site BFC Sequania: territorial identity and patrimonial dynamics (Sequania ID), shows that the raw material was mainly extracted from the ancient area of Sequania, located in the East of modern France, organized around the caput ciuitatis Besançon-Vesontio.

The characteristics of these stones allow us to look further into the correlation between choices of materials and local availability, or lack thereof, of exploited resources, especially concerning epigraphy and iconography. Our own research in this particular project aims to try to evidence the existence of a link between the text itself, its expression in Gallo-Roman civic life and the selection of luxurious and/or expensive materials. As they concern the identity of the characters belonging to this geographical area and stone resources exploited to produce inscribed stones, these natural and cultural elements allow us to define the Sequani territory through insight into its organization and its management, as well as understanding how these dynamics and interactions are implemented.

Our corpus, comprised of around twenty-five inscriptions collected in the caput ciuitatis Besançon-Vesontio, contains items of widely varied origins due to their use mostly in funerary and religious spheres. Heavy monolithic blocks, of important dimensions would have needed transportation, the methods of which seem to differ from the routes taken by Roman building materials, hinting at particular supply logistics. In order to set up a common database, the participation of several specialists working on various aspects, including the study of stonemason workshops and their influence in shaping the morphology of the inscribed stones, is essential.

#### 6 **AD FLUMEN. SPATIAL NETWORK ANALYSIS OF THE ROMAN-ERA TRANSPORT SYSTEM OF THE SCHELDT AND MEUSE BASINS**

**Abstract author(s): Bongers, Toon (SDEP - Ghent University)**

**Abstract format: Oral**

Very little systematic research has been done on the role of rivers and waterways in the Roman transport system (exceptions are, e.g. Adams 2009, Campbell 2012, Jansma et al. 2017, Franconi 2014/2016/2020). However, both ancient authors and present-day researchers agree that waterways constituted an effective means of transportation. Research on the Scheldt basin (Bongers 2020) indicated that the region was well connected to the larger Roman transport network and that this was, at least partially, due to the presence of navigable waterways.

This presentation aims to introduce the results of a PhD study on the role of the rivers Scheldt and Meuse in the Roman-era transport system (50 BCE – 410 CE). We applied GIS-based spatial network analysis (following de Soto 2019)

to construct cost-distance, transport time, and accessibility maps for the early, middle, and late Roman periods. Doing so for both the Scheldt and Meuse basin allows us to compare two distinct regions: one connected to the coastal area of the North Sea and one connected to the Rhine region. Integrating settlement, economic, and epigraphical data (agents, organisations and networks) allows us to evaluate our results.

These results highlight more and less connected (sub)regions while also analysing the multi-modal transport system as a whole, including (minor) evolutions through time. Furthermore, for the first time, we will provide quantified and grounded calculations of transport values (i.e. cost, time, accessibility) for the Meuse basin. Regrettably, the study is constrained by a general lack of (published) data. Nonetheless, our results provide a framework for future logistical studies of northern Gaul and Germania.

## 7 **INVISIBLE BORDERS: THE DISTRIBUTION OF STONE BUILDING MATERIALS IN VENETIA ET HISTRIA (ITALY) THROUGH THE CASE STUDY OF ROMAN VERONA**

**Abstract author(s):** Bridi, Eliana (Università degli Studi di Padova)

**Abstract format:** Oral

Regio X - Venetia et Histria is characterized by a territory rich in stone materials, extensively exploited for building purposes, especially since the Roman age. This is confirmed by evidence of quarrying activities and by the large use of local stone (mostly limestone) in structures and infrastructures of the main urban centres and of their territories. Stone building materials were traded not only within Regio X but also in the nearby regions, thanks to a dense network of roads, navigable rivers, and maritime routes. The considerable amount of material transported in and out of the region depicts, indeed, a well-structured trade network.

In this framework, the Roman city of Verona provides an interesting point of view. The city exploited local building materials of good quality thanks to its strategic position, very close both to the quarries and to the river Adige, facilitating transport. Imported building materials are rarely documented in the city. Conversely, Verona extensively exported the so-called marbles carved in the near Valpolicella and Valpantena valleys, particularly appreciated for their aesthetic qualities. Indeed, several urban centres in the nearby regions display architectural decoration, structures or single artefacts made of marbles of Verona.

The case study of Verona offers the opportunity to consider the supply of stone in Regio X in terms of economic systems structured on several scales; trade in stone building materials was organized in several sub-markets, each depending on municipal demand. This created an economic organization based on self-sufficiency wherever natural resources were quantitatively and qualitatively suitable. The invisible borders of municipia were crossed only by few materials, used for those specific architectural or ornamental/aesthetic necessities which could not be met by local stones.

---

## 434 **CREATION OF EUROPEAN IDENTITIES – FOOD, TEXTILES AND METALS IN THE IRON AGE BETWEEN ALPS, PANNONIA AND BALKANS**

**Theme: 3. The Carpathian Basin: Integration, Mobility and Diversity**

**Organisers:** Gleba, Margarita (Department of Cultural Heritage, University of Padua) - Potrebica, Hrvoje (University of Zagreb, Department of Archaeology)

**Format:** Regular session

Our theme are formative elements of the identity of the Iron Age communities. This was the period, which immediately preceded the emergence of those communities on the historical stage, when they became, together with the Mediterranean world and the continental Europe, an essential element of a much wider picture of the European cultural dynamics. The selected region is the key link connecting three broad cultural zones of Europe: the Central Europe, Mediterranean and Eastern Europe. Due to its position, this relatively small region is of a key importance for our understanding of much broader processes of creation and change of identities in a much wider European framework. The identity of a prehistoric community is complex concept, whose definition requires an interdisciplinary approach. Of the many factors involved, this session will focus on three: food, textile and metal. Although the first two are basic life needs, the way in which those needs are fulfilled reflects a choice, which determined the way of life of the Iron Age communities, and is strongly correlated with their perception of the world and of their own identities. On the other hand, metals – primarily bronze and iron – were the main driving force behind setting up contacts and communication among diverse cultural groups, which paved the way for cultural transfer and alteration of identities of individual communities. We welcome papers, which will offer alternative to current paradigms of identity of Iron Age communities, such as the cultural group. The aim is to bring fresh ideas into discussion on individual and/or complex identities of the Iron Age communities between Alps, Pannonia and Balkans.

## ABSTRACTS:

### 1 YOU ARE WHAT YOU WEAR? ARCHAEOLOGICAL TEXTILES AS ELEMENTS OF IDENTITY AND PROXIES FOR MOBILITY IN THE CENTRAL BALKANS

**Abstract author(s):** Gleba, Margarita (University of Padua)

**Abstract format:** Oral

Recent research on ancient Mediterranean textiles by the ERC project PROCON has demonstrated that since at least the Bronze Age, Italy and Greece developed two highly distinctive textile cultures. While twills dominate in Italy, in Greece only tabbies and weft-faced tabbies are found. The differences between the dominant weaves in Greece and Italy also exposed a larger regional pattern whereby Italy's textile culture has close affinity with central and western Europe (Hallstatt Culture) where twills prevail, while Greece's is closer to that of the Western Asia where tabbies are ubiquitous. Central Balkans stand out against this general pattern: preliminary investigations show that both twills and weft-faced tabbies are present in this region during the Early Iron Age, often at the same sites. The growing number of archaeological textile finds provides an opportunity to get the first, preliminary view of local textile sub-cultures and their development during the Iron Age in this region. Textiles are not only indicative of diverse expressions of identity among the local communities but also demonstrate that the area was an important crossroads for the exchange of textile technological knowledge through human mobility and interaction.

### 2 HALLSTATT PERIOD TEXTILES FROM THE BALKANS IN THE COLLECTION OF THE NATURAL HISTORY MUSEUM VIENNA

**Abstract author(s):** Groemer, Karina (Natural History Museum Vienna) - Lau, Ronja (Ruhr-Universität Bochum)

**Abstract format:** Oral

The Natural History Museum Vienna houses a rich collection of Iron Age textiles – among them items from the saltmine Hallstatt in Austria, but also mineralised textiles from Slovenian and Croatian cemeteries of the Hallstatt Period.

The textiles found at Slovenian cemeteries of the early Iron Age/Hallstatt period (800-400 BC) have been contextualised and analysed using a variety of methods in the course of a master thesis by Ronja Lau (Freie Universität Berlin). The archaeological sites of Magdalenska Gora, Brezje and Podzemlj represent settlements and cemeteries of the so-called Dolenjsko group in southeast Slovenia. The research discusses the methods that are important and what can be learned from very small textile fragments. Gaining information from Experimental Archaeology, international overview and textile tools are just a few methods shown within this research.

An overview of the textile production of the Hallstatt Culture is also one of the aims. Slovenia and Croatia are part of the so-called eastern Hallstatt territory and can be compared with other sites, e.g. with Hallstatt saltmine as well as with others. The similarities are probably no coincidence, as the main use of twill, twist patterns and quality are seen throughout the eastern Hallstatt regions. Another interesting observation is the existence of plied yarn in woven textiles in the three Slovenian sites. Just a few fragments build a connection to the western Hallstatt region, where plied yarn was frequently used.

### 3 TEXTILE NEWS FROM DONJA DOLINA – TEXTILE PRODUCTION TOOLS FROM THE IRON AGE

**Abstract author(s):** Fileš Kramberger, Julia (Department of Archaeology, Faculty of Humanities and Social Sciences, Zagreb)

**Abstract format:** Oral

The site of Donja Dolina is located on the right bank of the Sava River in northern Bosnia and Herzegovina. It is one of the most notable prehistoric sites in the Sava Valley region due to the results of archaeological excavations conducted for over a century. This site is considered to have been a prominent settlement and river crossing, and even a possible distribution and communication centre between the Alps, Pannonia and the Balkans during the Bronze (13th – 8th centuries BC) and the Iron Age (8th – 3rd centuries BC). Even at the beginning of archaeological research in the early 20th century, alongside various material finds such as vessels, tools, weapons and personal objects, textile production tools from Donja Dolina were always presented as a separate and surprisingly numerous category. Tools such as spindle whorls, loom-weights and spools have been found throughout the settlement at the Iron Age Gradina hillfort, mostly within unclear archaeological context, although some were located within the confines of pile-dwelling structures, and several spindle whorls were found in graves (probably female) at the nearby cemetery.

A total of over two and a half thousand ceramic textile production tools, kept at the National Museum of Bosnia and Herzegovina in Sarajevo, have been analysed and the preliminary results of the analysis will be presented in this paper. The research of textile production tools, among other approaches to archaeological textiles, can not only help in determining the textile production process of any given site, but may also be a source for the research of production organization, textile use and distribution within the community. Furthermore, based on the funerary ritual, it is possible

to address the topic of symbolism represented by textile production and the identity of its producers, especially when compared to synchronous sites in the vicinity.

#### 4 MILLET DRINK IN URNFIELD PERIOD BAVARIA AND HALLSTATT PERIOD CROATIA - CASE STUDIES OF BIOMOLECULAR ANALYSIS AND ITS CONTEXT

**Abstract author(s): Metzner-Nebelsick, Carola (Inst fuer Vor- und Fruehgeschichtliche Archaeologie, Provinzialroem Archeologie) - Loznjak Dizdar, Daria (The Institute of Archaeology Zagreb) - Rageot, Maxime (University of Tübingen)**

**Abstract format: Oral**

We will present two cases of millet consumption in a sepulchral context. The first features an elite burial in the late Urnfield cemetery of Künzing, Bavaria dating around 1000 BC. Two individuals were buried in an urn placed in the center of a large grave precinct. The intentionally smashed urn contained fragments of additional pottery vessels and one of the most unusual assemblages of metal objects in its time. Biomolecular analysis has revealed that one of the fragmented vessels in the urn grave contained traces of millet, attesting for the consumption of a millet beverage or mush. In addition, the sherds of two other vessels revealed traces of conifer (probably juniper) tar/oil, which could represent an early and rare case for the use of fragrances in a burial ceremony.

The second example dates to the early Hallstatt period and is located 850 km down the Danube in Sotin in eastern Croatia. Sotin is a late Urnfield and Hallstatt cemetery with over 100 excavated graves dating to the 9th -7th centuries BC. Grave 78, excavated in 2011 and dating to the 1st half of 7th century BC, contained an urn with cremated remains. Six vessels represent the additional inventory. The urn was probably wrapped in some organic material because a fibula was placed on the shoulder. East of the urn three bowls and a kantharos were found. Biomolecular analysis revealed traces of millet inside the kantharos. Organic residue analysis was applied for the first time in the area to investigate the content of the kantharos. The result represents the first evidence of millet consumption in association with a specific vessel type, usually interpreted as a container for liquids. Near it, unburnt animal bones as the remnant of a meat offering were deposited.

#### 5 DOWN BY THE RIVERSIDE – EATING AND LIVING IN PILE DWELLING SETTLEMENTS OF RIPAČ AND DONJA DOLINA

**Abstract author(s): Šoštarić, Renata (Department of Biology, Faculty of Science, University of Zagreb) - Pravidur, Anđrijana (National museum of Bosnia and Herzegovina, Sarajevo)**

**Abstract format: Oral**

Multilayered localities - pile dwelling settlements of Ripač (on the banks of the Una River) and Donja Dolina (on the banks of the Sava River) were discovered at the end of the 19th century and most of the significant archaeological excavations were made soon after the discovery organized by the National Museum in Sarajevo. Remains of the settlement and a large amount of archaeological and biological material were discovered, partially analyzed in parallel or soon after the excavation, and were part of the permanent museum exhibition. Large quantities of found material from both sites have been stored in the repository of the National Museum in Sarajevo, and some of the findings are still being analyzed and researched. This review presents the results of the latest archaeobotanical research on both sites, which includes analyzes of hitherto unprocessed plant remains and a revision of earlier finds from the Early Iron Age. At both localities, the finds are dominated by carbonized cereals with a share of over 90%, and the most common is emmer (*Triticum dicoccum*), which is in line with the first analysis published in 1896. In smaller quantities, legumes are present, primarily beans (*Vicia faba*), and occasional weeds. Wild fruits collected in the vicinity of the settlements have a significant share in the findings, and the most numerous in previous analyzes proved to be Cornelian cherry (*Cornus mas*) from Donja Dolina. Various mixtures of cereals and legumes were also found, which most likely were the basis of the diet. If we add to all of the above large quantities of found bones of domestic and wild animals, we can assume that the diet of the inhabitants was varied and high quality.

#### 6 SV. KRIŽ IN LIGHT OF NEW RESEARCH

**Abstract author(s): Mavrović Mokos, Janja (University of Zagreb Faculty of Humanities and Social Sciences Department of Archaeology) - Fileš, Mislav (Institute of Archeology) - Šejić, Laura (University of Zagreb Faculty of Humanities and Social Sciences Department of Archaeology)**

**Abstract format: Oral**

The site of Sv. Križ is an Iron Age site (7th - 5th century BC) situated on a hill 300 m above sea level overlooking the confluence of the Sutla and Sava rivers. The site complex consists of a settlement and an accompanying necropolis. First excavations were carried out in the late 80es and mid 90es. This paper aims to present the latest research on this site in 2019 and 2021 and provide interpretation and parallels to some of the older excavations.

The phenomenon of the rich princely burials with weapons, horse-riding gear and even horses show a pattern on many of the Hallstatt period sites and is well documented in the princely grave of Sv. Križ. This presentation will focus

on the princely grave excavated on the site in 2001 and show how it fits into the pattern of similar rich graves in the region and a much further geographical area.

Furthermore, a detailed investigation of a house excavated in the last three years shows an exciting overview of Iron Age identities marked by several artefacts. Finds such as an awl and a small iron knife found near the hearth in the house, along with a spear fragment and fibulae were discovered. Distribution of the artefacts within the house might also mark several areas within the household based on gender identity. Mapping similar artefacts in the region will show us how the distribution networks changed in this period such as the fibulae of the Certosa type, which mark a clear connection with the area spanning from the eastern Alpine regions in Slovenia to the heart of the Carpathian basin along the Sava River. Finally, we would like to present all the finds from Sv. Križ in a broader context of contacts and distribution networks in the region.

## 7 "SOMETHING OLD, SOMETHING NEW, SOMETHING BORROWED, SOMETHING BLUE" - ECLECTIC IDENTITIES OF THE IRON AGE

**Abstract author(s):** Potrebica, Hrvoje (Dept of archaeology)

**Abstract format:** Oral

Some cultural groups in the contact zone between Central and Southeastern Europe, such as the Dolenjska (Lower Carniola) Group demonstrate not only standardised visual identity in their graves but also impressive persistence of that identity even through fundamental changes of burial ritual. However, this cultural model is not universally applicable to the other parts of the Eastern Hallstatt Circle where cultural groups were defined using quite different sometimes almost arbitrary criteria. So-called Balkan groups, on the other hand, are often product of cultural-historical school of thought which persisted in this area almost to this day, partially as result of local theoretical and political background and partially because of constant references on this area in Roman and Greek sources. To go beyond these categories, we have to study individual communities and enhance resolution of research to individuals to fully understand the structure of communal identity. In our analysis of contacts between 'Hallstatt world' and 'Balkan' Iron Age cultures, we realised that result of these contacts was wide variety of grave inventories in each of these groups. Beside local component those assemblages would contain imported objects from different regions compiled in almost unique but always complementary functional sets. The situation is even more complicated with diachronical perspective of these sets since in many cases some of the grave goods is significantly older than the burial. If we perceive grave inventories as form of visual markers of identity, we could argue that eclectic nature of these sets is actually standard that defines their identity on the level of communities in question.

---

### 436 GENERAL SESSION

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Chair:**

**Format:** Regular session

### ABSTRACTS

## 1 CROSSING BOUNDARIES FOR NEW PERSPECTIVES FOR HOARDS RESEARCH

**Abstract author(s):** Maciejewski, Marcin (Institute of Archaeology Maria Curie-Skłodowska University)

**Abstract format:** Oral

For decades, hoards of metal artefacts from the Bronze Age and the Early Iron Age were "functioning beyond space." Researchers who focused on typological analyses were overlooking various aspects related to the location where the artefacts had been deposited, referring solely to basic contextual information. This changed approximately at the beginning of the 21st century when viewing landscape as a cultural category (a text) has inspired a number of research projects. Studies conducted in Poland indicate that hoards were frequently deposited on the borders of settled areas. The interpretation of this phenomenon is based on similarities between the symbolism of borders/boundaries and metal.

Pinpointing the meaning of hoards in a landscape is one of the boundaries, the crossing of which provides the researchers with a new perspective on many aspects of the act of depositing metal goods. Artefacts having similar meaning in a landscape are often distinctive in terms of—variously defined—inventory (typological and functional divisions, results of the use-wear research, and archaeometallurgical analyses) as well as possible structures related to the act of deposition. What thus plays the key role: is it the location in a landscape, the inventory, the immediate context of storing metal goods, or the cultural significance of metal? How may one decide on that, given that three thousand years have passed? This paper offers a solution to this epistemic dilemma, simultaneously enriching the perspective on artefacts, borders and boundaries in historic communities.

## 2 IBERIAN SHIPBUILDING DOCUMENTS, DATABASES, AND WORLDWIDE RESEARCH

**Abstract author(s):** Silveira Martins, Adolfo António (Universidade Autònoma de Lisboa, CICH; Centro de Geocên-  
cias. Universidade de Coimbra; Instituto Terra e Memória) - Martins, Adolfo Miguel (CFE, Centre for Functional Ecology  
– Science for People & the Planet, Department of Life Sciences, University of Coimbra, at the NOVE University)

**Abstract format:** Oral

The reconstruction attempts from known shipwrecks have supported a deeper analysis of their surviving remains. Most of these studies rely on the analysis of archaeological material. Although these pieces of evidence are highly limited, as just a small percentage of ships' remains survived across the centuries.

Therefore, it is required the use of different source material such as contemporary documentation i.e., shipbuilding treatises and ship' depictions. Referring to the contemporary documentation, much has been argued about the reliability of the Iberian shipbuilding treatises produced by clerics, architects and non-shipwrights.

Questions arose, during this investigation, such as: which is the level of influence/veracity contained in these treatises regarding shipbuilders' contemporary practices; Were the authors' former masters at the Iberian shipyards; Was the shipbuilders' knowledge factual documented; and, Considering the contemporary required secrecy at the shipyards, how much information was allowed to include in the treatises.

This study aims to: Unravel the value of each shipbuilding treatise under a scheme that privileges data sharing between History, archaeology and Heritage management; Process scientific data and disseminate it using accessible to different audiences; The development of a digital bilingual cooperative database that can be feed by worldwide researchers, containing a detailed glossary; and, to encourage a more inclusive participation from different levels of society.

This Project means the creation an open database of collaborative tools online, which allows to have an overview of the shipbuilding practices in wood, as well as an in-depth view on specialized data of ship construction elements, acquired in textual sources and materials that can be thus related.

## 3 HOW THE HILLFORTS BECAME THE MOST FAMOUS ARCHEOLOGICAL HERITAGE SITES IN LITHUANIA?

**Abstract author(s):** Virsiliene, Jurgita (University of Klaipeda)

**Abstract format:** Oral

Today, Lithuania is seen in the heritage aspect as a land of hillforts. In 2017. the Seimas (parlament) of the Republic declared the Year of hillforts. How was that achieved?

In the independent Republic of Lithuania which was established in 1918, was no protection of heritage. About 600 hillforts were known before the First World War and only 8 of them were excavated. In the 1920s, P. Tarasenska became interested in the hillforts and started to popularize them. The State Archaeological Commission, which took care of the heritage, in 1934-1936. began to actually protect the hillforts. Scientific knowledge of hillforts and protection revived in the 1950s. In 1967 after the adoption of the Law on the Protection of Monuments and the establishment of an organization carrying out heritage accounting, the protection of hillforts became more active. From the beginning of the 1970s, they began to be managed and adapted for visiting. The research was carried out more in hillforts, which were managed or damaged by natural forces.

In independent Lithuania positive experiences of hillfort research and management were inherited from the Soviet period. The Department of Cultural Heritage in 1991–2004 carried out a program for the preservation of Lithuanian hillforts damaged by natural forces. During it, the threat of an emergency situation was eliminated for 73 hillforts, and investigations were carried out in 21 hillforts.

At the beginning of the 20th century, the hillforts were only known to local people. The state's efforts to preserve them have intensified and maintained public interest in them. The research of the hillforts and the individual personalities who popularized them also contributed to this. These were the main factors that made Lithuanian hillforts the most famous type of prehistoric heritage.

## 4 WE ALL NEED AN EU HERITAGE AND HISTORIC ENVIRONMENT DIRECTIVE WHICH INCLUDES LICENSING FOR THOSE WHO WORK IN IT

**Abstract author(s):** Forrestal, Colin (Independent Researcher)

**Abstract format:** Oral

At Barcelona 2018, session 778 proposed Examining the different approaches, methodologies and legislatively there is both culturally and in the application to European Commercial Archaeology, to paraphrase. With the pandemic and continuing global turbulence this paper is arguing that what is needed in the archaeological and historic sector is an EU directive that promotes Heritage and the Historic Environment and provides a cohesive framework for those in the EU and those that wish to coalesce around.

With the Covid-19 pandemic and the rise of more populist nationalist government gaining power around the world it has never seemed more important to protect our inherited culture and heritage, regardless of colour, creed or beliefs from ourselves. Therefore we should be pushing organisations such as the EAA to persuade the EU as a prominent global standard setter to take on this proposal as a matter of urgency.

This paper proposes that there should be an agreed minimum level of expertise before one can call oneself an archaeologist, that this limits what your authority and ability is. Experience and ability should allow progress to more responsible roles. It should be policed either nationally or regionally. It should be subject to legal punishment (including jail) and should apply to academic and commercial professionals and organisations with equal severity.

This would also enable all to work across the EU and know the law and have accepted levels of confidence in their abilities and hopefully lead to a Global accepted set of standards.

## 5 CULTURAL HERITAGE THAT CREATES IDENTITY IN THE FACE OF CLIMATE CHANGE

**Abstract author(s): Sozer Kolemenoglu, Selma (Universidad Empresarial De Costa Rica)**

**Abstract format: Oral**

Along with the change, the effect of the technological big power plant emerged in Covid-19 with its dehydration in human metabolism. Human in the pharaoh structure, together with the bio-archeological socio-environmental actors, feminizing the human, injecting the demonization stone-worship cult into human blood with technological sanctions, distorting identities. The compelling negative metaphorical power of technological reactors produces the minimalist view that consciously leads the world balance to non-existence with the rapid cycle of the whole soul. In sustainability, the perverse malice that comes from the nafs powerhouse can be cut and prevented by the will power and unity of humanity. Pharaoh creates metaphorical chaos that pushes human rights, mixes identities that remove borders with exquisite migration. The tangible cultural heritage figurines we see in geoarchaeological formations also explain climate change with historical complaints. Man, created from a blood clot from the earth, is geopolitical. Climate change slows down the living system and adjusts the balance of the breath.

## 6 RECYCLING THE “SLOW APOCALYPSE”: CONFLICT, HERITAGE AND THE ARTS OF LIVING ON A DAMAGED PLANET

**Abstract author(s): Breithoff, Esther (Birkbeck, University of London)**

**Abstract format: Oral**

From 1964-1973, during an event known as the “Secret War”, the USA dropped 2.1 million tons of bombs on Laos, turning the latter into the most heavily bombed country (per capita) and one of the most UXO-contaminated places on earth. Fifty years on, the rice fields, jungle and villages of rural Laos remain littered with live mines and unexploded cluster bombs, ready to explode at the slightest movement. As a result, whole areas have been rendered uninhabitable, hindering social and economic progress, and impacting the lives and landscapes of those that exist amongst the debris of armed conflict.

This paper is a material account of this large-scale destruction and its aftermath as “slow apocalypse” – a viscous, all-infiltrating process that has lingered long after the fighter planes left. Using Laos’ “bomb villages” as a case study, this paper aims to explore how recycling practices and other local responses to conflict heritage tell global stories of conflict as a 20th century Anthropocene hyperobject (Morton 2013; Breithoff 2020). As such, they constitute creative spaces in and through which to learn what Anna Tsing and co-authors refer to as the “arts of living on a damaged planet” (Tsing et al. 2017).

## 7 APOCALYPSIS AND OTHER DISASTERS IN THE MESOAMERICAN NARRATIVE: FROM THE PAST TO THE PRESENT DAY

**Abstract author(s): Moragas, Natalia (University of Barcelona)**

**Abstract format: Oral**

A first approach to the archeology of the various Mesoamerican cultures shows us a whole series of mythical events that tell us about great apocalyptic phenomena both as part of creation and destruction processes. The ancient Mesoamerican societies had a series of mythologies that explained great moments of apocalypse and destruction and that are presented in the material culture as part of a real narrative that supported a complex system of beliefs but also collective attitudes towards crises. The phenomenon of collapse encompassing various cultures within a wide territory is well known by archaeologist from the beginning of the archaeology in this area. Finally, the Conquest itself is an apocalyptic end whose consequences remain until today. In this presentation we intend to reflect on how this vision has been built from the Academia to the society remaining as part of a popular and collective narrative and its survival at many levels of today’s society. Since the second half of the 20th century with the generalization of television, cinema and today social networks, this apocalyptic vision of cultures remains present.

## 8 THE HYDROGRAPHIC NETWORK: A BARRIER PREVENTING THE EXPANSION OF PREHISTORIC POPULATIONS?

**Abstract author(s):** Ibrahim Hassan, Tayiba - Degioanni, Anna (Aix-Marseille Université, Ministère de la Culture, CNRS, Lampea, Aix-en-Provence)

**Abstract format:** Oral

Human migrations have been, and still are, influenced by several factors (economic, health, environmental, etc.). As part of this study, we are interested in understanding and evaluating the impact of the hydrographic network on the migration of prehistoric populations. We focus on the arrival of anatomically modern humans in Europe around 60,000 years ago. Rivers constitute a physical barrier, a limit that is often difficult to cross, but they can as well be elements that facilitate dispersion. The presence of hydrographic networks is an indicator of the presence of fauna, in particular large herbivores (mammoth, horse, auroch, etc.), essential for the survival of hunter-gatherer populations. Rivers can establish preferential corridors for migrants following the gradient of abundant resources.

Therefore, we test two hypotheses (the first considers the river as a barrier, while the second tends to regard it as a landscape that eases human diffusion) by analyzing the distribution of European sites of the first Homo sapiens compared to the distance and locations of hydrographic networks. Through statistical analysis and regression models (linear and logistic), we assess whether the distance between the stream and the presence of the site are correlated. Then, using a migration model (based on the minimum convex polygon MCP), we evaluate if the expansion pattern of our population pursues the hydrographic network.

## 9 A MULTITEMPORAL TALE OF MONUMENTALITY IN THE NECKAR VALLEY

**Abstract author(s):** Verdonkschot, Jadranka (Universität Tübingen)

**Abstract format:** Oral

This presentation sets out to discuss the monumentality of the Neckar Valley in Baden-Württemberg, in southwestern Germany. Several megalithic monuments are known from this area; menhirs that were assumed to be from the Bronze Age or pertaining to the context of an Iron Age necropolis. Nevertheless, a much earlier date could be closer to the truth. Based on the pictorial decoration and parallels to other megalithic evidences it is suggested that these monuments were rather created as early as the Neolithic. Taking this into account, a far more dynamic situation emerges, suggesting the re-use of monumental elements over and over in posterior ages.

The aim of the presented research is twofold; on one hand, this continuity in monumentality could shed new light on life in the Neckar Valley, and the diachronic processes it encompassed. On the other hand, in an attempt to expand this view, the inclusion of new data from settlement contexts is suggested.

## 10 COIN HOARDS FROM HISPANIA AS DEMOGRAPHIC PROXY

**Abstract author(s):** Diez Castillo, Agustín - Martínez-Chico, David (Universitat de València)

**Abstract format:** Oral

This contribution explores the potential of coin hoard as demographic proxies. We approach our methodology after working with open data from Coin Hoards of the Roman Empire Project (Oxford). We intend to analyse the extension of the Hispanic cities and their phases of occupation. It seems evident that the greater the number of cities, the greater the number of inhabitants, just as the greater size of each of these cities, the greater the number of people in each of them. The data we are working on in R are the total number of cities in Hispania, their size (ha) and the Roman Empire Treasuries (opening/closing) found in Hispania, ordered chronologically by reigns or dynasties. This project uses open data to determine whether the coin hoards are a priori related to demography. In the case of Hispania, most of the hoards belong to late dates, specifically in northwestern Hispania (Gallaecia). Obviously, hoards such as Tomares (with more than 50,000 coins in 19 local amphorae of the Tejarillo I type) show that we still have a very partial view of reality. We must therefore look, on the one hand, at the number of cities (and at this stage, tentatively, at the villas), and, on the other hand, at our monetary treasures. One of the main challenges is that the size of the city has to be estimated every 50 years over six centuries of Roman presence in Hispania.

## 11 DRESS TO HEAL? NATURAL DYES AND DYE-PLANTS AS HERBAL REMEDIES IN THE ROMAN TIMES

**Abstract author(s):** Pásztokei-Szeoke, Judit (freelance archaeologist)

**Abstract format:** Oral

Shortly after the accidental, but revolutionizing discovery by William Perkins in 1856, mass-produced bright and cheap synthetic textile dyes had glutted both the textile industry and trade. By the 20th century they crowded out the plant-based natural dyes finally and due to the industrialized production of these colourful textiles in our consumer societies, the colour of garments and textiles is simply regarded as decorative, occasionally symbolic, even by researchers of pre-industrial societies.

Two textile refurbishing workshops in Roman Savaria and Siscia yielded an abundant corpus of textile tools and inscribed commercial lead tags. Tools in general are a very useful source for the textile technologies applied locally by the workers. The tags were used as ID-labels for valuable garments entrusted by clients to the care of this workshop for refurbishing (e.g. mending, cleaning and redyeing) them.

Based on the recent research on these workshops, the proposed paper would argue for the functionality of some plant-based natural textile colours beside just being socially symbolic and also emphasize the interdependence and vital importance of corporeal and sartorial hygiene in densely populated regions, such as urban areas or military camps and the tragic consequences of the absence of hygienic practices in the past.

## 12 THE ECONOMY DURING THE IV-VI CENTURIES IN DARDANIA

**Abstract author(s):** Shipoli, Elza (Pázmány Péter Catholic University)

**Abstract format:** Oral

Late Antique period that includes the IV-VI centuries resulted in noticeable changes in Roman provinces. Western Roman empire provinces during this period faced enough challenges from trying to maintain power and dominance that started to meet a new threat from lots of factors. This period brought many changes like building new defense systems and difficulties in commerce, yet Roman Empire tried to keep with their all capacities and not to let fall the empire, which at the end resulted in a weakened empire that lost the battle with new populations that started to settle to Roman provinces. Commercial networks during the Late Roman period especially, to the West, did not lose their importance while the exchange of cultures, following the benefits of trade, and other supplies were the main reasons.

While transformations affected the Roman Empire, they also influenced Moesia Superior provinces. In Dardania, this period started with considerable changes, especially in the economy, architecture, and settlements.

This paperwork will intensify the challenges in ancient Dardania, respectively, today's territory of Kosovo, with the main focus in the economy with main coin circulations and pottery during late antiquity.

## 13 FROM A MONUMENTAL CITY TO A RURAL SETTLEMENT: TEOTIHUACAN IN EARLY COLONIAL TIMES

**Abstract author(s):** Torras Freixa, Maria (Universitat de Barcelona; Boston University) - Moragas Segura, Natalia - Bosque Canton, Cristina - Alvaro Rueda, Maria Karen - Pecci, Alessandra (Universitat de Barcelona)

**Abstract format:** Oral

The pre-Hispanic urban center of Teotihuacan (1-650 C.E.) was unique in contemporary Mesoamerica for its size, 125,000 inhabitants living in an area of 20 km<sup>2</sup>, and its perfectly designed grid plan dominated by monumental buildings and two large avenues. After the city collapsed, the urban landscape was progressively abandoned and transformed depicting a ruralization process. Even though the urban settlement was abandoned and then rather anarchically reoccupied, pyramids and monumental architecture of Teotihuacan continued to exist mainly as forgotten ruins.

During the 16th and 17th centuries a bulk of historical sources were provided by the implementation of the new government and the creation of the Cacicazgo of Teotihuacan. Also, a narrative was constructed by the indigenous population reflected in ethnohistorical sources. These written sources describe the lands of the Cacicazgo mentioning crops, rivers, but also the remains of the buildings and other constructions.

It is essential to study and analyze the main ethnohistorical and indigenous sources and the archaeological remains to observe the narrative and description of the process of abandonment and ruralization of the space previously occupied by the ancient city. Thus, the primary aim of this contribution is to describe our first results using this methodology and explain the role played by the ruins and its perception by population in Early Colonial times.

## A. ARCHAEOLOGY, ARCHAEOLOGICAL HERITAGE AND THE LOCAL COMMUNITY IN BALTIC SEA REGION - ARCHAEOBALT PROJECT CASE STUDIES

**Abstract author(s):** Czonstke-Swiatkowska, Karolina (University of Gdańsk; Archaeological Museum of Gdańsk) - Caretta, Nicolas (Bornholms Museum) - Maddox, Timmis (University of Wisconsin-Milwaukee) - Świątkowski, Bartosz (University of Gdańsk) - Thorsen, Michael (Bornholms Museum)

**Abstract format:** Poster

Archaeology and anthropology can help us locate and build up local and regional identities that can result in wider social bonds and pride in heritage. Archaeological heritage projects can support the local and regional community identities and economies by linking and promoting archaeology and culture heritage with sustainable tourism but also help to build the feeling of community on a local and regional level.

This focus on the "local" has become even more important, especially in the pandemic situation in which people were restricted in their movements but wanted to be involved in cultural activities and needed the feeling of community.

The ArchaeoBalt project spans three Baltic countries - Poland, Denmark and Sweden. Different experiences and traditions in public archaeology activities various levels of social awareness related to archaeological heritage are an advantage and, at the same time, a challenge to the project partners who are trying to create a coherent narrative about the region.

## **B. "WHY AM I HANGING LIKE THAT?" EXECUTION SITES IN LOWER SILESIA AS A SPECIFIC FORM OF SPACE LIMITATION**

**Abstract author(s):** Swiatkowski, Bartosz (University of Gdańsk) - Wojtucki, Daniel - Wojtucka, Karolina (University of Wrocław) - Leśniewska, Dominika (University of Gdańsk) - Mucha, Natalia (Nicolaus Copernicus University)

**Abstract format:** Poster

Post medieval execution sites are a specific form of limited spaces, especially in Silesia. A unique feature in Lower Silesia is stone and brick-built gallows which used to tower over public execution sites. They were prominent elements of the topography of early modern towns and villages. They were usually well exposed and were a visible threat and warning against breaking the law. They were also a space that was to separate law-abiding citizens from criminals.

In the early modern age, the area closest to the gallows was used as a site of the burial of the remains of the executed and viewed as - faulx atre – a false cemetery. This was the final resting place of the bodies of felons who had been executed on the gallows or next to it and condemned to eternal damnation. The convicts had no right to dispose of their bodies. Dishonourable burials of this sort are usually referred to in the written record as sepultura asina, Eselsbe-gräbnis. The group of 'the dishonourable' (unehrllich) included condemned felons who had been refused Christian burial in the sentence passed by the court of law and suicides. Their burial was relegated by town authorities to the executioner or his assistants.

An important issue is also the internal division of space near the gallows, with a clear separation of prisoners' quarters from areas intended for burying suicides.

---

## **437 REINTEGRATION IN MEDIEVAL ARCHAEOLOGY (MERC FORUM)**

**Theme:** 2. Reintegration

**Chair:** Pluskowski, Aleks (University of Reading; MERC)

**Format:** Other - forum

This year's MERC forum draws on one of the annual meeting's key themes – reintegration. Presentations from Central European medieval archaeology will address this theme from different perspectives, with an emphasis on interdisciplinarity and methodological reflections, including the reintegration of historical narratives into archaeological source material, as well as the role and reuse of different paradigms within medieval archaeology. The discussion will consider the theme more broadly, including processes of re-integration in the past and present. This aim of the forum is to highlight the contribution of medieval archaeology to understanding this key theme.

---

## **438 EUROPE'S MEDIEVAL PAST: A MANIFESTO (MERC ROUND TABLE)**

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Chair:** Citter, Carlo (University of Siena; MERC)

**Format:** Round table

The manifesto lays out our vision for a socially-engaged medieval archaeology, one with potential to enhance cultural value all across Europe. The document demonstrates the significance of the legacy and contemporary relevance of the medieval and early modern, and illustrates 'Why Medieval Archaeology Matters'. The Manifesto builds upon the Burra Charter and highlights the guiding principles needed to foster and develop social value in the context of medieval archaeology. Case studies that embody one or more of these guiding principles are presented as examples of best practice.
