

**28<sup>TH</sup> EAA ANNUAL MEETING  
BUDAPEST, HUNGARY  
31 AUGUST - 3 SEPTEMBER 2022**

**ABSTRACT BOOK**

## ORGANISERS

## PARTNERS

## SPONSORS

## HOW TO READ THE ABSTRACT BOOK

The Abstract Book is ordered by session numbers which were allocated during the session submission (i.e., the number sequence is discontinuous).

Author's affiliation is stated in brackets following the author's name; where authors share the same affiliation, it is only stated once.

Index of Authors includes all session organisers and only the main authors of contributions.

Please note that names, titles and affiliations are reproduced as submitted by the session organisers and/or authors. Language and wording of titles and abstracts are not revised.

## 28th EAA Annual Meeting (Budapest, Hungary, 2022) – Abstract Book

**Technical editing:** Kateřina Kleinová (EAA)

**Design and layout:** Kateřina Kleinová (EAA)

**Design cover page:** Aliz Ertler

**ISBN:** 978-80-88441-02-1

**28TH EAA ANNUAL MEETING  
(BUDAPEST, HUNGARY, 2022)**

**ABSTRACT BOOK**

# CONTENTS...

10	United Europe of Things 3: Understanding Transition - Integration - [Re]Integration through Medieval Material Culture .....	7
12	Seeing the 'Art' in Artifacts: The Inter-connections of Archaeology and the Arts .....	10
16	The Dawn, Apogee and Modern Demise of Kurgans in Southeast and East-central Europe .....	18
17	Becoming a Published Archaeologist [ECA].....	23
27	Engaging the Public, Heritage and Educators through Material Culture Research .....	23
32	Skyscape, Landscape and Archaeology. Study of Ancient Buildings from Different Perspectives and Disciplines to Give Them a Cultural Meaning [SEAC-EAA] .....	27
35	Where's My Tribe? Developing New Approaches to Connectivity, Mobility and Community in Early Medieval Europe after the Ethnic Paradigm .....	32
38	Characterization of Lithic Material in Prehistory, Methods, Problems, Results.....	36
39	Presentism and the Archaeologies of the Present: Engaged Practices and Methodologies.....	39
45	Becoming Roman: The Role of Biological Resources in the Expansion of New Economic and Cultural Models throughout the Empire .....	44
51	Conquest, Migration and Cultural Change in the Medieval Mediterranean.....	50
53	Technology, Regionalisation and Environmental Adaptation in Europe and beyond [PaM] .....	59
67	Cremation Funerary Practices across the Roman Empire: A Bioarchaeological Approach.....	61
83	Climatic Changes in the Medieval World: Evidence for Adaptation and Resilience.....	66
85	Understanding Neanderthal Symbolic and Cultural Behaviour and Their Cognitive Underpinnings. Where Do We Stand? [PaM] .....	69
86	Prehistoric Warriorhood in Transition.....	70
90	The Technology and Use of Metals in the Prehistoric Eastern Mediterranean: Recent Advances through Microscale Analysis .....	76
93	Beyond the Chronology and Pathways of Dispersal: Reasoning the Use and Abandonment of Broomcorn Millet Cultivation across Eurasia.....	79
96	Neither River nor Lake: Human-made 'Waterscapes'. The Use of Ground- and Rainwater in Neolithic Times .....	85
98	Hunter-Gatherer's Societies in the Southwestern Europe between 18,500-10,000 cal. BP [PaM].....	87
100	Human Forensic Taphonomy – How Multidisciplinary Approaches Shed Light on Past Funerary Practices .....	94
102	Campaigning Strategies for Archaeology and Cultural Heritage - Principles, Strategies, and Practical Experiences .....	100
108	The Times Are a Changing - Socio-Cultural and Ecological Change during the Atlantic Biozone and Their Impact on Human Life [PaM] .....	103
109	Animal and Plant Management in Prehistoric Hunter-Fisher-Gatherer Communities [PaM] .....	105
112	Prehistoric Inter-Societal Dynamics along the Atlantic Façade II. Neolithic to the Iron Age.....	109
126	Limiting Spaces: The Attribution of Spatial Meaning through the Creation of Boundaries .....	112
127	Integrations, Interactions, and Intersections in Islamic Archaeologies of Afro-Eurasia.....	118
128	Above and around 60 Degrees North: Movement of Ideas, Practices, Materials and People AD 300-1300 .....	123
129	Populism, Authoritarianism, Autocracy and Other Kids of Neo-liberalism – in Academia and Archaeology .....	127
130	New Interactions and Relations with Heritage. Different Approaches between Heritage and Stakeholders .....	128
134	In the Margins of the Fabric: Towards a Social Archaeology of Industrial Impact in the Modern and Contemporary Eras .....	132
135	The Medieval Marketplace in Europe - Interdisciplinary and Theoretical Approaches to Its Biographies and Developments.....	136
142	Gender Archaeology at the Crossroads: The Future and Its Challenges [AGE].....	141
143	The Evolution of Coastal Archaeological Sites: Submerged, Preserved, in Flux .....	146
149	Interactions, Innovation and Communication in the Late Neolithic and Copper Age .....	150
153	Apps and Archaeology. Use of Apps as Archaeological Tools.....	160

154	Towards an Archaeology of Household Practices – Current Archaeological and Scientific Contributions .....	163
157	Finds Stories: Archaeological Biographies in Contexts of Mobility.....	168
161	Peripheral Regions in the Prehistory of Temperate Europe.....	172
162	Digital Humanities and Medieval Archaeology: Re-Integrating Isolated, Fragmented and Overlooked Archaeological Evidence .....	175
170	The Houses of Death as Ancestral Monuments. The Archaeology of Neolithic Long Barrows in Europe .....	181
174	Rhythms of Life. Exploring the Imprints of Temporalities and Annual Cycles on Prehistoric Settled Life.....	185
176	Ornaments as a Key to Understanding the Hunter-Gatherer to Farming Transition in Europe .....	188
177	Organic Materials in Tombs: The Quiet Protagonists .....	192
180	Multi-proxy Microarchaeological Approaches: State of the Art, New Advances, Limitations and Future Perspectives .....	195
181	Control the Divine: Integrating Sacred Spaces and Rituals at the 'Fringes' (Ancient Central and South Asia).....	206
184	Center vs Periphery. Interdisciplinary Approaches to the Study of Material Culture, Architecture, and Landscape in the Caucasus Region.....	210
187	The Network Former: Trade and Exchange of Glass in Antiquity.....	212
192	Multi-proxy Approaches to Kinship in the Greco-Roman World.....	217
194	Safer-Spaces Policies in Archaeological Practice [EAA ExB] .....	220
195	Silk: A Catalyst for Interconnection in the Sixth to Tenth Centuries AD/CE.....	221
196	"A Universe with an Additional Dimension": The Socioenvironmental Archaeology of Fishing [PaM] .....	226
197	Standardization in Qualitative and Quantitative Use-wear Analysis of Prehistoric Stone Tools: Discussing Issues and Solutions [PaM] .....	229
198	From Fire to Light.....	233
201	"For the Love" – The Impact and Potential of Amateur Enthusiasts on Archaeological Sites and Activities .....	238
203	Across the Maelstrom: Searching for New Departures in the Archaeology of the Viking Age .....	238
206	No Braudel for the Balkans? Forging a New, Interconnected Prehistory of the Balkan Peninsula .....	241
207	Remembrance of Things Past: New Approaches to the Construction and Uses of Cultural Memory from Iron Age to Antiquity .....	249
208	Telling Stories about Impacts of Academic Research in Archaeology on Society: Wider Lessons from the UK Research Excellence Framework Experience [EAA ExB] .....	251
210	Digging Women: Use and Misuse of Ancient Women as Role Models in Archaeological Research and Dissemination [AGE] .....	252
211	Right Here, Let's Get It Right Now. Collaborative Creation of Standards and Guidance to Define Good Archaeology in Different Jurisdictions.....	255
213	Isoscapes, Foodwebs and Provenance – Isotope Archaeology beyond Materials and Specialisations .....	258
215	Facing Water Resources and Variations in Central Asia from Prehistory to Timurid Period: Disaster(s), Adaptation, Anticipation .....	268
218	Science or Humanities – Whither Archaeology? .....	271
220	Apprenticeship as Research Method .....	276
221	Revisiting Husbandry and Subsistence in Southwestern Asia Using Integrated Approaches and the Latest Development in Bioarchaeology .....	278

**Theme: 2. [Re]integration**

**Organisers:** Sawicki, Jakub (Institute of Archaeology, Czech Academy of Sciences in Prague) - Lewis, Michael (Portable Antiquities Scheme; British Museum) - Vargha, Mária (Department of Archaeology, Charles University Prague)

**Format:** Regular session

Following two successful MERC-sponsored sessions at the EAA 2019 and EAA 2021 on portable material culture (i.e. archaeological small finds), we now wish to take the debate and discussion further at EAA 2022. As in previous years, we are interested in whether the idea of 'a unity of culture' within Medieval Europe is also visible in its portable material culture. To be more precise, what are the similarities and differences in portable material culture, 'in and between areas and regions, and in the processes of transition, integration and reintegration which we might observe through and in material culture? One of the aims of this session is to serve as a forum for researchers dealing with this topic within Europe to reintegrate, share ideas and thought processes. To date, the chronological framework has focused primarily on the high and late medieval periods (1000-1550). This time, we would like also to include more recent finds (up to ca. 1700), which may (for example) explore how specific trends change from the late medieval to the post-medieval period.

We would accept papers focusing on, among others:

- finds that are typical and/or rare in regions, as well as their comparison with other areas
- possible borders and peripheries of common material culture
- interactions between local material culture and imported things
- moments of change, including material culture (or technologies) taking over older ones
- theoretical studies about interpreting material culture and ideas of 'common material' culture
- the impact of finds gathered by metal-detectorists and other public finders
- grave finds and their presence in burials.

## ABSTRACTS

### 1 LETTERING ON MEDIEVAL AMPULLAE: EXPLORING ENGLISH AND WELSH FINDS WITHIN A EUROPEAN CONTEXT

**Abstract author(s):** Lewis, Michael (British Museum; Portable Antiquities Scheme)

**Abstract format:** Oral

Medieval lead ampullae are common in England and Wales, thanks to the work of the Portable Antiquities Scheme (PAS) recording archaeological finds made by the public. It is not known how these items - generally assumed to be vessels for holy water or oil - entered the ground, though various theories have been proposed, including that they were deliberately deposited for ritual purposes.

What is particularly fascinating about these small leaden items is that they can be decorated (sometimes ornately, other times not), also sometimes with letters. It is often presumed that these letters stand for saints and/or their cult centres - e.g. 'T' for St Thomas of Canterbury, 'W' for Walsingham - but that is by no means certain. This paper will test this theory by examining the distribution of ampullae in England and Wales within a European context, but also in the hope of better appreciating transition in art and style and integration of forms and types across Europe.

### 2 THE MEANING, USE AND REUSE OF PILGRIMBADGES - METALDETECTING AND ARCHAEOLOGICAL FINDS AS SOURCE TO MEDIEVAL RELIGIOUS PRACTICE IN DENMARK

**Abstract author(s):** Søvsø, Mette (Museum of Southwest Jutland)

**Abstract format:** Oral

Metal detecting and excavation activity in Denmark the last decades has not only changed the amount and distribution of finds related to pilgrimage and religious practice in medieval daily life. A much more varied and many faceted picture can be drawn today when it comes to the meaning, use and circulation of these artefacts in the medieval society. Observations of the finds, traces of use and find contexts like burials shows, that from the time pilgrim badges and related objects occur in the find material from around 1200, they were associated with inherent, protective powers. These properties, deriving from their origin, motives and symbolism, were useful not only for individuals but also to communities. It is clear that the objects often had an "afterlife" probably in the hands of several people or in different contexts. They were not always handled as delicate, sacred objects, but rather as practical utensils in everyday life and ritual.

### 3 **SEXUAL BADGES AND ITS UNIQUE VISUAL CULTURE: THE PERSPECTIVE OF THE LATE MEDIEVAL LOW COUNTRIES ON SEXUALITY**

**Abstract author(s):** Fenucci, Lisa (Group van Vooren - Department Archaeology)

**Abstract format:** Oral

In comparison to religious themed pilgrim badges, which are found throughout Europe, Late Medieval sexual badges have a sexual theme and are mostly found in the Low Countries. Therefore, these sexual badges are perceived as rare material culture, unique to the Low Countries. The rarity of these sexual objects does not automatically mean that the visual imagery that is depicted on these sexual badges is unique. This poster investigates if the visual imagery of the sexual badges really is as unique as the badges themselves are.

To better understand the rarity of the sexual imagery, this research focusses on the deeper analysis of three visual images that are regularly seen in sexual badges. The first visual concept compares figures of women displaying the vulva, depicted on sexual badges, with Sheela Na Gigs. The second category focusses on the depiction of the wound of Christ and its visual resemblance with the pointed oval in vulva badges, and the last category focusses on the fallus badges and its comparison with the Roman tintinnabulum.

Eventually, these results show that the visual imagery in sexual badges, for example vulva or fallus badges, are not completely unique to the region of the Low Countries. The true uniqueness of the sexual badges lies in the fact that they depict a seemingly similar sexual imagery to the one that can be found throughout Europe, but transformed it through the cultural context of the Low Countries.

### 4 **BLUE AND WHITE GLASS VESSELS AND EQUIVALENTS IN EUROPE IN THE 10TH-12TH CENTURY CE.**

**Abstract author(s):** Pactat, Inès - Gratuze, Bernard (Centre Ernest Babelon - IRAMAT - UMR 7065)

**Abstract format:** Oral

First considered as antique, the blue and white glasses found on elite and religious sites between the 10th and 12th centuries CE contrast with the contemporaneous glass productions, using wood or plant ash as flux. Although they are natron glasses, the forms and the contexts of discovery are typical of the Middle Ages. Their manufacture is based on the recycling of mosaic tesserae and perhaps ancient coloured vessels, a process described in the 12th century treatise of the monk Theophilus, *De Diversis artibus*. The decoration of these specific glass vessels plays with the contrast between a translucent dark blue body and opaque white trails and droplets. White vessels with a vivid coloured decoration and others with the same decoration associated to a purple or a green body belong to the same group. We offer here an overview of findings, including unpublished data, to discuss the significance of their large distribution, from Norway to Italy. These glass vessels seem to share the same symbolism, which makes sense over a very huge territory among religious and secular elites. Their manufacturing process also certainly gives them a special value. It will be discussed using archaeometric data and compared to other recipes in use at that time. Blue and white glass vessels and their equivalents are part of a common material culture covering most of the medieval Europe. Their interpretation constitutes an archaeological and a historical challenge to understand the diffusion of goods and/or knowledge across these various territories.

### 5 **TOOLS OF A MEDIEVAL RURAL METALWORKER**

**Abstract author(s):** Vargha, Maria (Charles University Prague)

**Abstract format:** Oral

The present paper showcases a unique find complex, the late-romanesque tools of a rural metalworker. The assembly, consisting of 25 items, has been discovered piece-by-piece by years of metal-detecting and was submitted to the Katona József Museum of Kecskemét together. The find complex consists of tools for shaping sheet metal: chasing tools, and several dies, all cast from brass; some not even shaped after casting, some of them quite worn. The designs – amongst others, four-lobed frames, various geometric forms, lilies, and a bird show a late Romanesque style.

The site was disturbed by agricultural works, which brought the finds up to the topsoil. Although the Museum has conducted two seasons of excavations to verify the context of the discoveries, unfortunately, there is little to know about it. It has been confirmed that an Avar period cemetery was once on the site. Later, a larger village developed there in the high middle ages, including a church and churchyard. The village ceased to exist in the thirteenth century, perhaps in connection to the Mongol invasion of the country; its name is lost. This unique find complex offers a rare insight into the metalworking practices of the contemporary rural communities, something that we otherwise have very little knowledge about.

## WHY THE BELLS RING FROM WEST TO EAST? A WESTERN TECHNOLOGICAL PATTERN OF BELL CASTING IN MEDIEVAL TRANSYLVANIA

**Abstract author(s):** Cringaci Tiplic, Maria Emilia (Institute of Social Sciences and Humanities Sibiu, Romanian Academy)

**Abstract format:** Oral

Although hundreds of churches and numerous medieval bells are documented in Transylvania in the 13th-15th centuries, very little is known about the process of casting medieval bells in Transylvania from an archaeological point of view but also from a documentary perspective.

According to the written data, the bell craftsmen are attested in the most important towns of Transylvania (Sibiu, Sighișoara, Brașov, Bistrița, etc.), but the most exciting and mysterious chapter regarding their history concerns the workshops and the places, where the bells were cast. This paper aims to present a very rare find in Transylvania, which shows very good similarities to Central and Western European ones. It is about a bell-casting pit discovered inside a Romanesque church in southern Transylvania, namely in Cîsnădie, very close to Sibiu. Cîsnădie, similar to Sibiu, is a settlement established during the Arpadian king Geza II (1141-1161) and it is part of the process of German colonization. In 2017 and 2019-2020, as a result of an extensive restoration project of the medieval fortified church of Cîsnădie, archaeological research was carried out for the first time. Fragments from a medieval bell-casting pit were identified in one of the trenches made inside the church, near the foundations of the western bell-tower. In our presentation we aim to discuss about the casting technology used in medieval Cîsnădie and the itinerant bell craftsmen, to suggest a chronology of the bell-casting pit and to identify the technological pattern which could be compared with other bell casting in Central and Western Europe.

7

## DRESS ACCESSORIES AS GRAVE-GOODS: THE CASE OF THE CHURCHYARD CEMETERIES OF SIBIU AND BAIA MARE

**Abstract author(s):** Szocs, Peter Levente (County Museum Satu Mare, Romania) - Marcu-Istrate, Daniela (Vasile Pârvan Institute of Archaeology, Bucharest)

**Abstract format:** Oral

Rescue excavations carried out during the last decade, have revealed a large number of medieval and early modern burials belonging to the churchyard cemeteries of the Transylvanian urban parish churches. The Lutheran Church of Sibiu (Nagyszeben, Hermannstadt) is the former medieval parish church of the town, and the religious center of the Transylvanian Saxons, inhabiting the southern part of the province since the 12th century. The exterior of the church was researched in 2005, while the interior in 2018 and 2019, revealing more than 2000 burials. In case of Baia Mare (Nagybánya, Frauenbach/Neustadt) the site of the former medieval parish church was researched during 2012 and 2014, revealing more than 700 burials. Both the towns were major economic centers during the Middle Ages and the Early Modern period: Sibiu was a hub of trade and craft of southern Transylvania, while Baia Mare a center of gold- and silver-mining and -processing in the northern part of the province. The earliest graves dates back at the beginning of the settlements: the 12th century at Sibiu and the 14th century at Baia Mare, while in both cases the cemeteries were in use until the 18th century (with sporadic continuation in the later decades). These aspects, more precisely the social and economic statuses of the towns, the number of the researched graves and their chronology make the two sites exquisite for individual and comparative analysis. In this sense, a brief survey will be presented on the types of the discovered grave-goods, focusing especially on the most numerous categories of dress accessories. In the same time, the changes during the functioning of the cemeteries will be highlighted, where the contexts of the discoveries permit. Furthermore, a comparative view of the finds, and their analogies might give an insight into the regional specificities of these finds.

8

## WERE THERE BORN A "NEW" TRADITION? EARLY MODERN SEGMENTED BELTS FROM CENTRAL EUROPE

**Abstract author(s):** Sawicki, Jakub (Institute of Archaeology, Czech Academy of Sciences in Prague)

**Abstract format:** Oral

In the 16th century, a new type of a female dress accessory can be observed in Central Europe. These items are often called in the literature of the subject the Bridal's girdle (German: „Brautgürtel“) and seem to be specific for the region. They are known from iconography, museum collections, as well as from texts from the era, i.e. probate inventories and criminal court records. Most of the specimens known from these sources are valuable items made of precious metal alloys.

The situation is slightly different with the archaeological finds, where the majority of specimens are made of copper alloys. In the older literature of the subject, segmented belts were often confused with the clasps and fittings of books, and even now, there are only few archaeological studies dedicated to those objects. The majority of finds consist only of single parts of the whole segmented belts, which had a complex construction. However, this picture

is complemented by funerary finds that allow the reconstruction of entire belts and also allow to ask more questions regarding the social context.

The purpose of this presentation is to discuss these characteristic belts, classify them, and try to understand this specific phenomenon.

## 9 LOCAL COOKS MEET FOREIGN GOODS: IMPORTED POTTERY AND LOCAL SOAPSTONE AT A PROTO-URBAN SITE ON THE EUROPEAN PERIPHERY

**Abstract author(s):** Blobel, Mathias (University Museum Bergen)

**Abstract format:** Oral

It is a truism in Norwegian medieval archaeology that there was no local pottery production in the country during the Middle Ages. Nevertheless, a large amount of ceramic vessels from the time period have been found, overwhelmingly in urban and proto-urban sites. These imports, mostly from central and western Europe, are a phenomenon unique to the Middle Ages (and later periods). The sudden contact with foreign tableware and kitchenware must have had an impact on local foodways. This paper looks at how this change is reflected in the finds spectrum from the medieval settlement of Borgund in Western Norway. In this proto-urban site, traditional local soapstone vessels (as well as bakestones and wooden vessels) were used side by side with imported pottery. The site covers the period from the first appearance of imported pottery to the disappearance of soapstone as a cooking medium by the end of the Middle Ages and thus makes it possible to chart this crucial period in Western Norwegian foodways.

## 10 FASHION ON THE TABLE – TABLEWARE OF WESTERN ORIGIN AND THEIR INFLUENCE IN LATE MEDIEVAL TRANSDANUBIA (HUNGARY)

**Abstract author(s):** Kovács, Bianka (Institute of Archaeology, Research Center for the Humanities)

**Abstract format:** Oral

Tableware is an interesting group within the medieval archaeological finds, as it had not only functional but also representative role. So the share of import products in this group is relatively high. Western goods were already present in the early centuries of the Hungarian Kingdom, but from the 13th century onwards they played a more important role. The latter is also the date from which we can clearly distinguish between kitchen utensils used for cooking or storage and tableware used for serving in Hungary. Foreign goods have always played an important role at the tables of the upper classes (metal, glass and ceramics alike). The more distant western products (e.g. Siegburg and Dreihäusen cups) are found only by the highest layer, while the closer ones (e.g. Loštice cups) are also widespread among the broader nobility. However, in many cases local potters also made ceramic imitations (e.g. about metal cups), which were the possibility of imitation and an affordable luxury for the lower classes. These social differences are a good indication of the direction and intensity of trade relations in the past, but also of the spread of a common material culture. The presentation will focus on foreign ceramic ware of the 14th-15th century and their influence on the local production in the western half of Hungary, but will also cover other types of tableware.

---

## 12 SEEING THE 'ART' IN ARTIFACTS: THE INTER-CONNECTIONS OF ARCHAEOLOGY AND THE ARTS

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Jameson, John H (ICOMOS ICIP; ICOMOS ICAHM) - Tint, Küllike (Tallinn City Museum)

**Format:** Regular session

The practice of archaeology, as well as archaeologically derived information and objects, can inspire a wide variety of artistic expressions ranging from straightforward computer-generated reconstructions and digital interventions to traditional artists' conceptions and other art forms such as public sculpture, poetry, music, opera, theatrical performances, exhibits, and storytelling. Although some level of conjecture will always be present in these works, they may be no less conjectural than technical interpretations and have the benefit of providing visual and conceptual metaphors that can communicate context, setting, and resource significance in compelling, novel, diverse, and unique ways. Conversely, experience with and exposure to art can inspire researchers to use and produce artistic and innovative expressions. These cognitive connections between archaeology and the arts reflect an inferential approach in defining, explaining, and introducing an object or resource and making it more meaningful to the public.

Our session examines a variety of examples of this approach as it applies to more meaningful and effective processes of interpretation that emphasize public awareness, access, and inspiration. We invite illustrations that show the relationships between archaeological phenomena and artistic representation, i.e., how archaeology has inspired artistic expression, and, conversely, how artistic expression has affected the ways archaeology is carried out and perceived by the public. Our hope is that the session will serve as a cornerstone for developing a substantive elaboration and publication sequel to an innovative book with a similar theme, entitled *Ancient Muses: Archaeology and the Arts* (University of Alabama Press, 2003).

**1 BEYOND ANCIENT MUSES: CAPTURING THE INTERPLAY BETWEEN ARCHAEOLOGY AND THE ARTS**

**Abstract author(s): Jameson, John H (ICOMOS)**

**Abstract format: Oral**

The practice of archaeology, as well as archaeologically derived information and objects, can inspire a wide variety of artistic expressions ranging from straightforward computer-generated reconstructions and traditional artists' conceptions to other art forms such as 2- and 3-dimensional art, public sculpture, poetry, music, opera, theatrical performance, and storytelling. Although some level of conjecture will always be present in these works, they may be no less conjectural than technical interpretations and have the benefit of providing visual and conceptual metaphors that can communicate context, setting, and resource significance in compelling, novel, diverse, and unique ways. These cognitive connections between archaeology and the arts reflect an inferential approach in defining, explaining, and introducing an object or resource and making it more meaningful to the public. In this paper, I present the results of the Ancient Muses project and book that presented case studies of "interpretive narrative archaeology," the practice of using creative methods to interpret and present current knowledge of the past. In examining examples of connections between archaeology and the arts, our plan is use the outcome of this session to publish a sequel that addresses the modern interplay between archaeology and the arts and how this is changing public perceptions about the meanings and values associated with material culture in relation to cultural and historic contexts, communities, and belief systems.

**2 NEW TECHNOLOGIES ANT THE INTER-CONNECTIONS BETWEEN MAYA ARCHAEOLOGY AND THE ARTS**

**Abstract author(s): Munoz Cosme, Gaspar (Universitat Politècnica de València) - Vidal Lorenzo, Cristina - Aliperta, Andrea (Universitat de València)**

**Abstract format: Oral**

Research into the main pre-Hispanic cities of the Maya area has benefited greatly from the existence of abundant illustrations made by explorers from the 18th century onwards. These intrepid travellers, who in many cases were also artists, embarked on the adventure of discovering and documenting these spectacular cities, most of them embedded deep in the tropical forest. Their drawings, engravings, watercolours and (in later stages) photographs are today fundamental tools of archaeology and, at the same time, authentic expressions of the visual culture of the eighteenth, nineteenth and twentieth centuries.

The diffusion of these images and travel diaries in North America and European countries were an incentive for other travellers of different nationalities to undertake expeditions to the heart of the Maya area. Their initial endeavours were followed by the organization of scientific research projects sponsored by various national and foreign institutions. The images became very valuable testimonies for the conservation and restoration of buildings and sculptural monuments, as well as for iconographic research. The introduction of new digital technologies in the 21st century and their application in archaeology has helped to produce some interesting reconstructions and 3D models of these buildings, monuments, and objects of material culture. In turn, these models have served to create another series of highly valued applications today, such as proposals for videomapping od archaeological ruins or other immersive digital experiences, a reflection of contemporary visual culture.

In this paper we present illustrations of the Palace of the Governor at Uxmal, which show the relationships between archaeological phenomena and artistic representations from the 19th century to the present day. These images are the result of our current research at this archaeological site in the Yucatan Peninsula (Mexico), inside the framework of the MAYATECH project.

**3 THE EYE OF THE BEHOLDER: ART APPRAISAL AS AN OBSTACLE TO ARCHAEOLOGICAL CONTEXT, THE CASE OF EARLY CYCLADIC ANTHROPOMORPHIC SCULPTURE**

**Abstract author(s): Hadji, Athena (DIKEMES - College Year in Athens; American University of Rome)**

**Abstract format: Oral**

About 5,000 years ago a small-scale culture flourished in the central Aegean archipelagos, producing, among other fabulous artifacts, a wide array of mostly marble sculptures echoing the human form. Until the advent of modernism in early 20th c. art and with the prevalent paradigm of classicism, the abstract renditions of the so-called Early Cycladic sculpture were considered brutal, naïve, ugly, 'abhorrent' (sic).

The rapid shift in their appreciation by the likes of Pablo Picasso, Henry Moore and Barbara Hepworth, among other proponents of modernism, resulted in an unprecedented popularity for the type, also a priority of a falsified aesthetic study thereof, at the expense of the archaeological context. With looting and forgery gaining ground in the 1960s,

thousands of the so-called figurines circulated widely in collections, museums and auction houses and lack of provenance rendered a systematic archaeological study almost impossible.

Art in this case worked as a distorting mirror, leading even established scholars to negate the obvious presence of painted-on details on the sculptures. The present contribution will discuss the relationship between art and archaeology as a contested category from a twofold perspective: the priority given to art in the archaeological record and its study as well as the effect of art-derived approaches and fallacies to the practice of archaeology.

#### **4 VISUALISING THE DEVELOPMENT OF A DISCIPLINE: THE ATLAS OF ARCHAEOLOGY – CHARTING THE HISTORICAL TRANSFORMATIONS OF A DISCIPLINE**

**Abstract author(s): Sinclair, Anthony (University of Liverpool)**

**Abstract format: Oral**

Archaeology has shared a long, fruitful relationship with geography in the creation of visual ways to understand our information. The map, and the historical atlas have become well-established and easily understood visual media in both disciplines for expressing an understanding of transformations in human behaviour across space and time. In contrast, traditional histories of disciplinary change (including archaeology and geography) take inspiration from history. They employ the form of textual narrative written following through the close reading of documents by a specialist. The historical process of transformation becomes a thread, narrating the story of interaction of people or themes or objects across time. Where visual media are present they are usually photographs of protagonists in the narrative be it person, place or object.

This paper explores the application of science mapping of bibliometric data – the indexed metadata of documents – for the construction of an historical atlas of the development of the discipline of archaeology since 1960. A series of interactive science maps will be presented to explore the relationships between themes, people, places (of study and publication) across time in an interactive manner, perhaps allowing us to escape the confines of the traditional literary narrative.

#### **5 INTERDISCIPLINARY RESEARCH ON THE BODY DECORATION OF A MUMMY FROM PACACHAMAC (PERU)**

**Abstract author(s): Bak, Judyta (Jagiellonian Univeristy) - Gerst, Robin (Goethe-Universität Frankfurt)**

**Abstract format: Oral**

The depots of the "Ethnologisches Museum" Berlin, Germany hold several human remains with a pre-columbian context from the Andean region. The collection includes mummified body parts and full-body mummies. Several of the mummies are still wrapped within the bundle (fardo) while others were left unwrapped earlier.

One of the unwrapped mummies presents an eye-catching set of unic, permanent skin marks (tattoos) with a very good state of preservation. The presumed place of discovery is the archaeological site Pachacamac near Lima (Peru), beyond that there is no cultural or chronological connection known. To date, only few studies have been conducted on this body, not have the findings been published, besides some examinations with conventional X-ray equipment in 1993. Apart from that, the skin signs of this body have not been recorded and described until now.

The proposed presentation aims of this new research is to collect and compile the existing results, to complement the approach with new scientific and archeological methods, in order to finally try to contextualize the more or less provenance-less body. The first results of an interdisciplinary research team dedicated to the questions around this mummy with different points of view, mainly anthropological and archaeological perspective, including archaeometric surveys and digitization, scientific investigations, anthropological data and iconographic comparisons.

#### **6 JUXTAPOSED: COLLABORATIONS WITH ART AND ARCHAEOLOGY**

**Abstract author(s): Nimura, Courtney - Creswell, Miranda (University of Oxford)**

**Abstract format: Oral**

The use of artworks in archaeology could be viewed on a spectrum, with historical visual reconstructions on one side, visual metaphors on the other, and a myriad of ways of illustrating archaeological research in between. However, what happens when an artwork and a piece of archaeological research are juxtaposed without an obvious representative connection between them? Does this allow the viewer and reader to think and interpret more freely and lead to more multi-vocal ideas than those generated by direct illustrations? Is it possible to present these disparate works on an equal footing?

The juxtaposition of art and archaeology can show two distinct and separate ways of investigating one topic. This may help inspire ideas and interpretations that are difficult to define in words or visual terms and fall between two ways of investigating, such as poems that relay a mood or an unexpected moment for the reader to consider. In this paper, University of Oxford School of Archaeology's Artist-in-Residence Miranda Creswell and archaeologist Courtney Nimura will present recent work undertaken by Miranda and members of the School, from a recently published

Atlas to a public engagement project. Through these case studies, they will consider the questions posed above and offer insights into this type of collaborative working.

## **7 EDUCATION FOR ARCHEOLOGY AND THE ARTS IN THE ROMAN RUINS OF MILREU, ALGARVE, PORTUGAL**

**Abstract author(s): Tété Garcia, Cristina (DRCA; CEAACP/UALG)**

**Abstract format: Oral**

This communication intends to present the results of a cultural promotion program, which was developed between 2015 and 2020, at the National Monument of the Roman Ruins of Milreu.

This programme was developed by the Algarve Regional Directorate of Culture, aimed to bring the population closer to its Archaeological Heritage, disseminate scientific knowledge in its various aspects of archaeology, geology, astronomy and landscape and promote artistic creation in a space of exceptional beauty.

Thus, it was possible to carry out activities to explore themes related to the History of the Monument, involving schools and the general public, taking advantage of the local synergies of artists, local associations and the university, promoting the exercise of different perspectives and artistic practices on the Archaeological Heritage.

Some practical cases related to creative workshops are presented through the exploration of themes such as Roman mosaics, symbols and money in Roman times, the use and application of medicinal and aromatic herbs, the traditional techniques of application of lime in the covering of tiles, pottery, the preparation of incense, among other activities.

Finally, the exploration and interaction with the archaeological site and its landscape through the promotion of artistic expression in its various aspects, such as "land-art", school theater, popular music, proverbs, shadow games, plastic expression, video production and traditional storytelling.

In conclusion, this non-formal education and artistic expression project developed affective bonds between the archaeological site and its community, teaching its meaning and value for the future generations.

## **8 PUBLIC ARCHAEOLOGY AND DANCE - A CASE OF TALLINN CITY MUSEUM**

**Abstract author(s): Tint, Küllike (Tallinn City Museum) - Tuominen, Suvi (University of Arts Helsinki)**

**Abstract format: Oral**

The paper presents an event that took place in Tallinn City Museum in September 2019. "One object, many stories" was an interplay between public archaeology and dance, where performers conveyed various meanings and interpretations of archaeological objects and excavations. The preliminary purpose of the project was to materialise the liminal space between the preservation of museum artefacts and the engagement of the public. The museum turned into an immersive performance space that allowed the public to connect with the objects through different sensory experiences. The bodies of the dancers used archaeological finds dynamically in the performance and so evoked the imaginations of the museum visitors. The presentation also brings forth different types of data that was collected from the performances and from the museum visitors. Throughout the performance weekend the museum visitors were encouraged to express their reactions, interpretations and feelings onto answering sheets. These answers will then be taken into account in the future public archaeology projects.

## **9 EXCAVATION PRAXIS IN AN ART/ARCHAEOLOGY TOPOS**

**Abstract author(s): Ifantidis, Fotis (University of the Aegean, Department of Cultural Technology & Communication)**

**Abstract format: Oral**

The focus of the paper is the archaeological photo-ethnographic research carried out on the excavation of a Neolithic site, that of Koutroulou Magoula in Central Greece. The static and moving imagery produced during the excavation praxis is a theme, which -though extremely familiar, and embodied, to the archaeological agents- has only very recently entered the field of an academic discussion regarding its expressive and hermeneutic potential qualities in the context of the creation of an art/archaeology topos -either as the key component of an art installation, an alternative academic documentation or a non-artefactual museological proposition aiming to the public.

To illustrate the various issues that emerge in imagining and re-imagining these art/archaeology topoi, examples are drawn from previous visual experimentations concerning both the excavation practice and the archaeological processes in general, and from the Koutroulou Magoula work-in-progress, which is related to the creation of a phygital, hybrid, art/archaeology museological installation.

## 10 **ARCHAEOPOETICS: A CONTEMPORARY ART INSTALLATION PRESENTED IN AN ARCHEOLOGY MUSEUM**

**Abstract author(s): Saillant, Francine (Université Laval) - Courier, Camille (UQAM)**

**Abstract format: Oral**

The presentation offers a virtual staging and discussion of the exhibition Archéopoétique and its sequels, which began in August 2021 at the archeological museum Îlot des Palais (Quebec, Canada) and will continue in 2022. The exhibition suggests a staging of 'false figurines' inspired, among other things, by Greek figurines founded at the Lipari Museum of Archeology (Italy) as well as at the Museum of Anthropology in Mexico City. The exhibition is a free, playful and poetic assemblage of scientific elements (earth blades, measuring tools), pieces founded in the archaeological site of the Îlot des Palais and figurines created by the anthropologist artist from a very large body. Anthropology Francine Saillant has joined the artist Camille Courier whose large format drawings create a dialogue with the figurines of F.Saillant and the spirit of the place, in particular the presence of Egyptian figurines dating from 600BC. within the Îlot. A sound creation by Alexandrine Boudreault-Fournier completes the installation. The discussion will focus on the notion of beauty, and authenticity in art and archeology. ans in the context of the dialog between contemporary art and archeology.

## 11 **ANCIENT AESTHETICS, PERCEPTION, AND CREATION OF BEAUTY. PALEOLITHIC AND MODERN ARTISTS' MINDS CONVERGE IN THE PROJECT "MATTER, GESTURE, SOUL"**

**Abstract author(s): Lindstrom, Torill Christine (University of Bergen; SapienCE, Univ. of Bergen)**

**Abstract format: Oral**

Ancient artefacts often strike us as being astonishingly beautiful. To have a distinct sense for beauty, seems to be a typical and exclusive human ability, connected to higher cognitive functions in the brain. As the brain evolved, so did the aesthetic and artistic creativity. In one investigation we study whether the aesthetic qualities of artefacts developed over time in the Paleolithic, using standardized criteria of aesthetics. In another investigation we study whether the brain activity is different during the production of stone tools of varying complexity (Oldowan, Acheulian, Levallois, Still Bay). In the "Matter, Gesture, and Soul"-project, a collaboration between SapienCE Centre for Early Human Cognition and Department of Contemporary Art, archaeologists and artists collaborate in exploring the artistic qualities and semiotic properties of ancient artefacts and symbolism. We expand their elements in novel works of art, and we express them, both artefacts and the art they inspire, in a museum exhibition, open to the public: "Dig it up, and put it in a bag" at The University Museum in Bergen, Norway. The exhibition is connected to a book "The Palimpsest", published by The University of Bergen. It is written by a team of artists, archaeologists, and a psychologist, exploring the materials, meanings, emotions, moments of imagination, perceptions, and experiences of creativity in both the ancient and the modern mind. Mutually inspiring for both archaeologists and artists!

## 12 **POSSIBILITIES OF INTERPRETATION OF THE NON-ATTRIBUTED ARTIFACTS**

**Abstract author(s): Chikunova, Irina (-)**

**Abstract format: Oral**

During the excavations of the Sargatka culture dwelling of the early Iron Age a small clay object was found. It is a hollow cylinder with a diameter of 4.5 cm and a length of 6 cm. The ends are deaf. In the middle of the forming face there was a round hole with a diameter of 1 cm . This item could not be attributed. And only a happy accident was able to lift the veil of secrecy in the process of cleaning this object from sand and dust. When blowing sand out of the inner space, a melodious sound was extracted. It turned out that when air is blown into the hole at a certain angle, the sound inherent in all ceramic whistles is obtained. Thus, we can say that this is one of the first known musical instruments of the Sargatka culture of the Early Iron Age in the territory of Western Siberia.

## 13 **KHANQAH ARCHAEOLOGY**

**Abstract author(s): Khalilli, Fariz (Azerbaijan State Culture and Art University)**

**Abstract format: Oral**

Various archaeological researches were carried out in Azerbaijan in the field of Khanqah Archaeology over the last 10 years. Agsu Archaeological Expedition conducted excavations at Shikhmazid Khanqah situated in Agsu City and found a mosque and a tomb, as well as Muslim graves with jar cover around the tomb in 2012-2014. MIRAS Social Organization in Support of Studying of Cultural Heritage and International YOCOCU Association carried out conservation and consolidation work in Sheikh Dursun Tomb, which belongs to Sheikh Dursun Khanqah, and read the Arabic inscriptions over the tombstones in 2018. The remains of another building belonging to the Khanqah were also revealed while cleaning the area around the tomb. Agsu Archaeological Expedition conducted archaeological excavations in Pir Muhammed Khanqah in Basgal settlement of Ismayilli region in 2019-2021, studied epigraphic samples of the mosque, ancient plane tree and grave monuments. A project was prepared to turn this Khanqah into an

archaeopark and the work is being done in that direction. Agsu Archaeological Expedition conducted archaeological research in Pir Omar Khanqah located in Avakhil Village of Shamakhi region in 2020. The expedition discovered the tomb of Pir Omar Khalwatiyya, the founder of Khalwatiyya Sufi Order, the inscription of his tomb, his grave, the graves of his successors and other epigraphic samples. Khanqah Archaeology will allow to determine the methods of studying khanqahs - training centers that play an important role in social, cultural, economic and political life of Turkic-Muslim cities on the historical Silk Road.

## 14 **ARCHAEOLOGY AND THE ARTS: THE ANCIENT OLYMPIC GAMES AS A SOURCE OF ARTISTIC INSPIRATION**

**Abstract author(s): Pateraki, Kleanthi (Freelance)**

**Abstract format: Oral**

The aim of the oral presentation is to highlight how the ancient Olympic Sports and Music (performing arts) Games, held in the Panhellenic Sanctuary of Zeus at Olympia from 776 BC. until 393 AD, were a prolific source of artistic inspiration.

Firstly, the main premises (the Stadium, the Gymnasium, the Palaestra) will be referred. Secondly, the relevant ancient sources (i.e. the list of the Olympic winners, the account of the 2nd c. AD traveller Pausanias) will be mentioned. Moreover, findings related to the competing events (aryballoi, dumbbells, strigils) and the athletes' victories (athletes' statuettes, inscriptions with rules and lists of athletes, etc.) will be presented.

Then, attention will be focused on the numerous works of ancient Greek literature (e.g. Pindar's victory odes, epigrams, etc.) and the arts (sculpture, painting, vase painting, numismatics, etc.), that were inspired from the specific Games. Other artistic expressions of later periods with main theme being the Olympic Games will be examined. Art competitions, which formed part of the modern Olympic Games from 1912 to 1948, will especially be mentioned; also, "The Noren Curtains", the exhibition presented at the Olympic Agora of Tokyo 2020 with the works by five Olympian and one Paralympian artists will be discussed.

## 15 **IMAGINE TO KNOW MORE – ART AS CREATIVE WAY TO REAWAKEN EGYPTOLOGICAL AND ARCHAEOLOGICAL COLLECTIONS**

**Abstract author(s): Zinn, Katharina (University of Wales Trinity Saint David)**

**Abstract format: Oral**

This paper focuses on case studies involving two fine-arts painters, a poet and a ballet choreographer/dancer, which are part of a unique annually recurring activity called The Museum of Lies within a wider project – led by the first author – of literal and cultural (re-)discovery of neglected ancient Egyptian artifacts completely devoid of their archaeological provenance and kept in Cyfarthfa Castle Museum, Merthyr Tydfil, Wales.

Inspired by the archaeological artifacts, artists, poets, craftsmen and pupils studying either art as A-level subject or getting acquainted with the skill of writing short-stories, are creating alternative narratives since 2017. These creative outcomes are exhibited together with the objects and their academic descriptions in annual pop-up exhibitions outside the museum. The artwork and stories function as simultaneous types of cultural representations. The emotional power and imagination connected with artistic representations allows to invoke and capture an inherent potential which otherwise cannot be detected. All narratives taken together allow to write a full object biography via different media (academic outputs, exhibitions, story-telling, and the Museum of Lies) for different audiences, thus capturing the temporality of social agency and changing identities these artifacts have or are able to stimulate. As such, they not only help to "unpack the collection" and to trace the "networks of material and social agency" (Byrne et al. 2011), but also connect different audiences with different interests and bring the objects back to life.

This paper and videos of Julie Davis and Prof Catrin Webster (painters), Samantha Wynne-Rhydderch (poet) and Friederike Zinn (choreographer/dancer) describe the commission of the artwork forming the case studies, their creative process and the ways in which art can enhance the Egyptological and archaeological exploration by overcoming the still accepted divide between traditional forms of research and audience related activities.

## 16 **ARCHAEOLOGY ON THE STREET**

**Abstract author(s): Ernyey, Katalin (Government Office of the Capital City Budapest, Heritage Department)**

**Abstract format: Oral**

In my paper, I would like to present a collection of Hungarian public works of art dedicated to archaeology, famous archaeologists or inspired by archaeology (chronologically until the Hungarian Conquest Period).

The basis of the collection is a community-based on-line database of public works of art, which I added with material collected through correspondence by the help of colleagues. The works of fine arts can be divided into figurative and non-figurative works, mainly sculptures and reliefs. In some cases, I also took into account the plaques only with

text, but I did not deal with the building ornaments. A separate group, but included, the non-in situ archeological finds (e.g. Roman tombstone) on a public square.

At the national level - at first glance - there are a significant number of works of art of the founders of Hungarian archaeology, the founders of the first museums. There are also works of art portraying archaeologists who have lived recently, but in much smaller numbers. However, there are only a few examples of sculptures representing archeology itself as a profession.

From the point of view of chronology most of the sculptures are connected to the Roman Period and the Period of the Hungarian Conquest. With the help of some examples, I will show how the artists have been influenced by the results of excavations, reconstructions and the historical tradition, how faithful the finished work is from an archaeological point of view. I would like to present the history, use and impact of the sculptures on the community through some examples.

At the end I will try to interpret the archeological public works from the point of view of the representation of archeology, also from the point of view of possible professional tasks.

## 17 **THORVALDSEN'S MUSES: THE REBIRTH OF THE ANCIENT FRESCO FROM VILLA ARIANNA IN STABIAE IN BERTEL THORVALDSEN'S WORK**

**Abstract author(s):** Petreková, Eliška (Masaryk University)

**Abstract format:** Oral

In the middle of the 18th century, the most famous archaeological sensation was gradually revealed near Naples in the form of the perfectly preserved ancient cities of Pompeii, Herculaneum, and Stabiae. Naples soon became a sought-after destination for travellers, scholars, collectors, and artists, and all of Europe eagerly awaited any news from the sites. Although it was the privilege of King Charles VII to publish discovered treasures, unauthorized picture albums and sets of prints soon appeared, mainly focusing on the mural painting.

One of the most famous motifs is the so-called Venditrice di amorini discovered in the Villa Arianna in Stabiae, which experienced a real rebirth in the 18th century. A year after its official publishing by the Royal Academy, the French painter Joseph-Marie Vien chose it as inspiration for his painting and presented his own (somewhat racy) paraphrase of this motif at the Paris Salon, which caught the attention of the influential art critic Denis Diderot. After this successful introduction to the art scene, the ancient fresco was reworked and reinterpreted by some of the most famous artists of the era.

The fresco also captivated the Danish sculptor Bertel Thorvaldsen, who created a marble relief based on the Stabian motif. He added several figures and adapted the story he told his visitors in his sculpture studio. The popularity of his marble soon went beyond that of an admired art object. It became a model for interior design and decorative arts. Thorvaldsen's legacy can be found on many aristocratic mansions throughout Europe, and thanks to him the decorative motif has once again revived and regained its original function, which was to represent the prestige and sophisticated taste of its owner.

## 18 **ART AND ARCHAEOLOGY AT THE TRAIN STATION**

**Abstract author(s):** Host-Madsen, Lene (Museum Skanderborg) - Dissing, Nina (Skanderborg Municipality)

**Abstract format:** Oral

Art Laboratory - Perron1 is a project created in a collaboration between the Museum and the local Art Council in Skanderborg. The project is part of the dissemination strategy that Museum Skanderborg is working on in the process of making a new museum.

The project works with concepts for the interpretation of archeology through contemporary art; both in temporary exhibitions and in building-integrated art in the building as a whole. One of the initiatives is to involve contemporary art as an active and outgoing citizen-involving participant.

In the exhibition Art Laboratory, special work is done with concepts for the dissemination of contemporary art, and artists are invited inside to explore, try out and challenge some of the museum's spaces,. Furthermore, to work with, and test concepts such as "Art to go" and "Bring Art". Visitors will be able to experience works of art in the stairwells, which connect the museum building's three floors together and in the exhibition space. They can experience "Art to-go" and also be a part of an art-piece themselves.

The art speaks a new language in communicating archaeology to the audience, and helps to explore opportunities. The knowledge gained by these experiments will contribute to the design of the future museum.

We find that the cooperation between art and archaeology possess great potential and would love to share our experiences in this session.

## 19 STAFFS WITH ELK HEADS – BETWEEN ARCHAEOLOGY AND ART

**Abstract author(s):** Iršenas, Marius - Butrimas, Adomas (Vilnius Academy of Arts)

**Abstract format:** Oral

One of the most striking archaeological stone age finds discovered in the settlements and burial sites of the Baltic region and European Russia and which is depicted in petroglyphs is a curved antler staff with an elk's (Alces alces) head. These staffs are described in detail and discussed in the archaeological literature. An overview of archaeological literature reveals evaluations which transcend the boundaries of archaeology and which can be understood in the context of a range of other disciplines. This paper is aimed at exploring the evaluation of staffs with elk heads as objects of art. It involves not only aesthetic evaluation but also hypotheses as to the function that these staffs served. The latter move closer to art criticism or even the theory and practice of artistic research which has emerged recently.

It turns out that archaeologists are more artists than they think because they use artistic research strategies. Meanwhile, art is just beginning to discover the phenomenon of elk-staffs.

## 20 SIGNS AND MONUMENTS

**Abstract author(s):** Gheorghiu, Dragos (National University of Arts - Bucharest; ITM Macao)

**Abstract format:** Oral

Although they are considered to be valuable elements of the cultural heritage, prehistoric and ancient monuments have lost their magic importance and visibility and coexist modestly alongside the structures of the modern world.

In order to be revealed and integrated into the contemporary world, they should be translated into the current visual language, respectively to be associated with an aesthetic vision with which we are accustomed, created by contemporary art and the new technologies. The image of each monument can be transformed into a sign or in a series of signs, inspired by the shape or the iconography of the monument. The sign(s) can be of large dimensions, they can be transposed over the place of the current monument, and can be made with the help of installations, land-art, or POIs on digital maps.

In this fashion, in the real and the digital worlds, the places of the monuments can be marked by signs and reveal their initial monumental dimension.

The paper presents several experiments of revealing prehistoric monuments in Wales and Portugal using different artistic and IT techniques.

## 21 ART, FOLK ART AND CRAFT: ARCHAEOLOGICAL PERSPECTIVES ON HISTORIC AND CONTEMPORARY MEMORIAL PRODUCTION

**Abstract author(s):** Mytum, Harold (University of Liverpool)

**Abstract format:** Oral

Archaeologists have shown interest in historic gravestones for over 50 years, but they have generally taken a distinctly different approach to them than art historians. This paper examines these divergent traditions and then considers the avoidance of archaeologists confronting how memorials fit within the debate regarding art, folk art and craft. Examples of memorial design inspired by archaeological discoveries - including reworking more ancient funerary art and memorial styles - will be contrasted with contemporary masons and artists demonstrating the range of practice in the present. Themes include Classical revival motifs widely used in 18th and 19th century mortuary motifs, as well as Egyptian motifs. Antiquarian investigations of early medieval sculpture and medieval monastic sites, together with discoveries during church restorations, led to a wide range of low monuments and crosses in a variety of medieval revival styles being designed for 19th century monuments. Today's products can be understood in the context of past stylistic change, sometimes reviving techniques of carving and letter cutting and choice of motifs.

## A. FROM ASSYROPHOBIA TO ASSYROMANIA: THE ENTANGLEMENTS OF ART AND ARCHAEOLOGY IN THE DRAWINGS OF ENRIC MONSERDÀ (1850-1926)

**Abstract author(s):** Garcia-Ventura, Agnes - Vidal, Jordi (Universitat Autònoma de Barcelona)

**Abstract format:** Poster

The archaeological campaigns led in northern Iraq by Paul-Émile Botta (1802-1870) or Austen Henry Layard (1817-1894) since the 1840s put before the eyes of the Europe of the moment a new artistic universe. Their diggings in settlements such as Nineveh and Khorsabad unearthed figurative reliefs portraying rich motifs and elements. The reception of this art was controversial, and even its consideration as art was matter of debate. This led to what we might call Assyrophobia and Assyromania, two trends well attested in Europe at the end of the 19th century and at the beginning of the 20th century.

In this poster we focus on one case study which exemplifies this complex reception of the Assyrian art at that moment. We concentrate on a sample of drawings of elements of Assyrian art, so far unpublished, by the Catalan painter Enric Monserdà (1850-1926). These drawings were made by Monserdà when preparing a lesson on Assyrian art in the framework of a course titled "History of the Decorative Arts". In this lesson, Monserdà claimed that the ancient Assyrians were able to produce masterpieces. This was, therefore, a good example of Assyromania. Interestingly enough, in a former lesson on the same topic, which was included in a previous general course titled "History of Art", Monserdà emphasized the opposite: the low quality of ancient Assyrian art. In this case, then, he was an advocate of Assyrophobia.

All in all, through this case study developed from Monserdà's drawings, we aim to discuss the two-way nature of the art and archaeology entanglements this session proposes to explore. We will show how archaeology inspired Monserdà's drawings and, at the same time, how his drawings and lessons clearly conditioned the way the Assyrian reliefs were perceived by his audience.

---

## 16 THE DAWN, APOGEE AND MODERN DEMISE OF KURGANS IN SOUTHEAST AND EAST-CENTRAL EUROPE

**Theme: 5. Climate Change and Socioenvironmental Perspectives**

**Organisers:** Peto, Ákos (Hungarian University of Agricultural and Life Sciences) - Heyd, Volker (University of Helsinki, Department of Cultures, Archaeology) - Dani, János (Déri Museum, Debrecen) - Kulcsár, Gabriella (Eötvös Loránd Research Network, Research Centre for the Humanities, Institute of Archaeology)

**Format:** Regular session

They once virtually dotted the steppe flatlands of southeast and east-central Europe: Burial mounds, often called kurgans deriving from their ancient Turkic synonym. For the westwards migration of Yamnaya populations some 5000 years ago, they are the only visible monuments. However what do we know about their erection? What comprises the activities of their construction? What does a mound tell us about the kurgan-builder community?

Equally important is the landscape archaeology of kurgans. We find them alone, in groups, in clusters, sometimes covering whole regions with distinct boundaries. Beyond, not a single mound is erected despite seemingly same landscapes and environmental conditions. What are the dynamics of this distribution? And what the intentions of their constructors? Burial mounds are equally significant elements of and research material for multiproxy scientific approaches. Buried soil profiles underneath the mound, and in its soil body, hold the 'memory' of the once existed landscape and its climatic conditions, being point-wise 'time capsules' on the map.

Finally, it is the ongoing destruction of kurgans that can only be called a heritage tragedy. Measures were already taken in some countries to protect these monuments, but are minimal in others. When comparing with early topographical maps the overall losses mostly due to industrial-scale agriculture and drastic landscape transformations become apparent. But reliable datasets for the degree of this destruction are patchy: What is the percentage of surviving kurgans compared to original numbers; are there correlations with size; how much is still preserved even when the burial mound has vanished? And what are the possibilities/limitations of making complete kurgan cadastres?

The session thus aims at linking, in an interdisciplinary way, various scientific approaches with landscape archaeology and ecology, and heritage management to the better understanding of burial mounds, their micro- and macro environmental conditions, and their legacy.

## ABSTRACTS

### 1 BURIAL MOUNDS IN YAMBOL DISTRICT, BULGARIA

**Abstract author(s):** Valchev, Todor (Regional Historical Museum)

**Abstract format:** Oral

The Yambol district is situated in South-east Bulgaria, on the border with Turkey, and is comprised of four municipalities with total area 3 335.5 sq. km. This area includes some 2,300 archaeological sites.

Burial mounds are earthen structures ranging from 0.5 to 10.0 m in height and up to 60 m diameter. They were built from the Early Bronze Age to the beginning of Late Antique period in connection with mortuary practices. Burial mounds are cultural monuments of national significance.

The aim of the present report is to examine the current condition of burial mounds in Yambol district. More than 1,200 such cultural monuments are known in this region. From the beginning of the 20th century 60 burial mounds have been excavated and provided interesting information about mortuary practice and beliefs of ancient people. In the last decade 850 burial mounds have been visited by local and foreign specialist during several field survey projects. All the visited sites have been registered with GPS points, photographed and their current condition was

thoroughly described. Knowing the exact position of archaeological sites is very important for the protection of these cultural monuments, especially during different infrastructure projects.

The "Cultural Heritage Law" of Bulgaria states that burial mounds are carriers of "historical memory, national identity and have scientific or culture value". They must be preserved for the next generations and for the prosperity of the community.

## 2 PATTERNS OF THE YAMNAYA CULTURE BARROW DISTRIBUTION IN THE NORTH-WEST PONTIC AREA

**Abstract author(s):** Topal, Denis (National Museum of History of Moldova)

**Abstract format:** Oral

According to my calculations, almost 11 000 burial mounds are located on the territory of the Dniester-Prut interflaves, with about 6 300 barrows in Moldova and 4 400 in the Ukrainian part. Between the Dniester and Prut rivers at least 1323 barrows containing at least 6300 burials were excavated. At the same time, over a third of the barrows remain unpublished, and most of them belong to the territory of the Odessa Region. Most likely, the erecting of the barrows appears in the North-Western Black Sea region no later than the second quarter of the 4th millennium BC and continues until modern times, while the Nogais population is still preserved in the Budzhak steppe. It is easy to see that the barrow erecting covers two main chronological sequences. Most of the mounds were erected in the late Eneolithic – early Bronze Age and early Iron Age – Roman period. More than three quarters (77%) of all the excavated barrows were constructed once, 13% have a second construction level, and 6% the third, 3% — the fourth, 1% — the fifth, in one case seven levels were recorded. And that is the most important feature that distinguishes the beginning of the Kurgan Era in the Late Copper Age and Early Bronze Age from the Kurgan Renaissance in the Scythian and Sarmatian times. So, in addition to the erection of burial mounds, the Yamnaya and Pre-Yamnaya population rearranged both "their own" and previous mounds (that increase the diameter and height of the barrow). Of course, within the main periods of "barrow construction" the monuments are unevenly distributed. Thus, according to preliminary data, most of the Yamnaya graves (at least 50%) belong to the most ancient Dniester type, while monuments of the later Budzhak type are about 30%.

## 3 MIDDLE DNEIPER AREA IN THE SYSTEM OF PIT-GRAVE RELICS

**Abstract author(s):** Syvolap, Mykhaylo (Cherkasy City Archaeological Museum)

**Abstract format:** Oral

The Middle Dnieper group (Merpert, 1968) of Pit-Grave relics covers forest-steppe Middle Dnieper Area with the territory of some 70,000-90,000 sq km. The relics are predominantly represented here by thousands of barrows and dozens of basic settlements and seasonal sites with poor cultural layer. The quantity of barrows in this area decreases from east to west and from south to north. In more deforested areas of southeast, on average, 1 barrow accounts for 1,5-3,5 sq km and further to the west 1 for 20-30 sq km and even more. The dimensions of barrows are different: 0,5-1m, less often 2-3m, sometimes up to 4-5m. One can trace the non-simultaneous addition of soil to embankment in the majority of barrows. Additions of soil were of fully circular, annular or local character. The thrice-repeated foot-shaped additions of soil were discovered too (Kuzmina, 1983; Syvolap, Syvolap, 1990). Sometimes, ditches can be traced around the ancient embankment, some of them are interrupted (Syvolap, 1998). The number of burials in barrows is between 1-3, less often up to 5-6. The funeral pits are rectangular, less often oval or of irregular shape. They are covered with longitudinal and transverse wooden boards (less often with bark) and cane. The peg holes (always 8) are found at the bottom. The bottom of funeral pits is covered with bark and cane bedding, powdered with red ochre. Fragments of ritual ochre paintings at the bottom of graves (Syvolap, 2001) have been discovered too. Western orientation prevails among the primary burials. Among the inlet ones, it is frequently combined with orientation to the primary burial by three basic principles: consecutive, circular and radial. The inventoryless burials are prevalent. Pottery from Pit-Grave barrows of this area shows conformity with the ceramic complex of nearby settlements.

## 4 EARLY BRONZE AGE BURIAL MOUNDS IN SOUTHEAST TRANSYLVANIA

**Abstract author(s):** Szász, Hajnal (Budapest History Museum)

**Abstract format:** Oral

The Early Bronze Age burial mounds of Southeast Transylvania are less researched, compared to other neighboring regions of the Carpathian Basin, such as the Great Hungarian Plain or the Apuseni Mountains (Western Romania). This type of burial rite in the Late Copper Age – Early Bronze Age period is thought to originate from the north-Pontic steppes (Yamnaya); however, the presence of this group has not yet been proved in SE Transylvania. Regarding the funerary rites, more likely a form of influence can be observed here. With just a handful of cemeteries identified in the specialized literature, the small number of sites in SE Transylvania is explained by historical events and the geographical positioning of the mounds. These are found on higher grounds, on mountain ridges, which are rather difficult to access. Some of the known sites were already researched in the 19th century; however, significant new survey or

excavation has been done more than a hundred years after their first discovery. Even so, the research of these sites seems to evolve rather slowly.

The aim of this presentation is to shed some light on this region as well, as the presence of the EBA burial mounds can be attested, however, larger-scale conclusions should be considered carefully. The ongoing debate in the scientific community on some aspects of terminology and chronology of the archaeological cultures make interpretations difficult, as well as the mixed characteristics of the funerary rites, which point to a rather transitional state of the given region.

## 5 KURGANS IN THE DEBRECEN AREA (NE-HUNGARY)

**Abstract author(s): Dani, Janos (Déri Múzeum, Debrecen) - Tóth, Csaba (Debreceni Deák Ferenc Tehetségfejlesztő Középiskolai Szakkollégium) - Czírbik-Gulyás, Tímea (Déri Múzeum, Debrecen)**

**Abstract format:** Oral

The research of the earthen tumuli in the periphery of Debrecen goes back to more than 100 years tradition. Lajos Zoltai not only carried out the first kurgan excavations around Debrecen, but he also prepared and published the first cadastre of all types of mounds found on the territory of the city. The location of the known kurgan sites in the Debrecen area shows a peculiar arrangement, behind this phenomenon the existence of different topographical and environmental conditions can be identified. In the wider area of Debrecen (up to the Tisza), more than 260 mounds were known in Zoltai's time. Recently, however, Csaba Tóth pointed out that during the last 250 years, the number of kurgans within the current city boundaries has decreased by more than 66%.

Historical maps allow us to trace the dynamics of their destruction up to the present day. In addition, the biographies and current state of some of the tumuli in the downtown of Debrecen show their inadequate protection. Hopefully, this shocking ratio and the poor condition of the kurgans will give food for thought to local and heritage authorities, archaeologists and encourage them to develop and adopt new, more effective conservation plans and measures.

## 6 ENEOLITHIC SANCTUARIES AND BRONZE AGE KURGANS IN THE PONTIC STEPPE AS MARKERS OF CLIMATIC SHIFTS

**Abstract author(s): Nikitin, Alexey (Grand Valley State University) - Ivanova, Svetlana (Institute of Archaeology, National Academy of Sciences of Ukraine)**

**Abstract format:** Oral

Large-scale cultural transformations are often connected with major climatic shifts. The end of Atlantic Climatic Optimum was associated with a series of climatic oscillations, leaving a mark on the cultural landscape of Europe in the early Metal Ages. These climatic fluctuations in the circum-Pontic region resulted in the appearance of cultural and genetic packages that transformed Europe in the Early Bronze Age (EBA). A unifying feature of the most recognized EBA steppe group, the Yamna historical-cultural complex, is kurgan burial. We will discuss a hypothesis that the origins of kurgans in the Pontic steppe are connected with the spread of megalithic/ditch-enclosed ground-level sanctuaries in the late 5th - first half of the 4th millennium BCE, coinciding with major climatic changes in the circum-Pontic area. By the end of the 4th millennium, these ritual constructions became foundations for the Yamna kurgans, wherein the main kurgan burial would be placed within the ritual space of the earlier sanctuary. In the 3rd millennium, the Yamna kurgans were expanded by the Catacomb and Babino cultural communities, while preserving ties with the ritual center space of the kurgan. The latter cultural transformations can also be tied to climatic events.

## 7 CULTURAL IDENTITY OF BARROWS IN EAST SLOVAKIA – XXTH CENTURY INVESTIGATIONS AND PRESENT-DAY PROSPECTIONS

**Abstract author(s): Jarosz, Pawel (Institute of Archaeology and Ethnology Polish Academy of Sciences) - Horváthová, Eva (Archeologický ústav SAV) - Podsiadło, Michał - Przybyła, Marcin (Dolmen S.C.) - Szczepanek, Anita (Institute of Archaeology and Ethnology Polish Academy of Sciences; Collegium Medicum Jagiellonian University) - Włodarczak, Piotr (Institute of Archaeology and Ethnology Polish Academy of Sciences)**

**Abstract format:** Oral

The aim of the study is to demonstrate the potential of incorporating geophysical analysis towards identifying funerary customs. The conducted prospections verified the presence of a groups of barrows in the area located in East Slovakia mainly Ondava and Laborec Uplands as well as Eastern Slovakia Lowlands near mounds excavated in the XXth century by V. Budínský-Krička. All barrows are situated in the upper parts of hills, in exposed places and they often form chains. Comparison of currently visible mounds with earlier published maps shows that barrows located in woodlands are still present but these ones situated in agricultural terrains nearly completely disappeared and their existence can be noticed only by vegetation differences or the colour of the ground visible on Google Maps. The biggest of explored mounds, located in Lešne was over 3 meters high others were 1–2 m in height and 10–15 m in diameter. Under mounds, there was usually one, centrally situated burial pit or the dead were deposited directly on the surface of the ground or within a specially prepared place. The burials were poorly equipped but funeral rite is

typical for Corded Ware or Yamnaya cultures. Generally in the Final Neolithic inhumation dominated but cremation graves have been also discovered, six of which were found in the Ondava Upland. The eastern Slovakia area seems to be a contact zone of both – the Corded Ware and Yamnaya cultures. Planned in the next years excavations of selected barrows will demonstrate the scale of these cultural units influences in time. The project is currently realized (National Science Centre, Poland, NCN 2020/37/B/HS3/03816).

## 8 LANDSCAPE ARCHAEOLOGICAL AND TOPOGRAPHICAL RESEARCHES ON PREHISTORIC KURGANS IN THE MAROS-KÖRÖS INTERFLUVE (HUNGARY AND ROMANIA)

**Abstract author(s):** Bede, Ádám - Valkó, Orsolya - Deák, Balázs ('Lendület' Seed Ecology Research Group, Institute of Ecology and Botany, Hungary)

**Abstract format:** Oral

Only a few ancient architectural monuments have remained standing in the central region of the Great Hungarian Plain. However, the kurgans that are unique 5,000-year-old anthropogenic objects still exist in this area, and have many landscape archaeological and topographical research prospects. The Carpathian Basin is the westernmost extent of the Yamnaya Entity, which is best known from the steppe zone of Eurasia. The Yamnaya Culture were nomadic people who built large burial mounds during the Late Copper and Early Bronze Ages. Mounds can be found at the banks of (sometimes no-longer existing) rivers and at some points of higher altitude areas. The main aim of our study was to map each mound located in the research area the Maros-Körös Interfluve that is situated in the Eastern Great Hungarian Plain. The study area covered approximately 8,000 km<sup>2</sup> in Hungary and in Romania. We surveyed almost 2,000 ancient burial mounds in 114 settlements. We collected all the available sources (handmade maps from the 18-19th centuries, medieval and later archives and archaeological documents) and other scientific publications (local history, archaeology, folklore, onomatology, botanics, natural science, etc.) about the mounds. The topography of the three kurgan fields (Kétegyháza, Hungary; Grăniceri-Șiclău and Sânmartin-Macea, Romania) were especially interesting. These were located relatively close to each other on the two sides of the country border. The mounds in the project area provide a valuable record of cultural and environmental conditions occurred at the time of their construction, as well as they serve as refuge for ancient loess steppe vegetation, therefore their conservation is highly recommended.

## 9 THE ROLE OF KURGANS IN GRASSLAND CONSERVATION - CASE STUDIES ON THE BIODIVERSITY POTENTIAL OF STEPPIC BURIAL MOUNDS

**Abstract author(s):** Deák, Balázs - Bede, Ádám - Valkó, Orsolya (MTA-ÖK 'Lendület' Seed Ecology Research Group)

**Abstract format:** Oral

Eurasian steppe and forest steppe are among the most endangered biomes of the world. Due to the intensified land use during the past centuries, they suffered a huge loss both in area and biodiversity. In many cases remaining stands of grassland habitats are maintained in small habitat islands such as road verges and river balks that are inadequate for cultivation. Besides these marginal sites, kurgans also have a high potential in grassland conservation. By using series of case studies, we aimed to reveal the conservation role of kurgans and the ecological processes and socio-economic factors that support or threaten their biodiversity potential. Data derived from our continental-scale database (Eurasian Kurgan Database) suggest that a high proportion of kurgans (61.5%) still hold grasslands, even in highly transformed landscapes, where they act as isolated safe havens for grassland species. We revealed that in Hungary, mounds covered by grasslands extend the borders of official nature reserves, since kurgans embedded in agricultural landscapes had the same biodiversity of plant and arthropod species as kurgans situated inside protected areas. This function is supported by the steep slopes hindering ploughing and also leading to a high level of environmental heterogeneity that enables the co-existence of several species with contrasting habitat requirements. The cultural, historical and religious values associated with kurgans also contributed to the maintenance of grassland vegetation by suppressing intensive land use and ensuring extensive management. Effective biodiversity conservation on kurgans requires active measures to suppress the most typical threats, such as ploughing, soil excavations, woody encroachment and activity of burrowing animals such as red foxes.

## 10 COMPLEX PALEOENVIRONMENTAL STUDIES OF KURGANS IN THE CARPATHIAN BASIN

**Abstract author(s):** Peto, Ákos - Braun, Ádám (Hungarian University of Agricultural and Life Sciences) - Dani, János (Déri Museum, Debrecen) - Kulcsár, Gabriella (Eötvös Loránd Research Network, Research Centre for the Humanities, Institute of Archaeology)

**Abstract format:** Oral

Kurgans are man-made geomorphological values of the Eurasian steppe zone. During the construction of these structures, humans sealed one of the most important information sources of the ancient environment: the surface soil cover. This conscious human act – the erection of these earthen features – isolated and therefore kept the original

soil in untouched conditions. These buried soil profiles act as 'time capsules', which can be opened for the sake of the better understanding of the contemporary environmental conditions.

Current presentation provides an overview of the complex scientific studies (incl. phytolith analysis, archaeobotany, soil scientific approaches and geoarchaeological methods) conducted at multiple kurgan sites within the territory of the Great Hungarian Plain (Hungary).

The main objective at each kurgan was to collect data on the possible construction phases of the mound structure, to identify and describe the buried paleosoil, and to collect paleoenvironmental data in order to complement our knowledge on the ancient environment of the Bronze Age.

## 11 GEOCHEMICAL ANALYSIS OF A BRONZE AGE KURGAN FROM THE WALLACHIAN PLAIN, ROMANIA

**Abstract author(s):** Braun, Ádám - Pető, Ákos (Hungarian University of Agriculture and Life Sciences, Institute of Nature Conservation and Environmental Management, Gödöllő) - Frînculeasa, Alin (Prahova District Museum of History and Archeology, Department of Archaeology) - Preda-Bălănică, Bianca - Heyd, Volker (University of Helsinki, Department of Cultures)

**Abstract format:** Oral

Kurgans are special, human-made formations of the endless steppes of Eurasia. For centuries, archaeology has been the primary science to deal with these features. Kurgans are not only bearers of notable botanical, zoological, pedological and geomorphological values, and as elements of the cultural heritage they represent unique aesthetical and culture historical significance of the landscape. The soils buried under these burial mounds are the messengers of ancient landscape forming factors and soil generation processes.

The aim of the research is to elucidate the construction of mound-bodies, to describe modern soil development, to analyze the buried soil under the formations and to reconstruct the ancient, paleoenvironment. This information can be accessed through the elemental composition of the layers of the mound body and the horizons of the buried paleosoil.

A kurgan located near the village Boldești-Grădiște (Romania, Prahova County-Muntenia region) was excavated and the cross-section sampled for geochemical and pedological analyses. Samples have been taken from the mound in a 5 cm resolution. The organic content was measured by loss of ignition at 550 °C, and the carbonate content was estimated by the loss of ignition at 950 °C. The samples have been digested both with aqua regia and hydro-fluoric acid. The major and minor elements have been measured with MP-AES (Agilent 4200) and ICP-MS (Agilent ICP-MS 8800). The dataset was evaluated using a multivariate statistical approach. Principal Component Analysis (PCA) and hierarchical cluster analysis was used to explore patterns of the multivariate space and assign the samples into groups. The correlation of the pedological layers and the assigned clusters was investigated. Linear discriminant analysis (LDA) was then used to assess the probability of cluster memberships. Lastly the LDA model was used to categorize the background samples collected nearby the mound, and from these results environmental information is drawn.

## A. KURGANS AS BIODIVERSITY HOTSPOTS IN AGRICULTURAL LANDSCAPES – RARE AND PROTECTED PLANT SPECIES ON THE MOUNDS OF THE TISZÁNTÚL, EAST-HUNGARY

**Abstract author(s):** Deák, Balázs - Kelemen, András ('Lendület' Seed Ecology Research Group) - Tölgyesi, Csaba (University of Szeged, Department of Ecology) - Bede, Ádám - Valkó, Orsolya ('Lendület' Seed Ecology Research Group)

**Abstract format:** Poster

In heavily transformed agricultural landscapes of Europe dry grassland habitats suffered a considerable decline during the past centuries being transformed into arable lands, afforestations and urban areas. In such landscapes small remnant grassland islands have a considerable role in preserving biodiversity and maintaining ecosystem services. In the steppe and forest-steppe biomes of continental Eurasia ancient burial mounds, the kurgans often act as refuges for grassland species and have an important role in fostering biodiversity. Using data from our large-scale survey we provide an overview on the nature conservation potential of 270 mounds in Hungary. The mounds were situated in the Tiszántúl region, in the Great Hungarian Plain covering an area of 22 600 km<sup>2</sup>. The mounds were covered by loess and alkali steppes and secondary dry grasslands formed after the cessation of arable farming. However, in many mounds we detected the signs degradation processes caused by ploughing, encroachment of woody and weedy species, soil excavation and activities of burrowing animals (foxes and badgers). We found altogether 536 taxa, of which 56 were protected (*Anchusa barrelieri*, *Aster sedifolius*, *Carduus hamulosus*, *Centaurea solstitialis*, *Chamaecytisus rochelii*, *Inula germanica*, *Phlomis tuberosa* and *Ranunculus illyricus*) or regionally rare (*Aegilops cylindrica*, *Asplenium ruta-muraria*, *Astragalus austriacus*, *Lychnis viscaria*, *Rosa gallica*, *Rosa rubiginosa* and *Stipa capillata*) dry grassland species typical to steppe and forest steppe species. The studied kurgans also harboured several formerly widespread arable weeds that became especially rare due to the intensive use of herbicides in agriculture; thus, are

also important from the nature conservation point (*Ajuga chamaeepytis*, *Androsace elongata*, *Carthamus lanatus*, *Caucalis platycarpus*, *Erodium ciconium*, *Glaucinum corniculatum* and *Nigella arvensis*). Our findings demonstrated that kurgans have a vital role in maintaining the populations of rare and endangered grassland species even in transformed landscapes, thus their protection is essential for preserving disappearing biodiversity of open habitats.

## **B. LANDSCAPE HISTORICAL AND ECOLOGICAL CHARACTERIZATION OF THE MOGYORÓS-HALOM KURGAN (ÖCSÖD, HUNGARY)**

**Abstract author(s):** Bede, Ádám - Valkó, Orsolya - Deák, Balázs ('Lendület' Seed Ecology Research Group, Institute of Ecology and Botany)

**Abstract format:** Poster

Ancient burial mounds (kurgans) built by nomadic steppic entities are iconic landmarks in the Eurasian steppe and forest steppe zones. The aim of our case study was to provide a comprehensive landscape ecological and botanical investigation of the Mogyorós-halom kurgan which is located in Southeast-Hungary. Historical data showed that in the migration period a cemetery and in the middle ages a village was established in the vicinity of the kurgan. The kurgan has served as a border mark between the settlements of Öcsöd and Békésszentandrás since the 18th century. On the maps from the late 18th century, the mound is situated in a farmland and it was ploughed until the 1970s. The kurgan has been subjected to several forms of disturbance during the centuries, including ploughing, archaeological excavations, mining, establishment of a triangulation point and garbage deposition. Despite these disturbances, the slopes of the mound still harbour dry grassland and meadow steppe vegetation. The most important plant species from the conservation viewpoint are *Aegilops cylindrica*, *Allium atropurpureum*, *Androsace elongata*, *Artemisia pontica*, *Aster sedifolius*, *Centaurea scabiosa*, *Centaurea solstitialis*, *Linaria biebersteinii*, and *Ornithogalum brevistylum*. Currently, the mound is not managed, and for the improvement of its conservation status, regular mowing would be necessary. On the long run, the eradication of invasive plant species, and the reconstruction of the body of the mound would be desirable.

---

## **17 BECOMING A PUBLISHED ARCHAEOLOGIST [ECA]**

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Brami, Maxime (Johannes Gutenberg University Mainz) - Coltofean-Arizancu, Laura (Archaeology and Gender in Europe - AGE - Community of the EAA) - Kolář, Jan (Academy of Sciences of the Czech Republic) - Preda-Bălănică, Bianca (University of Helsinki) - Frieman, Catherine (Australian National University)

**Format:** Round table

Publishing our work is a major part of being an archaeologist, but the routes to publication are not always clear. There are national differences in style and preferred publication type, different sub-disciplinary norms, and language and style barriers that may seem insurmountable. Moreover, wisely planned publication strategies are often necessary for gaining research funding at national and international levels. This round table hosted by the EAA's Early Career Archaeologists (ECA) community and European Journal of Archaeology (EJA) brings together journal editors and book publishers from around Europe to discuss the archaeological publishing ecosystem, answer questions about publication norms and practices, and address specific concerns early career archaeologists may have regarding the publication process.

Topics to be considered include:

- How does the journal editorial/peer review process work (and not work)?
- What do traditional publications do (and not do)?
- What do I need to know to start publishing my research?

## **27 ENGAGING THE PUBLIC, HERITAGE AND EDUCATORS THROUGH MATERIAL CULTURE RESEARCH**

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Wilson, Katherine - Pickles, Thomas (University of Chester) - Antenhofer, Christina (University of Salzburg)

**Format:** Regular session

This session will focus on the ways in which material culture can be and has been used successfully to engage members of the public, heritage and educators across Europe. Using the example of three European projects run by the session organisers, (Mobility of Objects Across Boundaries 1000-1700 (MOB), Early Christian Churches and Landscapes (ECCLES) and Virtual Materialities/Material Virtualities) it will investigate how interdisciplinary collaborations and research have, can and should be used to forge the future of work on material culture. Several key questions will shape the contributions to this session: Which material culture research projects have successfully engaged the public, heritage and/or educators? What methods and practices in these projects have successfully engaged the public, heritage and/or educators? What are the interdisciplinary collaborations that have shaped engagement with the

public, heritage/and or educators? What are the unexpected outcomes of material culture engagement with these groups? By addressing these questions, this session will contribute to a key moment for all who work with material culture in their research, which is how engagement with the public, heritage and educators is crucial for the future of Heritage, Archaeology and History.

## ABSTRACTS

### 1 THE HIDDEN LIFE OF THE LADY WITH CARNATION. CONNECTING HISTORY, MATERIAL CULTURE AND MUSEOLOGY

**Abstract author(s):** De Groot, Julie (Universiteit Antwerpen)

**Abstract format:** Oral

The temporary exhibition in the Mayer van den Bergh museum in Antwerp, *Madonna meets Mad Meg. Masterpieces and Their Collectors*, unites and confronts the fifteenth and sixteenth century collections of nineteenth century collectors Fritz Mayer van den Bergh and Florent Van Ertborn (5 October 2019 to 9 January 2022). Fritz Mayer van den Bergh was particularly attracted by a small late fifteenth century and anonymous portrait by Pieter Casenbroot, depicting a young woman in a simple dark colored dress, holding a white flower. It is certainly not the most striking piece in his collection, but it has a remarkable story of its own. This paper considers paintings as objects that had an important use value to their owners. Some, though not all, secular portraits were pendants, representing man and wife. They embodied both status and the liaison or marriage. These paintings symbolized some very familiar emotions of attachment, belonging and remembrance, honoring key moments in life. Nonetheless, the museum (like many other museums) chose to display all of the paintings and other pieces of art in a very traditional way, one next to the other, at a short distance to the visitor. But how can a visitor connect to the story of the anonymous painted lady? In other art exhibitions as well, attention is devoted almost exclusively to material-technical and style-typical features of portraits, sometimes reuniting pendants or showing the backside of paintings, but almost always without paying attention to their original context and to the biography of the object as part of a collection. This paper wants to investigate how seemingly 'old' emotions through seemingly high-end pieces of material culture can be captured and translated into museological settings and how these 'old' emotions can interact with emotions of museum visitors and learners today.

### 2 FOSTERING PARTNERSHIP ACROSS THE GREAT STEPPE

**Abstract author(s):** Amirova, Saltanat (University of Cambridge; Department of Archaeology) - Roberts, Rebecca (McDonald Institute for Archaeological Research; University of Cambridge; Fitzwilliam Museum) - Zainulla, Samashev (Margulan Institute of Archaeology) - Toleubayev, Abdesh (Al-Farabi Kazakh National University) - Nurgazyeva, Svetlana (East Kazakhstan Regional Museum of Local History)

**Abstract format:** Oral

The 'Gold of the Great Steppe' exhibition of Iron Age artefacts on loan from the East Kazakhstan Regional Museum of Local History, opened at the Fitzwilliam Museum, University of Cambridge, on the 28th September 2021 and ran until 30th January 2022. The text of the exhibition and accompanying catalogue drew on research by Kazakh archaeologists, and aimed to convey both the beauty and the scientific importance of the artefacts to the public in the United Kingdom, many of whom were entirely unfamiliar with Kazakhstan and its archaeology. Despite pandemic restrictions, it attracted over twenty-five thousand visitors. In addition to the public display, a programme of non-destructive research on the materials was carried out in Cambridge, in consultation with colleagues in Kazakhstan. The curation, design, build, and transportation of the exhibition was carried out during extraordinary times, beginning just before the first lockdowns of March 2020, and ending when modern Kazakhstan was changed forever by the tragic events of Bloody January.

Emerging from what was at times an overwhelming experience, we begin to reflect on the exhibition, and look ahead to future work. What worked well? What could we have done better? How can we build on the positive public response to the exhibition? What does a successful legacy look like? How do we promote knowledge exchange, both professional and public? Should we propose a 'return match' exhibition in Kazakhstan showing Iron Age artefacts from ancient Britain? How do we navigate collaborations going forward under the changed political landscape? How can we work to foster and support the next generation of archaeologists and museum-going public from Kazakhstan, and how can new research material be integrated into student learning at Cambridge? We have some answers to these questions, but at the same time are open to critical discussion.

### 3 **OBSCURE DUNGEONS: ON THE POTENTIAL OF VIRTUAL REALITY IN CASTLE HOHENSALZBURG**

**Abstract author(s):** Zimmermann, Judith - Färberböck, Peter (University of Salzburg)

**Abstract format:** Oral

What should "museums of the future" look like? One key approach from an ever-growing pool of possibilities are virtual worlds. Thus, this proposed paper will look at an educational approach in museums concerning the use of virtual reality and its technical possibilities. We want to highlight how inaccessible rooms/spaces can be processed and presented to visitors. These "obscure" rooms and their material culture are lost to the public. This dilemma can be approached from different angles. On the one hand, this virtual experience can be a supplement to traditional exhibitions. On the other hand, these virtual exhibitions can establish an accessible way of visiting a museum from home. Specifically, this paper will look at the chances and boundaries of Virtual Reality using the obscure dungeons of Castle Hohensalzburg which were located in the "Hoher Stock" ("high floor"). This paper will work with the current digital humanities project Hohensalzburg digital: the aim of that project is the digital processing and linking of space and object-based information from historical sources and historical building data of Hohensalzburg. Their gathered data will be included in Time Machine Europe, with which a new way to experience virtual journeys through time and space has been established. We would like to offer a different idea to that particular virtual journey. Virtual reality can serve as a link between space and information and unveil invisible rooms and data. Therefore, it can be a public history service that makes historical research accessible.

Virtual Reality can be an immersive experience that enhances traditional museum media already in existence. The Castle Hohensalzburg is presented as an example of how these media such as a website, a brochure or an audio guide combined with virtual offer a new interactive experience beneficial for visitors and the impact of the material culture as well.

### 4 **CARVING WITH LIGHT. SCANNING AND RE-MAKING THE BALLACHULISH GODDESS**

**Abstract author(s):** Griffiths, Mark (Freelance) - Power, Orla (MaREI the Center for Energy, Climate and Marine)

**Abstract format:** Oral

Discovered by chance in a village in the highlands of Scotland, the Ballachulish goddess is a near life size anthropomorphic figure, that is thought to represent a female deity connected with harsh weather and the three mountain peaks that dominate the landscape. Immediately after her excavation in 1880 this Alder wood figure (c. 600BC), was taken to the National Museum of Scotland where, due to poor initial conservation, her features have distorted dramatically.

The Pallasboy Project, recreated this prehistoric wooden artefact using laser scanned data as a guide. This multidisciplinary approach offered the woodcarver a unique opportunity to study and replicate not only tool marks, but also the flow and 'signature' of its original maker.

Using the village hall as a base, we actively encouraged members of the public to use our replica tools, discuss the figure's meaning and importance, and share with us their local heritage. This paper will reflect on the understanding, value, and insights gained by being present in the landscape of the original find, and the mutual exchange of knowledge that emerged through ongoing engagement with community participants.

Once finished this new representation was gifted to the people of Ballachulish and its heritage society. She went on to tour local schools and institutions where pupils were able to touch and explore the textures of the worked timber, before engaging with the accompanying 3D models of both the original and contemporary figures.

Initially, we had not appreciated the deep importance this wooden figure had to the cultural history of the people of Ballachulish and the resentment that removing this enigmatic find from the landscape, which inspired it, had previously evoked. Eventually, the heritage society held their own ritual and interred this new goddess close to the site of the original, restoring this guardian of storms and mountains.

### 5 **USING ARCHAEOLOGY AND LOCAL HERITAGE AS A COMMON THREAD FOR THE EDUCATIONAL PROJECT IN TWO RURAL SCHOOLS**

**Abstract author(s):** Carballido González, Elías - Rebollar Flecha, Luis (University of Oviedo) - López Gómez, Pablo - Fernández Mier, Margarita (University of León) - Fernández Fernández, Jesús (University of Oviedo)

**Abstract format:** Oral

The project "ConCiencia Histórica: Historia y Arqueología en comunidades rurales" is a cooperative activity of co-construction of knowledge in which the Academia, schools and the local community converge to stimulate scientific vocations in the rural space. The concession of two projects by the FECYT (Fundación Española para la Ciencia y la Tecnología) and the cooperation of municipalities, schools and the social and economic fabric of these territories have made possible to carry out excavations with the students of both rural schools —Belmonte and Proaza—, moving from children's games to working on a real intervention.

The project allowed us to be part of the design of the educational project along with the teachers, using archaeology as a basic tool to increment scientific culture, a critic spirit and a positive attitude towards the custody of cultural and local (both material and immaterial) heritage, serving this as the central element around which all the knowledge branches of the educational curriculum were articulated.

Thus, working in the classroom and organizing didactic workshops —designed to provide students with the necessary tools to understand the scientific process of archaeology— culminated with the design of an archaeological intervention in which the students participated actively in the associated research: from the previous studies to the field work and the analysis of the recovered material. The group looked for new ways to communicate the results of this project, which led to the recording of two short films and the diffusion of different materials through social media trying to implement a close, accessible and comprehensive communicative style.

## 6 TOUCHING THE PAST. RECONSTRUCTIONS OF ARTIFACTS AND EDUCATIONAL WORKSHOPS FOR CHILDREN – A CASE STUDY FROM POLAND

**Abstract author(s):** Dziechciarz, Pawel - Łukowska-Dziechciarz, Agnieszka (Uniwersytet Warszawski)

**Abstract format:** Oral

Popularization of the Past and material culture of former communities is one of the essential aspects of archaeological heritage management. However, for conservation, logistic or legal reasons, it is not always possible to use material remains in educational activities exclusively. The answer to this may be the use of accurate reconstructions and exact replicas of findings. This practice is widely used, among other areas, within private initiatives related to historical education. An example may be the activity of a small private business 'Archeologiczne Warsztaty', operating in Poland, run by the authors of this study.

Understanding the enormous possibilities offered by the use of modern technologies in education, we try to popularize archeology in a different manner, as assumed by the "Touching the Past" method. As part of educational workshops attended by over 35,000 school and preschool children so far, we build stories about the Past from objects that could be discovered during archaeological research, using reconstructors, replicas and high-quality models of archaeological relics. We put the participants of the classes as adepts of archeology, asking them questions about the functions and use of the objects, often referring to the contemporary reality they know. We also use appropriate materials to recreate past techniques and crafts together with workshop participants, following the path: material – object - action.

Within this study an attempt will be made to indicate the advantages of using the reconstruction of artifacts and direct contact of children with them. Examples of popularization projects conducted by 'Archeologiczne Warsztaty' in accordance with the 'Touching the Past' method will also be presented.

## 7 THE PUBLIC AND THE EXTRAORDINARY – MATERIAL CULTURE AS THE TOOL TO FASCINATE

**Abstract author(s):** Zinn, Katharina (University of Wales Trinity Saint David)

**Abstract format:** Oral

Museums-excavations – discovering unprovenanced and forgotten objects in museums' storerooms – open new opportunities for the engagement with the public and shed new light on the consequent necessity to contextualise the discovered artefacts. Despite being unprovenanced – one could even say especially because of that – it is important to make sense of these "ordinary" finds. Developing strategies of unmasking the EXTRA-ordinary within such neglected objects and the communication of these finds as part of imaginative activities for the wider public and the research community has been at the core of the cooperative projects between Cyfarthfa Castle Museum, Merthyr Tydfil, Wales (UK) and the University of Wales Trinity Saint David Wales aiming at the literal and cultural (re-)discovery of ancient Egyptian artefacts. As this regional museum serves the local South Wales valleys by representing the daily life and history of this region, it was seen difficult to incorporate the Egyptian collection into the narrative of the museum's permanent exhibition. The project brings these objects back to life by simultaneously creating different types of cultural representations via academic outputs, exhibitions, story-telling, a Museum of Lies and artwork inspired by the items in order to "unpack the collection (Byrne et al. 2011). This approach connects these objects, most of which lie dormant, with several identities in which they are placed: locally at Merthyr Tydfil in rural Wales – where the museum is situated, students of UWTSU in Lampeter who are becoming involved in primary research, local school children using the exhibited objects as case studies in their Religious Education and English curriculum, the community around Lampeter, the research community (Egyptologists, anthropologists, heritage professionals) and more. This is only possible by thinking about applicable methodological and theoretical approaches so that conclusions can be drawn.

A short introductory video can be seen here <https://www.youtube.com/watch?v=lx6168O8tJE>

## INFLUENCING THE PUBLIC. USING SOCIAL MEDIA PLATFORMS FOR ENGAGING ONLINE COMMUNITIES

**Abstract author(s):** Gergácz, Rebeka (Hungarian National Museum)

**Abstract format:** Oral

With the far-reaching appearance of social media platforms many new opportunities, and also several obstacles, have risen for archaeology. Hungarian archaeologists and museums were tardy in exploiting the tools of social media, and many are still yet to recognize the importance and necessity of an active presence on social media platforms. In contrast, pseudoarchaeological theories are spreading like wildfire in certain online communities. For example, the Hungarian Prehistory (Magyar Őstörténet) Facebook group, which has more than 26,000 members, and the Hungarian History III Youtube channel, which has more than four million views - which are great numbers in Hungarian terms. The situation is further aggravated by the fact that in recent decades, archaeology as a profession has significantly lost from its public appreciation. In Hungary, most people almost never encounter archaeology in their everyday lives, so the gap between researchers and the public is continuously increasing.

The solution for the above-mentioned problems might lie in engaging with communities, not only offline (e.g. public archaeological projects), but also online, adjusting to the digital era. In my presentation, I examine the role of the latter amongst Hungarian conditions, looking for answers to questions such as who and how can be addressed on social media? Is it possible to influence people's opinion about archaeology and its scientific results through online dissemination of knowledge and informal discourses? Is it important for the audience to see who the content creators are? Are online recommendations increasing the popularity of offline programs, e.g. exhibitions, educational events, public archaeology? Do these platforms help to 'fight' pseudoarchaeology? My search for answers was helped by the analysis of statistical data collected from the most popular Hungarian archaeological Facebook and Instagram pages, as well as by the evaluation of the results of a comprehensive questionnaire targeted on social media consumers.

### A. A BASQUE FARMHOUSE: PREVENTIVE ARCHAEOLOGY AND ARCHAEOLOGICAL HERITAGE AS AN EDUCATIONAL RESOURCE

**Abstract author(s):** Campos-Lopez, Teresa (University of the Basque Country - UPV/EHU)

**Abstract format:** Poster

Education in archaeological heritage is necessary to raise awareness of its meaning and importance, as well as to generate protection and conservation attitudes. We understand, therefore, that the best way to preserve our heritage is to valuing and by giving new meanings -(re)signification- through their knowledge. By working with these resources in the classroom – and outside it also- you become to promote critical and reflective capacity over the comprehension of our society and to understand the elements that define it.

So, the aim of this proposal is to present this project focused on a local research in Besoitaormatxea Baserria or farmhouse of Berriz (Vizcaya, Basque Country, Spain), in terms of valuing cultural heritage, where archaeological data and methodology can lead us through the occupation of the landscape and the several phases of the stone building 16th century until today. Moreover, how people lived and how can we investigate these processes thanks to archaeology.

It is a heritage education proposal that comes from a preventive archaeological and historical research; which results were displayed in a scientific illustration and in several divulgation activities. Is, therefore, a project of education and heritage sensitisation, in which possible and multiple lines are used to generate links, relations and provide value and meaning –based on historical knowledge- through the stakeholders involved, encouraging its conservation.

## SKYSCAPE, LANDSCAPE AND ARCHAEOLOGY. STUDY OF ANCIENT BUILDINGS FROM DIFFERENT PERSPECTIVES AND DISCIPLINES TO GIVE THEM A CULTURAL MEANING [SEAC-EAA]

**Theme:** 2. [Re]integration

**Organisers:** Balbi, Jose (Colchester Archaeological Group) - Iwaniszewski, Stanislaw (State Museum of Archaeology, Warsaw) - Martz de la Vega, Hans (Escuela Nacional de Antropología e Historia)

**Format:** Regular session

This session follows from the sessions presented in EAA 2020 and EAA 2021 and is the introduction and first year of the EAA-SEAC community. Our objectives are the same as those of the community of ethno and Archaeo astronomers. We intend to continue adding presentations, papers, and publications on the topics that guide our community of archaeological studies.

One of the aspects of the relationship between archaeology and cultural astronomy has been the interconnection between heavenly bodies and humans. The orientation of architectural structures at archaeological sites has been one of the most often recorded classes of evidence informing us about possible celestial relationships. By studying the

stars alignments with ancient constructions, we can learn about past human societies relationships with the celestial bodies and the phenomena. Understanding orientations is just one way to relate the human experience to the celestial landscape. From our point of view, places with cosmic connections could have generated new assemblages (term borrowed from Gilles Deleuze and Feliz Guattari) of objects, human and non-human, revealing sets of practices and materialities situated in time. We propose to study landscapes from different perspectives and to give them a cultural and ontological meaning.

Therefore, some of the issues that the papers in this session should address with the above criteria are: is it possible to understand how people lived in their environment by observing and studying the landscape with the sky or any other aspect of an archaeological site? How do technology and new techniques allow us to understand the known data? What is the ontological relationship between people and their environment? How can the construction of ancient buildings be understood from a skyscape or landscape point of view? The object of the session is to perform an archaeological study with multidisciplinary contributions. To get our aims, we complete archaeological data with those from other sciences.

## ABSTRACTS

### 1 **FORDHAM HALL ROMAN VILLA SITE. THE 3RD CENTURY BUILDING PHASE OF A ROMAN VILLA RUSTICA AND SOME ROMAN ASTRONOMY ELEMENTS**

**Abstract author(s):** Balbi, Jose (Colchester Archaeological Group)

**Abstract format:** Oral

Our presentation will describe the first five years of the excavation at Fordham, Essex, England and the relation between material archaeology and Roman Astronomy.

Fordham is a village built around a Norman church, the church was first mentioned in history in 1087, it is situated north west of Colchester (Camulodunum) which was, in the 1st Century the Roman Capital of Britain.

The site was first recognised as an archaeological site of interest by the discovery of a Roman lead lined coffin in 1984 by metal detectorist. Extensive field walking and recording was undertaken of the area and in later years Geophysics established the probable location of the Roman Villa site.

Excavation began in 2015 by the Fordham Historic Society and the Colchester Archaeological Group and continues to this day. The archaeology so far found justifies this as a possible long term project that could go on for many years.

### 2 **TIKAL AS A MESHWORKSCAPE. THE ORIENTATIONS OF ITS ARCHITECTURE**

**Abstract author(s):** Martz de la Vega, Hans (National School of Anthropology and History) - Pérez Negrete, Miguel (Instituto Nacional de Antropología e Historia, México)

**Abstract format:** Oral

It has been shown that the Mayan cities of the Classic Period (250-900 AD), in Mesoamerica, had a spatial configuration based on fundamental and symbolic classification systems, physiognomic properties of the landscape and cyclical and regular movements of celestial bodies. One of the ways to investigate these aspects is through Archaeoastronomy, a branch of Cultural Astronomy. Through field measurements of architecture and landscape and the analysis of planimetric plans, we can learn the reasons that led their builders to orient them in a certain way and to choose specific places for their emplacements.

In this oral presentation, we will show orientations of the architecture of a city that was the heart of one of the two most powerful socio-political spheres of its time, Tikal, in Guatemala.

One of the proposals related to the architecture of Tikal says that archetypal builder rulers have been identified due to the influence they had on the general layout. That the layout and distribution of its main structures could be based on a single family of rulers. The above will be part of the analysis that we will show based on archaeoastronomical field measurements. This has allowed us to see Tikal as a mesh in terms of Tim Ingold's life of lines theory. We propose

that it is a meshworkscape in which the construction epochs stand out. We understand that an epoch begins when a sociopolitical panorama has ended. Tikal allowed some of its rulers to leave their mark in an outstanding way compared to the totality of the rulers. This phenomenon is best explained by Jan Vasiņa's methodological tool, telescoping time. We show how orientations are related to power decisions; how they are part of the construction projects of the great Mayan rulers.

### 3 THE MEANING OF THE SOUTHWEST ALIGNMENTS OF FBC UNCHAMBERED LONG BARROWS AT SARNOWO, KUYAVIA, POLAND

**Abstract author(s):** Iwaniszewski, Stanislaw (Posgrado en Arqueologia Escuela Nacional de Antropologia e Historia - Instituto)

**Abstract format:** Oral

Contrasting with the site of Wietrzychowice examined at the EAA Kiel meeting, most FBC unchambered long barrows from Sarnowo display solar alignments. Situated on a slightly undulating moraine on the edge of the higher terrace above the valley of the Zgłowięcza River, these stone-and-earth monuments constitute a significant concentration of survived and excavated long barrows in the southern Kuyavia region in central-northern Poland. Except for the long barrow no. 7, all structures display a tendency to orient themselves long the ENE-WSW axis, suggesting that they were directed towards the sunset positions on the horizon during the autumn and winter months. Furthermore, since most graves follow the same orientation, we find that the head orientation of the male deceased also pointed to the southwest. Like the long barrows from the Izbica Kujawska microregion, Sarnowo long barrows are located on drier and higher elevations in a relatively flat environment and nearby water resources.

The paper will present the results of an archaeoastronomical analysis of the FBC long barrows at Sarnowo.

### 4 SYMBOLS, MEANING, AND SKYSCAPE IN GOLD AND STONE IN BRONZE AGE NORWEST IBERIA

**Abstract author(s):** González-García, Antonio César - Cabrejas, Elena (Institute of Heritage Sciences, Incipit-CSIC) - Comendador, Beatriz (University of Vigo)

**Abstract format:** Oral

In the present communication we propose an interdisciplinary analysis of three items of the late Bronze age located in a narrow area close to the central coast of Galicia: the 'casco de Leiro', the 'As Silgadas' hoard and 'Laxe dos Bolos' rock art site.

The 'casco de Leiro' (Rianxo, A Coruña, Spain) presents several bands with geometric decoration mostly formed by concentric circles by embossment that has been interpreted as an astral decoration. 'As Silgadas', (Caldas de Reis, Pontevedra, Spain) is a gold deposit of nearly 27 kg formed by different pieces including massive annular ring ingots, three handled cups, a comb, and fragments of a cylindrical collar with parallel bands cut in gold. It is interesting that two of the handled cups display decoration that has been interpreted as solar symbols. Finally, the rock art site of 'Laxe dos Bolos' is located near the summit of Xiabre hill, displaying a large visibility. It holds a large number of different engraved motifs with a rich iconography. Laxe dos Bolos is considered as a possible long-lasting sanctuary throughout recent Prehistory.

Besides the possible astral motifs engraved in the metal hoards and the rock art site, the three sites display a number of visibility and mobility relations and possible skyscape connections. Notably, the location of Leiro's cache faces the high parts of the Sierra, where Laxe dos Bolos is located. Such area coincides with winter solstice sunrise (or the southern rising of the moon). Conversely, from As Silgadas such area coincides with summer solstice sunset. Finally, the wide visibility from Laxe dos Bolos appears somewhat focused towards the summit of Mount Xesteiras, the highest peak in the area, where summer solstice sunrise happens as seen from Laxe dos Bolos. A possible interpretation of such relations and the astral decoration is provided.

### 5 CONVERGING CONCEPTUALISATIONS OF TIME IN HISTORY AND ANTHROPOLOGY AND IMPLICATIONS FOR SKYSCAPE ARCHAEOLOGY

**Abstract author(s):** Silva, Fabio (Bournemouth University)

**Abstract format:** Oral

The origins, function and meaning of calendars have been explored separately by historians and anthropologists for well over a century. On the one hand, historians have largely focused on the calendars of early civilisations, especially their role in the religious, social and political domains (e.g. Stern 2012). On the other hand, anthropologists have noted alternative conceptualisations of time and have been trying to make sense of the time-reckoning strategies of traditional societies. In particular, two modes of time-reckoning – ecological/cyclical time and structural/linear – have been invariably proposed (e.g. Aveni 2002, Gell 1992). Any links between the distinct anthropological and historical understandings of time remain unexplored since the two fields have worked in isolation.

This paper aims to bridge this gap by looking at anthropological and historical data together, with relationality and the ontological turn in mind. Borrowing the ontological model of classical Chinese philosophy as a theoretical and illustrative device (e.g. Sterckx 2019), it will be argued that any society's conceptualisation of time must come to terms with two facts: the cyclicity of the rhythms of nature (Heaven in Chinese thought) and the finality of death (associated with Earth in Chinese thought). It is from these that ecological/cyclical and structural/linear conceptualisations of time emerge. A new model for understanding the complementarity of the two anthropological modes will be proposed, with calendrical time understood as a third mode that contains, and yet fundamentally disrupts, the other two. Furthermore, the political origins of calendrical time will be highlighted as one of the few points of convergence between historical and anthropological data. Finally, the implications of this for the archaeological interpretation of time-reckoning devices and calendars in pre- and protohistory, including the role of structural alignments to celestial objects, will be discussed in some depth.

## 6 THE ORIENTATION OF MINOAN PALACES AND PEAK SANCTUARIES TOWARD NAVIGATIONAL STARS

**Abstract author(s):** Berio, Alessandro (Cultural Astronomy, University of Wales Trinity St. David)

**Abstract format:** Oral

Mentioned as early as Homer's 8th BCE "Odyssey", Arcturus (a Boötis), part of the constellation of Boötes, was often cited as a fundamental navigational star utilized by Bronze Age Mediterranean sailors. Since our understanding of Minoan sailing techniques and maritime technology remains underdeveloped, this article proposes a novel exploratory methodology for analyzing hypothetical celestial-nautical orientations of archaeological sites, through virtual and in situ fieldwork. Through the use of a professional clinometer, archaeoastronomical measurements will validate previous proposals that the peak sanctuaries of Petsophas and Traostalos along with other Minoan sites contain alignments toward the heliacal rising of Arcturus. The analysis will then cross reference sea currents, wind patterns, axial precession, and the material record to determine the viability of Arcturus as a navigational star within the Minoan maritime network. The research attempts to provide a new perspective on how these orientations unified skyscape, landscape and seascape into singular architectural syntaxes.

## 7 ARCHAEOASTRONOMY AND CONFLICT: ON THE ORIENTATION OF PRE-ISLAMIC TOMBS IN THE WESTERN SAHARA

**Abstract author(s):** Rodríguez-Antón, Andrea (Incipit - Institute of Heritage Sciences) - Urrutia-Aparicio, Maitane (Instituto de Astrofísica de Canarias) - Perera Betancor, María Antonia (Dirección General de Patrimonio Cultural. Gobierno de Canarias)

**Abstract format:** Oral

Western Sahara has been the subject of a territorial dispute between Morocco and the indigenous Frente Polisario independence movement since the withdrawal of Spain in 1975. Although some archeological studies have been undertaken in the last years, the still active political conflict caused that little research has been conducted in both the zone occupied by Morocco and the Sahrawi Arab Democratic Republic (SADR), due to different access and logistical difficulties, now increased with the break of the ceasefire in 2020.

In this presentation we show the preliminary results of an archaeoastronomical study of more than 200 Prehistoric tombs in the Western Sahara, mostly in the southern region of Dakhla-Oued Ed-Dahab. In particular, the orientation of engravings from different types have been measured during two fieldwork campaigns in the occupied Sahara in 2018 and 2019. The orientation patterns suggest a possible role of astronomy and key features of the surrounding landscape in the funerary architecture. Certain variations have been spotted by analyzing the architectural buildings by their morphology, but lunar standstills could be a common target. These results seem to be in agreement with previous studies made in the northern regions of Africa, in particular the skylight tumuli of Foum al Rjam in Morocco and the crescent monuments, found not only in the Central and Western Sahara, but also in Messak Settafet (Lybia).

This is the most complete archaeoastronomical research on these monuments made with data obtained in situ, where little material remains on surface have been found. In addition to this, the accordance of the present results with further astronomical traditions in the Maghreb, stresses the necessity of a continuation of the fieldwork in future campaigns in order to preserve this highly threatened cultural heritage of the so-called 'last colony of Africa'.

## 8 INTERRUPTED DITCHES FROM PIT-GRAVE BARROWS OF CENTRAL UKRAINE AS CALENDAR & RITUAL OBJECTS

**Abstract author(s):** Syvolap, Mykhaylo (Cherkasy City Archaeological Museum)

**Abstract format:** Oral

The subject of the paper are 3 interrupted ditches under the barrows of Pit-Grave culture (IV-III mil. B.C.) near the village of Les'ky outside Cherkasy City in Middle Dnieper Area. The best preserved circular ditch with 8 interruptions under the barrow "Vitriakova Mohyla" had the 15,8-15,9m outer diameter. The ditch profile was trapezoid, the filling

of the ditch was stratified and consisted of two blocks of alternate light congestive and dark wind streaks that must be the evidence of short-term functioning. Along the perimeter the ditch was surrounded by the two-ply loess-chernozem outer concentric and inner horseshoe-shaped out-throws, which resembled the solar circle and moon crescent. Among other objects of this barrow the lower parts of two wooden posts (view finders?) and two fire-places ("fire posts"?) must be mentioned. All the burials of the barrow belonged to Pit-Grave culture. Another two ditch barrows, situated some 1.7 km to the SW, had formed a triangle system.

Possibly, the interrupted underbarrow ditch was the peculiar negative cromlech which marked the significant directions, e.g. the solar-lunar azimuths between the interruptions and posts. Thus, the interrupted ditches could be astronomic non-permanent instruments (may be valid for one occasion only) used to adjust calendar countdown by means of ritual Sun and Moon observation.

There are many analogies to these objects on the territory of Ukraine, Central and Western Europe ("rondels" and "henges") from the British Isles (Stonehenge) to the Urals (Savin), dated back to IV-III mil. B.C.

Based on archaeological, astronomic and linguistic data it is suggested that the Les'ky underbarrow interrupted ditches could be the "sacred fences" – the sanctuaries of solar-lunar cycle of ancient Indo-Europeans with astronomic, calendar and ritual functions (Syvolap, 1998).

## 9 THE PRE-HISPANIC BALLCOURT COURTS IN THE STATE OF GUERRERO, MEXICO, AS RITUAL SCENARIOS FOR REQUESTING RAIN: THE CASE OF TEHUACALCO

**Abstract author(s):** Martz de la Vega, Hans (National School of Anthropology and History) - Pérez Negrete, Miguel (Instituto Nacional de Antropología e Historia, México)

**Abstract format:** Oral

One of the most outstanding elements of the Mesoamerican worldview is the ballcourt, which was held in a space designated for that purpose, with certain architectural characteristics fully identified. Regarding its function, the historical sources and archaeological studies highlight the fact that it is associated with rituals referring to the transit of the stars to the firmament, the solar cult and in some cases, recreational activities were carried out on its fields too, like performances.

One of the hypotheses is that, since the concept of the ballcourt is related to the stars, there must be a relationship between the points on the local horizon, where the Sun and the planets mark their transit. In turn, the conformation of the surrounding relief and the choice of the place where the courts were built, were transcendent to fill the structure with a ritual meaning in accordance with the Skyscape.

In the case of Guerrero, México, with more than 100 ballcourts registered in various archaeological sites, it can be identified that there are some oriented parallel, approximately, to the ecliptic, but others are rotated about 90 degrees, oriented from north to south, regions, as in the case of Tehuacalco (650 to 1000 AD), which is decorate on its walls with engravings related to aquatic worship.

Thus, through this oral presentation, we will study the archaeoastronomical values of Tehuacalco and his ballcourt court, and we will consider other data that lead to reinforce the proposal that the ballcourt is also linked to rain request ceremonies, analyzing the orientations, the features of the landscape and enriching the analysis with offering objects, with other courts and representations of court in caves with rock art.

## 10 ARCHAEOLOGICAL MONUMENTS OF KAZAKHSTAN AS OBJECTS OF SACRED GEOGRAPHY

**Abstract author(s):** Zhuniskhanov, Aidyn (Department of Archaeology, L.N. Gumilyov ENU) - Raissova, Aikumis (Department of Anthropology, Durham University)

**Abstract format:** Oral

In April 2017, an article was published by the then President of Kazakhstan, N. A. Nazarbayev, entitled "Looking into the future: modernization of public consciousness". This article proposed a project called "Spiritual Shrines of Kazakhstan" or in more popular parlance the "Sacred Geography of Kazakhstan" which was aimed at raising public awareness of Kazakhstan's heritage of archaeological artefacts dating from the pre-Islamic and Islamic periods in order to rejuvenate a sense of the nation's historical identity and culture.

Pre-Islamic archaeological monuments refer to those older sites earlier than the 8th-9th centuries, which were left behind by the nomadic and semi-nomadic tribes who lived within the terrain now constituting modern Kazakhstan for a millennium, which, according to the generally accepted opinion of Kazakhstani historians and archaeologists, played a significant role in the formation and origins of the Kazakh people. According to the "Sacral Kazakhstan Center", which was created specifically for the implementation of current project archaeological sites dating to the pre-Islamic period, forms the foundation of the sacred objects of Kazakhstan.

The main objective of the project is to create a review of these artefacts and to gauge how these archaeological sites were revered before the Islamic period and how they are viewed today by people in modern Kazakhstan. In fact, many of these monuments are places of pilgrimage. People come to these shrines to satisfy their spiritual needs

and for their spiritual enrichment, as well as to seek healing for their illnesses. Some of these shrines have now become mosques, particularly in the western region such as Shopan-Ata, Karaman-Ata, Esen-Ata, Beket-Ata (in the village of Sary Beyneu) and the Beket-Ata mosque (in the Oglandy area, western chink of Ustyurt).

## 11 NEOLITHIC MEGAXYLON-TYPE TOMBS IN THE CONTEXT OF LIGHT, LANDSCAPE, AND FASCINATION WITH BRILLIANCE

**Abstract author(s):** Gralak, Tomasz (University of Wrocław)

**Abstract format:** Oral

Last year were discovered two "megaxylons" (mega – big, xylos – wood/tree) in Nowa Huta Zestawice in Poland. Primary they were long trapezoidal buildings with few graves within. Such constructions might be treated as houses of the dead. Similar objects are known in southern Poland and are associated with the Funnel Beaker culture (TRB). Their location seems to be related to the fascination with sunlight. They were founded on hills - in well-sunny places. Probably the buildings were a small permanently open entrance - located on the eastern side. These buildings probably had a permanently open entrance - located on the eastern side. As a result, the sun's rays illuminated the entire interior at dawn and in the morning. Additionally, the tombs inside were made of white limestone - glistening in the sun. So it was the light that had a fundamental influence on the location and layout of the entire structure. The fascination with radiance is also visible through other products of material culture. Probably for these reasons, body ornaments were made of white shells - with shiny mother of pearl. Stone tools, on the other hand, have carefully polished shiny surfaces. The first copper items also appeared at this time. It seems that both the color and the glow of this metal meant that it was associated with the sun. This is also how the form of ornaments made of it can be understood. Circular and spiral motifs were used. As it seems, the shape and movement of celestial bodies were alluded to in this way. It is worth adding that in the oldest surviving languages, words referring to brilliance and light are also associated with the sacred and power.

## A. THE INTERACTION BETWEEN NEOLITHIC MAN AND THE SKY

**Abstract author(s):** de Oliveira Teixeira, Luisa (Universidade Autónoma de Lisboa)

**Abstract format:** Poster

The connection of the Human Being with the landscape and with the Celestial dynamics was fundamental for its survival and organisation. With sedentarisation, time becomes cyclical and ritualised, the landscape gains importance and is sacralised. The influence and astral conditioning (Sun and Moon) in the life of prehistoric communities was registered at various levels, from religion, to the prediction of events, in hunting, fishing, agriculture (sowing and harvesting), time marking systems, calendars, among others. It led to the creation of myths, beliefs and rituals. Several ethnographic studies show the interaction between landscape elements and astronomical events (eclipses, comets, meteors, meteorites) of various indigenous cultures, past and present. Interdisciplinary research on megalith-building civilisations indicates a perception in the selection of the site with astronomical phenomena (equinoxes, solstices, orientation with the rising sun and with various constellations). In certain cases, the axis of the funerary megalithic structures is orientated towards imposing mountains and the orientation of the chamber towards the rising sun, as well as possible alignments of menhirs, the conjugation between terrestrial and celestial landscape elements being visible. Solar and lunar representations are inscribed in megalithic art and material culture, referring to the connection of Man with the cosmos. Since ancient times, different cultures have had their own vision of the world, as well as countless ways of representing and identifying it in celestial observations.

## 35 WHERE'S MY TRIBE? DEVELOPING NEW APPROACHES TO CONNECTIVITY, MOBILITY AND COMMUNITY IN EARLY MEDIEVAL EUROPE AFTER THE ETHNIC PARADIGM

**Theme:** 2. [Re]integration

**Organisers:** Brownlee, Emma (University of Cambridge) - Klevnäs, Alison (Stockholm University) - Noterman, Astrid (Stockholm University; CESC)

**Format:** Regular session

Similarities and differences in burial practices across Europe in the 5th to 8th centuries have traditionally been understood through a paradigm centering origin and ethnicity. Distributions of different material culture types in graves were interpreted as distinctive of particular ethnic groups. These in turn were linked to names in written sources, such as Saxons, Franks, or Gepids, and traces of their historically attested migrations were sought in cemeteries, fueling the creation of ethno-nationalist origin myths.

Questioning of historically based frameworks and chronologies is now well-established and widespread in western and central Europe, from both theoretical and empirical directions. Most recently, results from new scientific methods, especially stable isotope and aDNA analyses, are allowing us to distinguish individual mobility from group movements and significantly disrupting previous migration models. Meanwhile studies of burials as assemblages or ritual

processes have brought greater recognition of both variability and connectivity at a wider variety of scales. Local creativity has become more visible as the search for the regionally typical has declined. Simultaneously there is a return to large-scale comparative studies, aimed at understanding mortuary material in its broader European context. This links to criticism that in many areas the ethnic labels by which we have traditionally separated burials have created artificial boundaries between generations as well as sites and regions.

We welcome papers which take comparative approaches to mortuary remains and funerary practices from across Europe in the Early Middle Ages - including connections to Late Roman practices. Papers might consider how we trace and understand shared and distinct burial rites at different scales, or what paradigms we can now use to conceptualize group identities from local to large. What is the impact of new scientific approaches? Do ethnic interpretations have any continuing role, and how do we keep them free of ethno-nationalist connotations?

## ABSTRACTS

### 1 INTRODUCTION

**Abstract author(s):** Brownlee, Emma (University of Cambridge) - Klevnäs, Alison (Stockholm University) - Noterman, Astrid (Stockholm University; CESC)

**Abstract format:** Oral

The study of burial practices in early medieval Europe has long been dominated by ethnic interpretations, either attempting to identify historically recorded groups in the archaeological record, or critiquing such interpretations, often based around the styles of objects deposited in graves. Our research has focused on multiple different topics within funerary archaeology including the decline in grave good use and grave reopening practices. This revealed shared practices extending across broad geographical areas, crossing traditional 'ethnic' boundaries, and raises new questions about how group identity was conceived in a highly mobile and connected world.

This introduction will use case studies from our own research to question the ethnic paradigm, and discuss how regional variations across early medieval Europe might be understood in terms of broader shared practices and connectivity. It will touch on the potentials of new scientific methods to further the understanding of mobility and connectivity, as a means of laying the groundwork for the papers to follow.

### 2 TELL ME WHAT YOU EAT AND I'LL TELL YOU WHO YOU ARE: NUTRITION AND IDENTITY IN EARLY MEDIEVAL ITALY

**Abstract author(s):** Barbiera, Irene (University of Padova)

**Abstract format:** Oral

In the traditional narrative, Lombards migrating to Italy in 568 AD were taller than local populations. Since they were coming from the north, they had Nordic genes determining their taller stature. This idea was supported by skeletal remains found in Lombard times cemeteries, indicating that buried individuals have been indeed quite tall. More recent research has indicated that stature is closely linked to an individual's nutritional regime when they were young and, to a lesser extent, to pathologies experienced during the early years of life (Steckel 2004; Moradi and Baten 2005; Koepke and Baten 2008; Stekel 2019). Following this paradigm, can we say that Lombards were taller because they ate better than local populations? But were the Lombards really taller than the locals? And what about women?

In this presentation I will investigate height of man and women and sexual dimorphism in early medieval Italy juxtaposing areas that were occupied by the Lombards and areas that were not. I will try to show that the increasing statures visible in the early middle ages are typical of all the peninsula – and not only of Lombard areas – and are connected to the changing nutritional regimes and standards of living that characterized the end of the Roman World.

### 3 LOOKING FOR ARCHAEOLOGICAL IDENTITY MARKERS IN THE NECROPOLIS OF EL CORTIJO DEL CHOPO (GRANADA)

**Abstract author(s):** vallejo casas, elena (Universidad de Granada)

**Abstract format:** Oral

Within the study of burial archaeology in the Early Middle Ages, one of the main frameworks of analysis has traditionally been the ethnic perspective, but it is one that we need to look beyond. We can agree that it is important to analyse a site from different perspectives and to take into account all the elements that form part of it, if we want to obtain information from the population we are analysing especially if we want to focus on the different types of identity that we can observe.

For this reason, I have used different perspectives to analyse in depth a necropolis that was excavated in the 1980s, and which is partially unpublished. This is the necropolis of El Cortijo del Chopo, located in the southeast of the Iberian Peninsula, the study of which opens the possibility to observe different types of identities within the same cemetery

space, such as gender, age or class, among others. Different identities from which the members of a group of people can differentiate themselves from each other and, in turn, allow them to define together as a group.

To this end, I have carried out a double study that covers different levels of analysis. Firstly, from the general aspect of the necropolis, such as the distribution of the graves in the territory, their typology, the presence or not of grave goods and the information that the human remains can provide us by carrying out a study of topochronology. And, secondly, the study of specific aspects of the grave goods, paying special attention to the pieces of personal ornament, of which we have taken into account both their external appearance and their composition. For this I have used pXRF and FTIR analyses to provide us a more detailed knowledge of some of the objects.

#### **4 A NEW APPROACH TO THE RESEARCH ON EARLY MEDIEVAL POPULATIONS IN EAST-CENTRAL EUROPE: COLLECTIVE ACTION AND CULTURAL TRANSMISSION**

**Abstract author(s): Machacek, Jiri (Masaryk University, Brno)**

**Abstract format: Oral**

This paper will discuss the transition from Late Antique or Great Migration period to Middle Ages in the East-Central Europe, where Slavic populations are thought to have arrived from the East after the Germanic tribes had left. The question of whether the Slavs did physically migrate from east to west has remained the subject of scientific arguments. According to some anthropologists and genetics corroboration of a mass migration is not found in palaeodemographic research aiming at determining the biological condition and dynamics of the Slav population. On the other hand, it is an indisputable fact that at the end of the first millennium AD the Slav language was spoken from the Elbe to the Volga and from the Baltic to the Peloponnese, whereby in many territories Slavic speakers overlaid the older Germanic, Roman or Greek language substrate. While the change of language could have been related to the arrival of a new population, it could have as well been a result of a language shift, during which one ethnolinguistic group persuades others to switch languages through force or prestige. I will present important archaeological discoveries, such as famous runic inscription from Láňy (CZ), burial mounds in Bernhardtsthal (AT) or Bavarian "princess" from Pušanky (CZ), which opens up a new door to studying the continuity or migrations of historical populations in Europe, challenges the notions of societies as closed units and makes more relative the sharp (pseudo)dichotomy between the Germanic and the Slavic part of Europe as presented by historians, archaeologists or linguists and abused by politicians throughout the 19th and a greater part of the 20th century. We believe in an empirical and theoretical shift in European archaeology, where the application of new approaches like collective action theory or genetics is still rare and cultural epidemiology is virtually absent.

#### **5 THINK OUTSIDE THE ROW! THE EMERGENCE OF ROW-GRAVE CEMETERIES IN TRANSYLVANIA IN THE CONTEXT OF POST-HUNNIC TRANSITIONS: AN ARCHAEOLOGICAL PERSPECTIVE**

**Abstract author(s): Dobos, Alpár (National Museum of Transylvanian History - Cluj-Napoca)**

**Abstract format: Oral**

After the middle of the 5th century, the Carpathian Basin witnessed significant political changes which resulted in the emergence of new, competing political powers trying to fill the vacuum left by the collapse of the Hun Empire. The eastern half of the Carpathian Basin had come under the rule of the Gepidic Kingdom that persisted until 567. According to Jordanes, as a consequence of the battle of Nedao, the Gepids occupied "the extent of all Dacia", suggesting an expansion in Transylvania in the second half of the 5th century. Correspondingly, the interpretation of the archaeological record was strongly influenced by the abovementioned passage by Jordanes, proposing a west-east Gepidic expansion. This also determined the ethnic interpretation of the archaeological finds. While the small grave groups from the second half of the 5th century were assigned either to the Ostrogoths or to the Gepids, who in this period would have held only the political and military power, the large row-grave cemeteries (Reihengräberfelder), generally dated after the turn of the 5th and 6th centuries were considered the hallmark of the Gepidic population. Nonetheless, the context of the emergence of the row-grave cemeteries in Transylvania has never been analysed thoroughly. Recent field research (even if mostly still unpublished), correlated with the already known archaeological data suggests that the situation was much more complex than a linear, west-east migration. Transylvania in the second half of the 5th century, as elsewhere, was a dynamically changing world, where different traditions and group identities coexisted. The emergence of the row-grave cemeteries suggests larger, settled communities and could only happen in a more stable economic and social context. Leaving aside the Gepidic migration, the presentation will attempt to sketch the changes in the funerary practices, highlighting the possible coexistent traditions.

## 6 CHALLENGING NARRATIVES OF CONTINUITY: EAST-CENTRAL EUROPE DURING THE AGE OF MIGRATIONS

**Abstract author(s):** Hanscam, Emily (Department of Cultural Sciences, Linnaeus University)

**Abstract format:** Oral

Since the late nineteenth century, archaeological research in East-Central Europe has been impacted by the hunt for peoples assumed to be the one true ancestral population, continuously occupying the territory of the modern nation-state. This especially affects research on the Age of Migrations (comprising Late Antiquity and the Early Medieval Period), during which peoples moved westwards from the Steppe to encounter the remnants of the waning Roman Empire. Archaeologically visible through differing funerary practices and associated material culture, this evidence has frequently been interpreted through a cultural-historical ethnic lens; peoples are seen as either the founders of the nation (Hungary, Bulgaria), or potentially interrupting the continuity of the earlier ancestral population (Romania). In this way, these national myths and the study of the past form a symbiotic relationship, creating and sustaining each other. Given this, is it possible to develop a new critical understanding of the archaeological evidence for the Age of Migrations in East-Central Europe?

This paper focuses on Romania to illustrate how a regionally diverse past has been co-opted into a narrative supporting one nation's myth of origin. Using the same funerary archaeological evidence from the Age of Migrations in the region of modern Romania, I consider how we might construct archaeological narratives that give a similar sense of 'deep' belonging without supporting narratives of mythical autochthonous continuity.

## 7 ANGLO-SAXON, ROMANO-BRITISH, OR BOTH: A RE-EXAMINATION OF IDENTITY AND MOBILITY THROUGH A MULTIPROXY ISOTOPIC ANALYSIS OF THREE SOUTHERN BRITISH CEMETERIES

**Abstract author(s):** Miller, Katherine (University of Bristol)

**Abstract format:** Oral

Debates are continually had concerning the social and cultural mechanisms that drove change during the fourth to seventh centuries AD in southern Britain. Mortuary practices have been one of the primary pieces of evidence to discuss this topic. The differences in the corpus presentation and objects placed alongside are seen as markers that distinguish the Romano-British and Anglo-Saxon traditions and peoples. Conversely, isotopic data has begun to reveal the impact of population intermixture and mobility and the nuanced expression of regional and local social and cultural identities.

This paper will present the final data and conclusions from a multi-proxy isotope study of three southern British cemetery sites to evaluate identity and individual mobility across regions and time. The sites in question were located in three regions of southern Britain: Apple Down (Compton, Sussex), Droxford (Droxford, Hampshire), and Pilgrim's Way (Wrotham, Kent). The material culture and burial practices utilized at these sites are currently classified as Anglo-Saxon, with the sub-categorizations of Saxon and Jutish. With new  $^{14}\text{C}$ ,  $\text{d}^{13}\text{C}$  and  $\text{d}^{15}\text{N}$ , and  $^{87}/^{86}\text{Sr}$  measurements analyzed from 41 individuals, this project has begun to examine how these communities may have used mortuary practices to express local and regional identities, in addition to questioning the social and cultural impact of lingering Romano-British influences with immigrating Anglo-Saxon populations through the centuries. This project suggests that critical interdisciplinary methods utilizing archaeological and isotopic data can reveal the intricacies of mortuary practices and contemporary ideas concerning identity during the fourth to seventh centuries AD. The conclusions made here will also debate whether the strict dichotomy and separation of the Romano-British and Anglo-Saxon periods and peoples in southern Britain is true, false, or somewhere in between.

## 8 CATCHMENTS OF CLIENTSHIP AND COMMUNITY: EXPLORING LIFETIME MOBILITY AND CONNECTIVITY IN EARLY MEDIEVAL SCOTLAND

**Abstract author(s):** Britton, Kate - Czére, Orsolya - Fawcett, Jovita - Noble, Gordon (University of Aberdeen)

**Abstract format:** Oral

Despite a rich corpus of eponymous symbol stones that adorn the Scottish landscape to the present day, 'Pictish' populations remain amongst the enigmatic early medieval peoples of northern Europe. Isotope analyses are a powerful means of accessing personal dietary and movement histories as well as of connections between communities on the scale of individual lifetimes. Working with a large network of collaborators and method specialists across zooarchaeology, osteoarchaeology, archaeology, (art) history and genetics, we aim to explore the movement histories of humans and animals living in north-east Scotland between the 3rd and 7th centuries using multi-isotope approaches to better understand contemporary connectivity, trade and exchange, and mobility. Samples include tooth and bone samples from multiple sites, including domestic sites and fort sites (in the case of faunal remains), and burial sites (in the case of human remains).

Sulphur isotope data from bone collagen indicate that in some instances animals (or animal products) were being moved to sites for consumption, particularly at the fort site of Burghead. At Burghead, strontium isotope analysis of cattle teeth, coupled with Sr concentration determinations, provide corroborative evidence of animals being moved to the site, possibly from as far a field as Orkney or Shetland. These data may evidence catchments of clientship and connectivity, reflecting both the coastal location and high status of the site. Strontium and oxygen isotope ratios determined in tooth enamel from the human burials were, for the most part, consistent with individuals spending their childhoods local to the areas in which they were eventually buried, incomers (including from the west coast of Scotland, or even Ireland) were also identified, including both males and females. The implications of these data for our understanding of early medieval communities in Scotland, and indeed for our understanding of 'Pictish' individual and group identities will be explored.

## A. FORMAL AND SPATIAL DYNAMICS OF THE BURIAL RITE – ETHNICITY, RELIGION, OR SOCIO-ECONOMIC DEVELOPMENT?

**Abstract author(s):** Hladikova, Katarina (Comenius University, Faculty of Arts, Bratislava) - Hladík, Marek (Institute of Archaeology Czech Academy of Sciences, Brno)

**Abstract format:** Poster

The geographical area of the middle and lower course of the Morava River, which produced archaeological sources that are discussed in the poster and used to demonstrate some aspects of changes in the burial rite, developed dynamically in the 1st millennium AD. Since the start of the 1st century, events in the studied area of the middle and lower course of the Morava River were accompanied by processes resulting in the origin and stabilization of medieval state units. This trend may be observed across Europe in regions originally located on the border of the Roman Empire. Our objectives are to analyse the relationship between changes in the burial rite and geographical space (using spatial analysis in GIS, spatial statistical analysis, and comparative studying of significant elements of burial rite). During the 1st millennium, settlement activities of several "ethnic" ("tribal") groups were documented in the studied area, which left traces of their presence in archaeological sources. Therefore, it is possible to analyse changes in the burial rite in relation to the ethnic and geopolitical situation. Of course, our considerations, aimed primarily at causes of the formal and spatial dynamics of the burial rite, constantly reflect on the relationship between archaeological sources and specific ethnic groups. We discuss important phenomena associated with the burial rite of Germans and Slavs, such as the change from cremation to inhumation, coexistence or continuity of these rites, and continuity or discontinuity of burial sites during the 1st millennium AD. We conclude that the primary determinant of changes in the burial rite in the studied area during the 1st millennium was ethnicity, but in synergy with religion and socio-economic development.

---

## 38 CHARACTERIZATION OF LITHIC MATERIAL IN PREHISTORY, METHODS, PROBLEMS, RESULTS

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Surmely, Fred (CNRS UMR 6042) - Civilyte, Agne (Lithuanian Institute of History)

**Format:** Regular session

The study of the circulation of lithic raw materials is an important component of prehistoric studies today. But the determination of the origins and supply circuits requires a good characterization of the materials: flint, hard rocks, quartz, soapstone, etc. This characterization can be done in several ways: macroscopic examination, microscopic examination, geochemistry of trace elements, X-ray diffraction, spectro-radiometry.

The aim of the session is to take stock of the methodology, the problems and the results of the various researches carried out to date. A focus will be made on the geochemistry of trace elements, which is a discipline of fairly recent use, and the results of which are sometimes controversial.

## ABSTRACTS

### 1 CHARACTERIZATION OF TERTIARY FLINTS BY GEOCHEMISTRY

**Abstract author(s):** Surmely, Fred (DRAC ARA)

**Abstract format:** Oral

In present-day France, tertiary flints have played an important part in the supply of prehistoric populations, due to their abundance, quality and presence in areas without marine flint. From the Upper Paleolithic until the end of the Neolithic period they were transported over far distances. Flints are found in carbonate levels belonging to palustre or lake sedimentary basins whose ages range from the Middle Eocene (Lutetian) to the Upper Oligocene. These basins are numerous on French territory and are found in many regions.

The variability of color and structure is great. The diversity of facies within the same sedimentary series, combined with the diagenetic similarity of the different tertiary sedimentary basins, are obstacles to determining the precise geographical origin of flints. Macroscopic and microscopic examinations are insufficient to attribute a precise geographical origin to an archaeological artifact. This is why the geochemical method is preferred. To form the geological repository, we have taken a very large geographical field, encompassing a large part of France, from the Marne to the Gard, and most of the major French sedimentary basins (Parisien Basin, Cantal, Gard). The archaeological corpus includes pieces from sites of the Upper Paleolithic and the Epipaleolithic of Auvergne. The geochemical study does not provide a comprehensive answer to the question of the geographical origin of tertiary flints, but nevertheless allows for certain and significant advances in knowledge. A sequel is planned, with an expansion of the reference geological corpus, incorporating other basins or portions of tertiary sedimentary basins not considered and complementing the range of samples taken in each sedimentary basin.

## 2 THE USE OF FLINT AND NON-FLINT ROCKS IN LITHUANIAN COASTAL AREA DURING THE FINAL PALAEOOLITHIC

**Abstract author(s):** Rimkus, Tomas (Centre for Baltic and Scandinavian Archaeology - ZBSA)

**Abstract format:** Oral

Baltic erratic flint outcrops in the territory of Lithuania are mainly situated in the southern part of the country. Sporadic nodules can also be found in the morainic landscape in western Lithuania, while the coastal lowlands are considered as the territory without good quality natural flint deposits. Evidence of the first human settlers during the Final Palaeolithic in the Lithuanian coastal area is scarce. The human subsistence economy and the use of lithic raw materials in this particular territory is still poorly investigated due to the lack of archaeological material. Currently, only one area contains the Final Palaeolithic settling site with lithic finds and their processing evidence. It is located in the southern part of the Lithuanian coast, in the eastern part of Aukštumala Highmoor. Three sites were located there close to each other in 2004 and 2018-2019. The sites are situated on the fluvio-glacial hill and according to the lithic technology they must be ascribed to the Final Palaeolithic Swiderian culture.

Over 350 lithic finds were obtained during the course of three excavation seasons. The lithic material revealed that good quality Baltic erratic flint raw materials were used at the sites for tools production. However, flint finds constitutes 51% of the entire lithic finds, whereas the rest of the 49% constitutes of various non-flint tools and knapping wastes. Site 3 contained possible non-flint rocks processing site with a characteristic hammerstone, cores, flake concentration and a possible knapping plate. This paper will present lithic raw material use and availability in the Aukštumala sites during the Final Palaeolithic. The presented results will shed light on the raw material imports, occurrence and preferences by the prehistoric societies in the coastal part of Lithuania.

## 3 RARE EARTH ELEMENTS GEOCHEMISTRY FINGERPRINTING EASTERN IBERIA CHERT PROVENANCE

**Abstract author(s):** Ramacciotti, Mirco (Department of Prehistory, Archaeology and Ancient History, University of Valencia; Department of Analytical Chemistry, University of Valencia) - García-Puchol, Oreto - Gallelo, Gianni (PRE-MEDOC, Department of Prehistory, Archaeology and Ancient History, University of Valencia) - Cortell-Nicolau, Alfredo (Department of Archaeology, McDonald Institute for Archaeological Research, University of Cambridge) - Juan Cabanilles, Joaquín (Prehistory Research Service, Prehistory Museum of Valencia) - Pastor, Agustín (Department of Analytical Chemistry, University of Valencia)

**Abstract format:** Oral

Cueva de la Cocina is a pivotal site for the study of the last hunter-gatherer inhabitants and neolithisation of the eastern Iberian Peninsula [1]. In recent works [2-3], cherts from potential non-local and local outcrops exploited by the cave inhabitants were chemically characterised developing a database of different raw materials deposits based on major, minor and trace elements. In particular, the analytical data statistically processed pointed out the effectiveness of rare earth elements as raw material provenance markers.

In this research, several Cueva de la Cocina artefacts unearthed from well documented Mesolithic and Neolithic levels were analysed by X-ray fluorescence spectroscopy and inductively coupled plasma mass spectrometry in order to compare their chemical profiles with those of the potential exploited outcrops. The developed approach to investigate the supply strategies for siliceous raw materials, focused in rare earth elements and multivariate statistics, provides complementary information on the mobility and occupational dynamics of Cueva de la Cocina inhabitants.

#### 4 FLINT, OBSIDIAN AND STONE ASSEMBLAGES FROM THE LINEAR POTTERY CULTURE SETTLEMENT MODRYCHI-I

**Abstract author(s):** Telishenko, Serhii - Silaiev, Oleksandr (Institute of Archaeology, National Academy of Sciences of Ukraine)

**Abstract format:** Oral

A total of 145 flint items, as well as 4 obsidian and 7 stone-made artifacts, were collected during the excavations on the Linear Pottery culture settlement Modrychi-1 in the Lviv region (Ukraine). Most of them were discovered at the central part of the classical LBC longhouse and outside its eastern wall. The assemblage of flint and obsidian items has been analyzed as an integral complex that characterizes the material culture of the Neolithic settlement. The prevailing number of flint items such as cores, flakes, and blades reflect on-site production. However, the starting phase of the core trimming could have taken place beyond the site, and afterward cores and blades arrived at the settlement already conditioned for further processing. There is also a high ratio of tools and retouched blade fragments. As for the obsidian artifacts, an attempt was made to establish the origin of raw materials. Deposits in the Carpathian basin are considered to be the most territorially closest. These are located in Hungary (Tokaj Mountains), Slovakia (Lower Zemplín), and Ukraine (Vihorlat-Gutinian ridge) – respectively chemical groups C1, C2, and C3. The collection of stone-made tools includes a distinctive item – an adze, made on the bar of fine-grained sandstone, and also knapping stone, grinders, and grindstones.

In general, the assortment of flint, obsidian, and stone artifacts is typical for most LBC sites. To a greater or lesser extent, all categories of tools are represented inherent to this culture.

#### 5 OBSIDIAN IN THE MEDITERRANEAN FROM CARPATHIAN SOURCES

**Abstract author(s):** Tykoł, Robert (-)

**Abstract format:** Oral

Obsidian from Carpathian sources in Hungary, Slovakia, and the Ukraine have been widely studied, with analyses done for archaeological artifacts from sites in Hungary and elsewhere in Central Europe showing widespread distribution. Analyses have now been conducted for many sites in Croatia and Italy, indicating the significant distances southward that obsidian traveled during the Neolithic. In southern Croatia and throughout the Adriatic, a distance of at least 750 km, obsidian from both Carpathian and Italian sources has been identified at a number of sites.

In this study, elemental analyses were conducted on a new collection of geological samples from sites in Hungary, Slovakia, and the Ukraine. The trace elements measured using a portable X-ray fluorescence (pXRF) spectrometer, including Rb, Sr, Y, Zr, and Nb, easily distinguishes at least six different groups, including Viničky, Cejkov, Tokaj, and the Ukraine. Also tested were archaeological sites in northern Croatia, where all of the obsidian artifacts tested come from these sources, while obsidian also reached as far south as the coast of the Adriatic but in lesser quantities.

The Croatian sites near the northern half of the Adriatic are about the same distance from the Carpathian Sources as from Lipari, just north of Sicily, more than 700 km, both illustrating the long-distance travel and exchange going on during the Neolithic and Copper Age (ca. 7000-3000 BCE). The initial use of obsidian began with the introduction of agriculture, most likely traveling in the same routes within the Cardial Impressed Ware network. The land-based distribution of obsidian from the Carpathian sources, including over the mountainous Dinaric Alps, is compared with the maritime routes taken by Lipari and Palmarola obsidian along and across the Adriatic. The combined data are integrated with the data available for chronology, early village sites, domesticated plants and animals, and ceramics.

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Pastor Pérez, Ana (University of Barcelona; Complutense University of Madrid) - Ayán, Xurxo (Universidade Nova de Lisboa) - Hattori, Marcia (Incipit-CSIC. Institute of Heritage Sciences) - Millán Pascual, Rafael (Incipit-CSIC. Institute of Heritage Sciences)

**Format:** Regular session

This Session aims to be a space for exchanging ideas and experiences from the increasing number of archaeological researchers of recent times, including Archaeology of the Contemporary Past, Industrial Heritage and Heritage Management. Archaeology offers concrete and situated knowledge about the plurality of temporal tensions in our current contested present. It helps to articulate different approaches when the historical discourse is not enough against epistemological populism. However, in this scenario, seasoned by a pandemic, understanding its challenges is more interesting than debating its labels.

Which are the historical conditions of our present? The Great Recession of 2008 extended and intensified the coercive nature of capitalism in different parts of the world. The neoliberal policies already displayed in the 70s were reinforced and doubled through austerity plans, implying the accelerated end of the so-called "slow cancellation of the future". Since then, it has been said that we live in a new historical regime called presentism, where the past and the future melts into the present. At the same time this "broad present" coexists with the negationism of history which can lead to anti-democratic regimes. How can we make diagnostics and propositions to combat the reification of the present in such a context? We propose to answer this question through practices from shared

interdisciplinary scenarios, where there is room for exchanges of perspectives and areas of work between different stakeholders. This session proposes an open forum to co-create knowledge on the subject of:

1. Interdisciplinary projects committed to the socio-economic challenges of the territories and actions for change.
2. Archaeological projects on deep economic and industrial landscape transformations, whether in rural or urban areas.
3. Different research on the process of expansion of inequalities and alternative forms of resistance by communities.
4. Studies on contemporary heritage sites or assemblages.

## ABSTRACTS

### 1 THE SUPERMODERN CITY: ARCHAEOLOGY AND ARCHITECTURE IN THE TIME OF PRESENTISM

**Abstract author(s):** Incio-del-Río, Cristina (Incipit-CSIC) - Falquina-Aparicio, Álvaro (Independent researcher)

**Abstract format:** Oral

Presentism implies to a large extent a dematerialization of time, which undermines the main epistemological bases of archaeology. In contemporary archaeology there are tendencies that can endanger these same epistemological keys, as well as the historicity of materiality, by proposing a symmetrical and non-conflicting vision of the relations between things in the present.

Supermodernity as an ideology, in which the present is its only temporal reality, sometimes marginalizes and annihilates this historical materiality: in the -political- process of reality production, the destruction of architectures from different periods generates architectural pastiches and amalgamations of rubble in which temporality is blurred, by making disappear the assemblages and stratigraphy that allow us to understand the temporal and dialectical tensions of the materiality of the past with respect to the constructed present .

Our proposal tries to give perspectives and methodological tools to confront the study of contemporary materiality, confronting the presentist visions of it. We focus specifically on built space, in this case on the architecture and urbanism of cities, since we consider that they are elements that by themselves have the capacity to deny the reification of the present: through the analysis of contemporary built space, we can see how elements of the past survive and act, thus shaping a present with history and emancipatory potentialities in the face of the policies of spatial construction of presentism in the everyday life of the cities of turbo-capitalism.

### 2 CONTESTING LANDSCAPES: A STUDY ON THE SETTING OF A CONTRACT ARCHAEOLOGICAL EXCAVATION IN A STOCKHOLM SUBURB

**Abstract author(s):** Nelson, Matthew (Linnaeus University)

**Abstract format:** Oral

In this presentation I will investigate what happens when a major contract archaeological excavation is dropped into an urban context of contested values and interests in a northern suburb of Stockholm, Sweden. New legislation has

put further demands on contract archaeology that the production of knowledge should be relevant for society and accessible to the public. What happens when these goals are applied in reality?

My study will take a landscape centered approach, applying the concept of contested landscapes to analysis. The study will show how the process of a professional temporal space formed by the notion of cultural environment together with the process of contract archaeology, (- what I call the archaeological heritage landscape), must compete with other contesting forms of landscapes sharing the same location, and the agendas tied to these.

I will also address how the formation of economic, cultural, and social capital in society, affects the position of actors and stakeholders. How do the capital and values associated with different actors and stakeholders relate to these contesting landscapes, what are the reasons for this, and how does it affect contract archaeology?

The study will focus on outreach efforts on behalf of contract archaeology and on the relationship between the archaeological contractors, other actors in the process, and the rest of society on a local level who are affected by the excavation site and process. Who is included and excluded in the archaeological process and the outreach program? In this I will evaluate the role of an archaeological heritage in a contested landscape.

### 3 CONFLICTS, ARCHAEOLOGICAL HERITAGE MANAGEMENT AND URBAN CHANGE

**Abstract author(s): Corpas, Nekbet (Independent researcher)**

**Abstract format: Oral**

This communication addresses disputes in archaeological heritage management: their analysis and resolution in a creative way so as to create governance models of heritage and urban change that take into account city's inhabitants. Drawing on the field of conflict resolution and analysis, conflicts or disputes involving archaeological heritage reveal a relationship that in its current form is not satisfactory for at least one of the stakeholders taking part. Different societies have developed various ways to manage people's disputes: rights-based approaches (e.g. judicial system), power-based ones (e.g. demonstrations) and interests-based approaches (e.g. mediation). This last means, and particularly mediation, deals with the interests of all stakeholders involved (local and state governments, NGOs, developers, ...), which may include: economic interests, social recognition and acceptance, a role in urban decision-making procedures, etc. Resolving disputes requires analysing values (e.g. the significance of nature over development) and considering power differentials as well. According to theory, there are three main elements of a dispute: people, process and problem. Disputes always have a time component: there has been a past history between the parties of the dispute and this history explains the conflict and how it has been dealt with. Simultaneously, interest-based approaches to disputes like mediation are future-oriented: the past of the dispute is addressed but it does not become the focus of the intervention to resolve it. The future is the key: how the dispute involving archaeological heritage can open a window to create new dynamics where stakeholders can deal with their differences in a more fulfilling way. This approach is consistent with developments in heritage management (Faro Convention and the Recommendation on Historic Urban Landscape) as to how address change in our increasingly under-pressured cities. As such, it is an opportunity to pursue the human right to the city: to shape and live it.

### 4 THE URBAN HERITAGE IN THE CASE OF THE "HOUSES FOR 1 EURO" PROJECT OF THE MUNICIPALITY OF TARANTO (ITALY)

**Abstract author(s): Frascella, Selene (University of Barcelona)**

**Abstract format: Oral**

The value of the urban heritage cannot be crystallised in one form or time. Its changes can be illustrated by the official decisions taken about preserving some structures or, on the contrary, letting them disappear. These decisions are the result of different and diachronic power dynamics, interests and uses. In the Recommendation for Historic Urban Landscapes UNESCO defined the historic urban landscape as "the urban area understood as the result of a historic layering of cultural and natural values and attributes, extending beyond the notion of 'historic centre' or 'ensemble'" (2011:3). In light of this interpretation, this contribution analyses the case of the "Houses for 1 euro" (Case ad 1 euro, in Italian) campaign of the Municipality of Taranto, southern Italy, from an archaeological perspective. The campaign promotes the sale of abandoned and degraded buildings in the historic centre. Interested parties pay a symbolic amount on the sole condition of taking care of their urban restoration. This project is the result of a top-down urban regeneration policy. Thus, from a static and material perspective, heritage is seen an opportunity for investment and economic growth, although, we will argue, may also lead to a gentrification of the area. In this paper a critical analysis of this case study will be undertaken through a transversal conception of time and space, not limited to the material sphere, and considering all the elements acting on urban transformations. The paper aims to explore whether this approach can lead to a conversation between all the multiple values and narratives that configure the urban heritage ecosystem in Taranto. We will seek to assess whether consensual dialogues applied to urban planning, understood as mediated and respectful of community identity may act as an alternative to unidirectional, neo-liberal dynamics, implemented by municipal policies.

## 5 DEVELOPMENT-LED ARCHAEOLOGY AS ARCHAEOLOGY OF THE PRESENT

**Abstract author(s): Beck, Anna (Museum Southeast Denmark)**

**Abstract format: Oral**

Rather than being regarded as the documentation and rescue of remains of the past, development-led archaeology should be regarded as an archaeology of the present: it is caused by events in the present, it takes place in the present and it investigates archaeological remains, not in their original form, but as they appear in the present. As such, the overall aim of development-led archaeology would not be to uncover the past but rather to add new temporal dimensions to the present.

In the paper, this argument will be unfolded and the practical consequences of such an approach discussed. The paper is based on the preliminary experiences and reflections from a new research- and dissemination project processing the extensive archaeological record from a large development project north of the city of Køge, Denmark. Here, the building of a new neighbourhood will add a large number of new inhabitants and new workplaces to the existing settlement. However, it will also lead to radical transformations that will remove the historical characteristics of the landscape and challenge the existing communities in the area.

Rather than describing the development of the area from the Late Mesolithic to the present, we will let the processing of the archaeological record focus on exploring and discussing themes related to the challenges created by the current development in a long-term perspective. To supplement and mirror the results of the traditional archaeological excavations, additional archaeological investigations will be made in the present settlement in collaboration with its inhabitants. As such the project makes a good starting point for discussing how development-led archaeology more generally can exploit its privileged position as a concrete link between past, present and future.

## 6 A BAUHAUS WASTE DEPOSIT – 20TH CENTURY WORKING-CLASS CONSUMPTION AND SYSTEM CHANGE THROUGH THE MAGNIFYING GLASS

**Abstract author(s): Rösch, Felix (University of Göttingen, Seminar für UFG)**

**Abstract format: Oral**

In 1930 a total of five Laubenganghäuser (tenement houses with galley access) were built in Dessau (Germany), on the initiative of the second Bauhaus director Hannes Meyer. The houses were designed to meet the needs of working-class families, while providing maximum comfort for low rent. The concept of the Laubenganghäuser also included external facilities such as allotment gardens, a washhouse and a playground.

As the use and appearance of the facilities have changed considerably over the years, the site underwent excavations in 2018 in order to reveal the original setting. A number of features dating to the construction period were brought to light. The archaeologists also unexpectedly came across a large waste disposal pit dating to 1945, which had been dug into a pre-existing sandbox. Besides militaria, the feature contained household interior and debris of several apartments that had been destroyed by World War II-bombing. The analysis of the material evidence allowed for precious insights into everyday life and consumption of working-class families. The discovery of military equipment, as well as objects related to Nazi propaganda and even self-made Jewish ceramics informs us further to which extent the political change in the 1930s and the following war had affected the life of the Laubenganghaus inhabitants.

In this paper, I will argue that the fill of the waste deposit can function as magnifying glass to reveal aspects of the impact of major societal changes and events of the first half of the 20th century – socialism, Nazi rule and the World War II – on the working-class. This case study demonstrates that even small archaeological investigations on material evidence can significantly improve our knowledge of the modern period.

## 7 SCARS OF THE FILM INDUSTRY IN MADRID. THE GOLDEN CITY MOVIE SET

**Abstract author(s): Martín, Jesus (Universiteit van Amsterdam)**

**Abstract format: Oral**

In 1960 Franco's regime significantly reduced the costs charged for filming in Spain, stimulating the growth of a new film industry as film directors sought locations in rural areas close to major cities. The arrival of big Hollywood productions such as *Spartacus* (Kubrik, 1960) or *55 Days at Peking* (Ray, 1963) led to the construction of gigantic film sets. This initial wave of Hollywood films significantly impacted the later development of European Westerns and peplum as hundreds of Spanish technicians, and professional actors gained experience working on these mega-productions.

The film industry also significantly boosted the local economy. Many inhabitants of villages to the north of Madrid were employed as extras or were paid to take care of the catering, transport, and site security. However, within a decade, the industry was in decline and eventually disappeared. This left a substantial economic void in the region and scars on the landscape of ruined sets that can still be seen today.

This paper will explore evidence from the "Golden City" set, the first permanent set built in the vicinity of the village of Hoyo de Manzanares in 1962 and the recovering and documenting tasks carried out by the local citizens' associ-

ation "Hoyo Cine". More than sixty movies were filmed in this location, including the acclaimed *For a Fistful of Dollars* (Leone, 1964). The Golden City set was abandoned by its promoter in 1975 but remained standing for several years and was finally demolished in 2010. The methods proposed by "fake archaeology" will be used to understand the landscape transformation in this rural area.

## 8 ON THE ANACHRONISM OF THINGS: ARCHAEOLOGY AND THE NON-CONTEMPORANEITY OF THE PRESENT (THREE CASES FROM RURAL SPAIN)

**Abstract author(s):** Millan-Pascual, Rafael (CSIC - Spanish National Research Council, Institute of Heritage Sciences)

**Abstract format:** Oral

'Presentism' is generally assumed (and felt) as our new historical regime. The past is no longer one distinctive historical category distant from us, but one among the many and varied dimensions of the present. Without a clear expectation about the future, it is the way our accelerated societies deal with time, and, to some extent, how capitalism consumes the past (or any time). In this sense, nostalgic consumerism is one uncanny echo from the past, so much as one social reaction towards acceleration. We all need to ground somewhere, even if this feeling implies the idealization of the past. For any reactionary movement, this context is one opportunity for their ideal cancellation of time, as they dream to get the definitive one (their one).

Rural lands and specially depopulated rural areas fluctuate between such idealization and reaction. It is presumed that some authenticity remains in the alleged simple rural way of life. At the same time, the ruin of the rural is considered one painful catastrophe under some nostalgic stances. These ideas create the other-ness of the rural, and its anachronism. To explore this question we need to move on from one static sense of 'presentism' towards the more decisive problem of the articulation of past, present, and future. That is the active production of the past in the present. For this reason, in this contribution, I propose to rethink this articulation through the Gramscian notion of non-contemporaneity instead of the most extended idea of multi-temporality. It is neither about the negation of the contemporaneity of the rural, nor just the phenomenon of 'allochronism', but its 'imposed anachronism' precisely because we depart from one homogeneous notion of the present (their one). Why if the present is not contemporaneous with itself? Is this non-contemporaneity the condition of any emancipatory politics?

## 9 MAGNETS ON MY FRIDGE: CONSTRUCTING SELF-IDENTITY AND SOCIAL NETWORKS THROUGH MOBILITY NARRATIVES IN DOMESTIC SPACES

**Abstract author(s):** Albero Santacreu, Daniel (Universitat de les Illes Balears)

**Abstract format:** Oral

Mobility is essential for human experience and everyday life. The emergence and development of mass tourism and globalization in the second half of the 20th century changed our physical mobility but also the way we construct our identity and define our social status through mobility. Mobility can be unaffordable for many people, since it takes money, knowledge and time. In this sense, the magnets that we purchase on our trips and we put on the door of our fridges are displaced objects that become a symbol of "being there". Magnets are mundane objects, but they are different from other everyday objects in the sense that they are made to be shown and to exhibit their exogenous origin.

In this presentation we are going to reflect on how fridge magnets are much more than mere decorative elements and constitute biographical objects loaded with narratives that are actively used in the construction of our self-identity. In addition, we will explore how this "technology of the imagination" is also used to strengthen our social bonds and define group's social status through mobility. Therefore, our research addresses how the presence of magnets inside our homes -closely associated with the mobility of people and things- can be related to a wide range of political, economic, ideological and social factors.

Finally, following some principles of the Actor-Network Theory, we will consider the role that the very physicality of magnets plays in these phenomena and how make magnets perfect people's allies in the definition of their social and economic capital.

## 10 CYCLICAL RUINS: A VIDEOPOEM ON 'SUN AND SAND' TOURISM SPACES IN THE LOW SEASON

**Abstract author(s):** Arboleda, Pablo (Incipit - Institute of Heritage Sciences)

**Abstract format:** Oral

Attracted by low-cost 'sun and sand' destinations, an increasing number of tourists visit the Spanish Mediterranean regions every summer – a fact that, within the 2008 post-crisis scenario, the authorities and general opinion have assumed to be a positive trend due to the growth that tourism represents in national macroeconomic data. However, such a development model has an evident side effect in terms of urban space. When summer ends, thousands of hotels, restaurants, leisure resorts, residential complexes, promenades, shops, etc. remain empty, merely awaiting the next year whilst leaving a series of obsolete materialities behind. Considering that a ruin is an abandoned place

where there was once an activity, it is suggested that their state of desertion during winter allows us to regard these seasonal archaeologies as 'cyclical ruins', representing a critical metaphor of the country's tourism model at present. In December 2019, I conducted a three-day road trip through 500km to explore the main 'sun and sand' tourism destinations in Southern Spain. The object was to reflect on a de-contextualized sense of place affected by the presentism of being-in, raising intimate feelings and impressions such as solitude, melancholia and sadness that resulted just the opposite of those for which these spaces are originally conceived. Deploying the notions of 'temporal liminality' and 'spectral ethnography', the goal is to contribute to interdisciplinary literatures on modern ruination – including cultural geography, contemporary archaeology, critical heritage, and urban studies. Also, the aim is to highlight the capacity of urban ambiances and the aesthetics of discomfort to contest the socio-economic challenges deriving from the unlimited development and aggressive shaping of the seafront landscape. Through the elaboration of a collaborative, 8-minute length videopoem, this presentation advances the potential, credibility and appeal of engaged, art-led practices and methodologies towards creative scientific writing.

## 11 THE CARDBOARD HOSPITAL OF CAPDELLA: INTERDISCIPLINARY CHALLENGES FOR THE ARCHEOLOGY OF THE PRESENT

**Abstract author(s):** Pastor Pérez, Ana (Institute of Archaeology of the University of Barcelona - IAUB; Norwegian Institute for Cultural Heritage Research - NIKU; Research Group of Cultural Heritage Management. Complutense University of Madrid - UCM) - Remacha Acebrón, Sigríð (University of Barcelona, Culture and Society Program - UB; National Museum of Science and Technology of Catalonia - MNACTEC)

**Abstract format:** Oral

In this work, we explore the interdisciplinary challenges surrounding the "Cardboard Hospital" renovation project in the mountain village of Capdella (Vall Fosca, Catalonia). Built in 1912, this prefabricated building of German origin is mainly made of wood and cardboard. The Cardboard Hospital functioned as a field hospital for the first large hydroelectric power plant construction in Catalonia (1911-1914). Originally intended only for the most immediate medical needs during the hydroelectric plant construction, the hospital was never dismantled and relocated. It became a multifunctional space until its gradual abandonment and deterioration until today. Due to a series of disturbances caused by the automation of the Hydroelectric Power Plant during the 1990's, much of the documentation was lost forever.

In 2020 the electric power company (Endesa) sold the hospital's land to the local authorities under the condition of starting a process of valorisation of the building and surroundings. The renovation project wants to preserve the hospital materiality and the oral stories and memories which grow up around the heritage space. The National Museum of Science and Technology of Catalonia (MNACTEC) is leading this interdisciplinary and participatory project that seeks to involve the local community in every step of scientific research. Through different instances of community archaeology and ethnographic research, we pursue to reveal how the numerous narratives linked to the hospital are entangled with each other and with its contemporary buildings. By sharing our incipient findings, we want to open a debate to discuss effective conservation strategies encompassing multivocal discourses to avoid muting local perspectives and to respond to the current challenges related to this site.

## 12 AGAINST THE NORMALITY OF EVERYDAY STATE VIOLENCE: A HISTORICAL ANALYSIS FROM THE BRAZILIAN CONTEXT

**Abstract author(s):** Hattori, Márcia (Institute of Heritage Sciences - Incipit)

**Abstract format:** Oral

This paper explores how different bodies, individuals and populations are variously categorized as undesirable, dangerous, and deviant, through the different forms of treatment they have received throughout their lives and deaths. It is argued that, if during life these populations are over-controlled by the State through its institutions and forms of policing, they are then also neglected and abandoned in the construction of their citizenship in death. A major approach of this work is to observe how material elements linked to individuality, a fundamental concept in the identification process, were lost on the way to burial. It is argued that institutional omission is one of the techniques of making people, whose bodies are not considered important, disappear. Further, when racism, sexism and classism essentially crossed paths, in the form of negligence and omission by officers and the State itself in the treatment of those people who are deprived of their status as political subjects, such people can only attain a socially acknowledged status of 'disappeared' when their fate is exposed by the mass media, social movements and/or family groups. The aim of this paper is to reflect on the idea that the normality of state violence is, in fact, the normality of a broad process of genocide and of annihilation of entire groups, reaffirming these groups' status of subalternity.

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Tereso, João (CIBIO, Centro de Investigação em Biodiversidade e Recursos Genéticos; BIOPOLIS Program in Genomics, Biodiversity and Land Planning; Centre for Archaeology. UNIARQ. School of Arts and Humanities. University of Lisbon; MHNC - UP - Natural History and Science Museum of the University of Porto; B-ROMAN Project PTDC/HAR-ARQ/4909/2020; Centre of Interdisciplinary Studies, University of Coimbra) - Detry, Cleia (Centre for Archaeology. UNIARQ. School of Arts and Humanities. University of Lisbon; B-ROMAN Project PTDC/HAR-ARQ/4909/2020) - Vaz, Filipe (CIBIO, Centro de Investigação em Biodiversidade e Recursos Genéticos; BIOPOLIS Program in Genomics, Biodiversity and Land Planning; B-ROMAN Project PTDC/HAR-ARQ/4909/2020) - Peña-Chocarro, Leonor (Spanish National Research Council-Consejo Superior de Investigaciones Científicas - CSIC; GI Paleoeconomía y Subsistencia de las Sociedades Preindustriales, Instituto de Historia - IH-CSIC; B-ROMAN Project PTDC/HAR-ARQ/4909/2020) - Valenzuela-Lamas, Sílvia (Spanish National Research Council-Consejo Superior de Investigaciones Científicas - CSIC; Archaeology of Social Dynamics, Milà i Fontanals Research Institute - ASD, IMF-CSIC; Centre for Archaeology. UNIARQ. School of Arts and Humanities. University of Lisbon; B-ROMAN Project PTDC/HAR-ARQ/4909/2020)

**Format:** Regular session

The expansion of the Roman Empire was a gradual process and far more encompassing than a mere military conquest: it also corresponded to the dissemination of novel cultural, religious and economic models. The introduction of new agricultural and husbandry practices, foodstuffs and other biological resources were fundamental steps of this process.

However, the de facto implementation of the *modus romanus* throughout a vast and diverse territory, inhabited by a wide variety of communities with distinct backgrounds and identities, was particularly complex and varied. Thus, understanding the regional or provincial specificities is crucial to properly assess and characterize the impacts of the Roman administration among the everyday life of indigenous communities.

In this session, we aim to explore how biological resources were exploited by indigenous communities, at local and regional levels, and to understand their role within the framework of the new economical and territorial exploration model imposed by the Roman Empire from the 2nd century BC to the 5th century AD. A wide variety of studies are thus welcomed, namely archaeobotanical, zooarchaeological, ancient DNA and isotopic analysis, as well as other proxy directly associated with biological resources.

Papers should focus all themes associated with plant and animal remains such as subsistence strategies, agricultural technical aspects, trade, species distribution, introduction, improvement/selection and their role in rituals and other cultural/social activities. Approaches addressing other rarer biological products such as honey, fungi, wild animals and plants, as well as these activities impacts in the perceivable environment are also welcomed. Regional or broader synthesis are preferred but interdisciplinary and highly informative site-studies will also be accepted.

## ABSTRACTS

### 1 BIOLOGICAL RESOURCES AND THE EXPANSION OF NEW ECONOMIC AND CULTURAL MODELS THROUGHOUT THE ROMAN EMPIRE: AN INTRODUCTION TO THE SESSION

**Abstract author(s):** Tereso, João (Associação BIOPOLIS; CIBIO, Centro de Investigação em Biodiversidade e Recursos Genéticos; Centre for Archaeology. UNIARQ. School of Arts and Humanities. University of Lisbon; MHNC - UP - Natural History and Science Museum of the University of Porto; B-ROMAN Project PTDC/HAR-ARQ/4909/2020; Centre of Interdisciplinary Studies, University of Coimbra) - Detry, Cleia (Centre for Archaeology. UNIARQ. School of Arts and Humanities. University of Lisbon; B-ROMAN Project PTDC/HAR-ARQ/4909/2020) - Vaz, Filipe (Associação BIOPOLIS; CIBIO, Centro de Investigação em Biodiversidade e Recursos Genéticos; B-ROMAN Project PTDC/HAR-ARQ/4909/2020) - Valenzuela-Lamas, Sílvia (Spanish National Research Council-Consejo Superior de Investigaciones Científicas - CSIC; Archaeology of Social Dynamics, Milà i Fontanals Research Institute - ASD, IMF-CSIC; Centre for Archaeology. UNIARQ. School of Arts and Humanities. University of Lisbon; B-ROMAN Project PTDC/HAR-ARQ/4909/2020) - Peña-Chocarro, Leonor (Spanish National Research Council-Consejo Superior de Investigaciones Científicas - CSIC; GI Paleoeconomía y Subsistencia de las Sociedades Preindustriales, Instituto de Historia - IH-CSIC; B-ROMAN Project PTDC/HAR-ARQ/4909/2020)

**Abstract format:** Oral

The expansion of the Roman Empire and the implementation of new socioeconomic models in the occupied territories were complex processes and varied greatly depending on the characteristics of indigenous communities and how its conquest took place. As such, despite having a strong common background, painstakingly established by Roman administration, trade, armies and religion, Roman society was in fact diverse.

The study of plant and animal remains in articulation with other archaeological evidences and written sources has the potential to shed some light on this diversity. By providing evidence on the exploitation, production, trade and consumption of biological resources in different chronological, environmental and social contexts, these approaches may help us clarify the powerful role such resources had in the introduction of new social and economic models and in the shaping of landscapes during Roman Times.

In this paper we will explore the role of zooarchaeological and archaeobotanical investigation in the study of the Romanization process, with a particular emphasis in the western empire, and present the research lines that stand in this session's core.

## 2 APPROACHING WOODLAND MANAGEMENT DURING ANTIQUITY IN NE OF THE IBERIAN PENINSULA

**Abstract author(s):** López Castillo, Eva María - López-Bulló, Oriol - Berrocal Barberà, Anna - Piqué Huerta, Raquel (Department of Prehistory, UAB) - Castanyer, Pere (Archaeological Museum of Catalonia-Empúries) - Pera, Joaquim (Department of Antiquities and Middle Age Studies) - Rodrigo, Esther (Department of Antiquities and Middle Age Studies) - Tremoleda Trilla, Joaquim (Department of History and History of Art from Universitat de Girona) - Frigola Torrent, Joan (Museu Arqueològic de Banyoles)

**Abstract format:** Oral

Woodland management, i.e. pollarding, coppicing or pruning, are documented through written sources and iconography from the Roman period onwards. These practices could affect different species and with different purposes: improving the production of fruits, procuring fodder or obtaining timber or wood with specific shape and size. However, direct evidences of these practices are scarce or difficult to identify in the archaeological record. The application of the measuring of the diameter and the number of tree rings of wood remains have recently been applied to identify woodland management practices with promising results for prehistoric cases (Out et al 2013). This paper aims to present the results of the application of this method to the exceptionally well preserved waterlogged wooden materials from Roman and Late Antiquity wells of North-East Iberia in order to determine practices of woodland management and pruning. The Roman archaeological site of Ileso (Guissona, Spain), dated s. III d C and Vilauba (Camòs, Spain), dated s. VI-VII dC has provided a significant amount of branches of different taxa that allow such an approach. Moreover, the wide variety of archaeobotanical studies developed on these sites, of both waterlogged and charred wooden and carpological remains, allow the contextualization of the results with respect to other evidences of tree cultivation or plant management.

## 3 COMBINED TRADITIONS: ARCHAEOZOOLOGY OF THE ROMAN-PERIOD-BURIALS IN POTZNEUSIEDL (BURGENLAND-AUSTRIA, 1ST-3RD CENTURIES AD)

**Abstract author(s):** Saliari, Konstantina (Naturhistorisches Museum Wien) - Formato, Lucia (Österreichische Akademie der Wissenschaften)

**Abstract format:** Oral

The archaeological and archaeozoological record from present-day Austria offers evidence about significant socio-political and economic changes that took place during the Roman period. Faunal remains from settlements indicate changes in husbandry practices and livestock management, whereas material from graves shows that the mortuary behavior of the local communities was also affected by the Roman presence. The current work investigates animal bones from the inhumations (1st century) and cremations (1st-3rd) found in Potzneusiedl (Burgenland, Austria) and discusses how people dealt with loss and death in a time of great novelties but also challenges. In order to better understand the impact of the Roman influence, a comparative study was conducted between funerary contexts of the Iron Age and Roman period, but also between faunal assemblages from settlements deriving from these periods. Our results suggest cultural mixing of local and newly imported traditions as early as the 1st century AD, additionally supported by archaeological finds. A final aspect of the analysis concerns the examination of the cremated animal bones, which can provide vital information on the pyre and the ritual itself.

- 4** **BIOLOGICAL RESOURCES (CROPS, WOOD AND ANIMALS) IN SANTARÉM (PORTUGAL) IN THE ROMANIZATION OF IBERIA'S SOUTH-WESTERN FAÇADE**
- Abstract author(s):** Costa Vaz, Filipe (CIBIO - University of Porto) - Detry, Cleia (UNIARQ - Centre for Archaeology University of Lisbon; School of Arts and Humanities - University of Lisbon) - Davis, Simon (DGPC - Directorate-General for Cultural Heritage; CIBIO - University of Porto) - Arruda, Ana - Viegas, Catarina (UNIARQ - Centre for Archaeology University of Lisbon; School of Arts and Humanities - University of Lisbon) - Tereso, João (CIBIO - University of Porto; UNIARQ - Centre for Archaeology University of Lisbon; Natural History and Science Museum - Univ. of Porto)
- Abstract format:** Oral
- For 20 years, excavations in Alcáçova de Santarém (Portugal) revealed a variety of contexts, spanning over 1500 years, from the Bronze Age to Medieval Times. A large number of biological remains, mostly encompassing animal bones and charred plant macroremains were recovered, but only the former have been published.
- Here, we will present novel archaeobotanical data from the Late Iron Age and Roman period, which will be integrated with the available zooarchaeological data, to provide a combined narrative on environmental dynamics, food consumption, agriculture and animal husbandry, in the framework of the Romanization of South-western Iberia. Although there is some continuity in the exploitation of major domestic animals such as sheep, goat, cattle and pig, there is a decrease in the presence of red deer and an increase of chicken and oyster, which may reflect changes in food consumption, economy and landscape. Charcoal data doesn't suggest major changes in vegetation, since firewood was gathered in different scrubland and woodland formations in both periods. Offsite pollen analysis, however, document the expansion of cultivated areas. Grains of barley and naked wheat are present throughout the whole sequence of Alcáçova de Santarém, but grapevine and other domestic and wild taxa were also recovered.
- 5** **LANGUAGE AND DIET CHANGE DURING THE IRON AGE-ROMAN TRANSITION NE IBERIA: AN INTEGRATED STUDY OF CABRERA VALLEY (CATALONIA, SPAIN)**
- Abstract author(s):** Valenzuela-Lamas, Silvia (ArchaeologyHub.CSIC) - Nieto-Espinet, Ariadna (University of Lleida) - Sinner, Alejandro (University of Victoria)
- Abstract format:** Oral
- Meat diet is often used as a reflection of cultural and socio-economic changes. Here we provide an interdisciplinary study combining zooarchaeological, funerary and epigraphic data as proxies for understanding complex processes and dynamics of cultural change between the late Iron Age and early Roman times NE Iberia. The faunal remains indicate the existence of significant dietary changes before and after the Roman conquest (starting in 318 BCE), while the epigraphic evidence implies that language changed at a slower pace, as shown by the use of indigenous onomastics and the continued use of the Iberian script, coin legends included until the 1st. c. BCE. Funerary practices changed before the predominance of Latin names attested in the 1st. c. CE, thus showing that cultural change may take place at different levels and according to different rhythms depending on the aspect involved (cooking, funerary practices, language). In addition, differences may occur between sites and even households at a given location.
- 6** **COPING WITH THE PAX ROMANA. THE SUNKEN BYRE AND CHANGES IN THE AGRICULTURAL SYSTEM OF GERMANIA INFERIOR AND GALLIA BELGICA**
- Abstract author(s):** Van der Velde, Henk (ADC ArcheoProjecten)
- Abstract format:** Oral
- At the beginning of the 1st century AD the northwestern parts of the Roman Empire (modern day Belgium and the Netherlands) became integrated in the Roman Empire. The process leading to the establishment of the Roman provinces of Germania Inferior and Gallia Belgica took almost a century resulting in the building of the limes infrastructure, administrative centres and road networks. By then a period of economic and population growth started resulting in an increase of the number of settlements. In this contribution we will focus on the Pleistocene parts of the study area. During the 2nd century AD almost all settlements witnessed the introduction of the sunken byre. This indicates the introduction of a new agricultural system. Funded by the Flemish Heritage Agency a multidisciplinary team of archaeologist and palaeo-botanists researched this sunken byres in order to reconstruct the way the agricultural system changed order to feed a growing population.

## 7 THE FAUNAL REMAINS FROM CALLE ALMENDARALEJO AND DOMUS MITREO (MÉRIDA, SPAIN): ONE MORE PIECE IN THE PUZZLE

**Abstract author(s):** Detry, Cleia (UNIARQ/FLUL) - Heras Mora, Javier (Junta de Extremadura) - Bustamante-Álvarez, Macarena (Universidad de Granada)

**Abstract format:** Oral

During the last 10 years we have been accumulating data concerning animal management in Roman Lusitania. We now understand a little better about what was being consumed and used during the roman period in Southwestern Iberia.

We have found clear differences between, on the one hand, cities founded by the Romans, such as Mérida and Ammaia, and on the other, cities with previous occupation such as Lisbon (Olisipo), Santarém and Conimbriga. The first group preferred the consumption of cattle and the second group favoured smaller animals such as sheep, goat and pig. Moreover, larger cattle were only found in the first group and in villas also of founded by Romans. This pattern is also observed in other parts of the Iberian Peninsula. However, in other parts of the Roman empire these zooarchaeological indicators do not always seems to apply once more data are available. This emphasizes the importance of large amounts of data.

An aspect that is common throughout Lusitania is a preference for hunting big game and consumption of oysters. This pattern appears at the sites of Casa del Mitreo, Domus Mitreo and Calle Almendralejo.

In Mérida we only had the results of a study of the fauna of Casa del Mitreo, but we have now studied the remains from Calle Almendralejo and Domus Mitreo. These remains date from the 1st Century BC until the 4th century AD. The pattern seems to confirm the ones already observed in Mérida including the finds of exotic animals such as camel which confirms the Roman introduction of exotic animals and new ways of managing them. Cattle also appear to have been the preferred animal both eaten and used for traction.

## 8 ZOOARCHAEOLOGICAL INSIGHTS ON THE INTEGRATION OF THE BALEARIC ISLANDS INTO THE ROMAN WORLD

**Abstract author(s):** Valenzuela, Alejandro (Department of Historical Sciences & Art Theory. University of the Balearic Islands - UIB)

**Abstract format:** Oral

The integration of the Balearic Islands within the Roman world entailed a series of important changes in the socio-economic and socio-political organization of the indigenous communities of the islands. These changes, however, did not occur simultaneously and their significance, character, and distribution have variably been interpreted and debated by historians and archaeologists alike. Some archaeological indicators, such as settlement patterns, ceramics and iconography, have been linked to issues of cultural and economic domination, resistance and syncretism.

Zooarchaeology has a critical role to play in the archaeological study of Roman colonization by providing new lines of evidence on fundamental questions such as changes in traditional foodways and political economy. Taking these considerations into account, this presentation aims to inform and discuss the numerous implications that occurred in the production, transformation and distribution of animal resources in Mallorca and Menorca during the late Republic and Empire. To do this, a variety of features of the zooarchaeological record will be explored (i.e., frequencies, metric and non-metric variations, and species translocation) and special attention will be given to characterize the time and rate of these changes.

## 9 EVALUATING ROMAN INFLUENCE AT THE EDGE OF THE EMPIRE BY ZOOARCHAEOLOGICAL META-ANALYSIS

**Abstract author(s):** Everett, Sarah (BioArCh, Department of Archaeology, University of York)

**Abstract format:** Oral

This talk presents PhD research that seeks to evaluate the extent of Roman influence at the edge of the Empire via the analysis of zooarchaeological data. It applies an approach that is well-established in the study of the Roman provinces to two regions at the furthest reaches of Roman control: one in southeast Europe, spanning the Danube limes, and the second in northern Britain, spanning the frontier along Hadrian's Wall. Roman imperial expansion led to a variety of changes in animal exploitation in occupied regions — in particular, livestock improvement and greater specialisation within husbandry practice. Zooarchaeological analysis has demonstrated the regional specificities of such changes and the extent to which they occurred across the varied territory of the Empire, providing an insight into the extent of Roman influence in the provinces. The current paper applies a similar zooarchaeological approach to two regions that span the imperial border, encompassing (a) long-standing provinces of the Empire, (b) territories only briefly subject to direct imperial control, and (c) regions beyond the furthest reaches of the Roman administration. The paper presents a synthesis of published zooarchaeological data aimed at evaluating the extent of Roman influence across this varied region through time. It will consider the role played by factors such as site type and loca-

tion, proximity to communication routes, and local pre-Roman husbandry practices in influencing the trajectory of change in animal resource exploitation during the Roman imperial period.

## 10 BETWEEN LIFE AND DEATH. INVESTIGATING FOOD AND FUEL IN THE EARLY IMPERIAL NECROPOLIS OF ST. ANTONI MARKET (BARCELONA, SPAIN)

**Abstract author(s):** Tarongi, Miguel (Universitat de Lleida. Facultat de Lletres) - Bianco, Sabrina (Catalan Institute of Human Paleoecology and Social Evolution - IPHES-CERCA; University of Barcelona, Faculty of Geography and History) - Alonso, Natàlia (Universitat de Lleida. Facultat de Lletres) - Allué, Ethel (Catalan Institute of Human Paleoecology and Social Evolution - IPHES-CERCA; University Rovira and Virgili, Department of History and Art History) - Riera Mora, Santiago (University of Barcelona, Faculty of Geography and History) - Hinojo, Emiliano (Freelance archaeologist) - Miró i Alaix, Carme (Archaeological Service of Barcelona, responsible of Pla Bàrcino, Direcció de Memòria, Història i Patrimoni – Institut de Cultura - ICUB)

**Abstract format:** Oral

Excavations carried out recently (2011-2017) at the St. Antoni covered market, located in the western part of the Barcelona city, have provided a wealth of information to understand the functionality of this area since the Roman times. In fact, below the structure of this building, a 50-metre-long section of a main Roman road (called Via Augusta) has been discovered. This branch of the road was built at the end of the 1st century BC to link the ex-novo founded colony of Bàrcino (Barcelona) with neighbouring cities, as for example Tarraco (Tarragona), Iluro (Mataró) and Baetulo (Badalona). In association with this road, part of a necropolis with several funerary enclosures have been identified on both sides, including burials and cremations, dating the 1st century AD.

In this framework, the aim of this work is to provide new information on the selection of plant resources in the necropolis, based on symbolic, functional or convenience criteria. Furthermore, the investigation sheds light on the economy of food and wood management for supplying Roman funerary rituals in Barcelona.

In fact, archaeobotanical macroremains (seeds and wood-charcoals) have been systematically sampled from different cremation areas of the necropolis, and their analysis is providing valuable information about the use of food and fuel in funerary practices. On one hand, charred seeds and fruits remains recovered on the site, can shed light on the composition of funerary banquets or food offered to the deceased. On the other hand, charcoal analysis provides evidences of the woody species used to build the funerary pyres, the enclosure structures or as fuel for cooking oblation.

Results of this investigation constitute the first systematic study of archaeobotanical remains in a roman funerary context of Barcelona, up to now very limited to a few samples.

## 11 ROMAN FARMERS IN EASTERN IBERIA. SPATIAL, GEOARCHAEOLOGICAL AND BIOARCHAEOLOGICAL APPROACH TO AGRARIAN STRATEGIES

**Abstract author(s):** Grau, Ignasi (University of Alicante) - Gutiérrez, Mario (University of Jaén) - Portillo, Marta (IMF-CSIC) - López-Sáez, Jose Antonio (CCHS-CSIC) - Gallelo, Gianni (University of València) - Sarabia, Julia (University of Alicante)

**Abstract format:** Oral

Recent Archaeological landscape studies in the Valley of Alcoi (Eastern Iberia) have detected important settlement changes during the 1st c. BC related to Roman territorial organization. Rural settlement of previous Iberian Iron Age was confined to areas close to fortified oppida due to defensive strategies, but Roman pacification and dominion of the region created a context of political stability that allowed an increase of rural sites, with significant occupation of previously empty areas. The resulting rural landscape was composed by small farms connected to small plots of intensive uses, with manuring and terracing as agrarian strategies. This spatial organization characterized the later Roman Imperial Landscape.

The aim of this communication is to present the archaeological data that permits the characterization of this landscape of intensive farmers. We present an analytical strategy combining spatial analysis, microstratigraphic analysis by means of soil micromorphology and physical-chemical analyses of bulk soil samples, as well as archaeobotanical analyses including palynology, phytoliths and other calcitic microfossils. This high-resolution, multifiscal, and multi-analytical approach pursues to characterize these archaeological contexts to singularize these intensive agricultural practices. The creation of this peasant landscape is related to specific models of economic and social organization in the Roman period.

12

## THE ANIMAL REMAINS FROM ROMAN LISBON: FOUR SITE STUDIES FROM OLISIPO

**Abstract author(s):** Santos, Ana (UNIARQ - Centro de Arqueologia da Universidade de Lisboa, FLUL – Faculdade de Letras da Universidade de Lisboa)

**Abstract format:** Oral

We plan to study the remains of mammals, birds and molluscs recovered from sites in the Lisbon region and view them within the general context of Lusitanian zooarchaeology.

We aim, among other things, to discover which animals were a source of food for Roman Lisbon.

We shall present what is already known and then discuss the studies of four sites: Rua dos Anjos nº 10; Rua de Santa Marta 25-25A; Antigos Armazéns Sommer and Banco of Portugal (now the Money Museum). We shall also discuss the lines of research that we plan to develop in the coming years.

A wide range of mammals was present, most of them domestic, such as sheep, goat, cattle and pig. However, wild animals such as red, roe deer and rabbit are also represented. With regard to birds, the remains are scarce being represented mostly by domestic chicken. In addition, we note the presence of various molluscs such as oysters, clams and terrestrial gastropods.

We will first examine the data from each archaeological site and then we shall undertake a more comprehensive study in order to identify patterns of food consumption, animal improvement, and the introduction of exotic animals.

13

## INVESTIGATING WOOD-FUEL USE IN BARCINO (BARCELONA, NE IBERIA): MULTI-SITES CHARCOAL ANALYSIS ALONG THE ROMAN CITY'S WALL AND MOAT (CC.1ST-4TH CE)

**Abstract author(s):** Bianco, Sabrina (Catalan Institute of Human Paleoecology and Social Evolution - IPHES-CERCA; University of Barcelona, Faculty of Geography and History) - Picornell-Gelabert, Llorenç (University of Balearic Islands, ArqueoUIB research group, Department of Historic Sciences and Theory of Arts) - Allué, Ethel (Catalan Institute of Human Paleoecology and Social Evolution - IPHES-CERCA; University Rovira and Virgili, Department of History and Art History) - Riera Mora, Santiago (University of Barcelona, Faculty of Geography and History) - Miró i Alaix, Carme (Archaeological Service of Barcelona, responsible of Pla Bàrcino, Direcció de Memòria, Història i Patrimoni – Institut de Cultura - ICUB)

**Abstract format:** Oral

Woodlands were very important spaces for fuel-supplying in the past. In particular, in a Roman city there was a frequent wood-energy requirement due to the presence of many activities and facilities: from domestic heating and kitchens, to the widespread *thermae*, as well as several workshops (i.e. pottery, metallurgical and glass productions), bakeries or other food processing installations. As consequence, woodland management and exploitation had to be well integrated into a precise urban Roman economic model.

The colony of Barcino (current Barcelona) was founded *ex-novo* at around 10 BCE in NE Hispania Citerior region, in a coastal plain providing diverse natural resources. Pollen analyses indicate that a limited transformation of the landscape occurred nearby the city at this time, evidencing a predominance of woodlands over crops.

Thence, through the analysis of charcoal remains sampled during 10 different preventive archaeological excavations in the proximities of the roman city perimeter-wall and the moat, the aim of this work is to evaluate the overall wood taxa used as fuel by the colony inhabitants between the 1st-4th centuries CE.

Valuable archaeobotanical information has been obtained from the moat's layers, localized in 5 different sectors of the urban limit and representing waste deposits produced by the settlement. Other samples have been obtained, among others, from circulation layers near the *intervallum*, from metallurgic combustion pits and from a run-down well.

All these different contexts seem to point to a targeted and standardized exploitation of holm oak (*Quercus ilex/coccifera*), tree heather (*Erica arborea*) and strawberry tree (*Arbutus unedo*).

Altogether, these anthracological data are relevant, as the results of a first systematic archaeobotanical study focusing on Roman urban contexts in Barcelona, very scarce until present. This allows, thus, to approach past woodland exploitation system of the city, its environmental impact and the landscape transformation of the surrounding area.

A.

## BIOLOGICAL RESOURCES IN THE PALEOECONOMY OF HALMYRIS - A ROMAN SETTLEMENT IN SOUTHEAST ROMANIA

**Abstract author(s):** Stanc, Simina Margareta (Alexandru Ioan Cuza University of Iași) - Nuțu, George (Eco-Museum Research Institute of Tulcea) - Danu, Mihaela - Bejenaru, Luminița (Alexandru Ioan Cuza University of Iași)

**Abstract format:** Poster

Halmyris (Murighiol, Tulcea County) is one of the most important Roman and Late Roman settlements located in the inferior sector of the Danube Delta, in the easternmost part of Scythia province during the Late Antiquity. The fort (2nd-4th century AD) and early Byzantine city (5th-early 7th century AD) experienced a long existence benefiting of

strategic position. Halmyris was the most easterly point of the Danubian border in Roman times and probably served as a supply centre for the fleet; early Roman inscriptions inform us of the existence of a 'mariner's village' – vicus clasicorum. In 2014, extensive research took place in the extramural area of the city. The bone assemblages presented were discovered in this area in contexts dating to the Late Roman and early Byzantine periods (4th-6th centuries AD).

Phytolith assemblages from the Halmyris site are composed mainly of grass phytoliths. We noticed important amounts of ELONGATE DENDRITIC forms and a high proportion of silica skeletons. Our results show that cereals (i.e., wheat, barley) were a relevant part of the subsistence economy of the site, phytolith analysis revealing an important signal of cereal processing. Flax fibers, which are the strongest natural fibers, were also identified in samples from Halmyris.

The exploited animal resources are varied, including molluscs, fish, birds and mammals. Most of the remains belong to the group of mammals.

Animal husbandry represented an important occupation. The identified domestic mammals are cattle, sheep, goat, pig, horse, donkey, dog. The predominant species are cattle and sheep/goat, both by the number of identified specimens and by the minimal number of individuals. Hunting has small importance for the settlement under study. The identified wild mammals are red deer, wild boar, roe deer, aurochs, hare, wolf, European badger. Red deer and wild boar have the highest proportion of wild mammals.

## **B. ARCHAEOZOOLOGICAL EVIDENCE ON EATING HABITS IN THE LIMES OUTPOSTS AT THE NORTH-WESTERN ROMAN FRONTIER OF DACIA POROLISSENSIS**

**Abstract author(s):** Malaxa, Daniel (Alexandru Ioan Cuza University of Iasi; Iași Institute of Archaeology) - Cociș, Horațiu (Zalău County Museum of History and Art) - Stanc, Simina (Alexandru Ioan Cuza University of Iasi)

**Abstract format:** Poster

A novelty within the Romanian historiography concerning the food supply and consumption habit of the soldiers garrisoned on the north-western Roman frontier of Dacia Porolissensis, the present study brings forward a series of recent analyses based on 18 faunal assemblages collected from earlier archaeological research carried by Nicolae Gudea.

The supply network of the minor fortifications (especially the watchtowers) is based on several operating parameters, including the limit (frequency and spatiality) on which these supply chains are operating. The main topic of this study is following such parameters, namely, where the official food supply chain ends and where the hunting begins.

The activities concerning the daily life of the garrisoned troops are revealed through the archaeozoological analysis, outlining for the first time the diet and the related eating habits of a series of limites outposts of Dacia Porolissensis.

From 18 minor fortifications, 1070 faunal remains were collected during several archeological campaigns; the faunal assemblages are represented by bone and dental fragments belonging exclusively to mammals (domestic and wild), representing remains of domestic origin.

Most of the fragments belong to domestic mammals (707) and five species have been identified: cattle, ovicaprids, pig and horse; cattle remains has the highest frequency. No dog remains have been identified, but its presence is indicated by bite marks (some bones are gnawed).

The wild mammals are less represented (95 remains), and six species have been identified: red deer, wild boar, roe deer, hare, aurochs and badger; for the group of wild mammals, red deer has the largest percentage.

---

## **51 CONQUEST, MIGRATION AND CULTURAL CHANGE IN THE MEDIEVAL MEDITERRANEAN**

**Theme:** 2. [Re]integration

**Organisers:** Pluskowski, Aleks (University of Reading) - García-Contreras, Guillermo (University of Granada) - Alexander, Michelle (University of York) - Banerjea, Rowena (University of Reading) - Mattei, Luca (University of Granada)

**Format:** Regular session

From the Levant to Iberia and north-western Africa, the medieval Mediterranean world was defined by multiple waves of conquest and regime change, accompanied by migration and variable encounters with resident populations, resulting in marked episodes of cultural transformation. These included the Arab conquests of the Levant and north Africa, the Arab-Berber conquests of Iberia and Sicily, the protracted Christian conquests of those regions, the crusader states of the Levant, their replacement by the Mamluk sultanate and later Ottoman expansion into south-eastern Europe. These resulted in a lasting frontier between the Christian and Islamic worlds, as well as a series of shifting borderlands between opposing polities where social identities became attached to religious, as well as political differences. The resulting palimpsest of cultural encounters defines the recent heritage of Mediterranean countries, elements of which have been politicised within the context of ongoing debates on European identity and migration.

The archaeological study of cultural change across the medieval Mediterranean world has intensified in recent decades, whilst environmental archaeology is increasingly used to understand these transformations at varying scales. This session, organised by the "Landscapes of (Re)Conquest" project, aims to capture the state-of-the-art from across

the Mediterranean and to showcase its own results from south-western Europe. Papers are invited on new research of cultural change in the medieval Mediterranean, with the aim of publishing a special issue drawn from the contributions.

## ABSTRACTS

### 1 DYNAMICS OF MEDIEVAL SETTLEMENT IN CENTRAL IBERIA: DISCUSSIONS BETWEEN MIGRATIONS, CULTURAL CHANGE AND ECOLOGY

**Abstract author(s):** Garcia-Contreras Ruiz, Guillermo (Universidad de Granada) - Banerjea, Rowena Y. (University of Reading) - García-García, Marcos (Universidad de Alicante) - Hernández-Casas, Yaiza (Universidad de Granada) - Ros, Jerome (Institut des sciences de l'évolution de Montpellier) - Alexander, Michelle (University of York) - Pluskowski, Aleks G. (University of Reading)

**Abstract format:** Oral

The province of Guadalajara in central Iberia represents a suitable territory for analyzing the dynamics of long-term settlement patterns during the Middle Ages, a period characterized by multiple waves of conquest and colonization processes. Since the Late Roman period and the organization of the Visigothic Kingdom, the settlement network was restructured with the creation of new cities and episcopates, and the maintenance of rural sites in the fertile river valleys. Starting in 711 CE with the Islamic conquest of Iberia and the formation of al-Andalus, a new picture of rural settlement emerges with small and medium-sized settlements. These are associated with irrigated fields and organized around fortifications (including single towers) that became more important during the centuries in which these lands functioned as political frontiers. From the 12th century, when this region was conquered and colonized by Christian societies, a new network of towns was consolidated that still exists today, structured around the great fortifications that were the capitals of the *comunidades de villa y tierra* (communities of "towns and lands"). This paper integrates all existing information on long-term population dynamics in this region, discussing the impact and role of settlers in each period, the economic and political changes that are reflected in the landscape, as well as the influence of local geology, hydrology and topography.

### 2 CONNECTING SITE TO LANDSCAPE: EXPLORING MIDDLE MARCH BORDER CASTLES TO UNDERSTAND THE DYNAMICS OF CULTURAL AND ECOLOGICAL CHANGES

**Abstract author(s):** Mattei, Luca - García-Contreras Ruiz, Guillermo (University of Granada) - García-García, Marcos (University of Alicante) - Banerjea, Rowena (University of Reading) - Hernández-Casas, Yaiza (University of Granada) - Ros, Jerome (CNRS, Université de Montpellier) - Alexander, Michelle (University of York) - Pluskowski, Aleks (University of Reading)

**Abstract format:** Oral

The dynamics that support the cultural and ecological changes that occur on a large scale in the border area of the Middle March in Iberia during the medieval period can be understood as a whole, by linking the regional environmental information of the landscape and territory with data from the detailed analysis of settlements. A connection between the micro and macro scale requires a continuous dialogue in both directions to generate knowledge.

The main aim of this paper is to present the micro-scale results of the studies carried out in the castles of Molina de Aragón and Atienza. The laboratory analyses and the material record from the excavations carried out in 2021 have enabled us to better understand not only the spatial and functional contexts of some of these structures, but also to refine their chronological framework and ultimately to develop an initial interpretation of their occupation within a broader historical context. These initial data enable us, for the first time, to present a narrative concerning daily life in these castles, the changing character of their occupation and use, and their associated long-distance connections including the exploitation of resources and the reach of their commercial networks. This new information will integrate and enrich the concept of 'castlescape', that in its definition tries to create synergies between the archaeological deposits of castles and the sediments in their surrounding landscape. This is essential for developing our understanding of these castles and their diachronic roles in the territory that surrounds them.

### GEOARCHAEOLOGICAL APPROACHES TO UNDERSTANDING THE DYNAMICS OF 'CASTLESCAPES' IN THE IBERIAN PENINSULA

**Abstract author(s):** Banerjea, Rowena (University of Reading) - García- García, Marcos (University of York; University of Alicante) - Ros, Jérôme (CNRS, University of Montpellier) - Mattei, Luca - Hernández Casas, Yaiza - García-Contreras Ruiz, Guillermo (University of Granada) - Alexander, Michelle (University of York) - Pluskowski, Aleks (University of Reading)

**Abstract format:** Oral

Soils and sediments are the backbone of the archaeological record and provide information about the changing form and function of spaces within castles and concerning the links between these spaces and activities in their hinterlands. In this paper, by applying a range of geoarchaeological techniques, the activities within the castle are revealed in the buried archaeological soils and sediments, and other related sites and features in the landscape, such as associated agricultural terraces and irrigation systems, from a range of frontier medieval castle sites in Spain in connection with the research project "Landscapes of (Re)Conquest: Dynamics of Multicultural Frontiers in Medieval South Western Europe", funded by AHRC.

The occupation of a castle site can be dynamic. At Molina de Aragón, Guadalajara, soil micromorphological data from profiles within the citadel and the church of Santa Catalina, or Cristo de las Murallas show alternating periods of habitation occupation, abandonment and post-abandonment occupation. These microstratigraphic data show the changing nature of the occupation from Islamic to Christian, and how the occupation within the castle is reflected in the use of terraces and irrigation systems around the castle.

Comparative geoarchaeological case studies show how the "Land of Aynadamar" in Nasrid Granada, was transformed following the Castilian conquest and the Christian colonization in the last peri-urban place of al-Andalus. At Cártama, Malaga, soil micromorphological analysis identified in situ corralling deposits with well-preserved dung of both larger herbivores (cattle or horses) and caprines, in an urban area during the Almohad period, which developed just below the hill where the castle is located. Remains of fodder are identifiable within the dung remains, which provides information concerning their alimentation and animal husbandry practices during the Almohad period. These strata are truncated by a pit, following the end of use of the area as a corral.

### ANIMALISING CULTURAL BOUNDARIES: IDENTITY, FOODWAYS AND SUBSISTENCE IN MEDIEVAL IBERIA

**Abstract author(s):** García, Marcos (University of Alicante; University of York) - García-Contreras Ruiz, Guillermo - Mattei, Luca - Hernández Casas, Yaiza (University of Granada) - Banerjea, Rowena Y. (University of Reading) - Ros, Jérôme (CNRS, University of Montpellier) - Alexander, Michelle (University of York) - Pluskowski, Aleks (University of Reading)

**Abstract format:** Oral

Foodways represent a sphere of action which, in the past as well as in the present, has been recurrently used in the field of everyday life as one of the main identity markers for producing, reproducing and expressing cultural affinity or otherness. In an historical context marked by profound differences derived from the cohabitation of diverse ethno-religious groups such as medieval Iberia, eating habits played an essential role in the demarcation of cultural boundaries between members of different communities that can be explored archaeologically.

This paper presents the results of the zooarchaeological study of a set of sites occupied during the medieval period and located in different frontier regions of the Iberian Peninsula. The results demonstrate the informative potential of archaeofaunal analysis to contribute to the recognition of the consumption patterns of animal food products, the identity of the groups responsible for the accumulation of the food debris and the systems of exploitation and management of the animals.

Project "Landscapes of (Re)Conquest: Dynamics of Multicultural Frontiers in Medieval South Western Europe" (AH/R013861/1), funded by AHRC.

## LIFE ON THE FRONTIER: EXPLORING ECONOMY AND SUBSISTENCE IN TRANSITIONAL MULTI-FAITH SOCIETIES OF MEDIEVAL SPAIN

**Abstract author(s):** Alexander, Michelle (BioArCh, Department of Archaeology, University of York) - García-Collado, Maite (BioArCh, Department of Archaeology, University of York; GIPYPAC, Department of Geography, Prehistory and Archaeology, University of the Basque Country - UPV/EHU) - García-García, Marcos (BioArCh, Department of Archaeology, University of York; Instituto de investigación en Arqueología y Patrimonio Histórico, University of Alicante) - Ros, Jérôme (Institut des Sciences de l'Evolution, CNRS, Université de Montpellier) - Mattei, Luca (Department of Medieval History and Historiographic Sciences and Techniques, University of Granada) - Banerjea, Rowena (Department of Archaeology, University of Reading) - García-Contreras Ruiz, Guillermo (Department of Medieval History and Historiographic Sciences and Techniques, University of Granada) - Pluskowski, Aleks (Department of Archaeology, University of Reading)

**Abstract format:** Oral

We present the results of interdisciplinary bioarchaeological research on the multicultural frontier context of the (Re) conquest of Islamic Iberia, focusing on human and animal subsistence as a proxy of political, social and economic changes from multiple sites in the province of Guadalajara between 10th and 15th c. CE.

Guadalajara, located in central Spain was defined by opposing Christian and Muslim frontier societies in the 11th and 12th centuries. We study sites dating to either side of the (Re)conquest to explore this frontier in transition, including the castle of Molina de Aragón, Prao de los Judíos, the Cathedral of Sigüenza, Alcázar Real de Guadalajara, Palacio de los Guzmán, castle of Zorita de los Canes, the cemetery of Guadalajara and the Campus de las Cristinas cemetery. These are mainly urban and military settlements which played a role as central places in the region and represent differing religious communities, including Muslim, Christian and Jewish contexts.

Biomolecular techniques were applied to these contexts in order to obtain a deeper understanding of animal husbandry strategies and food consumption patterns by both livestock and humans. Bulk carbon ( $\delta^{13}C$ ), nitrogen ( $\delta^{15}N$ ) and sulphur ( $\delta^{34}S$ ) stable isotope analyses were performed on the bone collagen of >300 samples, including humans, domestic mammals, birds and fish. A subsample of these were also analysed for oxygen ( $\delta^{16}O$ ) and strontium ( $^{87}/^{86}Sr$ ) isotopes to investigate mobility. Research questions to be addressed through these data include exploring differences in production strategies through time and between religious communities, differences between food supply networks to cities and castles and the consequences of changes in political rulership in animal husbandry management. Particular themes emerge, such as the use of C4 plants as fodder or the supply and consumption of fish at these inland settlements.

## EXPLORING PLANT RESOURCES AND VEGETAL LANDSCAPES EXPLOITED IN THE FRONTIERS OF MEDIEVAL IBERIA: ARCHAEOBOTANICAL CONTRIBUTION

**Abstract author(s):** Ros, Jerome (Institut des Sciences de l'Evolution, CNRS, Université de Montpellier) - Losilla, Nicolas (Department of Medieval History and Historiographic Sciences and Techniques, University of Granada) - Pastor, Thierry (Institut des Sciences de l'Evolution, CNRS, Université de Montpellier) - Mattei, Luca - García-Contreras Ruiz, Guillermo (Department of Medieval History and Historiographic Sciences and Techniques, University of Granada) - García-García, Marcos (Instituto de investigación en Arqueología y Patrimonio Histórico, University of Alicante) - Banerjea, Rowena (Department of Archaeology, University of Reading) - Hernández-Casas, Yaiza (Department of Medieval History and Historiographic Sciences and Techniques, University of Granada) - Alexander, Michelle (BioArCh, Department of Archaeology, University of York) - Pluskowski, Aleks (Department of Archaeology, University of Reading)

**Abstract format:** Oral

In recent decades, the development of archaeobotany in the Mediterranean has made it possible to document the main plant resources exploited, the agricultural practices implemented, as well as major phenomena of circulation and integration of new plant resources within historical societies. Concerning the medieval Western Mediterranean world, archaeobotanical studies have recently received a new impulse, allowing for a better characterization of Muslim agriculture, of its diffusion and of its effective implantation in the Iberian Peninsula, both in rural and urban contexts. This innovative work lays the foundations for a new reflection on the persistence and evolution of this agriculture in the face of the great political, social and economic changes occurring in this area during the Christian (Re)conquest.

The main goal of this paper is to present the results of new studies carried out in a range of frontier medieval sites in Spain, in connection with the research project "Landscapes of (Re)Conquest: Dynamics of Multicultural Frontiers in Medieval South Western Europe", funded by AHRC. The results, based on studies of seeds and charcoal fragments issued from archaeological samples dated from the 10th to the 15th c., make it possible to enlighten the main agro-horticultural productions and their evolution in the face of changing socio-economic dynamics. The question of changes in forest management and fuel economy is also raised.

## 7 **ARCHAEOMETALLURGY ON THE MEDIEVAL IBERIAN FRONTIER: THE USE AND EXPLOITATION OF METAL IN A FEUDAL CONTEXT**

**Abstract author(s):** Hernández-Casas, Yaiza - García-Contreras Ruíz, Guillermo - Murillo-Barroso, Mercedes (University of Granada) - García-García, Marcos (University of Alicante) - Banerjea, Rowena Y. (University of Reading) - Ros, Jérôme (CNRS, Université de Montpellier) - Mattei, Luca (University of Granada) - Brown, Alex D. (Wessex Archaeology) - Alexander, Michelle (University of York) - Pluskowski, Aleks G. (University of Reading)

**Abstract format:** Oral

In this work, we propose characterizing the metallurgical production of the feudal social formation in Medieval Iberia. Playing a leading role in the Middle Ages borders, we study the use and exploitation of metal developed in frontier settlements from an archaeometallurgical perspective.

Being part of the Project «Landscapes of (Re)Conquest: Dynamics of Multicultural Frontiers in Medieval South Western Europe» (AH/R013861/1), our interest lies in integrating the study of metal artefacts and slags from border sites by incorporating their archaeometallurgical analysis. So, we present the preliminary results of some of the feudal contexts that we are studying through Archaeometallurgy, using techniques such as pXRF, SEM, and metallography. All this will allow us to detect origin, technology or distribution of metal artefacts, as well as documenting the alloying practices and technology developed in some key settlements of feudal colonization.

Finally, this means to present new analytical, spatial and socio-cultural results of settlements whose archaeological metallic record has much to contribute to our knowledge of landscape, social dynamics and daily life in the Iberian medieval frontiers.

## 8 **SOCIAL, CULTURAL AND TERRITORIAL CHANGES IN THE EASTERN PYRENEES BETWEEN 9TH-14TH C. CE : WHAT ROLE FOR CLIMATE CHANGE ?**

**Abstract author(s):** Carozza, Jean-Michel (La Rochelle University) - Puig, Carole (FRAMESPA, UMR 5136, Toulouse)

**Abstract format:** Oral

During the period between the 9th century and the 14th century CE, the Eastern Pyrenees experienced a phase of unprecedented expansion and then retreat of settlements, which led to the disappearance of villages both in the lowland plains and in mountain areas (Carozza et al., 2009, 2011, 2012, 2013). Such "deserted villages" were successively interpreted as the consequence of political, economic and demographic changes linked to the plagues. This last hypothesis permeates the historiography of deserted villages, notably in mountainous areas.

In this work, we explore the possible contribution of the Little Ice Age, i.e. the progressive temperature cooling and rainfall increase starting locally from 1250 CE, as a factor that favoured this process. Based on previous the works carried out in the Roussillon lowlands (Carozza et al.,) we explored the potential transposition of this model to the highland areas in the Capcir and more specifically in Valserra valley, in the vicinity the deserted village. The historical and archaeological data show that the valley was initially populated during the last years of the 10th century CE. From the 14th century, the archives show signs of the impoverishment of the community, then of its decline, the number of fires falling from 15 to 3 during the second half of the 14th century CE, leading to its gradual abandonment in the 16th c. CE. The cross-referencing of historical, archaeological and palaeoenvironmental data makes it possible to produce an impact model that integrates the various socio-economic, political and environmental dimensions.

## 9 **THROUGH THE GLASS. CONQUEST, MIGRATION AND CULTURAL CHANGE IN MEDIEVAL SPAIN AND PORTUGAL**

**Abstract author(s):** De Juan, Jorge (UNIARQ, Centre of Archaeology of the University of Lisbon; Department of Prehistory, Ancient History and Archaeology, Universidad Complutense de Madrid)

**Abstract format:** Oral

The aim of this contribution is to provide an overview of the recent advances in glass research on the medieval Iberian Peninsula from the Visigothic Kingdom in the 6th to the Hispanic Monarchy of the 16th century. The presentation will expose on how the new research findings can be related to some of the political and cultural changes that took place along that period.

The comparative analysis of the variations in the typology, the technology and the origin of glass objects with a broad geographical and temporal view, provides some insights into the transfer of objects, how-know in glassmaking and of the raw materials to make glass. This is also helpful to detect processes of technological hybridization, diverse temporal and spatial patterns, supply routes, changes in decorative shapes, the diffusion of styles and the occurrence of different cultural and regional peculiarities in the ways in which glass was produced, distributed, and consumed.

## 10 WHAT ABOUT THE FOOD? MIGRATION AND AGRICULTURE IN AL-ANDALUS HISTORICAL TRADITIONS

**Abstract author(s):** Grisales, Daniel (Universidad de Antioquia)

**Abstract format:** Oral

Regardless the fact that medieval societies are deemed as primarily agrarian, agriculture technology and its social impact in the post-roman society seems to be a secondary topic in the historiographical tradition of a substantial part of the Mediterranean Sea. When migration is brought to the table, the absence of agricultural knowledge is even more evident due to the fact that the movement of the different groups to the provinces of the Western Roman Empire only possess a problem in ideological, political or religious terms. Thus, it appears to be that the food supply was not an issue even though the transition from the Antiquity to the Middle ages is characterised by a transformation of land tenure and the disappearance of long distance trade that made local supply way more important that it was in Roman times.

The Muslim occupation of mostly of the Iberian Peninsula represents an interesting case to understand the relationship between migration and agriculture. Not only because the expansion of the Umayyad Caliphate was swift overcoming older political units derived from the first migration wave, but also because the occupation encompassed different ecological niches within the Iberian Peninsula that in theory would require invention or adaptation of existing agrarian technologies. This paper, searches to summarize the existing historical approaches to migration and agriculture in Al-Andalus, from the early works of Pirenne and his disciples, to the latest theoretical revisions produced after Hodges and Whitehouse. Moreover, it intends to compile the results of the latest archaeological researches to see how they related to these models or how they set apart from them. All of this with the objective of setting a state of the art that allow us to think in new study directions.

## 11 LIFEWAYS AND MOBILITY OF THE CHRISTIAN CONQUERORS OF PALMELA: A 12TH-13TH CENTURY POPULATION IN PORTUGAL

**Abstract author(s):** MacRoberts, Rebecca (HERCULES laboratory- University of Evora) - Santos, Michele (Museu Municipal de Palmela) - Fernandes, Isabel (Museu Municipal de Palmela; IEM-NOVA FCSH; School of Social Sciences- CIDEHUS, University of Évora) - Dias, Cristina (HERCULES laboratory- University of Evora; School of Technology Sciences, Department of Chemistry, University of Évora) - Vilar, Herminia (School of Social Sciences- CIDEHUS, University of Évora) - Maurer, Anne-France (HERCULES laboratory- University of Evora)

**Abstract format:** Oral

The city of Palmela held an important strategic position in the newly-conquered Christian territories of Portugal from the 12th century onwards. With its visual dominion over the Tagus and Sado estuaries and the surrounding plains, and communication networks with other Christian strongholds, the Castle of Palmela was in a prime position to defend Lisbon from attacks from the south while simultaneously being on the frontier with the Almohad Empire. The castle, which had been under Islamic rule since the 8th century was captured in 1147 AD by D. Afonso Henriques (first king of Portugal) and donated to the friars of Santiago in 1186. Although Palmela fell back under Berber control for a brief period, it was recovered by Christians again by 1194 with significant participation by the knights of the Order of Santiago. Excavations within the castle walls in the late 1990s recovered a series of graves in the site of the former convent of the Order, dating to the 12th-13th century. Many of the skeletons uncovered belonged to males, of whom a number appeared to be quite tall and robust. A medal bearing the insignia of the Order of Santiago lends support to the hypothesis that at least some of these individuals belonged to this militia. The analysis of stable isotopes in these skeletons presents a rare opportunity to infer patterns of dietary and migratory behaviour directly in individuals who may have played an active role in the Christian conquest of Portugal or at the least were living through these transitional times. In this study, carbon and nitrogen stable isotopes have been measured in bone collagen to reconstruct plant choices and protein inputs in the diet, while stable oxygen and radiogenic strontium in tooth enamel have been analysed to elucidate mobility patterns among these individuals.

## 12 AFTER THE CONQUEST. THE BUILDING OF CASTLE NETWORK AND LANDSCAPE IN THE ALPUJARRA (SOUTHEAST SPAIN)

**Abstract author(s):** Rouco Collazo, Jorge (Universidad de Granada)

**Abstract format:** Oral

The Arab-Berber conquest of Iberian Peninsula marked the beginning of a cultural change. This is clearly visible in material culture, especially on the transformations in settlement patterns and the exploitation of natural resources, generating a new landscape. The aim of this paper is to analyse the transformation process in landscape after the conquest in Southeast Spain, in particular in the Alpujarra, the southern slope of Sierra Nevada, in the first centuries of al-Andalus (8th-10th centuries).

For this objective, given the lack of historical and archaeological data about the Alpujarra in Late Antiquity and Early Medieval times, we will focus on the several rural fortifications built on these centuries. They will be analysed through an interdisciplinary methodology that combines Building Archaeology and Landscape Archaeology to obtain the most data as possible about these sites and their role on territory. Through this analysis, we contribute with new data and interpretations about the conquest process of al-Andalus and the settlement of new human groups, breaking previous structures. Nevertheless, we also deepen into the resistance process to this change, either religious or political in nature, which took place in al-Andalus until the proclaiming of Cordoba's caliphate in 10th century.

### 13 **"ARCHAEOLOGY OF CHANGE AND CONTINUITY: TRANSFORMATIONS IN PRODUCTIVE SPACES IN THE SOUTH-EAST PENINSULAR AFTER THE FEUDAL CONQUEST (13TH CENTURY)"**

**Abstract author(s):** Molina-Campuzano, María Isabel - Eiroa-Rodríguez, Jorge Alejandro (University of Murcia) - González-Ballesteros, José Ángel (Archaeologist)

**Abstract format:** Oral

After the conquest of the south-eastern territories of the Iberian peninsula by the armies of Castile, in the middle decades of the 13th century, a profound process of social and cultural change began, which only culminated at the end of the 15th century. The biggest transformations in the social organisation of the space and productive processes are clearly perceptible through archaeological analysis. In this context, the study of artisanal and industrial production process makes it possible to define in a clear way the dimension of the cultural change that takes place.

Taking as an observatory the main cities of the kingdom of Murcia in the late Middle Ages, the information concerning the productive spaces related to the industries of the moment is analysed; mainly metallurgical workshops, textile production centres and pottery and glass workshops. It also characterises the ceramic and vitreous productions of those decades. Through this archaeological information, a complex situation of changes and continuities in craftsmanship during the years after the conquest is clearly traced, in the framework of a changing commercial circumstances, especially due to the presence of increasingly aggressive external agents.

To conclude, this paper presents the general characteristics of the different productive contexts after the conquest process, and it also presents the first results of the research project "The origins of the Italian presence in Murcia (12th to 13th centuries)" (20896/PI/18), supported by Fundación Séneca (2019-2022).

### 14 **ENCOUNTER, SUBSTITUTION, REPLACEMENT, AND TRANSFORMATION AT THE SITE OF TORRE D'EN GALMÉS, MENORCA, SPAIN**

**Abstract author(s):** Perez-Juez, Amalia (Boston University) - Smith, Alexander (SUNY Brockport) - Goldberg, Paul (Boston University; INA, University of Tübingen) - Forste, Kathleen (Boston University) - Wagner, Emma (North Carolina State University)

**Abstract format:** Oral

Conquest, frontiers, and cultural changes are familiar topics in Spanish Medieval archaeology. Other concepts are also vividly discussed, rejected, revisited, or nuanced, depending on the historiographic and political moment. Terms such as Muslim Spain or Reconquest carry an ideological weight that influence the representation of historical moments, particularly if those periods deal with the interaction between Muslims and Christians. Nevertheless, the archaeological and historical interpretation of Iberian realities have changed in the past few decades.

This paper presents the research conducted by an international team working at the site of Torre d'en Galmés, Menorca, Spain. The site is one of the many settlements on the island that were occupied for over two thousand years. In fact, the main features remaining at the site date from the Iron Age Talayotic period. That time period has been extensively studied and restored. However, later Islamic remains are lesser-known and generate less interest. The Christian conquest of the 13th century erased the evidence and memory of this Muslim presence, which is still largely overlooked today.

We will present how the different cultures that lived at the site marked episodes of cultural transformation, adapting buildings, spaces, and other archaeological features. Different people left their own imprint based on their own cultural identity. All these changes can be identified and interpreted at the site, which works as a laboratory for understanding some of the topics of the session: cultural interaction, encounter, substitution, replacement, and transformation.

### 15 **CULTURAL CHANGES IN CENTRAL SICILY IN THE MEDIEVAL AGE**

**Abstract author(s):** Patti, Daniela (University of Enna)

**Abstract format:** Oral

In Late Antiquity Sicily became a privileged place of religious changes in the Ancient Mediterranean: the South Eastern end of the Island is the last frontier of the Byzantine Empire, the place of the last resistance to Islamic domination. The Byzantine Empire organized the defence against the Islamic advance also in the North of central Sicily (EN),

which has a considerable archaeological potential, mainly linked to the impressive rocky habitat scenery, dating back to Antiquity.

The impact of the cult of Saints, who are named after rock churches and oratories, is particularly important because it regulates the profound transformations in the organization of sacred spaces and in the religious practice of local communities in the Byzantine world. Some examples of rock churches in the middle of Sicily, dedicated to the cult of Saints, can be explained in this way, many of which are of Greek heritage. The strategic importance of this area will be later confirmed when the area itself became the military stronghold of the Norman Conquest and of the military and ecclesiastic reorganization of the Christian Church promoted in Sicily from the Great Count Roger.

The archaeological and the documentary sources, become essential not only for the knowledge of the processing of the identity and the ideology of the single sites, but also for the important effects on the ideological concept of the territory and for the identification of the "Geography of power" between Late Antiquity and Early Medieval Age.

## 16 FROM ISLAMIC SETTLEMENT TO NORMAN HOSPITAL: ARCHAEOLOGICAL RESEARCH IN SAN GIOVANNI DEI LEBBROSI (PALERMO, SICILY, ITALY)

**Abstract author(s):** **Castrorao Barba, Angelo (The Polish Academy of Sciences, Institute of Archaeology and Ethnology, Centre for Late Antique and Early Medieval Studies) - Utrero Agudo, María de los Ángeles (CSIC, Española de Historia y Arqueología en Roma) - Battaglia, Giuseppina (Soprintendenza BB.CC.AA. of Palermo) - Mandalà, Giuseppe (University of Milan) - Murillo Fragero, Jose Ignacio (Urbe pro Orbe) - Aleo Nero, Carla (Soprintendenza BB.CC.AA. of Palermo) - Miccichè, Roberto - Canale, Alessandra (University of Palermo)**

**Abstract format:** Oral

Traditions handed down from ancient and modern written sources attribute the construction of the church of San Giovanni dei Lebbrosi (southern suburban area of Palermo, Sicily, Italy) to the early phase of Norman age (between 1071 and 1085 AD). This foundation would have been built on the top of the remains of an Arab-Islamic fortification, a castle called "de Jean" (perhaps a *ribāṭ*), presumably occupied by the Normans during their conquest of the city of Palermo in 1071-1072 AD. Faced with this traditional proposal, archaeological research campaigns (since 2014) have made it possible to provide new insights on the diachronic dynamics of this complex. First of all, the results of the archaeological analysis of the architecture have demonstrated that a unitary project was carried out for the construction in the mid 12th century of the hospital, dedicated to infectious diseases, with the church of San Giovanni as its inner chapel. Archaeological excavations have confirmed the pre-existing Islamic presence on the site by putting levels of life with ceramics from the 10th/11th century and an Islamic rite burial, right lateral decubitus deposition and east-west orientation, dated besides by radiocarbon analysis between the end of 10th and first half of the 11th century. Furthermore, the remains of an architectural structure of the Islamic period has been found, having been almost completely dismantled by the Normans during the mentioned construction of the hospital. At the moment, it is difficult to interpret with certainty the function of this Islamic structure, the identification of which however represents an important element that attests to a certain consistency of an Islamic settlement. The aim of this paper is to show the complex archaeological sequence of occupation of the site across the time as a case study of the transition from Islamic to Norman period in Palermo.

## 17 STEĆCI AND CULTURAL CHANGES IN THE LATE MEDIEVAL WESTERN BALKANS

**Abstract author(s):** **Caval, Saša (Scientific-research center of the SAZU)**

**Abstract format:** Oral

This paper aims to provide a general overview of the archaeology of cultural change in the Western Balkans, the region historically renowned for its social dynamics. The central object of this overview are *stećci*, the medieval tombstones found scattered in the landscapes of the Western Balkans, particularly in Bosnia and Herzegovina. They embody centuries of Bosnian tolerance that evolved from long-lasting cohabitation of local, diverse ethnicities, concurrently following different religions: Orthodox Christianity, Roman Catholicism, the Bosnian Church, and also Islam. *Stećci* synthesize the historical, cultural, and religious aspects of the medieval Western Balkans and offer an insight into the dynamic nature of the regional cultural traditions. As such, they are defining elements of a cultural change *per sé*: why they appeared in the twelfth century, what triggered their creation, and the presence of precursors are still unknown. However, *stećci* are the core features of a funerary phenomenon that has endured for more than four centuries (12th - 16th C) and serve as essential witnesses and markers of cultural changes occurring in the region.

## 18 THE LORDSHIP OF TRANSJORDAN: A FRONTIER OF THE CRUSADER LEVANT?

**Abstract author(s):** **Sinibaldi, Micaela (Cardiff University)**

**Abstract format:** Oral

This paper presents recent developments of an ongoing study on the Crusader Lordship of Transjordan (1100-1189), part of the Kingdom of Jerusalem. Largely underexplored in the past, the subject has also been long associated with several incorrect notions. One was that the Crusader period in Transjordan consisted of a phase of revival and deep

changes, following a period of settlement crisis and depopulation; another was that this region's main function was essentially to be a military and political frontier of the kingdom, from which it was rather isolated.

The new research presented here, however, has concluded that the Lordship was both very closely connected to the rest of the Kingdom of Jerusalem and of crucial importance to it, from the economic, social, political and strategic points of view, and that attributing to this region the traditional function of frontier is a limiting and incorrect concept. Settlement in Transjordan had complex and diverse patterns and was characterized by a variety of socio-economic aspects. Finally, the case study of Petra has clarified that the former understanding that the conquest and migration in the Crusader period had a deep impact on the local socio-economic landscape of Jordan needs revising. While there was certainly a clear, long-lasting impact on the landscape due the construction of Crusader castles, results have also highlighted many patterns of continuity and adaptation with the culture of the local populations, and have clarified that cultural influences have occurred mainly from the local inhabitants towards the Franks.

Characterizing specifically the Lordship of Transjordan was the relationship of the Franks with the local Christian and Bedouin populations, which was crucial to the survival of the Franks in the region, and is particularly interesting within the context of the definition of cultural frontiers during the Crusader period.

## 19 ENVIRONMENTAL ARCHAEOLOGIES OF CULTURAL CHANGE IN THE MEDIEVAL MEDITERRANEAN

**Abstract author(s):** Pluskowski, Aleks (University of Reading) - García-Contreras Ruiz, Guillermo (University of Granada) - Alexander, Michelle (University of York) - Banerjee, Rowena (University of Reading) - Mattei, Luca (University of Granada) - García Garcá, Marcos (University of Alicante) - Ros, Jérôme (CNRS) - Hernández-Casas, Yaiza (University of Granada)

**Abstract format:** Oral

The medieval Mediterranean world was defined by multiple waves of conquest and regime change, accompanied by migration and variable encounters with resident populations, resulting in marked episodes of cultural transformation. These are widely recognised as composite or hybrid societies, accommodating varying degrees of multiculturalism, even where secular and religious authorities strove for cultural homogeneity. Alongside the written record, the composite nature of these societies has been traditionally understood through monumental architecture, applied art and a range of portable material culture. Environmental and landscape archaeology also includes a powerful set of methodological tools that can potentially be used to understand the pluralist character of these societies at varying scales. This includes how plants, animals and landscapes were utilised before and after periods of conquest, within the shifting mosaic of heartland and frontier regions. Are the effects of political, territorial, demographic, and ideological reorganisation visible in these multi-scalar traces of environmental exploitation? Can we interpret trends in continuity and change in relation to the varied encounters between migrant and resident populations? Drawing on case studies from the "Landscapes of (Re)Conquest" project and related research, this paper will consider whether we can use environmental and landscape data to understand the impact of conquest, migration and cultural change across the medieval Mediterranean world.

## A. INTERDISCIPLINARY APPROACHES ON THE RURAL SETTLEMENT OF CONTRADA CASTRO (CORLEONE, SICILY, ITALY) DURING THE EARLY MIDDLE AGES

**Abstract author(s):** Castrorao Barba, Angelo (The Polish Academy of Sciences, Institute of Archaeology and Ethnology, Centre for Late Antique and Early Medieval Studies) - Micciché, Roberto (University of Palermo) - Pisciotta, Filippo (Aix-Marseille Université / University of Palermo) - Aleo Nero, Carla (Soprintendenza BB.CC.AA. of Palermo) - Speciale, Claudia (University of Gothenburg) - Montana, Giuseppe - Gasparo Morticelli, Maurizio (University of Palermo) - Marino, Pasquale (Bona Fortuna LLC) - Bazan, Giuseppe (University of Palermo)

**Abstract format:** Poster

In the Contrada Castro site (Corleone, Sicily, Italy), located in the area of the Sicani Mountains in central-western Sicily, a main sequence of occupation during the early Middle Ages – between the end of the Byzantine period and the Islamic period (late 8th-11th c. AD) – has been identified. The research has been carried out with an interdisciplinary approach to better understand human-environment interactions over the time. In fact, on the basis of the stratigraphic data it was possible to combine different types of analysis. The zooarchaeological study has been focused on the reconstruction of the economic dynamics of exploitation of animal resources which were also integrated with the data on seeds for a more complex interpretation of the agricultural economy of the settlement. The anthracological analysis, in addition to offering insights into the use of wood, was fundamental for a diachronic comparison with current phytosociological dynamics that have shown a long-term sustainability in the management of landscape resources. Finally, the discovery of a pottery kiln has allowed us to analyze the catchment area for clayey raw materials. These different approaches have been crucial for demonstrating the importance of an interdisciplinary dialogue aimed to propose, through archaeological data, new perspectives on the settlement, economic and environmental patterns of the Early Medieval Sicilian countryside.

**Theme: 5. Climate Change and Socioenvironmental Perspectives**

**Organisers: Meyer, Ann-Katrin (University of Hamburg) - Chaudesaigues-Clausen, Solveig (University of Bergen)**

**Format: Discussion session**

In recent years, the rise of detailed material culture studies, the refinement of chronologies and the focus on the diversity of subsistence practices have paved the way towards a dynamic narrative of heterogeneous hunter-gatherer groups of Mesolithic Europe. These narratives focus on foragers responding differently to local biotopes through their material culture and social and technological choices.

This applies especially to the late forager societies of the Baltic Sea region, but also to Western and Central European late Mesolithic groups. These hunter-gatherers often existed in close proximity to the established Neolithic and thus were not only confronted with diverse environments in an ecological sense, but also exposed to and in some cases actively engaged in various influences and exchange in regard to technological innovations and subsistence practices.

In this session, we would like to explore to what extent relationships between the environment, humans and things actually influenced patterns of regionality, trade, technological traditions and the spreading of innovations within hunter-gatherer societies between 7000 and 4000 BC in the regions mentioned above. Our focus is on thinking beyond environments as purely ecological but as social and cultural settings in which human relationships flourish. Specifically, we explore:

How do innovative technologies help societies adapt to their environment and influence social developments? Are technological developments prompted by specific environmental conditions or climatic changes, and at what scale? What is the connection between technological developments and social and cultural choices? Is the environment a determining factor for regionality, or is the latter instead prompted by strong human interconnectivity?

Through this session, we hope to foster new approaches in exploring the unique connections and mutual dependencies between humans, things and given social, cultural and ecological environments in forager societies of Europe and beyond.

## ABSTRACTS

### 1 THE NEW COOL THING - DIFFUSION OF A LITHIC TECHNOLOGY DURING THE MESOLITHIC IN NORTHERN EUROPE

**Abstract author(s): Söderlind, Sandra (Museum Lolland-Falster)**

**Abstract format: Oral**

A study of the Mesolithic handle core pressure concept (HCPC) technology in northern Europe has resulted in new knowledge regarding contacts, communication and transmission of knowledge. This lithic technology is focused on blade production from single-fronted cores using pressure technique, a technique that requires social learning and interaction between people to diffuse.

The HCPC has been thoroughly researched within Scandinavia during the past 100 years but it is only now that the possibility of a larger spatial distribution pattern for the concept, across northern Europe, has been investigated. The results indicate that the single-fronted cores found in northern Europe relate to two separate lithic traditions, that share some similarities but also differences. An older technology that includes single-fronted cores was found in western Russia, and was probably used alongside conical and subconical cores around 10500-7200 cal BC. A younger technology is found in Scandinavia (and northern Germany), which seemingly was invented in southern Scandinavia, seems to have been implemented between ca 6400-5200 cal BC. The chronologies of these concepts, however, come with some issues related to lacking radiocarbon dates that directly relate to the finds.

These patterns nonetheless provide indications for possible communication routes and the characteristics of social learning across large spatial scales. Furthermore, the character of the diffusion process within northern Europe, indicate that the innovation spread rapidly within certain areas, where knowledge and know-how relating to pressure technique was already existing.

The diffusion of the HCPC within southern Scandinavia and northern Germany seems to have occurred alongside drastic environmental and landscape-related changes, including the 8.2 event (BP), the creation of the Danish islands and local extinction events which may have played some role in the rapid spread of this newly invented technological concept.

## 2 REGIONAL FISHERIES IN LATE MESOLITHIC DENMARK: THE INTERPLAY OF FISH, PEOPLE, TECHNOLOGY, AND ENVIRONMENT

**Abstract author(s):** Ritchie, Kenneth - Astrup, Peter (Moesgaard Museum) - Robson, Harry (University of York) - Andersen, Søren (Moesgaard Museum)

**Abstract format:** Oral

The Late Mesolithic Ertebølle culture (ca. 5400-4000 BC) in Southern Scandinavia has been recognized as an example of marine-focused hunter-gatherers since investigations of the signature kitchen middens (køkkenmøddinger) began in the mid-19th century. With the advent of more refined excavation techniques in the 20th century (e.g., wet sieving), enormous numbers of fish remains have been recovered from numerous sites, especially in Denmark. Recently, analysis of this material has begun to identify regional and chronological variability in the Ertebølle fisheries. With investigations of new faunal assemblages from underwater Ertebølle sites near Hjørnø, a small island just off the eastern coast of Jutland near the mouth of Horsens Fjord, as a departure point, the way animal populations and behavior, environment, technology, and other aspects of society influenced cultural adaptations are examined. Differences in which fish (and other animals) appear to have been the focus of procurement for groups in various regions of Denmark during the Mesolithic suggest that rather than accepting a monomodal picture of these coastal hunter-gatherers, a more dynamic understanding is necessary that reflects the inherent complexity of how people interact with their surroundings.

## 3 IMPROVED AMS 14C-BASED CHRONOLOGY OF THE EARLY AND LATE HOLOCENE OSSEOUS IMPLEMENTS FROM BIRŽULIS LAKE AREA, WESTERN LITHUANIA

**Abstract author(s):** Iršenas, Marius - Rimkus, Tomas - Butrimas, Adomas (Vilnius Academy of Arts)

**Abstract format:** Oral

Biržulis Lake is one of the most significant areas in western Lithuania in order to study hunter-gatherer societies, their economy, technologies and changes in subsistence. More than 60 sites, dated from the Final Palaeolithic to the beginning of the Bronze Age are known from this area. This area also contains wetland sites with good preservation conditions for organics that revealed a significant number and a variety of osseous implements. The stray finds from Janapolė village, Rešketa River and a large collection of bone and antler tools from Daktariškė 5 site gave more information about hunter-gatherer's technologies and the use of raw materials in the area. These finds, however, have not been directly dated by radiocarbon, therefore, in most cases their true chronology has been only speculated. A new dating program of osseous implements from western Lithuania, primarily from the Biržulis Lake area, took place in 2021-2022. The results presented in this paper shows new radiocarbon-based chronology of various osseous tools (hunting and working implements, ornaments). Therefore, this allows to supplement on the chronology of a particular osseous technologies and their continuation throughout the Early and Late Holocene. Another aspect is the use of particular decoration type and its chronology, as some of the dated objects contain decoration on their surfaces. Finally, the paper also contributes on the cultural history in the area during the Stone Age.

## A. SEMIROM COUNTY (SOUTH OF IRAN) IN PREHISTORIC PERIODS, SETTLEMENTS AND POPULATION FLUCTUATIONS

**Abstract author(s):** Taheri, Mohammad Hossin (University of Tehran) - Khoshdast, Amir Hossein (Science and Research Branch Islamic Azad University)

**Abstract format:** Poster

Surveying and studying the plains and valleys of the southern Zagros basins leads to a deeper understanding of how its archaeological cultures are formed, explained, and expanded; these regions have their own distinct geographical and cultural basins. Including its southern regions to the Persian Gulf, eastern regions to Darab, Fasa, Jahrom counties, as well as northern regions to Abadeh, Eqlid, and Semirom; North Fars and Semirom region have a different ecosystem and specific geographical locations for the formation and development of archaeological cultures that are the subject of the present study and based on a season of archaeological survey of the central part of Semirom county, with the aim of identifying all archaeological works focusing on the prehistoric periods were carried out in October and November 2018, which resulted in the identification of 66 sites from the Paleolithic to the Islamic period. Paleolithic sites include scattered stone assemblages in three open sites, thereafter a Neolithic settlement from Shamsabad period was identified; from Bakun period 7 sites, Lapui 4 sites, and three sites from Banesh period were identified. According to the studies, the prehistoric period of this region was completely influenced by Fars archaeological cultures and there was no evidence of impact from the neighboring areas.

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Silva, Filipa (Research Centre for Anthropology and Health - CIAS, Department of Life Sciences, University of Coimbra) - Masotti, Sabrina (Department of Neuroscience and Rehabilitation, University of Ferrara) - Grosskopf, Birgit (Historische Anthropologie und Humanökologie Johann-Friedrich-Blumenbach-Institut der Georg-August-Universität Göttingen)

**Format:** Regular session

In one of the greatest and most enduring Empires of antiquity, particularly until the first two centuries AD, cremation was the most dominant way of disposing of the dead. Trends of regional scope and/or according to the historical period were unveiled through the analysis of the characteristics of their graves. Moreover, the advances in the analysis of burned bone, have allowed to gather data on these individuals (biological profile, signs of diseases and geographic mobility) and related cremation funerary practices.

This session will take a multidisciplinary bioarchaeological approach regarding cremation usages across the Roman Empire between the 2nd century BD to the 4th century AD. Papers may explore issues related to the process of combustion (e.g. body position, temperatures achieved, bone's burning degree or cases of multiple cremations) and post-cremation funerary gestures (e.g. bone collected from the pyre; place of deposition and burial of the human remains). Another relevant contribution would be the diachronological analysis related to a specific city/region, or studies comparing cremation burial rites in distinct types of settlements (e.g. pre-Roman versus new, urban versus rural) in a given historical period. Atypical cremation cases are also considered. Interpretations of these data will be also based on information achieved from other disciplines (e.g. historical sources and archaeological and biochemical data) in order to have a sociocultural view of the cremation funerary practices across Roman Empire.

This session intends to bring together recent bioarchaeological studies of cremated human remains from different Roman provinces, and to update the knowledge and methodologies currently used.

## ABSTRACTS

### 1 **ATRI IGNES. RITUALS AND PRACTICES BEHIND THE CREMATION: THE CASE OF THE ROMAN NECROPOLIS OF GAZZO VERONESE (VERONA, ITALY)**

**Abstract author(s):** Mongillo, Jessica (Department of Environmental and Prevention Sciences, University of Ferrara) - Scalzeri, Marina (Department of Culture and Civilisation, University of Verona) - Zancan, Valentina (Department of Environmental and Prevention Sciences, University of Ferrara) - Masotti, Sabrina - Gualdi, Emanuela (Department of Neuroscience and Rehabilitation, University of Ferrara) - Basso, Patrizia - Grazioli, Valeria - Zentilini, Elisa (Department of Culture and Civilisation, University of Verona) - Bramanti, Barbara (Department of Environmental and Prevention Sciences, University of Ferrara)

**Abstract format:** Oral

In North-Eastern Italy, we know from archaeological evidence that cremation was a practice used since the prehistoric time, yet only with the process of Romanisation, the rite of incineration has become prevalent. As regards funeral practices during the Empire Age in the region, bioarchaeologists are observing that the rituality of cremation has assumed particular features which could be explained by a progressive and peaceful admixture with the indigenous society. Yet, the hypothesis needs to be addressed further.

The necropolis of Gazzo Veronese (Verona, Italy), represents a case of considerable interest for evaluating changes in rituality during the Empire Age, since it was located along the Via Claudia Augusta, one of the strategic roads of the Roman Empire, and since it is probably one of the largest burial sites of the Early Imperial Age in Northern Italy. The archaeological investigation carried out in Gazzo Veronese revealed a very extensive number of graves (approximately 1000-1100 over a time of about 150 years - from the 1st century BD to the middle of the 2nd century AD). We performed anthropological analyses on 68 burials containing cremated individuals to estimate their biological profile (sex, age at death, and minimum number of individuals), and considered ritual factors by examining variations in bone colour, fragmentation, skeletal completeness, and the presence of animal bones. Considering these indicators of the funeral treatment of the body before, during and after cremation, we were able to reconstruct the incineration rite in this area of the Empire and to highlight specific features of our sample by comparison with other necropolises. With this work, we demonstrated that traditional anthropological methods combined with archaeological and socio-cultural data may provide a more accurate picture of funerary behaviour in sites attributed to the Empire Age in Northern Italy.

## 2 CONTINUITY OR DISCONTINUITY IN CREMATION RITUAL? THE CASE OF THE ROMAN AGE NECROPOLIS OF BOLOGNA CENTRAL STATION (ITALY)

**Abstract author(s):** Masotti, Sabrina - Gualdi-Russo, Emanuela (Department of Neuroscience and Rehabilitation, University of Ferrara)

**Abstract format:** Oral

During the chronological period between the Late Republic and Early Imperial Ages, the picture of funerary rituals is not static and unitary but is marked by a continuous evolution of burial practices. In the Imperial Age (1st-3rd century AD) necropolis of Bologna Central Station, two ritual forms were represented: indirect incineration and inhumation. This duality that characterizes the necropolis during this historical period is linked to multiple factors: local influences, contacts with the Hellenistic and Central-Italic world, and the influence of religious cults. The ethnic-cultural factors and those imposed by the social system of the historical period can be reflected in different ways concerning sex, age or status, and socioeconomic rank. Furthermore, there are individual factors determined by perception and attitudes towards death. In this study, 144 cremation graves were analyzed through a bio-archeological approach to reconstruct the funerary behavior of the inhabitants of Bononia, through their burned skeletal remains. Several parameters were taken into account from the anthropological analyses: the biological profile, state of health, and pathologies. Information about coloration, fragmentation, skeletal areas representation, and presence of animal bones and botanical elements were considered in the funeral ritual analyses. The stratigraphic analysis of the multiple tombs showed different burial methods: contemporary and consecutive depositions with or without mixing bones between previous and successive cremation. This phenomenon attests to the practice of reopening the burial for the inclusion of a new deceased. The study of burials from Bologna Central Station necropolis can provide an important contribution to the knowledge of Roman funerary practices highlighting differences and continuity of rituals with previous periods in one of the most important areas in northern Italy.

## 3 CRUMBLED LIVES – ROMAN CREMATION BURIALS FROM LAURIACUM/ENNS, UPPER AUSTRIA

**Abstract author(s):** Stadlmayr, Andrea - Marschler, Maria (Department of Anthropology, Natural History Museum Vienna) - Böhm, Herbert (Institute of Egyptology, University of Vienna) - Huber, Lisa - Lang, Felix (Department of Classical Studies, Faculty of Cultural Sciences, Paris Lodron University Salzburg) - Traxler, Stefan (Department of Archaeology: Roman Period, Middle Ages, Modern Times, OÖ Landes-Kultur GmbH)

**Abstract format:** Oral

Lauriacum/Enns was the base of the legio II Italica from the late 2nd century into Late Antiquity and the most important military location in the Roman Provincia Noricum. The biritual cemetery at today's „Steinpaß" in Enns, Upper Austria, is located in the vicinity of the legionary camp and was already at the time of its discovery in the 1950s discussed as a cemetery of legionaries and military affiliates – an interpretation which is supported by modern anthropological analyses of the inhumation burials. The burial ground was in use from the 2nd to the 5th century, likely established just before the legionary camp. Housing a total of almost 400 burials, with a quarter of them being cremation burials, the cemetery provides insights into burial rites from the earliest roman military settlement phase until Late Antiquity.

In this paper, we focus on the results of the anthropological analysis of the cremated human remains which date to the 2nd and 3rd century. Basic demographic analyses will be provided as well as burning temperature estimations and data on the representation of the different skeletal regions of the cremains. Furthermore, we like to present a few – in terms of completeness or their combustion processes – exceptional burials, indicating a rather unusual treatment of the human remains. Despite some limitations of the analysis of cremains, our results offer, in context with the archaeological and archaeozoological findings, important insights into (post-)cremation funerary practices at the northern frontier of the Roman Empire.

## 4 WAS IT A BUSTUM TYPE GRAVE? ANALYSIS OF THE BURIALS FOUND NEAR THE ROMAN LEGIONARY FORTRESS AT NOVAE (LOWER MOESIA)

**Abstract author(s):** Jaskulska, Elzbieta - Tomas, Agnieszka (Faculty of Archaeology, University of Warsaw)

**Abstract format:** Oral

During the 2016-2019 seasons, a less intensely researched area to the east of the legionary fortress of Novae in Lower Moesia (nowadays Bulgaria) has been excavated. It shed new light on the function of this place before it was surrounded by new fortifications and became part of the Late Roman town. One of the unexpected discoveries was unearthing graves belonging to a type referred to in the literature as "alla cappuccina" or "tile graves" containing cremation burials. The careful exploration of the discovered cremations allowed for an interpretation that two of the findings should be classified as so-called bustum describing the practice of building the funeral pyre on top of the prepared grave pit, resulting in the rare type of primary cremation burial. There is an ongoing discussion in modern literature considering the validity of such interpretation based both on the experimental approach and theoretical considerations. The presentation explains the use of spatial analysis using the cremation analysis method established by one of the authors to confirm the character of the discovered cremation burial.

## 5 THE BIOARCHAEOLOGY OF CREMATION RITUALS IN ROMAN HISPANIA: AN OVERVIEW

**Abstract author(s):** Silva, Filipa (Research Centre for Anthropology and Health - CIAS, Department of Life Sciences, University of Coimbra; Archaeology Institute of Mérida-CSIC)

**Abstract format:** Oral

In recent years, studies of cremated human bone have generated further and further interest thanks to an in-depth understanding of the bone's fire action and the development of specific methodology. There has been a detailed analysis of different areas of the Roman Empire, such as Italia, Germania, Gallia or Britannia. In the case of Hispania (the Iberian Peninsula), the studies carried out are still scarce and limited to certain sites, although they provide quite interesting information. The present work aims to present a bioarchaeological overview of the cremation funerary practices in this territory.

The data examined comes from funerary areas associated with the cities included in three Roman provinces that belonged to Hispania in the High Empire: Lusitania (Augusta Emerita, Olisipo, Eborac and Salacia), Hispania Citerior Tarraconensis (Tongobriga, Bracara Augusta, Valentia, Saguntum, Barcino, Caesaraugusta and Segobriga) and Hispania Ulterior Baetica (Colonia Patricia Corduba, Carmo and Oripo).

Linear comparisons are prevented due to the analysis of different sample sizes, studied parameters and the methodology used. Nonetheless, it is possible to ascertain that the biological profile of the studied individuals corresponds, essentially, to adults of both sexes, with rare cases of non-adults, particularly infants under 1 year of age. Much of them would be cremated shortly after death. There are differences between sites regarding the cremation process, as well as the skeletal representation in the burial. Except the case of Augusta Emerita, most human remains were subjected to secondary burials, especially in ceramic urns.

For future research, it is crucial to standardize criteria and methodologies, and to expand the studied sites and samples. Multidisciplinary approaches are also needed to enhance the understanding about crematio in Hispania.

## 6 APPLICATION OF COMPUTATIONAL MORPHOMETRICS TO INTERPRET CREMATION FUNERARY PRACTICES: A ROMANO-BRITISH EXAMPLE

**Abstract author(s):** Monetti, Lisa (UCL Institute of Archaeology; Drew University)

**Abstract format:** Oral

This presentation will introduce the application of computational morphometrics of cremated bone to interpret funerary practices from geographically distinct Romano-British regions.

This project compared cremated remains of 82 individuals from Romano-British cemeteries. They represent 9 sites, 4 of which were countryside cemeteries while 5 were from within and around the city of Canterbury in the UK. Canterbury is notable for continental Roman influence on architecture and material culture. This project attempted to identify differences in cremation practices between these two geographically distinct regions, which perhaps had different levels of exposure to continental funerary traditions or different access to resources connected with cremation funerals.

The method for this investigation draws from forensic anthropology as well as ceramic petrographical analyses. Archaeological cremations tend to be more fully cremated or calcined than forensic cremations, making some of the advancements in forensic anthropology nonapplicable to archaeological bone. One example is employing differential burning when reconstructing the burn scenario. Forensic fires frequently leave the body partially burned, so differential burning, the juxtaposition of highly burned areas next to those of fewer heat-induced changes, can be utilised to infer directionality of the fire or body position. Archaeological cremations, however, tend to be more uniformly burned and present greater fragmentation. This project examined differential burning on a smaller scale by adapting computational 2D morphometric analysis previously utilised in the study of depositional histories of potsherds to recognize variation across the body and between individuals in the way heat affected the fragments' shape, size, and fracture patterns.

Results of the application of this method indicate statistically significant differences in burn pattern between the Canterbury individuals and those of the British countryside, broadly suggesting a more systematic and perhaps prescribed funerary tradition in the former, with greater variation and heat fluctuation in the latter.

## HOW DID ROMANS CREMATE? INVESTIGATING THE CREMATION CONDITIONS DURING THE ROMAN PERIOD IN BELGIUM

**Abstract author(s):** Stamataki, Elisavet (Vrije Universiteit Brussel) - Salessé, Kevin (Masaryk University) - McMillan, Rhy (Vrije Universiteit Brussel) - Kontopoulos, Ioannis (University of Copenhagen) - Veselka, Barbara (Vrije Universiteit Brussel) - Dalle, Sarah (Ghent University) - Hlad, Marta (Vrije Universiteit Brussel) - Sabaux, Charlotte - De Mulder, Guy (Ghent University) - Snoeck, Christophe (Vrije Universiteit Brussel)

**Abstract format:** Oral

Cremation was the main funerary practice in present-day Belgium during the Roman period (ca. 58 BCE- 425 AD). Until the end of the 20th century, researchers assumed that most biological, chronological, and environmental information recorded in bone was destroyed due to high temperatures (up to 1000°C) reached during combustion. The exposure to high temperatures leads to significant structural, chemical, and isotopic changes to the inorganic fraction of bone while destroying the organic components. Despite these limitations, recent developments in Infrared Spectroscopy and carbon and oxygen isotope analysis indicate that the study of cremated bones provides important information regarding pyre technology and body management in ancient societies in which cremation was the dominant funerary practice.

The aim of this study is to assess the intra- and inter-site variability in cremation conditions during the Roman period in Belgium, using Attenuated Total Reflectance-Fourier Transform Infrared Spectroscopy (ATR-FTIR) and carbon and oxygen isotope analysis on burnt human remains. For this reason, five sites from the Early and Middle Roman period (ca. 58 BCE-270 AD) were selected. The spectroscopic and isotopic results of the cremated remains indicate that there is a high degree of homogeneity in cremation conditions during the Roman period. However, statistically, significant differences can be observed when comparing the data of the Roman period to Late Bronze Age and Early Iron Age (ca. 1200–500/450 BCE) data, indicating that the way cremation was performed changed between the two chronological periods from the same area. The homogeneity in cremation settings in the Roman period compared to the variability in the Metal Ages adds to our understanding regarding the changes in cremation practices through time and space in ancient communities where cremation was the predominant funerary practice and provides useful insights regarding the pyre technology, body treatment, and pyre management during cremation.

## OSTEOLOGICAL MODIFICATION IN CREMATED BONES FROM ROMAN IMPERIAL NECROPOLIS OF MONTE CARRU (ALGHERO, SARDINIA, ITALY)

**Abstract author(s):** Serra, Rita (Department of Biomedical Sciences, University of Sassari; Center for Anthropological, Paleopathological and Historical Studies of the Sardinian and Mediterranean populations, Department of Biomedical Sciences, University of Sassari) - La Fragola, Alessandra - Rovina, Daniela (Superintendence for Archaeological Heritage for the provinces of Sassari and Nuoro) - Piana, Loredana (University of Sassari) - Sofgiu, Maria (Department of Biomedical Sciences, University of Sassari) - Mazzarello, Vittorio - Pirino, Alessio - Montella, Andrea - Bandiera, Pasquale (Department of Biomedical Sciences, University of Sassari; Center for Anthropological, Paleopathological and Historical Studies of the Sardinian and Mediterranean populations, Department of Biomedical Sciences, University of Sassari)

**Abstract format:** Oral

Sardinia became a Roman province in 238 BC; the empire introduced a ritual of cremation, present, in previous periods, just occasionally. Fire produces changes in bone tissue in colour, size of fragments, shrinkage, and microscopic structure that can be used to understand ritual and distinguish between voluntary and casual cremation.

In this study, we analyzed different heat-induced modifications of bone, starting from the standard temperature-colour classification of cremation. Our samples come from the Sardinian necropolis of Monte Carru-Alghero, a Roman imperial necropolis with 200 cremations, of which 10% were analyzed. By measuring macroscopic changes in colour, size, and shrinkage associated with the combustion temperature, we were able to better understand the body position during cremation; we divided the results into anatomical regions. Using SEM, we observed microscopic changes in the structure of the osteon and the step-by-step modification of the external edge to the internal edge of the bone.

The most calcined regions were located in the central part of the body (pelvis and lumbar spine); most bones were white or grey-white, except for the skull, which was largely brown-black. A greater variability was observed in size, weight, shrinkage, and fragment fracture patterns, which are related to the original shape of the bone. The bone organization destruction seems to be associated with a burning temperature; this is almost survived in the brown fragments and on the inner edge, mostly destroyed in the white or blue-white fragments and on the outer edge of the bone. Interesting, case T.27: a mother-newborn child cremation with a different degree of combustion among individuals.

Macroscopic and microscopic bone modifications seem to be related to the temperature of the fire in cremated remains. It would be interesting to investigate aDNA's survival in this kind of sample.

Acknowledgment: FAR-Uniss 2019-2020.

## HISTOLOGICAL EXAMINATION METHODS

**Abstract author(s):** Grosskopf, Birgit (Georg-August-Universität Göttingen)

**Abstract format:** Oral

A histological examination of bone cross-sections allows for the approximate estimation of individual age at death. This is an important aspect of anthropological diagnosis of highly fragmented cremated remains, where the determination of the age at death is much more difficult than for intact, unburned skeletons. In addition, this method allows for the differentiation between human and animal bones. If portions of joints are present or the shape of the bone is characteristic for a particular anatomical element, an identification based on morphology is possible. However, specification in small diaphysis fragments can be difficult or even impossible morphologically.

Cremations often show an admixture of animal bones, especially those from the Roman period. This can occur, for example, as a result of burning the corpse along with a cline that was decorated with carvings of animal bones. These carved bones are usually recognisable because of their distinct shape and artificially crafted features, in contrast to the difficult task of identifying bone remains originating from (meat) offerings commingled with human bones. Discerning between human and faunal remains can be accomplished histologically, however, mounting cross-section specimens on microscopic slides is time consuming. Through experience in histological diagnostics, it is often possible to assess the internal structure of fracture preparations, even at high magnification, using a reflected-light microscope to scan for characteristic elements that make it possible to identify the bone fragments as animal or human.

### A. HISTOMORPHOLOGICAL ANALYSIS OF CREMATED AND UNBURNED BONES: AGE-ESTIMATION OF ROMAN THESSALONIKIS' POPULATION

**Abstract author(s):** Bantavanou, Panagiota (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Valakos, Eustratios (Department of Biology, National and Kapodistrian University of Athens) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

**Abstract format:** Poster

Age estimation on cremated and poorly preserved skeletons is a challenging task. Standard age estimation methods do not perform efficiently on skeletal material that has been taphonomically modified due to high temperatures (<300o C) or strong fragmentation. In such cases, histomorphological methods can estimate age-at-death with an estimation error of  $\pm 5$ -15 years. However, existing methods are not applicable on cremated bones and exhibit the highest estimation error (>10 years).

In this study, we present a new histomorphological age estimation method for cremated bones. For this, we used femur cross-sections of cremated (n=30) and unburned individuals (n=45) of the same archaeological and taphonomic context (Thessaloniki, Metro osteological material, Roman Period 1st-4th c. AD). As a blind-test sample we used modern left femurs (n=8) of known sex and age-at-death from the Human Skeletal Reference Collection of the University of Athens.

For histological sample preparation we developed two protocols one for cremated and modern bones and one for unburned bones. We generated four regression equations based on the densities of osteons and osteon fragments: a) osteon population density (OPD), b) osteon fragment population density (FPD), c) total population density (osteon and fragments) (TPD), d) multiple regression of osteon and osteon fragment population density (MPD). The regressions were tested for accuracy and reliability and compared with previous published methods.

The regressions based on FPD and TPD were the most accurate with a mean estimation error of three years, whereas the multiple regression MPD, followed by the OPD regression were the less accurate. Our method performs better than previously published methods which showed a mean estimation error of 6.71 and 7 years respectively.

**Acknowledgment:** This research has been co-financed by the European Regional Development Fund of the European Union and Greek national funds through the Operational Program Competitiveness, Entrepreneurship and Innovation, under the call RESEARCH – CREATE – INNOVATE (project title: ECHOES-Development of a methodology for the digital reconstruction of ancient human biographies through the study of archaeo-anthropological material, project code:T2EDK-00152).

**Theme: 5. Climate Change and Socioenvironmental Perspectives**

**Organisers: Kerr, Sarah (Aarhus University) - Tisdall, Eileen (University of Stirling) - Sagrott, Stefan (Historic Environment Scotland)**

**Format: Regular session**

Anthropogenic climate change is affecting societies across the world. While impacts have varying degrees of severity, it is clear that more and larger areas will be impacted by climate change and the communities in those areas will have to adapt.

Adaptation to changing climates has emerged in archaeological discourse, balancing the former propensity for studying social collapse. While collapse brought wholesale impacts on all aspects of life, the over-arching narrative in human past is one of resilience. The perceptible increase in adaptation research has concentrated on prehistoric societies, despite identified climatic changes in the medieval world. In addition, much research has focused on resilience across longer time scales yet it has been argued that a better understanding of adaptation and resilience at a human, generational timescale is required for today's climate response.

Therefore this session creates a space for medieval archaeology to contribute to the adaptation and resilience narrative. It debates whether medieval resilience can be actively exploited as a bridge to reduce the psychological distance of climate change (a known barrier to climate action) especially in those geographical areas where climate change impacts have not yet been greatly felt, such as western Europe.

This session seeks papers on the human responses to climatic changes across the medieval world; particularly those detailing approaches to understanding the medieval environment and how adaptation and resilience may be detected. Papers may comprise paleoenvironmental records, material culture, or source-based approaches to known climatic trends such as the Medieval Warm Period (MWP) and Little Ice Age (LIA) or individual case studies. Discursive papers on the issues of linking adaptation at individual sites to the MWP or LIA are encouraged. In addition, this session welcomes papers on utilising medieval adaptation in anthropogenic climate change communication, or the challenges facing this inherently interdisciplinary research topic.

## ABSTRACTS

### 1 **STORMING CASTLES':THE TWO CASTLES AT CAERLAVEROCK AND MEDIEVAL CLIMATE CHANGE**

**Abstract author(s): Tisdall, Eileen - Tipping, Richard (University of Stirling) - French, Morvern - Sagrott, Stephan (Historic Environment Scotland) - Kinnaird, Tim - Srivastava, Aayush (University of St Andrews)**

**Abstract format: Oral**

Caerlaverock Castle is the most significant Medieval castle complex in Dumfriesshire, south west Scotland. There are two castles, the Old Castle built in c. AD 1229 on the northern shore of the Solway Firth and the famously shield-shaped triangle of the New Castle, built <50 years later, some 200m inland on higher and firmer ground. Archaeological and palaeoenvironmental research in 2004 suggested that abandonment of the Old Castle may have been because storm surge events impacted the Old Castle and its associated harbour.

Here we present new palaeoenvironmental research (2021-22) that further define the nature and timing of these storm surges. Sediment records from coastal landforms, barrier beaches and related lagoons that formed along the early Medieval coast indicate that a series of very large storm surges impacted the coastline, temporarily raising sea level by >2.5m. Here a combination of <sup>14</sup>C and OSL dating have been used to better constrain the chronology, resolving the timing of these events and linking these storm surges to changes in northern hemisphere atmospheric circulation and the North Atlantic Oscillation. It is thought that the coastline had experienced significant storminess several human generations before the Old Castle was planned or constructed and access to the harbour would at times have been very problematic. This new research provides more evidence for when and why the harbour went out of use, better defining its role and changing relationship with the two Castles. These findings will also enable us to better understand the use of the wider landscape at Caerlaverock, including Medieval responses and adaptations to climate change events and the changes in access to the coast for travel and trade.

### 2 **CLIMATE ADAPTATION IN PASTORAL SOCIETIES: TESTING CORRELATIONS BETWEEN CLIMATE AND LAND USE IN HIGHLAND SCOTLAND AND IRELAND, 1250-1750 AD**

**Abstract author(s): Costello, Eugene (Stockholm University; Uppsala University) - Kearney, Kevin - Gearey, Ben (University College Cork)**

**Abstract format: Oral**

The influence of climate change on late medieval and early modern agrarian society in Europe has been much discussed in the discipline of history. However, the most detailed historical research has had a bias towards regions that

were heavily involved in grain production, since these tend to contain the most detailed written records regarding land use. More pastoral regions where cattle, sheep and goat herding dominated have received less attention. This paper reviews the results of pollen records and archaeological fieldwork in different parts of Highland Scotland and Ireland in order to open up the question of how pastoral regions fared in the early and mid- 'Little Ice Age' (c.1250-1750). It discusses whether they can be described as vulnerable and highlights certain land-use changes in uplands which may, in part, may be a response to increased climate-related risks. However, Bayesian modelling shows that the chronological resolution of much field data is still too rough to establish firm correlations with specific climatic shifts during the Little Ice Age. What is more, decisions about land use were also influenced by socio-political and economic considerations. The presentation finishes with a discussion of how the influence of climate on pastoral regions might become more visible with future research.

### 3 RECONSTRUCTING PALAEOCLIMATE RECORDS FROM WELL-DATED MEDIEVAL PARCHMENT MANUSCRIPTS

**Abstract author(s):** Johns, Samuel - Maule, Charlie (Organic Geochemistry Unit, University of Bristol) - Angelova, Lora - Fitzgerald, Solange (The National Archives) - Collins, Sian - Johnson, Anna (Cambridge University Library) - Collins, Matthew (Section for Evolutionary Genomics, The GLOBE Institute, Faculty of Health and Medical Sciences, University of Copenhagen; McDonald Institute for Archaeological Research, University of Cambridge) - Roffet-Salque, Melanie (Organic Geochemistry Unit, University of Bristol)

**Abstract format:** Oral

Parchment is an ancient material used for the documentation of litigation art and societal information for over 2000 years. Formed from animal skins, its manufacture comprises repeated liming and scraping steps before drying under tension. Historical parchment represents a valuable record of cultural heritage but due to this, presents a considerable analytical challenge with many studies limited to non-invasive techniques.

In this paper, we recognise that (1) animal lipids within well-dated manuscripts provide an untapped record of historical climates and (2) highlight the need for high-resolution records that encompass the medieval period. We, therefore, report a novel, non-destructive lipid extraction technique for parchments. By employing this technique on well-dated manuscripts, we are able to determine the hydrogen stable isotopic composition of parchment lipids to reconstruct precipitation-driven climate records. We are thus able to probe past climatic events, such as The Great Famine period (1315 – 1317 CE) which saw heavy rains and lower temperatures across Europe leading to extreme food shortages felt by all levels of society.

### 4 ADAPTATION AND RESILIENCE IN LATE MEDIEVAL JUTLAND (DENMARK)

**Abstract author(s):** Kerr, Sarah (Aarhus University)

**Abstract format:** Oral

This paper examines the evidence for adaptation in the face of climatic anomalies in late medieval Jutland, central Denmark. It explores the case studies of Nørre Vosborg, a site comprising two late medieval manor houses, describing the architecture and archaeological remains from surveys and excavations. It is argued that Nørre Vosborg 1 was moved approximately 900m inland after it sustained considerable flooding and damage, likely at the end of the medieval to early modern period. In addition, Nørre Vosborg 2 was also moved either pre-emptively or after some damage from the same environmental events. The climatic events which drove these settlement changes appear to have been a series of storm surges in the sixteenth century, including a particularly violent event in c.1593. The combination of archaeological, architectural and environmental data at Nørre Vosborg 1 and 2 allows contemplation of the human response to climate disasters, that is resilience and adaptation, including analysis of the pace of these responses.

The paper turns to set the climatic anomalies in their wider context to argue they may be indicative of the impacts stemming from the onset of the Little Ice Age (LIA). It compares the Nørre Vosborg case studies with other similar examples in western Europe and postulates that there may be a wider trend detectable in the archaeological record during the shift from the Medieval Warm Period (WMP) to the LIA. Methods, and the associated challenges, of 'scaling up' these seemingly disparate case studies is discussed. Lastly, it is acknowledged that despite such challenges, awareness of human resilience in the recent-past is an important element of today's climate communication.

### 5 MITIGATING CLIMATE CHANGE. PEASANT DRIVEN SOCIO-ECOLOGICAL ADAPTATION STRATEGIES IN BOREAL INLAND SCANDINAVIA

**Abstract author(s):** Svensson, Eva (Karlstad University) - Petterson, Susanne (Norskt Maritimt Museum)

**Abstract format:** Oral

In boreal inland Scandinavia, the onset of the Little Ice Age was a game changer as cereal cultivation became (almost) impossible in some areas where the preceding Medieval Warm Period had allowed for expansion of settlement

and fields into places with otherwise unsuitable conditions. In some areas the colder climate was a major problem, in other areas the major challenge was rather the increasing precipitation.

Climate change, the onset of the Little Ice Age, was part of the Late Medieval Agrarian Crisis together with disasters such as the Black Death killing vast numbers of people. The Late Medieval Agrarian Crises caused settlement desertion and transformation of agrarian life. But the peasants were not just passive victims of external forces, they also developed strategies to mitigate the disasters.

In this paper archaeological and palaeobotanical evidence of strategies carried out by the peasants in boreal inland Scandinavia to mitigate climate change, and adopt to the new conditions will be discussed. The detected strategies, with geographical variations, were: Establishing settlements and fields in elevated and drier locations; Introducing autumn and spring crops for spreading risks; Increased cultivation of oats, being less sensitive to harsher and wetter cultivation conditions; Concentrating landowning on fewer hands for promotion of cattle breeding; Improving dwelling houses to better withstand colder climate. The major actors behind the strategies were the land-owning peasants, in some cases as individual initiatives and in other cases as communities.

## 6 RESILIENCE AND VULNERABILITY IN THE LITTLE ICE AGE: OSL AND MICROMORPHOLOGY IN RESEARCHING THE DESTRUCTION OF A SHETLAND FARMING COMMUNITY

**Abstract author(s):** McKenzie, Jo (Archaeological Sciences, University of Bradford) - Bigelow, Gerald (Archaeology Institute, University of the Highlands and Islands; Burroughs & Chapin Center for Marine and Wetland Studies, Coastal Carolina University) - Saunders, Kristen (Biological and Environmental Sciences, University of Stirling) - Simpson, Ian (Department of Archaeology, University of Durham) - Sanderson, David (Scottish Universities Environmental Research Centre, University of Glasgow) - Kinnaird, Tim (School of Earth and Environmental Sciences, University of St. Andrews)

**Abstract format:** Oral

In the late 17th century AD the 'Broo' community of four farms, on the southern end of the Shetland Islands, UK, was almost completely buried by sand blows from a nearby beach. The well-preserved Broo Site Complex, representing very likely the last abandoned farm, provides a unique opportunity to trace human-environmental interactions at a high chronological resolution, possessing historical documentation, a broad array of artefacts of known and often short periods of production, and extensive archaeological sequences comprising activity-related horizons and highly dateable sand strata. The environmental history is complex, with OSL dating suggesting that farms survived sand blow events in the 14th and mid-16th centuries, and records showing that the township was still a valuable property as late as 1650.

Such mobilisations of coastal sand deposits have been attributed to enhanced storminess embedded in periods of cooling climate, and medieval and post-medieval Little Ice Age conditions may have played a role in the Broo transgressions. However, over 15 years of multi- and inter-disciplinary research suggests a more complex story of human-environment interaction. Anthropogenic modifications of landscape and local ecology from cultivation, herding and/or introduction of new species may have been equally important catalysts in Broo's demise. This presentation discusses the specific contribution of soil micromorphology, with its ability to provide high-resolution analysis of both anthropogenic character and environmental context in archaeological horizons, alongside OSL dating evidence, in order to reconstruct potential causes for the Broo sand blows, and why the landscape restabilized in the medieval period but became a vast, permanent dunefield in the 17th century. The Broo story contributes valuable data on the causes of, and human adaptations to, a type of environmental extreme event that has occurred many times in many places on European coasts, but seems to have been particularly common during the Little Ice Age.

## 7 WATER MANAGEMENT AND RESILIENCE TO CLIMATIC CHANGE IN MEDIEVAL MIDDLE EASTERN CITIES - EVIDENCE FROM THE SOURCE OF LIFE PROJECT

**Abstract author(s):** Brown, Peter (Radboud University)

**Abstract format:** Oral

Compared to European medieval cities, those of the Middle East were larger and supported more numerous populations. Counterintuitively though, these cities were typically situated in zones in which water was considerably scarcer than contemporary European settlements. While social adaptations and sophisticated hydraulic infrastructure evidently permitted high concentrations of urbanised settlement at specific locations within these regions, the extent to which these populations were resilient to climatic fluctuations remains a matter of some debate. A plummet in precipitation could substantially impact crop yields, prevent the transportation of goods by waterways and even threaten a city's water supply. Anomalously high rainfall, on the other hand, could lead to destructive flooding with equally alarming consequences. The security of water supplies was not only threatened by environmental change however. Military action often targeted a city's hydraulic infrastructure while longer-term economic and political pressures could result in more gradual degradation to a city's water supply. While a number of the major early Islamic cities remain occupied to this day (such as Baghdad and Cairo), several (such as Samarra and Basra) were abandoned during the medieval period—with the water supply often cited as a factor in their depopulation. Drawing on evi-

dence collected through the ongoing Source of Life project, this paper explores the extent to which climate change may have influenced the urban populations of the medieval Middle East. In particular, strategies that enhanced resilience to environmental variation, such as using water from several different sources (including rivers, rainwater and groundwater), regular maintenance and improvement works to ensure waterways remained functional and the storage of water for extended periods in dedicated infrastructure, are evaluated. Whether or not they actively realised it, climatic variation undoubtedly affected medieval Middle Eastern populations and urban communities had to guard against its impacts alongside, perhaps more tangible, economic and geo-political concerns.

## 8 CLIMATE CHANGE VS WAR CONDITIONS

**Abstract author(s):** Lukacevic, Marijana (private company)

**Abstract format:** Oral

In this presentation, the results of *cribrae orbitaliae* analysis will be presented by comparing two populations that lived in the same geographical area, today's continental Croatia, surrounded by the Sava, Drava and Danube rivers in the central and eastern parts and the Žumberak mountain in the east. These populations lived in different historical periods. Population A lived from 11th to the 15th century. According to historical data, during the period from the 10th to the 14th century climate change happened in Central Europe and the average summer temperatures were one and a half degrees higher than today. Such changes, according to today's knowledge, can compromise seasonal agricultural production and thus endanger children's health and growth, but also the general health and working abilities of adults.

Population B lived from 15th to 18th century in the same geographical area. Significant political and historical changes happened in the historical period from 15th to 17th century. Croatian history in the second half of 15th century was marked by the war campaigns of the Ottoman Empire in order to conquer Western Europe. These military campaigns lasted for almost two and a half centuries and brought with them everything that the state of war brings, extremely poor conditions for normal life and long-term consequences for the population exposed to such conditions.

Bioarchaeological analysis of *cribrae orbitaliae* has shown that the population A have higher incidence of this pathology than population B. In this presentation we will try to explain what exactly is the reason for this results. Whether climate change has a more negative impact on the quality of life compared to war and which group of the population is most vulnerable in both conditions will be presented in this lecture.

## 9 CHANGING CLIMATE AND EMERGENCE OF THE OTTOMAN STATE: INTEGRATING ARCHAEOLOGY, HISTORY AND PALEOENVIRONMENTAL STUDIES

**Abstract author(s):** Dikkaya, Fahri (TED University)

**Abstract format:** Oral

The Medieval Warm Period, the Medieval Climate Anomaly, which lasted from c. 950 to c. 1250, can be defined as the beginning of the Turkish period in Anatolia. At the end of this period, adverse climatic conditions marked with dryness and cooler phases became prevalent in Anatolia and the Balkans, possibly in response to a volcanic eruption that occurred in 1257. Following this period, history demonstrates that the Byzantine socio-political system that was already weakened, encountered a new rival on its frontiers. The Ottomans emerged as a socio-political power in north-western Anatolia in the second part of the 12th century under the leaderships of Ertuğrul and Osman, while the Byzantine political and militaristic control over Anatolia collapsed. This paper aims to evaluate the climate change as an important contributing factor for Ottoman success against the Byzantine Empire along with militaristic and political factors. In other words, the ability of the newly arising Ottomans to operate in the changing environment of Anatolia contributed to their consolidation and emerge as regional power. This study will also be based on an interdisciplinary approach to this issue through historical textual, archaeological, environmental and climate data.

---

## 85 UNDERSTANDING NEANDERTHAL SYMBOLIC AND CULTURAL BEHAVIOUR AND THEIR COGNITIVE UNDERPINNINGS. WHERE DO WE STAND? [PAM]

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Leder, Dirk (Niedersächsisches Landesamt für Denkmalpflege) - Majkić, Ana (Department of Archaeology, University of Belgrade)

**Format:** Round table

In the last decade evidence of sophisticated symbolic and cultural behaviour among Neanderthals has accumulated substantially across Eurasia. This is exemplified by Neanderthal's usage of birds of prey feathers, talons, and phalanges at a number of European Mediterranean sites, by engraved rocks, lithics, and bone objects from a variety of places, the usage of spaces deep inside caves and colorants, by human burials, and potentially by cave paintings in Iberia, among further examples.

The very notion of sophisticated symbolic and cultural behaviour in Neanderthals pivotally bears implications in regard to human evolution and the cognitive abilities of one of our genetically closest relatives. Is *Homo sapiens* as special as we like to believe, or have there been other human species that – under yet unknown circumstances – disappeared in the past, but had strikingly similar abilities? What are the cognitive underpinnings of these recent discoveries and recognitions? Do we need more research on human cognitive evolution, neurosciences and past brain development connected to these particular questions?

The archaeological discoveries of objects with symbolically mediated behaviour lay the foundations for new possibilities to reconsider the very nature of Neanderthals – first regarded as primitives, later seen as capable of adapting to a variety of environments and climate changes, and now possibly as self-aware human beings that were able to communicate in abstract ways, displayed care for their deceased, and commanded imaginative means similar to us. Were these complex behaviours independent ‘inventions’ or the result of acculturation? Do we suffer from a historical legacy of seeing Neanderthals as ‘the others’?

Where do we stand today, and which direction does future research need to take in order to investigate such complex issues that ultimately aim to address one of the most essential questions humankind might have – what makes us human?

---

## 86 PREHISTORIC WARRIORHOOD IN TRANSITION

**Theme: 2. [Re]integration**

**Organisers: Dolfini, Andrea (Newcastle University) - Frieman, Catherine (Australian National University) - Harrison, Eleanor (Newcastle University) - Molloy, Barry (University College Dublin)**

**Format: Regular session**

The session invites theoretically-oriented papers exploring Neolithic to Late Bronze Age notions of martiality and warriorhood as laid out in individual ‘warrior graves’ and cognate evidence. In large swathes of Europe, the late 5th to 2nd millennia BC witnessed the emergence of a new funerary language centring on individual furnished burials. While all gender and age groups were interred in this way, male burials equipped with impressive panoplies of stone and metal weapons have drawn the keenest interest from scholars. For many, these burials are thought to embody a major transition to (a) individualising forms of prestige and sociopolitical ranking; (b) a binary gender ideology; (c) novel cosmological principles governing funerary behaviour and society; (d) a ‘heroic’ male persona defined, in life as much as in death, by martial valour; and (e) new migratory dynamics originating from the Pontic-Caspian steppes. While all these readings provide valuable insights into the social dimensions of warrior graves, none are conclusive due to a fractured theoretical landscape and oft-overheated debate. Consequently, even the definition of a ‘warrior grave’ and underlying social notions of warriorhood are contested.

The session discusses new perspectives on warrior burials from Neolithic, Chalcolithic, and Bronze Age Europe focusing on the relationship between martial ideology and martial practices; markers of received or inflicted violence and related bioarchaeological evidence; and the funerary and non-funerary dimensions of grave kits. Papers may also discuss the gender dynamics underlying warrior graves as well as meaningfully associated or comparative evidence, e.g., unfurnished or differently furnished burials. True to the session’s focus on transitions, papers are also welcomed, which investigate the shift from weapon-poor to weapon-rich burials in the Neolithic and the transformation of warrior burial and ideology during the Bronze Age. A parallel poster session will host narrower studies, e.g., those solely focusing on bone trauma.

## ABSTRACTS

### 1 FROM HUNTERS TO WARRIORS? QUESTIONING IMPLICIT MASCULINITIES FROM GRAVE GOODS FROM THE 6TH AND 5TH MILLENNIUM CAL BC, CENTRAL EUROPE

**Abstract author(s): Bickle, Penny (University of York)**

**Abstract format: Oral**

If the Bronze Age is characterized by the “Warrior burial”, conjuring images of heroic leaders, martial ideologies and idealised visions of masculinity, the Neolithic equivalent is “the hunter”. Yet, hunting occupies an uncertain place in narratives of the Neolithic, at once both seemingly highly valued in rich grave assemblages, while also playing perhaps a more muted role in food production. It can thus both be a prestige activity, or a supplement to the diet, when domesticated resources fail. Hunting remains, however, most frequently interpreted (explicitly or implicitly) as a male activity, wild and untamed, in comparison to the domestic sphere, which in turn is considered to mostly be populated with women. Such divisions seem influenced by modern gender expectations, and thus warrant further consideration and debate. In this paper, I explore the symbolism of hunting and masculinity in the 6th and 5th millenniums cal BC, drawing on the burial evidence, isotope data and use-wear analysis of stone tools. This evidence points to a strong division of labour, but with different value systems influencing grave good choice through time. As a contribution to

the sessions themes, the aim is consider sex and gender ideologies amongst early farmers, and to argue for dynamic relations between different genders through time.

## 2 LATE NEOLITHIC WARRIOR SYMBOLISM IN CENTRAL EUROPE

**Abstract author(s): Schultrich, Sebastian (Institut fuer Ur- und Fruehgeschichte Kiel)**

**Abstract format: Oral**

Battle-axes are central to understanding ideological changes in Central Europe during the Late Neolithic (LN 3300–2800 BC). The number of stone battle-axes in burials significantly increase during this period. They were made of stone, copper, antler and depicted on stone slabs. We know this specific pattern from Southern Europe, linked to daggers and halberds.

The occurrence of battle axes in collective graves has hitherto hindered the recognition of their importance, as collective burials often are equated with collectively oriented societies. However, if we look closely into the specific burial customs, huge regional differences occur. In gallery graves, the grave goods seem more “collective” than in rock-cut tombs or passage graves. In the latter, battle axes appear. Perhaps, in these graves, the societies expressed individuality and certain idealised social roles.

Also, different forms of single burials occur already in LN Central Europe. Generally, scholars assume that single graves, individuality and idealised social roles appear related to the Final Neolithic (2800–2200 BC) Corded Ware Culture (CWC). That is not true, as the LN situation shows. This observation is important as it limits the high importance that is (again) attributed to the CWC in recent research.

Scholars already related the developments in Southern Europe to Eastern Europe. Now we can also relate Central European developments to this. Accordingly, we face a pan-European network, in which certain symbols and ideas were shared. Thus, specific patterns which are attributed to FN Cultures rest on the LN patterns.

However, the meaning of the idealised warrior in diverse societies is uncertain. It is clear, however, that warriorhood is just one feature of complex symbolic system, which highlights human beings. Moreover, it is not certain if males were associated with the idealised warrior role. On the contrary, there is evidence that female individuals were.

## 3 NEOLITHIC WARRIORHOOD?: INTERPRETING LATER NEOLITHIC INDIVIDUAL BURIAL IN BRITAIN AND IRELAND

**Abstract author(s): Harrison, Eleanor (Newcastle University)**

**Abstract format: Oral**

When we think of a ‘warrior grave’, Neolithic burial practices may not be the first to spring to mind. This is particularly true for the Neolithic in Britain and Ireland, where burial practices are generally characterised as unfurnished and communal, and reflective of societal ideas of relational personhood as opposed to individual identity. There does appear to be, however, traditions of furnished individual burial in the Middle to Late Neolithic of Britain and Ireland. These burials are furnished with different assemblages of grave goods including pottery, ornamentation and stone tool, sometimes in significant numbers. Burials of this kind are then absent from Britain for centuries before a period of increased individual burial, associated with Beaker pottery in the Early Bronze Age. This paper will explore how these Neolithic individual graves compare to the notion of a ‘warrior grave’ and the implications of this to our broader understandings of the Later Neolithic and the transition to the Early Bronze Age in Britain and Ireland.

## 4 RETHINKING WARRIOR GRAVES: NEW PERSPECTIVES FROM COPPER AGE ITALY

**Abstract author(s): Dolfini, Andrea (Newcastle University)**

**Abstract format: Oral**

A new funerary language arose across Europe in the 4th and 3rd millennia BC, which centred on individual burial, gender diacritics, and metal-rich grave sets. Warrior graves arguably are the best studied manifestation of this language. Who was buried in these graves? And why were these dead afforded weapon-laden funerals? The paper addresses these questions from the vantage point of the ‘Rinaldone’ burial tradition from Copper Age central Italy, c.3650-2200 BC. After presenting Casetta Mistici, a recently excavated cemetery with warrior graves from the environs of Rome, the paper explores three cross-cultural concepts, viz. (1) the gendered life course; (2) life force, or ‘virtue’; and (3) violence, both inflicted and suffered. It is argued that a revolutionary new reading of warrior graves emerges at the nexus between these concepts. The reading, it is maintained, fits well the Italian evidence and might perhaps be extended to other early warrior grave ‘cultures’ from 4th and 3rd millennia Europe.

## 5 SODALITIES, SEXUALITIES, OR PERHAPS BOTH? RETHINKING LATE PREHISTORIC SAME-SEX DOUBLE-GRAVES

**Abstract author(s):** Walsh, Matthew - Reiter, Samantha (National Museum of Denmark) - Frieman, Catherine (Australian National University) - Kaul, Flemming - Frei, Karin (National Museum of Denmark)

**Abstract format:** Oral

Gender identities and categories are integral to social groups that are highly-performative and/or rigorously hierarchical. One example of such communities is martial fraternities. From a queer theory perspective, we ask whether the hierarchal 'elite' warrior class of late European prehistory may have embodied a distinctive gender- and/or sexuality-related category of its own based on dynamic fraternal relationships, such as those well-documented among the Greeks in the form of erastes-eromenos pairings. Drawing on ethnology and Classical sources, we re-interpret a subset of late prehistoric double graves to better understand this possibility in the archaeological record. We posit that in some cases the archaeological evidence reasonably suggests the possibility that martial identities and lifestyles could indeed have sanctioned intimate interpersonal relationships between men as part of shared 'warrior' ideologies and that this is reflected in the funerary assemblage of warriors' graves. Throughout the 19th and 20th centuries double graves have been interpreted differently in various contexts, namely as representing so-called 'blood-brother' or fosterage relationships, or as a reflection of Indo-European cosmological dualities, or even human sacrifices made in honour of a deceased individual. However, to date, interpretations of same-sex double-graves have ignored or at least left unspoken the possibility that they simply reflect the reality of intimate same-sex relationships in the past.

## 6 SHARED WARRIOR PRESTIGE: BEAKER MEN, WOMEN, CHILDREN AND THEIR WEAPONS

**Abstract author(s):** Turek, Jan (Center for Theoretical Study, Charles University, Prague)

**Abstract format:** Oral

The Copper Age funerary practices seem to be a symbolic reflection of the division of labour within the family and a reflection of the different social status of men, women, and children. The individuality expressed within the burial rites is indicative of an individual's association with a particular social category. Such concept is connecting the warrior prestige mainly with the male gender category, however, the symbolic meaning of weapons seems to have much more complex social context. The warrior's social status was not exclusively attached to men. It was rather shared within elite families demonstrating the social power of men, women and children. The male-gendered artefacts, such as weapons may have been 'delegated' also to women in order to reinforce social norms and rules of social differentiation. As such, the Bell Beaker female burials with archery equipment represent members of a social elite, possibly female warriors-'Amazons'.

In the 3rd millennium funerary assemblages in Central Europe stone/copper weapons accompany some of the children's burials, especially those with a male orientation. In the context of children's graves, these artefacts clearly were of symbolic importance and may have well have been anticipating their social roles as adults. In Corded Ware cemeteries, the bodies of very young boys are accompanied by stone battle-axes or mace-heads that may be interpreted as symbols of wealth and social status. Such weapons do not necessarily reflect prehistoric social relations simply because these children died so young. Because other child graves do not contain such symbolic artefacts, it can be assumed that this group of sub-adult burials may represent socially favoured individuals of some sort. They may have been firstborn sons/daughters, potential heirs of social status and wealth within a family or a community, suggesting the existence of a system of ascribed hereditary wealth.

## 7 ARGARIC WEAPONS: MARKERS OF VIOLENCE OR MARKERS OF NETWORKS?

**Abstract author(s):** Lackinger, Aaron - Ibarz-Navarro, Sergio - Murillo-Barroso, Mercedes (Departamento de Prehistoria y Arqueología- Universidad de Granada) - Montero-Ruiz, Ignacio (Instituto de Historia- CSIC)

**Abstract format:** Oral

The halberd is one of the most characteristic objects and one of the most solidly linked to the metallic productions of the Argaric communities. The type of 'argaric halberd' has even been applied to other halberds found outside the argaric region (eg. Brandherm, 2012; Lull et al. 2018). Halberds, which are considered a marker of male status for the Argaric elites, disappear from the funerary record around 1800 BC, being replaced by axes and swords (Lull et al. 2017; 2018). Functionally, the halberds have no other use than exercising violence, but are they actually weapons produced by the Argaric communities for that end?

Some previous works have pointed out the low use of halberds as an element of war, either because of their scarcity of use-wear marks, or because of the limited evidence of individuals with stab wounds (Brandherm, 2012; Aranda et al. 2009).

In this work we present the results of composition and lead isotopes analysis by MC-ICP-MS of a set of argaric halberds to explore the productive chain of these weapons and the exchange networks involved in their production and acquisition. In a reassessment of halberds as emblems of power rather than as objects to exert direct violence, the

exchanges and social relations established in their acquisition and elaboration must have played an important role defining their social value.

## 8 THE THINGS THEY CARRIED

**Abstract author(s):** Baca, Martin (Department of Archaeology, Comenius University in Bratislava) - Havlíková, Markéta (Department of Archaeology and Museology, Masaryk University in Brno)

**Abstract format:** Oral

Over the last decades, a lot has changed about our understanding of war, warfare, and warrior societies in prehistoric Europe. It is especially true about the Bronze Age which benefited greatly from the new scientific methods as well as from the introduction of more elaborated theoretical models. The beauty in this fact is that we finally start to realize how multi-layered the world of prehistoric warriorhood was and how much there is still to uncover/understand. In this paper, we would like to focus on two regions, Bohemia and Central Danube area, from the Early to the Late Bronze Age. We will shortly sum up the current state of research in terms of warfare/warriorhood evidence in the focus area, including the basic models as we understand them. This will provide the background for us, so we could tell stories. However, these stories will not be based solely on rich burials. There are other data that are often overlooked, even if they could provide us with excellent opportunities for interpretation. Therefore we will focus on weapons - mostly swords - lost or deposited in rivers, forests, fields, etc. With the help of metal wear analysis, experimental archaeology, and maybe even some metallography, we could tell stories that are not as much affected by the agenda of past or present. From the first look, one could almost say that some of them may even challenge our safe binary constructions.

## 9 RE-EXAMINING MOBILITY IN LATER EUROPEAN PREHISTORY: THE ULTIMATE GIFT THEOREM AND GENDERED MOBILITY PATTERNS VIS À VIS NEW MOBILITY DATA

**Abstract author(s):** Reiter, Samantha - Frei, Karin (National Museum of Denmark)

**Abstract format:** Oral

Anthropological and archaeological models of gendered mobility in Later European prehistory suggest that scholars have ascribed different capacities for movement to prehistoric people in relation to their gender. According to the model adopted from Lévi-Strauss, if women were mobile, researchers tend to assume that they migrated in a single instance on the occasion of their marriage within an exogamic, patrilocal system. Men, however, were thought to be tied to their local region while nonetheless possibly engaging in repeated movements for raiding, trading or guest-friendship visits. We will juxtapose the Ultimate Gift theorem and the gendered mobility model with data from various recent studies from Nordic Bronze Age contexts (the Skrydstrup Woman, the Egtved Girl, the Ølby Woman, the male from Jelling Øst A14 and the Jestrup warrior from Thy) as well as the various gendered mobility trends observable from diverse mobility studies conducted on later prehistoric material in recent years. We conclude that, while portions of the Ultimate Gift theorem seem to be valid, our study suggests that the patterns thereby encompassed do not represent the totality of kinds of mobility available in prehistory.

## 10 IDEOLOGY AND IDENTITY. DEPICTIONS OF WEAPONRY ON POMERANIAN FACE-URNS

**Abstract author(s):** Dziechciarz, Pawel (Uniwersytet Warszawski)

**Abstract format:** Oral

At the turn of the Late Bronze Age and the Early Iron Age in Eastern Pomerania (Pomorze Wschodnie, northern part of the present Polish lands) an essential change in a cultural model took place. It led to the emergence of a new, post-urnfield cultural phenomenon known as the Pomeranian culture. In addition to the funeral rite and the social structure, the mode of demonstrating social content related to the military aspects of the functioning of these communities has also shifted. The practice of hoarding of weapons has lost its importance due to the emerging warfare iconography, through the medium (very distinctive, so-called pomeranian face-urns) directly associated with funeral activities. The repertoire of depictions with unequivocally masculine, military and heroic connotations (weaponry, warriors, horses, riders and wagons) clearly contrasts with the 'female pattern' of the decoration of funeral vessels, functioning simultaneously within the same communities.

In this study, an attempt will be made to explain what mechanisms led to the creation of such a clearly internally systematized package of representations, and what was the impact of long-distance contacts, especially with the Hallstatt milieu, and the transmission of Mediterranean cultural patterns on the development of a warrior ideology within these peripheral communities. On the basis of the analysis of the weaponry representations the question of the usefulness of prehistoric iconography in the reconstruction of combat practices will also be raised.

## MILITARY CONFLICTS AT THE END OF 3D AND EARLY 2ND MILLENNIUM BC IN THE EASTERN EUROPEAN STEPPE – FOREST-STEPPE

**Abstract author(s):** Zagorodnia, Olga (Independent researcher) - Mimokhod, Roman (Institute of Archaeology Russian Academy of Sciences)

**Abstract format:** Oral

The period 2200-1800 cal. BC in Eastern Europe is a time of large-scale migrations and military conflicts. They are presented in archaeological sources, both burial and settlement. This confrontation is recorded at the burials of warriors of post-catacomb cultural formations (2200-2000 cal. BC), primarily individuals who are equipped with quiver sets of flint arrows, battle axes and maces. During this period military clashes are observed within the post-Catacomb world. They led to military territorial conflicts at the stage of its formation and eventually to the stabilization of the areas of cultures. The results of the military confrontation in the materials of funerary sites are also recorded according to evidence of injuries and murders. It can be traced by traumatic injuries of skeletons (traces on the skulls of percussion weapons) and arrowheads in the skeletons.

One of the most striking examples of the military confrontation in the post-Catacomb period in the Eastern Europe is the materials of the Liventsovsko-Karataevskaya fortress (2100-2000 cal. BC) located in the Don delta. It fell as a result of a raid by bearers of the southern sub-Caucasian traditions, as evidenced by chronology and the typology of arrowheads.

During the final phase of the post-Catacomb cultures (2000-1800 cal. BC) the peak of military tension is observed. Carriers of chariot cultures entered the historical arena, the expansion of which was directed from the Urals to the East. They can rightfully be called warrior burial cultures. In addition to the remnants of the chariots and chariot harness, they contain a wide range of weapons (bronze spears, axes, arrowheads, etc.). Before the onslaught of the super-military societies of that time, which moved from the Urals to the Dnieper, the scattered societies of the post-Catacomb world could not offer any serious resistance and lost their territories and cultural self-identification.

## MATERIAL EVIDENCE OF VIOLENT ARMED CONFLICTS IN BRONZE AGE LOWER MUREŞ VALLEY

**Abstract author(s):** Gogaltan, Florin (Institutul de Arheologie si Istoria Artei Cluj Napoca; Universitatea Babes-Bolyai Cluj Napoca) - Sava, Victor (Complexul Muzeal Arad)

**Abstract format:** Oral

To understand the context in which it was possible for such a big event as the siege of the Late Bronze Age mega-fort from Sântana-Cetatea Veche to take place, we have enlarged our area of research on violent conflicts both geographically and chronologically. Our area of study, the Lower Mureş Valley, is situated at the border connecting the Western Romanian Carpathians and the Pannonian Plain, nowadays between the borders of Romania, Serbia and Hungary. The time frame of choice is the Bronze Age as a whole, conventionally from 2700/2600 to 900/800 BC.

To attain a diachronic perspective on the violent conflicts, we cataloged, ranked and contextualized a series of discoveries, such as weapons, fortifications, or physical traumas. Through the analysis of such evidence, we argue that during the Bronze Age, our region of interest went through a series of significant changes in regard to the society perspective on warfare. These can be correlated with the deep social and economic changes of the European Bronze Age.

In order to obtain a comprehensive view of the material evidence of violent armed conflicts, all data were integrated into a complex analysis that took into account the quantity, dispersion and intensity of the various categories of evidence. Assessment of the quantity and dispersal of weapons, graves furnished with weapons, fortified sites and direct evidence of violent conflict (physical trauma, battlefields), was displayed by graphs and maps. Heatmaps have been used for displaying the intensity of each of the categories of finds already mentioned. Weapons and weapon-bearing graves were each given the value of one unit and then plotted out.

## NO COUNTRY FOR ARMED DEAD. MARTIAL PRACTICES AND IDEALS IN ABSENCE OF WARRIOR GRAVES

**Abstract author(s):** Gentile, Valerio (Leiden University)

**Abstract format:** Oral

During the Bronze Age in the Low Countries, rigid rules governed the deposition of weaponry. Since at least the second part of the Middle Bronze Age, weapons, and swords in particular, have been surrendered into main rivers for hundreds of years while systematically kept away from coeval burials. Only towards the beginning of the Iron Age, weapons gradually disappear from watery contexts and start being deposited in graves, but only after being intentionally destroyed.

The absence of so-called warrior graves for the majority of the Bronze Age poses substantial challenges to the identification and study of martial identities and practices. The rigorous exclusion of swords from burial contexts and their presence in structured depositions has often been portrayed as the proxy of a system revolving around warriorhood

as a temporary, context-based identity, which could be enacted and successively dismissed through the discard of specific paraphernalia. Nonetheless, exploring other models and interpretative avenues can contribute to better our understanding and stimulate debate around prehistoric martial practices and identities.

The research presented here focuses specifically on weaponry from non-funerary contexts. Through a combination of experimental archaeology and in-depth wear analysis, it is possible to partially reconstruct the events that preceded the depositions of these weapons. Piecing together the life-path of these items enables us to make inferences on the contexts of use as well as the owners of these items. Furthermore, it allows one to speculate on what governed the selection and treatment of these items prior to deposition.

## 14 FORTIFICATIONS, SWORDS AND WARRIORS – WEAPON DEPOSITION RITUAL, HOARDS AND WEAPON/METAL TABOO IN GRAVES IN LATE BRONZE AGE EASTERN CROATIA

**Abstract author(s):** Kalafatic, Hrvoje (Institute of Archaeology, Zagreb) - Šošić Klindžić, Rajna (University of Zagreb) - Šiljeg, Bartul (Institute of Archaeology, Zagreb)

**Abstract format:** Oral

One of most significant characteristics of LBA in Eastern Croatia is the lack / invisibility of warrior graves and the simultaneous appearance of numerous hoards, many of which contain whole or fragmented weapons. This kind of inverse proportionality always attracted the attention of the researchers. At first sight, these occurrences seem interrelated but deeper insights suggest that such an approach is too simplified and the actual level of correlation is yet to be determined.

The aim of this presentation is to discuss opposing Late Bronze Age rituals which came to light during rescue excavations of a Bronze Age settlement in Čepinski Martinci, Eastern Croatia. Everything we know about weapons and warriorhood in LBA Croatia, we know mostly from hoards or rare finds like the sword from Čepinski Martinci. Deposited swords are opposed to absence/taboo of weapons in early phases of LBA between Sava and Drava rivers.

This presentation analyses a sword that has been ritually deposited by the south entrance gate in fence ditch of the Čepinski Martinci settlement. We suggest the sword to be interpreted as a foundational votive offering. We understand this to be an object to which community assigns specific powers and significance. Thus, it is proposed that the sword find is to be interpreted as a symbolical „gift“ at the moment of the settlement's foundation. On the one hand, the sword could be seen as a pledge for community security but on the other hand it could be argued that it is a signal of the military nature of the LBA society.

The non-funerary context of the single sword deposition find from Čepinski Martinci suggests that weapons were active agents in non-conflict related rituals within the settlement and argues for symbolic values not necessarily connected to a specific person, but to but the entire community.

## 15 BEYOND BURIALS WITH WEAPONS: WHERE IS THE “RICHNESS” GONE?

**Abstract author(s):** Tarbay, János Gábor (Hungarian National Museum)

**Abstract format:** Oral

During the Late Bronze Age (1450–850 BC), only a handful of burials with weapons are known in Transdanubia, West Hungary. The weaponry set for these cremation burials is usually limited to intentionally broken swords, daggers, winged axes, or spearheads. Considering burials, this is a “weapon poor” region, which can be best illustrated by the fact that between 1450 BC and 1100 BC, only 16 burials with swords were known in the archaeological record, and this phenomenon became completely absent towards the end of the LBA.

Weapons may be rare among the grave kits of local Urnfield burials, but offensive weapons, armor, and symbolic weapons can be found in hoards. For over a half century, Hungarian research followed the “orthodox” idea that “bronze hoards are a collection of objects not related to settlements, nor to burials.” In recent decades, this concept has been tested by new discoveries and by the systematic revision of old ones. Currently, it seems that the burials and at least some of the hoards were part of a complex system of funerary behavior that dealt with the manipulation of the possessions of the deceased and objects destroyed in the pyre. Weapon sets resembling grave kits, melted weapons selected from pyres, and lavish “funerary hoards” are the missing links here between these phenomena.

The paper presents evidence for the selection of objects from pyres based on the re-examination of all LBA burials with weapons and hoards with weapons from the territory of Transdanubia by metalwork production and use-wear analysis. It also illustrates the connection between burials and hoards through examples and case studies. It ultimately seeks to give an explanation, or rather explanations, why hoards are “rich” in weapons in this region during the LBA.

## A. **AMBER MAN – AN UNPRECEDENTED LATE NEOLITHIC BURIAL AMONG HUNTER-GATHERERS IN NORTH-EASTERN POLAND**

**Abstract author(s):** Klecha, Aleksandra (Antiquity of Southeastern Europe Research Center, Faculty of Archaeology, University of Warsaw) - Manasterski, Dariusz (Faculty of Archaeology, University of Warsaw) - Borówka, Paulina (Faculty of Biology and Environmental Protection, University of Łódź)

**Abstract format:** Poster

In the Late Neolithic the Masurian Lake District was still dominated by hunter-gatherers belonging to the Neman cultural sphere, although from the 5th millennium BC groups with manufacturing economy entered the area. These included representatives of the Globular Amphora Culture, and later also the Corded Ware Culture and the Bell Beaker societies, which clearly influenced the natives, contributing to the formation of a syncretic cultural unit in this area, which was the Ząbzie-Szeszno Group. One of the most interesting contexts related to all them is the funeral and ritual site Ząbzie 10 location on the island of Łańskie Lake. It consisted of seven burials. Among them was one belonging to a man aged 40-45 years. During the excavation, 50 amber ornaments were discovered on the deceased. These were many various beads with W- and V-shaped holes and holes made straight through. A small fish, whose species could not be determined, and a flint tool were placed near the face. The examination of the skeleton revealed numerous traces of injuries on the skull and long bones, most probably inflicted by an axe. Since, many aspect of this burial are unique e.g. stylistic of amber ornaments and the burial itself, in depth study related to material studies (FTIR spectroscopy) and aDNA analysis were performed. They revealed foreign provenance of the adornments and widely local origin of the deceased. This paper aims to present issues related to research on this burial within hunter-gatherer context.

---

## 90 **THE TECHNOLOGY AND USE OF METALS IN THE PREHISTORIC EASTERN MEDITERRANEAN: RECENT ADVANCES THROUGH MICROSCALE ANALYSIS**

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Aulsebrook, Stephanie (University of Warsaw) - Ramé, Betty (ArScAn - Archéologie et Science de l'Antiquité - UMR 7041) - Martin, Valentine (University Paris 1 Panthéon-Sorbonne; ArScAn - Archéologie et Science de l'Antiquité - UMR 7041)

**Format:** Regular session

A recent development in the investigation of object biographies is the application of high-quality portable optical microscopes and scanning electron microscopy to uncover details about the individual life-histories of specific artefacts in unprecedented detail, especially metalwork. These devices have opened up a new realm of microscale analysis that has enabled the exploration of far more advanced research questions, concerning the manufacture and use of metal artefacts in ancient societies, than had been hitherto conceived. In particular, this technology has made it possible to investigate aspects of individual object biographies en masse, providing, in some cases for the very first time, a way to move beyond Appadurai's more generic 'social history of things' towards idiosyncratic narratives for artefacts other than the most heavily studied objets d'art. We would argue that this is an overlooked aspect of the 'Third Science Revolution in Archaeology', and demonstrates how the sciences and humanities can work together to generate new opportunities for archaeological research.

The principal aim of this session is to showcase how this technology has been utilised to study the engagement between people and metalwork during its production and use in ancient societies. We invite papers that cover any time between the Neolithic and the end of the Bronze Age across the area of the East Mediterranean basin (Greece, Turkey, the Levantine coast, Cyprus, Near East, Egypt and Libya). We also hope that this session will provide an important forum for the sharing of ideas about best practice, when using this type of equipment for the study of metal artefacts in particular.

## ABSTRACTS

### 1 **OF PEOPLE AND METALS: CROSS-MATERIAL MICROANALYSIS REVEALS USES OF PREHISTORIC DAGGERS**

**Abstract author(s):** Dolfini, Andrea - Caricola, Isabella (Newcastle University)

**Abstract format:** Oral

Daggers were widespread in early Mediterranean Europe. Alternatively made from either flint or copper alloy, daggers were frequently placed in Chalcolithic and Bronze Age warrior graves to mark out the gender, identity, social role, and perhaps elevated status of the deceased. Despite their undoubted salience to prehistoric society, it is yet unclear how daggers were utilized prior to funerals, and whether their lifetime uses were part of idiosyncratic object biographies explaining deployment in select individual burials. A recently concluded EU-funded project carried out

by the authors provides meaningful answers to these questions. The paper discusses results of (a) low- and high-magnification microwear analysis of a sample of copper-alloy daggers from Chalcolithic and Bronze Age Italy; (b) the first ever successful attempt to extract organic residues from the corroded surfaces of said daggers; and (c), for comparison, select data stemming from the microwear analysis of lithic daggers. This innovative cross-material, multi-method approach to microanalysis has permitted a holistic appraisal of the life-histories of early Italian daggers. The research suggests that daggers were multi-functional tools (and perhaps tool-weapons) whose social value was predicated upon widespread practices that might have been shared across the entire Mediterranean basin.

## 2 USING MICROSCOPY TO UNLOCK OBJECT BIOGRAPHIES: CASE STUDIES FROM LATE BRONZE AGE MYCENAE

**Abstract author(s):** Aulsebrook, Stephanie (University of Warsaw)

**Abstract format:** Oral

The importance of metal artefacts within the Late Bronze Age societies on the Greek mainland (1700–1200 BC), otherwise known as the Mycenaean culture, has been acknowledged since the earliest archaeological discoveries in the latter half of the 19th century. Research conducted since then has only strengthened that observation, with the economic, social and political role of metals evident through their use for tools essential to agricultural and industrial production, objects intended as insignia and to promote and legitimate social status, personal items used to create and perpetuate ideas concerning bodily appearance, identity and consumption practices, weaponry to extend and impose military power, and more widely as a driving force for trade and interaction across the contemporary East Mediterranean and beyond. Yet, for the most part, this picture remains rather generic with a macroscale focus; the specific or even unique characteristics of these cultural practices and meanings within Mycenaean societies remain comparatively unexplored. In particular, an understanding of the presumably differential integration of metal artefacts into the daily routine of people across the whole social spectrum of a typical Mycenaean community still eludes us.

The ongoing research project "Forging Society at Late Bronze Age Mycenae: the Relationships between People and Metals" aims to provide the foundations needed to address this question through a microscale analysis of a single site, Mycenae. Fundamental to this approach is the reconstruction of specific object biographies. A portable optical microscope has been used to examine a range of metal artefacts from Mycenae, in order to gather information concerning their production and use. This paper will present a small selection of these analyses to demonstrate how this extension of traditional artefact analysis has affected the quantity and quality of extractable information, and the impact this had on the reconstruction of object biographies and our wider interpretations.

## 3 MICROSCALE ANALYSIS ON THE FIRST METAL OF GREECE: A METHODOLOGICAL WAY TO RECONSTRUCT MANUFACTURING PROCESSES FOR NEOLITHIC METAL OBJECTS

**Abstract author(s):** Martin, Valentine (University Paris 1 Panthéon-Sorbonne; UMR 7041 ArScAn)

**Abstract format:** Oral

Metalwork emerged early in Greece, at the end of the Neolithic. During this period, the population started to work with gold, copper and even silver. At the end of the 6th millennium, the metal used was pure or native, without alloys. But we do not have much knowledge about their manufacturing processes: neither workshops nor tools have been discovered yet. However, we can make some hypotheses because during this period, it is quite possible that metal was worked like other more common materials of the Neolithic, such as stone or shell. These actions have left traces on the objects, still visible when the object is not too corroded. These can be observed on their surface with an optical camera, up to a magnification of 200. To interpret them, experimental archaeology is employed. One can then compare the archaeological and the experimental objects with the optical camera, after having tested different techniques (cold hammering, hot hammering, casting). This approach has been conducted on the neolithic metal objects from Dikili Tash, a prehistoric tell settlement in Eastern Macedonia. It allows us to understand the way in which the objects were made, from the obtaining of a workable raw material to the surface finishes. The particular characteristics of the traces identified on Neolithic metal objects is linked to the use of "simple" tools, mainly of stone. Several techniques are differentiated according to whether the maker sought to obtain hardness (weapons and tools) or a high level of aesthetics (ornaments). Changes occur between the end of the Neolithic and the beginning of the Bronze Age, with the use of alloys and the resulting decrease in fusion temperatures facilitating new techniques for metalworking.

#### 4 METAL OBJECTS FROM NORTHERN AEGEAN, GREECE: AN EBA HOARD FROM MESI GLYFADA SEA

**Abstract author(s):** Nikolopoulou, Athina (National and Kapodistrian University of Athens; INN NCSR DEMOKRITOS) - Filippaki, Eleni (INN NCSR DEMOKRITOS)

**Abstract format:** Oral

An accumulation of metal objects was found in the sea in the Rhodope Prefecture in northern Greece. The hoard of 134 metal objects came to light via the Ephorate of Underwater Antiquities after following information from an individual to the Archaeological Service in 2008. The hoard consisted mostly of axes (110), with the interesting presence of ingots (19), which are considered as the raw material for manufacturing the tools. Also, two bases of Early Helladic handmade vessels were found.

To determine the alloy type that was used for the manufacture of the axes, analyses were carried out with the non-destructive XRF method. The measurements took place at the Ephorate of Underwater Antiquities, where the portable XRF device of the Laboratory of Palaeoenvironmental and Ancient Metal Structures of the Institute of Nanoscience and Nanotechnology of the N.C.S.R. "Demokritos" was transferred. The data that have been obtained showed that all the axes are made of arsenical copper. It should be noted that arsenic is also present within the ingots. We sampled 32 items to conduct analyses under the Scanning Electron Microscope (SEM), in order to draw further conclusions about the proportion of the components and the manufacturing technology of these items.

This paper presents the preliminary analytical results of the SEM analyses as well as the metallographic examination. The main aim of this paper is to illuminate some aspects of the reconstruction of the metallurgical techniques that were practised in northern Greece during the 3rd millennium B.C.

#### 5 PRELIMINARY RESULTS OF METALS RESEARCH FROM IRON AGE ASHDOD-YAM

**Abstract author(s):** Mazis, Matasha (Technical University Darmstadt) - Fantalkin, Alexander (Tel Aviv University)

**Abstract format:** Oral

Ashdod-Yam is an ancient maritime site in the southern Levant. The site was occupied from the Bronze Age to the Crusader period and, throughout its history, has been a link between hinterland cities and the Eastern Mediterranean coast. The southern Levant played an important role in early metal production and distribution. Copper-based production is linked to the emergence of Early Bronze Age societies in the region, and features in the complex trade systems of the Late Bronze Age. After the collapse of Bronze Age societies, decentralised settlements emerged, accompanied by an increasing shift from copper-based technology to that of iron. At Ashdod-Yam, a deep anchorage and massive fortifications were constructed in the Iron Age II, the latter attesting to pressures from Neo-Assyrian incursions. Metal objects dating to this period are currently being investigated using various techniques of surface microscopy, radiography, chemical composition analysis, and metallography. The work in this area is ongoing; however, early analyses of individual pieces of jewellery, cultic items, and weaponry are showing surprising results concerning the site's society, culture, and technology. More broadly, the results are helping to bring to light new information about early Philistine metal technology and the transition from bronze to iron.

#### 6 SHEDDING LIGHT ON EGYPTIAN MIRRORS: NEW INSIGHT INTO THEIR MANUFACTURE

**Abstract author(s):** Thomas, Elizabeth (University of Liverpool; AHRC NWCDTP)

**Abstract format:** Oral

Ancient Egyptian mirrors have received a great deal of attention for their cultural significance and connections to religious beliefs. However, in-depth investigations into their production processes have been lacking with only a handful included in wider analyses. So how were mirrors manufactured and what kind of reflection did the metal produce? What colour and how clear were the images? Essentially, how did the Ancient Egyptian elite see themselves? The combination of metallurgical analysis and experimental work presented here aims to shed light on some of these questions.

With the use of a novel minimally destructive sampling method called flat edge abrasion, analysis of mirrors from a range of UK museum collections using SEM-EDX has revealed the chemical composition and microstructure of the metal. The mirrors' provenance spans from the Old Kingdom through to the Late Period, allowing the manufacturing techniques used to produce them to be characterised and then tracked over time, showing when various developments occurred. Additionally, different surface treatments have been identified which will have varying effects on the type of reflection created, ranging from a coppery through to a silvery appearance. Ongoing experimental work based on these analyses aims to re-create the manufacturing sequence alongside the visual characteristics of the mirrors which will aid our understanding of how they originally functioned.

## A. NON-DESTRUCTIVE AND NON-INVASIVE INVESTIGATIONS TO STUDY BRONZE AGE METALS FROM THE AEGEAN

**Abstract author(s):** Giardino, Claudio - Zappatore, Tiziana (University of Salento) - Dell'Aquila, Daniele (Department of Chemistry and Pharmacy, University of Sassari; NFN-Southern National Laboratories, Catania)

**Abstract format:** Poster

The progressively more widespread use of non-destructive methodologies offers new research opportunities to archaeometallurgical studies.

Microscopy investigations on traces of processing and use constitute a particularly significant research field, as they are a totally non-destructive method of investigation. Their use is very valuable when it is associated with another technique, such as X-Ray Fluorescence (XRF), in order to detect the chemical composition. The XRF fundamental characteristic is to be totally non-destructive, especially for investigations carried out on particularly rare and precious finds, such as the gold ornaments. Here are shown some examples conducted on some Late Bronze Age metal artifacts of Aegean origin, but found in southern Apulia.

Radiography can also provide otherwise undetectable information in a non-destructive manner, as in the case of a fragment of a Mycenaean sword from the Middle Bronze Age imported to the Italian island of Vivara.

The use of optical and electronic microscopy is the most effective tool to analyse metallurgical slag; microscopy can be carried out in a minimally invasive manner, taking samples of very small dimensions. We show here examples of such investigations conducted on smelting slag from the excavations of Pyrgos - Mavroraki, a Bronze Age settlement in Cyprus.

---

## 93 BEYOND THE CHRONOLOGY AND PATHWAYS OF DISPERSAL: REASONING THE USE AND ABANDONMENT OF BROOMCORN MILLET CULTIVATION ACROSS EURASIA

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Motuzaitė Matuzevičiūtė Keen, Giedre (Department of Archaeology, Vilnius University; Department of City Research, Lithuanian Institute of History) - Pospieszny, Łukasz (Institute of Archaeology and Ethnology of the Polish Academy of Sciences, Poznań; School of Earth Sciences, University of Bristol)

**Format:** Regular session

Broomcorn millet (*Panicum miliaceum*) is one of the most enigmatic crops of the ancient world. It was domesticated in northern China around 8000 years ago, becoming a dominant crop across Eurasian societies between 4000-3000 years ago. The ubiquitous use of this species led to crop diversification, which in turn heavily impacted the so called "third food revolution" in Bronze Age Europe and the subsequent rise of complex societies during the Early Iron Age of Central Asia and Mongolia. Nevertheless, the past spatial distribution of millet cultivation remains a puzzle, ranging from being a major crop among some societies to being completely absent in others.

Multiple research projects have addressed the timing and chronology of broomcorn millet dispersal across Eurasia by tracing the existence of millet processing and consumption by humans and animals, achieved by employing recent methodological advances in archaeobotany, radiocarbon dating, biomarker analysis in sediments and vessels, and stable isotope analysis. However, the reasons for the initial success and later decline of broomcorn millet across space and time is not fully understood. Why was millet first adopted and then later abandoned in some parts of Eurasia after centuries of thriving? Was the introduction of millet a response to growing food demands caused by rapid demographic growth, or tightly linked with climatic conditions? Or perhaps it was first an exotic novelty integrated in new territories by social elites and later adapted by commoners?

In this session we hope to discuss these and other hypotheses, and we therefore call for researchers who study the interplay between culture, agriculture and climate with a focus not only on broomcorn millet but also on other minor crops.

## ABSTRACTS

### 1 THE USE OF MILLET BY THE SCYTHIAN SOCIETIES OF EASTERN EUROPE FOREST-STEPPE ZONE: A MARKER OF CULTURAL MIXING?

**Abstract author(s):** Dobrovolskaya, Maria (-) - Nelubov, Sergey (-)

**Abstract format:** Oral

The formation of the "Scythian world" in the steppe and forest-steppe zones of Eurasia is one of the most striking cultural phenomena of the Early Iron Age. We are to note that the scientific knowledge of the economic system, culture of everyday life of the societies included in this huge cultural belt, is much poorer than the significant scientific knowledge of the Scythian material culture. As is known from archaeobotanical and isotopic studies, the Scythians commonly used millet. The northeastern borders of Scythia were located in the Middle Don region, according to

Herodotus. There were studied the skeletal remains from five burial mounds in the Middle Don region (Voronezh region). The analysis of the isotopic composition of collagen in the bone tissue of humans and animals from burial mounds demonstrates differences in the structure of human diet, associated with the use of C3 and C4 plants. Most of individuals belong to the "use of C4 plants" group. We consider millet as the dominant C4 food plant. At the same time, a part of individuals whose diet is deprived of this food resource, typical of the steppe nomads, was revealed. In collective burials there were found individuals who differ greatly in dietary traditions associated with the use of millet. Most individuals whose diet does not include millet are male. The results of cluster analysis indicate the statistical significance of the noted differences. The article discusses data on the isotopic composition of strontium, characterising the moderate mobility of the Early Iron Age population. The authors make assumptions about the possible reasons for the coexistence of different diets within the group of the local Scythian population.

## 2 **GRAINS AND SKELETONS: LIGHTS AND SHADOWS OF THE BROOMCORN MILLET CULTIVATION AND CONSUMPTION IN THE IBERIAN PENINSULA**

**Abstract author(s):** Teira-Brión, Andrés (University of Oxford) - López-Costas, Olalla (Universidade de Santiago de Compostela)

**Abstract format:** Oral

The framework of broomcorn millet farming in Iberia Peninsula highlights, at least, two different narratives. In the northern region this C4 crop invades the fields, reaching a mosaic of diverse peoples and becoming an essential food. However, in southernmost region belongs to Bronze Age communities that epitomise the emergence of social inequalities, this new crop was barely relevant during prehistoric and historical times. Between these lights and shadows, there was a broad half-light where millet has adapted to a secondary role in agricultural systems.

In order to understand the uneven adoption of broomcorn millet among the Iberian communities this presentation aims to decipher the probable causes that triggered its use as food or fodder, taking into account the data available in Northwestern Iberia and its comparison with other regions of the Iberian Peninsula. The intense consumption of millet in this region has suggested by the accumulation of surpluses in storage structures from the first millennium BC onwards. Here, *Panicum miliaceum* is the second-most ubiquitous crop (24.90%), right after *Triticum* spp. Moreover, the analysis of more than 600 human skeletons has revealed a high dependence of millet directly consumed as human food, especially in coastal settlements from Roman Period onwards. NW Spain one of the most humid regions in the Iberian Peninsula, and these humidity trends to concentrate in Winter-Spring seasons making cultivation of spring crops an alternative.

Broomcorn millet is a not well-balance crop leading to important vitamin deficiencies when became staple. Considering this fact, we hypothesise that millet became staple on these areas of the Iberian Peninsula where its cultivation constitutes a clear advantage regarding other crops. This work shows the advantage of combining archaeobotanical, osteoarchaeological and historical texts studies, as well as the need to consider environmental conditions when trying to explain increases in millet consumption.

## 3 **ENVIRONMENTAL AND CULTURAL FACTORS IN THE USE OF BROOMCORN MILLET IN THE WESTERN HIMALAYAS**

**Abstract author(s):** Spate, Michael - Betts, Alison (University of Sydney) - Yatoo, Mumtaz (University of Kashmir)

**Abstract format:** Oral

Archaeobotanical data from the Kashmir Valley now places the adoption of broomcorn millet in the Western Himalayas to around 4400 BP. Palaeoenvironmental records from this time indicate a protracted weakening of summer (monsoon) and winter (westerly) precipitation, that may have influenced the adoption and selection of crops across the region. While seldom cultivated in the valley today, until the 19th century broomcorn millet remained an important insurance crop, sown in years when lower water availability precluded the extensive cultivation of more water demanding rice. Examining long term archaeobotanical, environmental and historical records, this presentation considers the drivers of the adoption, expansion and abandonment of broomcorn millet in the Western Himalayas. While there are some correlations between climate shifts and the expansion of millet in the archaeobotanical record during drier climate phases, we argue that other cultural and historical factors may have also had an important role in the cultivation and consumption of millet in this region.

## SUBSISTENCE STRATEGIES FROM VALDARO (MANTUA, ITALY) DURING THE ITALIAN PROTOHISTORY

**Abstract author(s):** Cortese, Francesca (Department of History, Humanities and Society, University of Rome Tor Vergata) - De Angelis, Flavio (Centre of Molecular Anthropology for Ancient DNA Studies, University of Rome Tor Vergata) - Bontempo, Luana (Edmund Mach Foundation, Food Quality and Nutrition Department – Traceability Unit) - Hirose, Mari (Complesso Museale di Palazzo Ducale di Mantova) - Lamanna, Leonardo (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Cremona, Lodi e Mantova) - Longhi, Cristina (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Bergamo e Brescia) - Rickards, Olga (Centre of Molecular Anthropology for Ancient DNA Studies, University of Rome Tor Vergata) - Rolfo, Mario (Department of History, Humanities and Society, University of Rome Tor Vergata)

**Abstract format:** Oral

The arrival of the Broomcorn millet in Italy is a very debated theme, and scholars supposed that this plant spread in the Italian peninsula only during the Middle Bronze Age following a leap-frog pattern. In the first decade of the 21st century, stable isotope analysis revealed for the first time the consumption of millet in a Bronze Age community of northern Italy (Olmo di Nogara). Subsequently, only a few protohistoric sites showed a steady consumption of C4 plants, and they are located primarily in central and northern Italy. A recent genetic study shows how changes in the genetic pool of local communities during the Middle Bronze Age might be connected to the arrival of a steppe-related population in the Italian peninsula.

Thus, the paper aims at explaining further the complex dissemination routes for the C4 spread through carbon and nitrogen stable isotope analyses. Valdaro, a locality few kilometers North-East of the city of Mantua (Northern Italy, Lombardy), was chosen as a funerary area by local communities from the Copper Age to the Late Bronze Age. The chronological and spatial locations pave the way to consider the area an essential crossroad for the southwards dispersal of the C4 in the Italian Peninsula.

About 60 humans and 10 faunal remains from several necropolises excavated in Valdaro area have been analyzed. The wide archaeological span led us to hypothesize changes in dietary choices: during the Copper Age, there was a preference for C3; in the following period, the diet showed changes, suggesting the gradual introduction of new crops in the diet.

This study is crucial to support the current understanding of millet consumption in ancient Italian communities, also focusing on the social differentiation and climatic situation that could have underpinned the development of the new dietary pattern.

## RETHINKING GRAIN METRICS AS DOMESTICATION MEASURES: GRAIN SIZE VARIATIONS OF BROOMCORN AND FOXTAIL MILLET ACROSS ASIA, 5000-1500 BC

**Abstract author(s):** Sun, Yufeng - Liu, Xinyi (Washington University in St. Louis)

**Abstract format:** Oral

Archaeological and archaeogenetic research in recent decades have been challenging the prevailing narratives positioning domestication as linear, progressive, and localized processes, which calls for a more dynamic and explanatory framework to understand pathways to domestication. In this study, we combined over 2500 published and newly collected measurements of charred grains of broomcorn millet and foxtail millet (*Panicum miliaceum* and *Setaria italica*), two crop species first cultivated in North China dating back to at least 8000 years ago. Results of the meta-analysis show the grain metrics of the two millets displayed significant regional variations as those crops expanded beyond the home environment in north China reaching Central and South Asia between proximately the 4th and 1st millennium BC. A contrast can be drawn between millet's southbound and westbound journeys, namely, grain size reduction when two millets moved to the hilly environments in South China, and grain size increase when millet moved wester-wards along the Hexi-Tianshan and Inner Asian Mountain Corridors. These morphological differences could be explained by regional cultural preferences, including culinary choices and field management practices. Observations presented here resonate with recent discussions of the eastern expansion of wheat and barley and diminished grain size as the Fertile Crescent crops moved from their origin in southwestern Asia to China. Together, these studies call for a better understanding of the role of crop grain size in measuring domestication and inferring the transregional dimension of the domestication processes.

## 6 HOW THEY LIVED? A NOBLE GRAVE AT THE MIKULOV SITE.

**Abstract author(s):** Šabatová, Klára (Masaryk University) - Snoeck, Christophe (Vrije Universiteit Brussel) - Baldovič, Marian (Comenius University) - Hajnalová, Mária (Constantine the Philosopher University Nitra) - Parma, David (Institute for Archaeological Heritage Brno) - Pospieszny, Lukasz (University of Bristol) - Trampota, František (Regional Museum in Mikulov) - Vargová, Lenka - Vymazalová, Kateřina (Masaryk University) - Jarošová, Ivana (Freelancer in anthropology)

**Abstract format:** Oral

This paper aims to answer the question, how the millet was adopted in the society of Tumulus culture. On an example of a complex analysis of the burial from the site Mikulov, Moravia, dated to the Middle Bronze Age and other examples of millet finds from the settlement features in region we will ask the social position of this new crop in the diet.

During rescue archaeological excavation in 2018, a grave with stone chambers was found, in which two individuals were buried – a young male and a 13- to 14-year-old probably girl. We have realized a comprehensive analysis of the find, both the burial and typological context, analysis of radiocarbon data, anthropological, palaeopathological, and genetic analysis of these individuals, also analysis of their dietary habits and their local origin on the base of the stable isotope analysis. This is a possible starting point for our talk about the life of this couple. On the end we want to interpret their dietary habits in the context of other documented millet examples in Moravia and Slovakia. Findings of this cereal are documented by numerous archaeobotanical samples from layers and specific bulk finds as well as isotope analyses.

## 7 EXAMINING BROOMCORN MILLET CULTIVATION IN LITHUANIA IN THE 16TH–18TH CENTURIES

**Abstract author(s):** Lauzikas, Rimvydas (Vilnius University Faculty of Communication)

**Abstract format:** Oral

Broomcorn millet cultivation was not common in Lithuania in the 16th–18th centuries. At that time, rye, barley and oats dominated the manor and peasants' fields. Wheat, buckwheat, peas and beans were slightly less cultivated. Broomcorn millet is mentioned in few written sources. This paper analyses written sources on broomcorn millet cultivation in Lithuania in the 16th–18th centuries, addressing three issues:

1. The relationship between the broomcorn millet name and plant. In the Lithuanian and Latvian languages, broomcorn millet is called the specific word "sora". However, the same word is used for other cultivated and semi-cultivated cereals, such as different kinds of manna grass, foxtail millet, cockspear grass and large crabgrass.
2. The agricultural engineering of broomcorn millet. According to 16th–18th-century sources, millet was sown in the second half of May when the threat of frost was no longer dangerous. For broomcorn millet cultivation, fertile soil that was not too sandy or clayey was chosen. The cut of broomcorn millet was tied in sheaves, dried in hayricks and immediately threshed.
3. The use of millet for treatment, human food and animal feed. Like most plants, broomcorn millet had its place in humoral medicine and dietetics. The specific millet gruel ("sariene") was known in Lithuania. It was also used for animal feed.

The paper argues that the abandonment of broomcorn millet cultivation and consumption in Lithuania in the 16th–18th centuries was related to climate change (the Little Ice Age). Due to climate change and the shortening of the vegetation period, other summer cereals (like barley and oats) became dominant in the fields and on the table.

## 8 REVISITING THE PRESENCE OF MILLETS IN THE ARCHAEOLOGICAL RECORD

**Abstract author(s):** Lancelotti, Carla (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra; ICREA) - Jimenéz-Arteaga, Carolina (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra) - Abro, Tasleem (Department of Archaeology, Shah Abdul Latif University) - Balossi, Francesca (Dipartimento di Scienze dell'Antichità dell'Università Sapienza di Roma) - D'Andrea, Catherine (Department of Archaeology, Simon Fraser University) - Ruiz-Giralt, Abel - Santiago-Marerro, Carlos (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra) - Usai, Donatella (Centro Studi Sudanese e Sub-Sahariani) - Madella, Marco (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra; ICREA) - Chandio, Amin (Department of Archaeology, Shah Abdul Latif University)

**Abstract format:** Oral

Milletts comprise a broad spectrum of small-seeded cereals that share certain morphological and ecological similarities. They can easily grow in poor soils and low-rainfall systems, which makes them well-adapted to dry environments, and due to their short-growing cycles they are also highly reliable cereals in times of food shortage. The importance of milletts in the past is sometimes overlooked due to the difficulties in recovering them in some archaeological contexts. Some species are very small, especially when compared to crops such as wheat and barley, and their preservation has been proven to be highly affected by charring at high temperature. Also, in many instances they were used

in areas where preservation of archaeological material is poor due to salinisation or a constant alternance between humid and arid conditions.

Recently, the increased attention to micro-remains (phytoliths and starch especially) in archaeobotanical studies, and the ever more frequent application of systematic flotation strategies outside of Europe, is changing our understanding of the presence of millets in archaeological contexts. We will show examples from West Asia, South Asia and Africa where, thanks to new archaeobotanical research, millets are emerging in unexpected contexts or with previously underrepresented importance.

## 9 WHEN DID THE COMMON MILLET BECOME COMMONLY EATEN? OLD AND NEW BOTANICAL AND ISOTOPIC EVIDENCE FROM NORTHERN CENTRAL EUROPE

**Abstract author(s):** Pospieszny, Lukasz (Bristol Isotope Group, University of Bristol; Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Rennwanz, Joanna (Institute of Archaeology and Ethnology, Polish Academy of Sciences)

**Abstract format:** Oral

Recent years have brought a series of discoveries that have shed new light on the appearance of common millet in Europe. Large series of radiocarbon dates on plant macro-remains indicate that it should be dated to the Bronze Age and not to the Neolithic as previously thought. The results of human diet reconstruction using isotopic methods has led to similar conclusions. Since millet belongs to C4 group of plants, its consumption led to increased values of carbon isotopes in the organisms of its consumers. This has been observed for an increasing number of human individuals around Europe but not all of them were directly radiocarbon dated and their exact absolute age remains uncertain.

In our paper we will present the results of the reanalysis of millet's macro-remains and imprints on pottery still claimed to be Neolithic in date. We will also discuss the oldest certain finds of millet, secured by radiocarbon dating to Middle Bronze Age, and the first large deposits of millet, demonstrating its growing importance in the economy of Early Iron Age societies.

Following the recent advances in the field, we will review the largest series of paired radiocarbon dates and carbon and nitrogen stable isotope signatures available for humans from selected regions of Central Europe. We will trace the beginnings of human consumption of millet as mirrored by increased carbon stable isotope ratios. Where possible, we will look at the mobility of first "millet eaters" as reconstructed by the use of strontium and oxygen isotope analyses. We will also discuss the specificity of their burials in the contexts of local material culture and funeral customs. Lastly, our paper will be an attempt to answer the question about the reasons for the appearance of common millet in Central Europe, its success and the decline of its economic importance.

## 10 PREHISTORIC GLOBALIZATION OF FOOD VALUES: EFFECTS OF CULTURAL CONDITIONS ON NON-NATIVE CULTIGENS

**Abstract author(s):** Liu, Xinyi (Washington University in St. Louis)

**Abstract format:** Oral

There has been considerable recent momentum in understanding the movements of cultigens and livestock across Eurasia thousands of years before the Silk Road, and the consequent knowledge is having profound implications to the understanding of the human past on a global scale. Crops and their associated cultivation management and culinary treatment may be independently traced in the archaeological record across space and time. The farming dispersals across the Eurasian continent during the third and second millennium BC had profound long-term social and ecological impacts, which transformed the ancient societies and formed the foundation of modern-day foodways. However, identifying the specific manner of their cultivation and cooking has proven problematic. It is timely for innovative inquiries. This paper will seek answers to two questions: (a) were the movement of new resources accompanied by the knowledge of how best to use them? (b) How did receiving communities integrate them into their lifeways? The paper will highlight recent multidisciplinary evidence (isotope, archaeobotany and zooarchaeology) from East and Central Asia to illustrate the process in which non-native innovations were transformed within the indigenous social and cultural spheres.

## DETECTION OF MILIACIN IN ARCHAEOLOGICAL DEPOSITS ILLUSTRATES THE EXTENT OF BROOMCORN MILLET CULTIVATION IN ANCIENT CENTRAL ASIA

**Abstract author(s):** Motuzaitė Matuzeviciūtė Keen, Giedre (Vilnius University; Lithuanian Institute of History) - Jacob, Jérémy (Laboratoire des Sciences du Climat et de l'Environnement, CEA-CNRS-UVSQ, Université Paris-Saclay) - Hermes, Taylor (Max Planck Institute for Evolutionary Anthropology) - Frachetti, Michael (Washington University in St. Louis)

**Abstract format:** Oral

The miliacin biomarker represents an effective proxy for identifying the cultivation, processing, cooking, and consumption of broomcorn millet (*Panicum miliaceum*). Miliacin is the principal (c. 99%) PTME in broomcorn millet, while it is absent in other commonly cultivated crop species. Stable isotope research across the steppe and mountain zones of Central Asia has identified elevated  $\delta^{13}\text{C}$  values in ancient human and animal bone collagen and tooth enamel, pointing towards broomcorn millet consumption. Yet, naturally occurring endemic wild C4 grasses and elevation effects have also been suggested as potential contributors to these higher  $\delta^{13}\text{C}$  values in human tissues via diets based on pastoralist herding. Therefore, identifying miliacin in archaeological deposits associated with human settlements, while simultaneously confirming miliacin absence in more distant, unsettled areas of the landscape from the same time period might indicate cultivated broomcorn millet as the source of high  $\delta^{13}\text{C}$  values. The miliacin biomarker, however, is synthesized by other wild plants, such as Panicoideae family grass species *Digitaria*, *Glyceria* and *Pennisetum*, but in much smaller quantities than domesticated broomcorn millet. Most of those wild grasses also make use of the C4 photosynthesis pathway, making identification of broomcorn millet cultivation less straightforward.

Here, we present results from our investigation of the miliacin biomarker at several sites in Kazakhstan and Kyrgyzstan. Samples were collected either from ancient settlements or palaeofields with known histories of broomcorn millet cultivation or from off-site locations on the landscape. Our data shows the presence of miliacin only in the areas of human activity and an absence of detectable miliacin levels in landscapes distanced from archaeological traces. Our data confirm that both the miliacin biomarker and high  $\delta^{13}\text{C}$  values in human and animal tissues are most likely coming from the cultivation and use of broomcorn millet in Central Asia rather than from wild plants.

## INVESTIGATING THE USE OF BROOMCORN MILLET USING MOLECULAR AND COMPOUND-SPECIFIC STABLE CARBON ISOTOPIC ANALYSES OF POTTERY VESSELS

**Abstract author(s):** Zhang, Mengyao - Roffet-Salque, Melanie (Organic Geochemistry Unit, School of Chemistry, University of Bristol) - Pospieszny, Łukasz (Institute of Archaeology and Ethnology of the Polish Academy of Sciences, Poznań; School of Earth Sciences, University of Bristol) - Evershed, Richard (Organic Geochemistry Unit, School of Chemistry, University of Bristol)

**Abstract format:** Oral

Analysis of organic residues in archaeological pottery vessels has been successful in detecting a range of animal and plant products as indicators of food preparation in human prehistory. Broomcorn millet (*Panicum miliaceum*), one of the most economically important domesticated crops in prehistory, was first domesticated in China ca. 8000BC and arrived in Europe as early as the Middle Bronze Age.

Miliacin, a pentacyclic triterpene methyl ether, is a promising biomarker for broomcorn millet and provides a means to track the introduction, spread and use of this important crop using pottery vessels. Here, we present the results of organic residue analysis from a Late Bronze Age Polish site, where miliacin was present in lipid extracts from pottery sherds. The presence of millet lipids in the extracts is also supported by enriched carbon stable isotope values from the major fatty acids, C16:0 and C18:0, consistent with a C4 plant origin.

For a better understanding of the behaviour of miliacin, cooking experiments were conducted and the uptake of this biomarker into the ceramic matrix investigated using Gas Chromatography-Mass Spectrometry (GC-MS). We cooked five mixtures of millet with water, milk and meat. Although in these experiments low transfer of millet lipids into the pottery matrix was observed, miliacin was detected. This investigation helps refining interpretations regarding the use of broomcorn millet in the past.

## ORIGIN AND EVOLUTION OF MILLET CULTIVATION IN THE IBERIAN PENINSULA'S MEDITERRANEAN AREA (13TH CENTURY BC - 13TH CENTURY AD)

**Abstract author(s):** Alonso, Natàlia (University of Lleida) - Pérez-Jordà, Guillem (University of València)

**Abstract format:** Poster

The history of the cultivation of millet (*Panicum miliaceum*, *Setaria italica*) in Iberia's Mediterranean area could have had different origins and dynamics depending on which geographical zone, its historical evolution and its political organisation. The earliest traces of the cultivation of millet are in Western Catalonia in the northeast of the Peninsula in Bronze Age contexts (13th-12th centuries BC). Here millet was presumably of trans-Pyrenean origin and introduced, like other archaeological elements of the period, through the Segre River Valley. Millet species, on the other hand,

are recorded in southern Iberia (Andalusia and in the area of Valencia) in later 9th-7th century BC contexts where they coincide with the sphere of Phoenician influence. The evidence leads to explore different options, notably a penetration from the NE into the South or two different routes of entry in the two different timeframes. From this moment on, millet was established throughout the area, although there are zones such as the interior of the Ebro Valley and especially the surroundings of the Greek colony of Emporion where it was particularly relevant. Later, the evolution of the archaeobotanical finds of millet suffers a significant decline during Roman times before recovering in Late Antiquity. The record decreases once among the finds of Islamic settlements while increasing in Christian sites. This trend appears to correspond to periods of centralisation of political power in urban contexts (with a decrease of importance of the crop) and to times of dispersion when a more rural organisation appears to coincide with an increase in its cultivation.

## 96 NEITHER RIVER NOR LAKE: HUMAN-MADE 'WATERSCAPES'. THE USE OF GROUND- AND RAINWATER IN NEOLITHIC TIMES

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Staeuble, Harald (Archaeological Heritage Office Saxony) - Pyzel, Joanna (University of Gdansk) - Vostrovská, Ivana (Palacký University Olomouc) - Tóth, Krisztián (Dornyay Béla Museum of Salgótarján)

**Format:** Regular session

The early sedentary communities were mainly focused on the banks of rivers and lakes to meet their vital needs for water. For a long time, this was the dominating paradigm within the Central European settlement archaeology, if not worldwide. In regions with centrally organised states, one must think of complex irrigating systems that bring the water to the settlement. In prehistoric Central Europe, it was not until recently, that human-made sources of water like wells or even potential cisterns were discovered. These findings initially caused a lot of irritation and astonishment among researchers. But since then excavations of wells have increased rapidly for the early sedentary communities, such as the Linear Pottery Culture in Central Europe. We know today more than four dozens of cases. These new discoveries happened mostly by chance or, in the best case, by a very intensive and systematic research in peripheral settlement areas mainly due to very large scale construction or extraction projects.

In this session we do not want to restrict our view to a specific region but as we are interested in early settled societies, we would like to concentrate on the Neolithic Period. The presentation of new finds should not be in our focus. Even if the knowledge gained by each new case is very important and can alter the relatively recent understanding of human-made constructions for this vital resource anytime. The speakers should mainly concentrate on the understanding of the use and distribution of wells and cisterns within the settlements. Their presentation should demonstrate theoretic reflections as well as the manifold analysis of the natural sciences, which can be applied to the often exquisitely preserved organic material in water-logged features.

## ABSTRACTS

### 1 WELL, WELL, WELL, WAS THE WATER SO PRECIOUS FOR EARLY AGRICULTURAL SOCIETIES?

**Abstract author(s):** Tóth, Krisztián (Dornyay Béla Museum) - Csengeri, Piroska - Hajdú, Melinda (Herman Ottó Museum)

**Abstract format:** Oral

In November 2012, during a preventive archaeological excavation necessitated by the construction of a new highway bypassing Sajószentpéter (Borsod-Abaúj-Zemplén county, North-Eastern Hungary), a Middle Neolithic water well with astonishing wooden lining was uncovered by the archaeologists of Herman Ottó Museum, Miskolc. The 60 cm high remains of the tube-like wooden structure was made from a single oak tree with a total diameter of 90 cm. The trunk had been initially cut into four pieces (panels) that were later bond together with trusses of twisted rods. The wooden structure had amazing tool-marks on the entire surface that could be related to at least 3 different axes and bear fundamental information regarding the chaine opératoire. In 2014 another well had been discovered only a few kilometers to the South from Sajószentpéter near the village called Arnót. In this case only a small part of the wooden trunk had been preserved. Based on these two cases we would like to analyse the constructions and structural features of wells from North-Eastern Hungary. On the other hand we aim to investigate settlement patterns, the role of wells and water within settlements, which is an attempt presenting some characteristics of settlement structures from the Neolithic Period of North-Eastern Hungary.

## 2 WELLS AND WATER HOLES OF THE LBK IN KUYAVIA, CENTRAL POLAND

**Abstract author(s):** Pyzel, Joanna (University of Gdansk) - Kittel, Piotr (University of Lodz) - Muzolf, Błażej (Museum of Archaeology and Ethnography in Lodz)

**Abstract format:** Oral

Due to the construction of the A1 motorway, large scale emergency excavations were conducted in eastern Kuyavia region on altogether 34 sites of the Linear Pottery Culture (LBK) which enabled for the first time the insight into the settlement structure of the first farming communities in the Polish lowlands. On seven LBK sites, 12 particularly deep pits of this culture were detected among other regular settlement features. They vary in size, shape, the type and number of finds associated with them, and they were found in different locations within settlements' area. All of them were dug into moraine basal till of the last glaciation, and although any traces of timber structures or other organic material have been registered, these pits can be interpreted as more or less temporary wells or water holes from the Early Neolithic. In this presentation studied features will be compared with each other and with similar objects from other periods in Kuyavia.

## 3 NEOLITHIC WELLS IN MORAVIA IN THE LIGHT OF RECENT ARCHAEOLOGICAL AND ENVIRONMENTAL RESEARCH

**Abstract author(s):** Kalabková, Pavlína - Vostrovská, Ivana (Palacký University Olomouc)

**Abstract format:** Oral

The discoveries at Mohelnice in Moravia (Czech Republic) in the early 1970s have started the exploration of Neolithic wells of the Linear Pottery Culture in Europe. Besides unique archaeological findings also the first environmental analyses were made, which helped to reconstruct the natural conditions at the beginning of the Neolithic Period. After an almost fifty-year-long research we can now compare and update the achieved results. The paper presents the results of excavations of Neolithic wells at Mohelnice, Brno – Bohunice and Uničov in Moravia. It compares the building techniques used with individual wells, construction types, the way of use and decline, movable archaeological finds and the results of environmental analyses leading to reconstructions of natural environment on individual sites and on the whole territory of Moravia. Results of dendrochronology and radiocarbon dating, trasology, lithostratigraphy, palynology, anthracology and xylotomy, plant macroremains and mosses, zoology and entomology will be presented. Subsistence strategy of the first farmers in Moravia will be presented.

## 4 WHERE WAS THE WATER? GEOARCHAEOLOGICAL INVESTIGATIONS REGARDING THE FORMER GROUNDWATER TABLE OF EARLY NEOLITHIC WELLS IN NW-SAXONY

**Abstract author(s):** Tinapp, Christian (Saxonian Heritage office)

**Abstract format:** Oral

From 1997 onwards 12 Early Neolithic wells were discovered and excavated in NW-Saxony. All of them were affected by former and recent open coal mines. Thus the former groundwater tables are difficult to detect.

The situation of 6 wells were reconstructed by using available hydrogeologic informations and some unpublished groundwater studies. All of them were dug in loose sediments of Pleistocene age. In the Leipzig basin Tertiary sands and different layers of glacial fill of the Elsterian and Saalian ice age are the aquicludes, sand and gravel between them form the aquifers.

All wells reached the groundwater. Some of them achieved the aquifer, others are deepened in the aquiclude. Using of the aquifer guarantees nearly unlimited use of ground water. Waterlogged aquicludes were obviously also suitable despite their reduced water refilling capacity. Obviously, wells in the Leipzig basin with available groundwater less than 7m below the surface were build in or nearby the settlement and the places were mostly found by chance.

## 5 CONSIDERATIONS ON THE SETTLEMENT PATTERN WITH WELLS IN THE EARLY NEOLITHIC SETTLEMENT AREA OF EYTHRA, SAXONY, GERMANY

**Abstract author(s):** Staeuble, Harald (Archaeological Heritage Office Saxony)

**Abstract format:** Oral

In the course of large-scale excavations prior to lignite mining, an extensive settlement area of the Linear and Stroked Pottery Culture was discovered with findings of about 300 houses dating from about 5400-4600 BC. It was located at the edge of the wide river valley of the White Elster and thus belonged to the traditional settlement type near flowing water. Among several thousand settlement features, wooden constructions of a total of three Linear Pottery Culture wells were found in only two pits. Two successive wells within one pit were built shortly after each other, as both were dated around 5200 dendroBC. The third was constructed more than 100 years later, in 5098 dendroBC. Within the continuous settlement activity of about 800 years, evidence of daily water use from wells was thus underrepresented. Based on various dating results such as dendrochronology, radiocarbon dating and typoschronology, we reconstruct the settlement phases with wells.

Even if the discussion about the temporal relationship between houses, pits and the finds in them is still ongoing, wells and water management in settlements can only ever be discussed in the context of the settlement existing at the same time.

## 6 IS ALL WELL? SEVEN PRESERVED WOODEN CONSTRUCTIONS FROM THE LBK-SITE DROSSDORF, LEIPZIG COUNTY, SAXONY, GERMANY

**Abstract author(s):** Schell, Frank - Kretschmer, Saskia - Stäuble, Harald (Landesamt für Archäologie Sachsen / Archaeological Heritage Office Saxony)

**Abstract format:** Oral

During large-scale excavations in the opencast lignite mine Peres, south of Leipzig a large settlement of the Linear Pottery Culture (LBK) ranging from the 53rd to approximately 51st century BC was documented. On an excavation area of about 12 ha up to 70 typical house layouts and thousands of settlement pits were documented, among them seven more or less deep pits in which wooden constructions were preserved. Six of those were concentrated in a large waterlogged depression about 100 m southwest from the settlement. The constructions were built in different ways, three had chest-like wooden linings, one was built with wattle and two were made of hollowed tree trunks reaching depths between 2.5-3 metres. The seventh and biggest one, located at the south-eastern periphery of the settlement, reached 4 m deep and was built in log cabin style with finely shaped notched timbers.

Although Droßdorf was not conventionally located near a watercourse, the first six well-constructions may not have served primarily for potable water supply. This is suggested by their constructional details as well as by their location within the settlement and the landscape as well as by the finds from within. The substandard construction of these wells and their location in some distance to the settlement might imply that these were meant for other technical purposes like tanning, bast retting, for keeping things moist or as a watering place for live-stock. To understand the water management within the settlement during its entire 250-300 years of existence we have to consider that the largest and probably single water-well was built as late as during the last half century of habitation, at 5134 dendroBC.

---

## 98 HUNTER-GATHERER'S SOCIETIES IN THE SOUTHWESTERN EUROPE BETWEEN 18,500-10,000 CAL. BP [PAM]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Vadillo Conesa, Margarita - Real, Cristina (Departament de Prehistòria, Arqueologia i Història Antiga. Universitat de València) - Ricci, Giulia (Laboratoire Méditerranéen de Préhistoire, Europe, Afrique - LAMPEA – UMR 7269, Aix-Marseille Université, CNRS, Ministère de la Culture)

**Format:** Regular session

The Southwestern Europe covers a wide territory with diverse ecosystems, from the Iberian Peninsula, through southern France to Italy. In each of these areas the different research tradition has focused on defining cultural characteristics at the regional level, that has resulted in varied nomenclatures (eg. Badegoulian-Magdalenian-Epigravettian; Epipalaeolithic-Epimagdalenian-Azilian) used to name the latest palaeolithic technocomplexes of the same chronology. This fact makes it difficult to establish comparisons between the results of the different studies.

Some of the differences that characterize, a priori, these cultural groups located in the several territories may be a consequence of the research tradition and / or the methodologies used. If this were the case, the existence of possible similarities between the territories should be considered and highlighted. If not, we should ask ourselves why these differences occur.

This session aims to be a starting point to establish a summary of the current state of the art to assess the existence or otherwise of a cultural process of regionalization or to recognize and highlight the existence of common characteristics between territories in the proposed chronology: 18,500-10,000 cal. BP. Therefore, in the face of the increasing specialization of research projects, we propose an effort of synthesis of an interdisciplinary nature. In this sense, we invite you to present works that show the dynamics of human groups, connecting the main axes of study: resources (biotic and abiotic), technology, paleoenvironment, symbolism, settlement / occupation patterns. All this included in an updated radiocarbon chronology, which allows to establish a common chronological framework for the different regions.

**1 THE TAIHA PROJECT “THE LATEGLACIAL IN ATLANTIC ARC: INTERACTIONS BETWEEN HUMAN AND NON-HUMAN COMMUNITIES DURING THE TRANSITION PLEISTOCENE-HOLOCENE”**

**Abstract author(s):** Mathieu, Langlais (CNRS) - Nicolas, Naudinot (Univ Nice)

**Abstract format:** Oral

The TAIHA program focuses on the last upper paleolithic communities of the second half of the Lateglacial (between 14500 and 11000 cal BP). This key period is marked by important paleoenvironmental changes in parallel of complex cultural transformations. In addition to consolidating a collaborative network already partially established in the large geographical area under consideration (Atlantic coastline between England and northwestern Spain), this program seeks to bring together this community of researchers around a particular issue that has not yet been fully addressed: to better assess all interactions between humans and non-human animals. Because of a wide latitudinal gradient selected, the study area of the program is particularly relevant to advance on this question and in particular on the role potentially played by environmental transformations in these processes. This project will allow us to question our respective paradigms from a common methodology of analysis of lithic equipment, faunal remains and graphic representations on contextualized artefacts collected at the most important sites in the study area. Other corpus will also be mobilized to move forward on more targeted issues. This contribution aims to present the issues and means of this program as well as to highlight the first developments of this ongoing research for the next four years.

**2 GLOBALISATION OF BACK RETOUCH TECHNIQUES? COMPARING THE LATE EPIGRAVETTIAN OF NORTHERN ITALY TO THE LATE GLACIAL SEQUENCE OF SOUTH-WESTERN FRANCE**

**Abstract author(s):** Fasser, Nicolò (Università degli Studi di Ferrara, Dipartimento di Studi Umanistici - Sezione di Scienze Preistoriche e Antropologiche; TRACES, UMR 5608, Université Toulouse Jean Jaurès) - Visentin, Davide (Università degli Studi di Ferrara, Dipartimento di Studi Umanistici - Sezione di Scienze Preistoriche e Antropologiche; Archaeology of Social Dynamics Group, Institución Milá y Fontanals, Consejo Superior de Investigaciones Científicas - IMF-CSIC) - Langlais, Mathieu (PACEA, UMR 5199, Université de Bordeaux) - Valdeyron, Nicolas (TRACES, UMR 5608, Université Toulouse Jean Jaurès) - Fontana, Federica (Università degli Studi di Ferrara, Dipartimento di Studi Umanistici - Sezione di Scienze Preistoriche e Antropologiche)

**Abstract format:** Oral

Since the earliest studies dated to the end of the 19th and the beginning of the 20th century, the typological variability of lithic armatures and other specific traits in lithic and osseous technology after the Gravettian have allowed establishing a cultural separation between the Western-Atlantic and Mediterranean-Balkan regions. According to the latest studies, the former is characterised by the Solutrean-Badegoulian-Magdalenian-Azilian-Laborian sequence, whereas the second attests to the Early and the Late Epigravettian development. Moreover, the adoption of new methodological approaches is enlarging our view on the cultural complexity of European Late Palaeolithic groups. To contribute to this debate, our research has focused on the reconstruction of manufacturing modalities of lithic armatures, verifying whether there is a correlation between their morphological/typological variability and retouch techniques used to manufacture them.

To answer this question, we present the results of studies on a sample of lithic armatures from five South European sites dated between the last part of GS-2 and GS-1. Riparo Tagliente (VR), Riparo Biarzo (UD) and Riparo Soman (VR) belong to the Late Epigravettian, and they are located in North-Eastern Italy, while Troubat and Pont d'Ambon cover the period between the Upper Magdalenian and the Late Laborian. The former is situated in the northern Pyrenees (Hautes Pyrénées, France), the latter is in northern Périgord (Dordogne, France). The identification of retouch techniques was performed by combining an experimental activity, a low and high magnification analysis and a quantitative approach creating a new protocol for the study of lithic backed armatures. Applying this type of analysis at a large scale allowed observing the variability of Late Glacial armatures in a new light and highlighted several similarities between the two cultural sequences, suggesting the presence of social networks linking Epigravettian and Western societies across time.

**3 THE LIGURO-PROVENÇAL ARC BETWEEN TERMINAL PLEISTOCENE AND EARLY HOLOCENE. INNOVATIONS, PERSISTENT BEHAVIOURS AND TECHNO-ECONOMIC CHANGES AMONG LATE EPIGRAVETTIAN-MESOLITHIC GROUPS**

**Abstract author(s):** Ricci, Giulia (LAMPEA-UMR 7269, Aix-Marseille Université, CNRS) - Negrino, Fabio (Dipartimento di Antichità, Filosofia, Storia - DAFIST, Università di Genova)

**Abstract format:** Oral

The Liguro-Provençal Arc (ALP) forms a narrow coastal band between the Alps and the Mediterranean Sea. For the study of human settlements on the scale of the western Mediterranean, the ALP is a privileged area of investigation

since it constitutes a circulation corridor between Italian peninsula and the Rhône valley and where several prehistoric human occupations are attested.

The end of the Upper Palaeolithic in the ALP is marked by a technical and techno-economic change attesting a mutation in the organisation systems and socio-economic structures of populations. This is reflected in changing modes of raw materials procurements, from now on characterised by a more flexible selection and circulation of lithotypes over shorter distances. This transformation is also reflected in a less standardized blank production and in integrating new typological elements, especially among microlithic armatures (e.g., segments and triangles). It should be noted, anyway, that the Late Epigravettian and the appearance of the Mesolithic (Sauveterrian) in the ALP is based on a very small set of archaeological sites, especially if compared with the neighbouring areas (south-western France or north-eastern Italy). However, archaeological assemblages from this region reveal a remarkable heterogeneity, suggesting that many factors - environmental, functional and/or cultural - remain to be explored.

This speech is intended to be a synthesis of the recent discoveries and studies that have nevertheless brought new notable outputs about terminal Pleistocene and Early Holocene of this area. The reflection will take into account different proxies as well as lithic industries, ornaments, burials, subsistence practices, human mobility, and the evolution of the local environmental conditions. Different and common features in the technical and behavioural evolution of the ALP Late Epigravettian-Mesolithic population will be highlighted, using an interdisciplinary approach, but also benefiting from new radiocarbon dates necessary to define a more detailed chronological and cultural framework.

#### 4 AN INTEGRATED ANALYSIS OF THE LATE UPPER PALAEOLITHIC LAYERS 4009-4011 FROM THE ROMANELLI CAVE (SOUTHERN ITALY)

**Abstract author(s):** Sigari, Dario (CNRS - UMR 5608 TRACES, Toulouse; CNR-ISPC - Area della Ricerca di Roma 1, Montelibretti, RM) - Mazzini, Ilaria (CNR-IGAG, Area della Ricerca di Roma 1, Montelibretti, RM) - Bona, Fabio (Dipartimento di Scienze della Terra "Ardito Desio", Università degli Studi di Milano) - Forti, Luca (Dipartimento di Scienze della Terra "Ardito Desio", Università degli Studi di Milano; IGG-CNR) - Lembo, Giuseppe (Associazione Culturale Archeoldea, Campobasso) - Mecozzi, Beniamino (Dipartimento Scienze della Terra, Sapienza Università di Roma; Laboratorio PaleoFactory, Dipartimento Scienze della Terra, Sapienza Università di Roma) - Muffillo, Brunella (Dipartimento di Studi Umanistici, Sezione Scienze Preistoriche e Antropologiche, Università degli Studi di Ferrara) - Ranaldo, Filomena (Museo della Preistoria di Nardò; Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, U.R. Preistoria e Antropologia, Università degli Studi di Siena) - Sadori, Laura (Dipartimento di Biologia Ambientale, Sapienza Università di Roma) - Sardella, Raffaele (Dipartimento Scienze della Terra, Sapienza Università di Roma)

**Abstract format:** Oral

The new research activities started in 2015 at the Romanelli Cave aim to improve the resolution of the site stratigraphy, to revise and update the existing palaeontological and archaeological research and to develop conservation strategies of the infilling sequence and the cave itself.

In 2018, a new area of excavation of the so-called Terre Brune sequence i.e., attributed to the upper Palaeolithic occupation, was opened close to the northern wall of the cave.

A high quantity and variety of findings and data have come to light from the four excavated squares. Some of the findings have already been published: a distal phalanx of the hand of a child; a first record of pollen samples; new dating series.

In this work, we present the whole record recovered so far from the stratigraphic units 4009-4011, which have been dated between c. 14,000 and 11,200 cal. years BP. From these units several and varied findings, including lithics, bone tools and portable art pieces have been brought to light. Here we provide a first integrated analysis of these units using a multidisciplinary approach towards the understanding of how the last hunter-fisher-gatherer societies exploited the Romanelli Cave and the environment in which they lived.

#### 5 ENVIRONMENTAL SHIFTS AND TECHNICAL TRADITION CHANGES DURING THE PLEISTOCENE/ HOLOCENE TRANSITION IN SOUTHERN ITALY. NEW DATA FROM THE GROTTA DELLA SERRATURA

**Abstract author(s):** Poggiali, Federico (University of Liverpool) - Ricci, Giulia (LAMPEA – UMR 7269. Aix-Marseille Université, CNRS)

**Abstract format:** Oral

Grotta della Serratura represents an excellent reference site for the study of the Upper Paleolithic and the Mesolithic of the lower Tyrrhenian Italian peninsula. The long and well-detailed archaeological stratigraphy, which has been the focus of numerous interdisciplinary studies, offers a remarkable standpoint for the study of past hunter-gatherer societies during the shifting landscapes of the late Pleistocene and the early Holocene. New anthracological evidence (carbonized fuel wood waste) from the layers attributed to Evolved and Final Epigravettian (Strata 10B; 10A; 10; 9; 8C), Sauveterrian (Stratum 7) and Epipaleolithic Indifferetiated (Stratum 5) assist in the reconstruction of the past human exploitations of woodland resources and their interactions with the changing ecology of the Lateglacial period and the transition to the early Holocene. The data from these archaeobotanical analyses are discussed and

integrated with the data related to material culture, leading us to a more coherent discussion of the complex socio-cultural interactions between past human communities and the vegetational ecology surrounding this coastal site in the southern Italian peninsula.

## 6 THE MAGDALENIAN SETTLEMENT OF PORTUGUESE ESTREMADURA: NEW DATA FROM LAPA DO PICAREIRO

**Abstract author(s):** Haws, Jonathan (University of Louisville; ICArEHB, University of Algarve) - Benedetti, Michael (University of North Carolina Wilmington; ICArEHB, University of Algarve) - Bicho, Nuno (ICArEHB, University of Algarve) - Carvalho, Milena (University of New Mexico; ICArEHB, University of Algarve) - Friedl, Lukas (University of West Bohemia; ICArEHB, University of Algarve) - Ellis, M. (Colorado State University; ICArEHB, University of Algarve) - Pereira, Telmo (Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar, Portugal; Centro de Geociências da Universidade de Coimbra; UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Cascalheira, João (ICArEHB, University of Algarve)

**Abstract format:** Oral

Portuguese Estremadura has a well-documented record of human settlement during the Upper Paleolithic with a couple notable exceptions. The Early and Middle Magdalenian phases are largely absent in the regional archaeological record. Only a few radiocarbon dates from a small number of sites provide evidence for human presence. By contrast, the Late Magdalenian is very well represented in numerous open-air sites and a few relatively thick cave and rockshelter sequences. Why is the earlier Magdalenian so poorly represented? Climate appears to have played a significant role. One possibility is that the harsh climate conditions of Heinrich Stadial 1 led to demographic declines after the LGM. Another potential explanation is that climate-mediated erosive episodes at the end of cold/arid phases like H1 led to widespread landscape modification and destruction of archaeological evidence for human occupations in sites across Estremadura. Here we present and discuss new archaeological and paleoenvironmental data from Lapa do Picareiro that may help shed light on this problem. The cave has a lengthy stratigraphic sequence with ca. 6 m of sediment containing artifact assemblages from all the major Upper Paleolithic phases. For the Magdalenian, rich occupations are evident from the Late and Final Magdalenian phases. Recent excavations yielded lithic and osseous artifacts from levels dated to the Early and Middle Magdalenian time frame. These assemblages are much smaller and limit any purely typological attributions. Nevertheless, they demonstrate the presence of human populations on the landscape, but the earlier Magdalenian occupations were more ephemeral than the later ones.

## 7 TITO BUSTILLO REVISITED: NEW RESEARCH ABOUT HUNTER-GATHERER'S SOCIETIES IN THE SELLA VALLEY (ASTURIAS, NORTHERN SPAIN) DURING THE MAGDALENIAN

**Abstract author(s):** Alvarez-Fernández, Esteban (University of Salamanca) - Cueto, Marián (Universitat Autònoma Barcelona) - Tapia, Jesús (Sociedad de Ciencias Aranzadi) - Cerezo-Fernández, Rosana (Universidad de Salamanca) - Wanderley, Rafael (IIIPC-Universidad de Cantabria)

**Abstract format:** Oral

The "Living Area" of the Tito Bustillo cave (Ribadesella, Asturias, Spain) was the subject of systematic excavations, first by M. A. García Guinea (1970) and later by J. A. Moure (between 1972 and 1986). In the excavated area (27 m<sup>2</sup>) various occupations assigned to different phases from the Magdalenian (Lower, Middle and Upper Phases) were documented (Level 1), determined fundamentally from radiocarbon dates and "fossil directeurs". Level 2, also ascribed to the Magdalenian (Lower Phase), corresponds to a period with sedimentation in the cave. Recently, the materials documented in the excavations carried out in the last century have begun to be reviewed, in particular, the bone industry and the personal ornaments. This has been completed with new interventions carried out in the "Living Area" since 2020, whose objective is to better understand the occupations in Tito Bustillo. This communication offers preliminary data on these investigations carried out in the cave.

## 8 THE ANTLER AS A CORE: NEW PERSPECTIVES ON THE CHAÎNE OPÉRATOIRE OF BONE INDUSTRY

**Abstract author(s):** Tapia, Jesus (Aranzadi Science Society) - Álvarez-Fernández, Esteban - Cerezo-Fernández, Rosana (University of Salamanca) - Cueto, Marián (Autonomous University of Barcelona)

**Abstract format:** Oral

Bone industry has been a key subject of study in the periodization and classification of Upper Paleolithic cultures in Europe since the beginning of prehistoric research, which has traditionally been oriented towards the description of formal and typological aspects. Since the 1970's, technological studies and experimental programs have led to a new understanding of prehistoric material culture and to the emergence of the concept of operational sequence. In recent decades, research on the Upper Paleolithic has focused on the reconstruction of the technical procedures followed to make bone and antler tools, describing complete sequences from the collection of raw material to the use of the artifacts. However, the study of operative sequences of the bone industry has not yet reached its full explanatory potential compared to the lithic industry.

Specifically, the analysis of incomplete or partial operational chains makes it possible to identify time lapses between different production phases, but up to now, technical procedures specifically conceived for their deferred processing have not been described.

In this communication, we present a study that we are carrying out of three sets of Magdalenian antler remains from Tito Bustillo, El Cierro and Arangas caves, trying to identify if the extraction of blanks was intended to transport and transform them in a deferred way. Preliminary results suggest that, during Magdalenian in Cantabrian Spain, the production of broad antler blanks was designed for their transport and deferred processing.

## 9 REACHING HIGH: A MOUNTAIN HUNTING CAMP OF THE LATE UPPER PALEOLITHIC IN SAN ADRIAN, NORTHERN IBERIA

**Abstract author(s):** Tapia, Jesus - Castaños, Pedro (Aranzadi Science Society)

**Abstract format:** Oral

In recent decades, numerous Late Upper Paleolithic sites have been discovered in the Mediterranean watershed of northern Iberia, revealing that human settlement was not restricted to the Atlantic coast. In the same way, the study of lithic raw materials has shown that some of the flint varieties used in this area come from outcrops located to the south of the Cantabrian mountain range. However, human settlement in the inland area has been considered sporadic, short or limited to more temperate climatic periods due to its altitude. In this sense, it has been considered that hunter-gatherer groups would access these inland areas through low mountain passes, and in short, that the mountainous areas were hardly occupied until the Holocene. In this communication we present San Adrian cave, a new site located at 1.000 m.a.s.l., that has been dated 11.200BP. Our study helps to understand how human settlement was articulated between coastal and inland areas at the end of the Paleolithic and how the occupation of mountain areas occurred at the end of the last ice age.

## 10 LITHIC PRODUCTIONS AND TECHNO-ECONOMIC BEHAVIOR IN THE PRE-PYRENEAN MAGDALENIAN SITE OF CUEVA DE CHAVES (BASTARÁS, SPAIN)

**Abstract author(s):** Jiménez Ruiz, Luis (Primeros Pobladores y Patrimonio Arqueológico-IPH. Universidad de Zaragoza) - Sánchez de la Torre, Marta (SERP-IAUB. Universitat de Barcelona) - Domingo, Rafael - Utrilla, Pilar (Primeros Pobladores y Patrimonio Arqueológico-IPH. Universidad de Zaragoza)

**Abstract format:** Oral

The study of Late Pleistocene at the Iberian Peninsula shows us the variability of lithic techno-economic behaviors that were developed during the Magdalenian chronology. The archaeological site of Cueva de Chaves (Bastarás, Huesca, Spain) is an exceptional example of human occupations coming from recent times to Upper-Final Magdalenian chronology (15141-14485 cal. BP) at the Pre-Pyrenean mountains. The site was excavated from the eighties until its destruction in 2007, and the archaeological works founded a rich hunter-gatherer camping site with several lithic and bone-tools ensembles in two different levels (2a & 2b).

Through techno-typological and morphometric studies, we have identified the lithic reduction systems and the economical processes that were developed in the cave. Bladelets and little blades were the most produced kind of raw blanks as they were used to produce backed bladelets and hunting armatures. Some domestic tools and big retouched blades were probably brought to the site preconfigured due to the absence of big blade cores.

Along with the geochemical and micropaleontological characterization of raw materials, our study shows the complexity of economic interactions of these human groups and the great mobility of their lithic exchange's through the northern and southern Pyrenean slopes. This explains the progressive efficiency of lithic productions and the high level of portability at close, middle, and long-outcrops distances that were managed by these societies at the end of Pleistocene times.

## LATE GLACIAL TECHNOLOGICAL EVOLUTION IN NE IBERIA: INSIGHTS FROM COVA DE LES BORRES AND COVA GRAN DE MONTSERRAT SEQUENCES

**Abstract author(s):** Rabuñal, José Ramón (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico - INAPH, Universidad de Alicante; Department of Archaeology and Heritage Studies, Aarhus University Moesgård) - Morales, Juan Ignacio (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV) - Soto, María (Madrid Institute for Advanced Study, MIAS. Casa Velázquez; Departamento de Prehistoria y Arqueología. Facultad de Filosofía y Letras. Universidad Autónoma de Madrid) - Cebrià, Artur (SERP, Departament d'Història i Arqueologia, Secció de Prehistòria, Universitat de Barcelona) - Hernando, Raquel (Àrea de Prehistòria, Universitat Rovira i Virgili - URV; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Marsal, Roser (Institut de Recerca de l'Aigua - IdRA, Universidad de Barcelona; Department of Archaeology and Ancient History, Uppsala University) - Soares-Remiseiro, Miguel (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV) - Riede, Felix (Department of Archaeology and Heritage Studies, Aarhus University Moesgård) - Vallverdú, Josep (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV)

**Abstract format:** Oral

Northeastern Iberia has a long-established research tradition on Late Pleistocene archaeology, resulting in an extensive record of sites that have allowed continuous discussion and refinement of the periodization models for the cultural evolution during the Pleistocene-Holocene transition. Post-Magdalenian assemblages (Epipalaeolithic sensu lato; post-ca.14000 cal BP) have been characterized as microlaminar industries with clear Magdalenian filiation, as suggested by the stability of their general design with minor gradual modifications in the production systems and typological structure.

In this paper we present unpublished technological and chronological data from the recently excavated multi-stratified sequences of Cova de les Borres (La Febró, Tarragona) and Cova Gran de Montserrat (Collbató, Barcelona), and discuss their role within the actual state-of-the-art for the post-Magdalenian sequence from both regional (NE Iberia) and macro-regional (SW Europe) perspectives.

Cova de les Borres rockshelter has been excavated since 2015, opening a surface over 35m<sup>2</sup>. Within its archaeological sequence, layers 2.1 and 2 are dated to the mid GI-1, and layer 1.2 to the late GI-1 – early GS-1. These yielded abundant lithic remains, featuring similar blade and bladelet production strategies and retouched assemblages, dominated by endscrapers and backed elements, but standing out the appearance of geometric microliths in layer 1.2.

At Cova Gran cave, excavated since 2018 through over 25 m<sup>2</sup>, Late Glacial occupations have been documented in two archaeological layers: layer 202, dated to the mid GI-1, and still scarcely investigated; and layer 200, which yielded well-preserved occupations dated to the GS-I and a microlaminar lithic assemblage with endscrapers, backed elements and geometric microliths.

This work will contribute with new valuable chronological and techno-typological data to the discussion of major questions regarding the final Pleistocene technological and cultural evolution, such as the evolution of the post-Magdalenian techno-complexes, including the appearance of the first geometric microliths, during the Late Glacial period.

## MULTI-ISOTOPE STUDY ON UNGULATES FROM COVA DE LES CENDRES (ALACANT, SPAIN): PALEOENVIRONMENT AND HUNTING STRATEGY RECONSTRUCTIONS THROUGHOUT THE UPPER PALEOLITHIC

**Abstract author(s):** Salazar García, Domingo Carlos (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València; Grupo de Investigación en Prehistoria IT-1223-19 - UPV-EHU/IKERBASQUE-Basque Foundation for Science; Department of Geological Sciences, University of Cape Town) - Tornero, Carlos (Departament de Prehistòria, Universitat Autònoma de Barcelona - UAB, Edifici B Facultat de Filosofia i Lletres; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Real, Cristina (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València; Laboratory of Osteoarchaeology and Paleoanthropology, Department of Cultural Heritage, University of Bologna) - Villaverde, Valentín (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València)

**Abstract format:** Oral

We here present isotopic analysis of wild goat and red deer remains from the site of Cova de les Cendres (Mediterranean coast of central eastern Iberia) as a proxy to reconstruct paleoecological conditions during the Late Pleistocene and to assess hunting strategies of Upper Palaeolithic human groups in the region. Analysing both carbon and nitrogen isotope ratios on bone bulk collagen, as well as carbon and oxygen isotope ratios on sequential samples of molar enamel, offers isotopic different temporal resolutions of an animal's life to address these questions. During this time period, climatic conditions changed rapidly and human occupations were adapted to abrupt modifications on environmental conditions. Both species analysed (*Capra pyrenaica* and *Cervus elaphus*) are dominant throughout

the Solutrean and Magdalenian levels, dating from 20,300-20,200 calBP to 15,180-14,100 calBP, although a variety of other ungulates, leporids and carnivores are also present but in lower amounts. Our study allows comparing isotope values from same species between all layers, giving our results new insights on environmental factors and hunting strategies from the Western Mediterranean Late Upper Palaeolithic.

### 13 THE SAUVETERRIAN OCCUPATIONS OF COVETA DE LA FOIA (VILAFRANCA, VALENCIAN COUNTRY) AND THE END OF PALAEOOLITHIC CULTURES IN MEDITERRANEAN IBERIA

**Abstract author(s):** Roman, Didac (Universitat Jaume I) - Domingo, Inés (ICREA; Universitat de Barcelona) - Fullola-Isern, Joan - Alcàntara, Roger (Universitat Jaume I)

**Abstract format:** Oral

In the last few years, research on the cultures of the Pleistocene-Holocene transition has experienced a growing interest in Western Europe. Within this wide area, the Mediterranean side of the Iberian Peninsula is one of the regions contributing new evidence to feed current discussions.

The study of the end of the cultures based on microlaminar industries (Magdalenian, Epimagdalenian and Sauveterrian) and their transition to those based on the production of flakes (ancient Mesolithic), is one of the issues to be delved into in the coming years. To this end, it is particularly important to rely on new sites with potential to provide fresh data to advance on the characterization of these periods. Our recent projects exploring human occupations in the inland area of Castelló (north of the Valencian Country) have included the excavation of a couple of sites of interest to this research. La Fontanella site, excavated between 2011 and 2015, preserves a deposit including ancient Mesolithic industries valuable to refine the characteristics of the beginning of the period (Román and Domingo, 2021; Lloveras et al, 2020). In addition, our excavations at Coveta de la Foia site, still in progress, are offering a series of deposits dating between the end of the Magdalenian and the Sauveterrian. Our aim in this presentation is to introduce the latest finds uncovered at the Sauveterrian level and dating right to the Pleistocene-Holocene transition. We will focus on the techno-typological features of the stone tools, paying special attention to the geometrical and backed tools, as well as on the analysis of the faunal remains, with a dominance of red deer and wild goat, and a smaller presence of horses and carnivores. These data will be analyzed in the regional context.

### 14 REVIEW OF THE TECHNO-ECONOMIC TRENDS FROM THE CENTRAL IBERIAN MEDITERRANEAN AREA DURING THE TARDIGLACIAL AND EARLY POSTGLACIAL

**Abstract author(s):** Real, Cristina (Departamento de Prehistoria, Arqueología e Historia Antigua. Universidad de Valencia; Laboratory of Osteoarchaeology and Paleoanthropology. Department of Cultural Heritage. University of Bologna) - Vadillo Conesa, Margarita - Aura, J. Emili - Villaverde, Valentín (Departamento de Prehistoria, Arqueología e Historia Antigua. Universidad de Valencia.) - Morales, J. Vicente (Departamento de didáctica de las ciencias experimentales y sociales. Universidad de Valencia) - Román, Dídac (Departamento de Historia, Geografía y Arte. Universidad Jaume I)

**Abstract format:** Oral

The central Iberian Mediterranean region is a narrow area but with a wide record of Upper and Final Palaeolithic sites, studied from a technological, ecological, and economic point of view, although the relationship between the hinterland and the coastal landscapes has not been dealt with in enough depth. Our main objective is to review the techno-economic trends from these two types of landscape, their coincidences and their differences. We focus our data on the Upper and Final Palaeolithic sequences from Coves de Santa Maira (hinterland) and Cova de les Cendres (coastal), which are fundamental in the construction of the regional sequence.

The laminar-microlaminar techno-complexes from the end of the Late Glacial period to the early Holocene are characterised by continuity: local and regional raw material procurement, production objectives. It is a Magdalenian substrate that lasts until the beginning of the Mesolithic period. Although some changes occur in the exploitation modalities and retouched tools, however, this did not affect the essential purposes of lithic production. Through the analysis of the lithic assemblages from these sites, we can observe the characteristics and particularities of this entire Magdalenian cycle.

The subsistence model has common characteristics: hunting based on one medium-sized species (red deer or Spanish ibex), with a complementary consumption of other ungulates, carnivores, small prey, and even marine resources. Domestic human activities show a complete exploitation processing and even preparation of skins and preservation activities related to long-term strategy. We explore the difference in the taxonomic spectrum and the domestic activities between both areas. And to what extent might landscape or settlement dynamics have influenced.

The final goal is to develop a comparison with other Mediterranean regions, leaving aside the different nomenclatures that create confusion, and open a discussion on the traditions and changes that define these final Palaeolithic human groups.

## A. RECONSTRUCTING REINDEER (RANGIFER TARANDUS) MOBILITY PATTERNS THROUGH 3D GMM ANALYSIS OF THEIR PHALANGES

**Abstract author(s):** Galán López, Ana Belén (CNRS TRACES UMR 5608 - Université Toulouse Jean Jaurès) - Pelletier, Maxime (Archaeology, History, Culture and Communication Studies, Faculty of Humanities, University of Oulu) - Discamps, Emmanuel (CNRS TRACES UMR 5608 - Université Toulouse Jean Jaurès)

**Abstract format:** Poster

Reconstructing the interactions between Palaeolithic human groups and their prey is often complicated by a general lack of data on the ethology and ecology of past animal communities. DeerPal is an interdisciplinary project aimed at applying different cutting-edge analytical techniques (dental microwear texture analysis, stable isotopic analysis, cementochronology and geometric morphometrics [GMM]) to progress in this avenue. It focuses on two archaeological periods (the Middle Palaeolithic of southwestern France and the Late Glacial from the Pyrenees to the Paris-Basin) and two animal species that were key to hunter-gatherer groups: reindeer (*Rangifer tarandus*) and red deer (*Cervus elaphus*). At the end of the Late Glacial, reindeer gradually disappeared from southwestern Europe with the climate warming. As they became more fragmented geographically, different responses should be expected, such as variation in their migratory patterns (e.g. more or less sedentary groups, latitudinal vs. altitudinal migration along the Pyrenees, etc.). As the migration behaviours of reindeer herds during this period are largely unknown, it is difficult to interpret Late Glacial socio-economic organization and mobility strategies. In this contribution, we present the first results acquired by GMM on reindeer phalanges from modern populations.

Due to the fact that locomotor morphological adaptations are closely related to habitat preferences and mobility, it is possible to infer behavioural responses using an animal's cranial and post-cranial morphology. GMM allows identifying subtle differences in size and form between individuals of the same species.

For our study, a total of 155 first and third phalanges from different ecotypes of extant caribou were scanned with a laser-surface 3D-scanner. Results acquired by the 3D-GMM analysis of this reference sample allows a discussion of our capacity to identify migratory/non-migratory reindeer in past populations. A similar methodology is then applied to archaeological remains to test hypothesis on migratory behaviour of Late Glacial reindeer populations.

---

## 100 HUMAN FORENSIC TAPHONOMY – HOW MULTIDISCIPLINARY APPROACHES SHED LIGHT ON PAST FUNERARY PRACTICES

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Moghaddam, Negahnaz (Swiss Human Institute of Forensic Taphonomy, University Centre of Legal Medicine Lausanne-Geneva; Unit of Forensic Imaging and Anthropology, University Centre of Legal Medicine Lausanne-Geneva) - Varlet, Vincent (Swiss Human Institute of Forensic Taphonomy, University Centre of Legal Medicine Lausanne-Geneva) - Shvedchikova, Tatiana (-) - Mateovics-László, Orsolya (Hungarian National Museum, Archaeological Heritage Directorate)

**Format:** Regular session

Over the last decades, human taphonomy became an important research field within the study of funeral practices and burials of the past. For a better understanding of mortuary practices in history and prehistory, in-depth knowledge of the natural processes of cadaver decomposition is indispensable. There are various external factors, such as environmental and climatic conditions but also human behavior, which affect the rate of decomposition. The analyses of burnt and cremated human remains, for instant, involves great challenges. Other examples are human remains found in water but also conserved bodies due to volcanic activity, bogs or frozen remains that date thousands of years ago. Those are rare and outstanding archaeological findings that can provide valuable information about decomposition under rigorous conditions. On the other hand, the methodological approaches of forensic taphonomy, modern cases and experimental research should be taken into consideration to understand the impact and influence of various external factors. Forensic taphonomy is a cross-cutting approach, which uses the knowledge of several disciplines, such as for example forensic medicine, imaging, toxicology, biological anthropology, archaeo-ethanatology, odontology, entomology, botany and environmental sciences.

The aim of the session is to bring together various scientific fields to gain insights on the influences of different external factors and natural environments on buried human remains and how this knowledge should be used for further historic and prehistoric interpretations.

**1 HOW FORENSIC TAPHONOMY CAN HELP TO INTERPRET HUMAN BURIALS IN THE ARCHAEOLOGICAL RECORD: INSIGHTS FROM AN INTERDISCIPLINARY EXPERIMENTAL RESEARCH PROGRAM**

**Abstract author(s):** Mickleburgh, Hayley (Linnaeus University; Forensic Anthropology Center Texas State University)

**Abstract format:** Oral

Actualistic taphonomic research on human remains can provide uniquely valuable insights into the sequence of events surrounding death and burial as well as the subsequent formation processes of the grave. Observations of the process of human decomposition and the effects of different variables on the outcome (such as the manner of body treatment and positioning of the body in the grave), can help to distinguish between the results of human actions and other taphonomic processes in the archaeological record. Experiments importantly provide information on processes that cannot be gleaned from archaeological data alone. This paper discusses the methods and findings of an ongoing experimental forensic taphonomic research program developed to assist the interpretation of human burials in both traditional and forensic archaeological contexts. The program replicates two distinct medicolegal/archaeological burial contexts - individual depositions and mass graves - in a series of actualistic experiments at the human taphonomy facility managed by the Forensic Anthropology Center at Texas State University (FACTS). This inter-disciplinary program aims to contribute to mortuary archaeology by advancing archaeoethanatology analysis, as well as to the forensic sciences by among others, developing new methods to estimate time since death and human identification, assessing the implications of tissue diagenesis for isotope forensics, and testing and validating methods for the detection of clandestine graves.

To date, the series of experiments has provided valuable new information on the processes involved in joint disarticulation, and the relation between bone displacement and 1) open space (voids) in the grave, 2) the position of the body upon placement (flexed, extended), and 3) the condition of the body (fresh, mummified). These processes are fundamental to models and interpretations applied in archaeoethanatology, and the results obtained from the actualistic taphonomic research allow us to reevaluate and augment our reconstructions of funerary practices in the past.

**2 INTRODUCING GEOFOR – A NOVEL GIS-BASED APPLICATION FOR IMPROVING PMI METHODS**

**Abstract author(s):** Tica, Cristina - Weisensee, Katherine - Clafin, Patrick - Carbajales-Dale, Patricia (Clemson University)

**Abstract format:** Oral

One of the crucial aspects of forensic death investigations is the determination of time since death, or postmortem interval (PMI). To date, PMI research has either made use of a few outdoor decomposition research facilities, or of geographically constrained case studies, both approaches based on relatively small sample sizes. Thus, no current PMI methods incorporate large reference datasets, representative of various geographical and environmental settings.

In order to remedy this gap in research, the geoFOR application was built to allow forensic practitioners to efficiently submit reliable and accurate information about the characteristics observed in forensic casework, with the goal of improving upon existing methods for estimating PMI. The project uses the data repository from submitted forensic casework and develops robust models for calculating PMI, to provide accurate estimates with known error rates by utilizing georeferenced environmental information. The application is available to coroners, medical examiners, and death investigators worldwide. With more than 550 cases entered up to date, it is the largest database used for PMI estimations.

The application has a built-in calculator that encourages data submission and provides practitioners with immediate benefits: it estimates PMI based on the recovered remains' location and the accumulated degree days (ADD) or total body score (TBS) entered. ADD is frequently used for many of the available methods. The investigator inputs the information about the case and geoFOR automatically compiles temperature information from the National Oceanic and Atmospheric Administration (NOAA), with weather stations available worldwide; it locates the nearest weather station and calculates daily average temperatures until it reaches the entered ADD, thus providing the user with an estimated PMI and corresponding calendar date or range. geoFOR aims to deliver PMI estimates easier and quicker than currently available methods, an immediate incentive for medicolegal death investigators and forensic professionals to contribute their data.

### 3 GRAVES MATTERS: INTERDISCIPLINARY RESEARCH OF MORTUARY BEHAVIOR

**Abstract author(s):** Durczak, Kinga (Independent researcher)

**Abstract format:** Oral

Human mortuary behaviors have many variations throughout humankind's history. One of the most common practice, but usually forgotten or unnoticed in archaeological records, is warping human remains in shrouds. This funerary behavior can be a focal point of early preparation of a corpse, however, that may also be one of many steps of mortuary practice. Nevertheless, decomposition of the body and other taphonomic factors can have a huge impact on the formation of a grave site.

Nowadays, it is still widely practiced in many different cultures and religions, it is most pronounced among Muslim and Jews. However, it is usually omitted in the research on the Early Christian funerary practice in Poland. This practice has been incorporated into mortuary rites, and the custom was widespread, until, the use of coffin became a common practice, slowly disappeared and currently it almost completely went out of use.

For better understanding this invisible practice, we can apply a twofold approach. On the one hand research of the past archival documentation; on the other detailed excavation processes, incorporating new techniques, that could help to better understand existing data. This can provide improved, new insights into existing knowledge of funerary rites. A case study illustrating such research comes from Giecz cemetery of Early medieval Poland.

### 4 BEETLES, FLIES AND LICE ASSOCIATED WITH SOUTH AMERICAN HUMAN MUMMIES: THE ARCHAEOENTOMOLOGICAL EVIDENCE

**Abstract author(s):** Kirgís, Pauline (UMR 5199 du CNRS, PACEA, University of Bordeaux) - Huchet, Jean-Bernard (UMR 5199 du CNRS, PACEA, University of Bordeaux; UMR 7209, Muséum d'Histoire Naturelle de Paris; UMR 7205 CNRS MNHN UPMC EPHE, Muséum national d'Histoire naturelle de Paris)

**Abstract format:** Oral

Insects are powerful sources of information both in forensic and archaeological studies. The application of forensic entomology in an archaeological context, designated by the term of 'funerary archaeoentomology', appears as a relevant method to improve investigations of the treatment of the dead, taphonomic events, and, by extension, of the funerary practices of past societies. While the entomofauna associated with human and animal mummies from ancient Egypt is now relatively well documented, few archaeoentomological studies have been devoted to pre-Hispanic mummies, despite their high prevalence in most American and European museums. We will present here some insects and other arthropods originated from human mummies from the Royal Museums of Art and History in Brussels and the Musée de l'Homme in Paris. These investigations led us to evidence a large corpus of insect remains belonging to 10 distinct orders and to propose some first hypotheses, both on the funerary practices and on the health conditions of these ancient populations of South America.

### 5 "COLD CASES FROM THE PAST" - COMPREHENSIVE EVALUATION OF SHARP FORCE SKELETAL TRAUMAS FROM MEDIEVAL HUNGARY

**Abstract author(s):** László-Mateovics, Orsolya (Hungarian National Museum / Magyar Nemzeti Múzeum)

**Abstract format:** Oral

Interpretation of violent injuries on archaeological specimens is a great challenge for bioarchaeologists. Forensic methodology and evaluation criteria can support such analyses and help to avoid missing data or false explanations of certain injuries. This is especially valid for sharp force injuries, especially from deviant burials. The in-depth interpretation of how these wounds were inflicted is crucial to reconstruct the circumstances of the death. This presentation intends to use this critical view to interpret blade injuries from two Hungarian archaeological contexts. These studies represent special sharp force injuries, namely cutmarks of decapitation and an amputation. This study aims to show and evaluate the special features of these types of lesions which can be instructive for future interpretations of such traumas and injuries. On the other hand, these case studies can also point at how the osteobiography of a skeleton combined with the historical and cultural framework can turn into a unique story of one's life and death from the past.

### 6 PRELIMINARY ESTIMATION OF THE CADAVER PRESERVATION STATE AND THE REALITY: THE CASE STUDY OF GENERAL GUDIN'S BURIAL

**Abstract author(s):** Shvedchikova, Tatiana (-)

**Abstract format:** Oral

Our contemporary rich knowledge about human cadaver decay help us to understand the processes that commence after its burial. This knowledge gives the possibility to detect the ritualistic behavior, estimate the external environmental influence and predict the human tissue preservation state. But do always the models we have, studying

the contemporary cases and experimental sets can answer these questions precisely? What unexpected factors can influence on preservation state of the burial and cadaver itself? The case study of the 19th century burial is presented. According to written sources, burial found in 2019 in the center of Smolensk city is supposed to belong to the general Gudin, one of the closest friend of Napoleon. He was injured in the battle near Lubino (Valutino), lost left leg and died in the couple of days. The precise place of his burial remained unknown until the archaeological investigations. Preliminary estimation of the soil conditions tended to the excellent body preservation and taphonomical situation when hair and textile could be preserved. But the revealed remains showed the extremely bad preservation state. Most of the spongy bones were almost decayed. The possibility of the further micromolecular investigations was under the big question. Fast changes of the bone tissue after the burial opening made us to act quickly and with the higher state of accuracy. The possible causes of such bad preservation state are discussed. The conservation protocol is presented.

## 7 YET IN MY FLESH I WILL SEE GOD - COMPARING THEOLOGICAL, ARCHAEOLOGICAL AND FORENSIC THOUGHTS ON NATURAL AND ARTIFICIAL MUMMIFICATION

**Abstract author(s):** Alterauge, Amelie (University of Bern; University of Tübingen)

**Abstract format:** Oral

Post-medieval church crypts were the preferred burial place of the European elite between the 16th and 19th centuries AD. They offer perfect conditions for the preservation of human remains: coffins placed above ground, absorbent coffin padding, good ventilation, and slowly changing temperatures and humidity. For those reasons, most of the bodies are naturally mummified due to simple desiccation. However, some individuals were artificially mummified through evisceration and embalming, as revealed by medical examinations. The aim of this paper is to discuss whether both types of mummification lead to a similar body preservation or if there are type-specific decomposition patterns. By using forensic methods, such as imaging techniques (X-ray, computed tomography) and entomology, multiple factors influencing the mummification process are considered. In combination with the historical sources reporting on the burial of the deceased, it is possible to reconstruct the burial circumstances, such as the time span between death and burial or the season. The inscriptions on the coffins are biblical quotations which recall the hope of resurrection and transience of life. It is reasoned whether both mummification processes were regarded as equally beneficial to an assumed bodily resurrection.

## 8 MULTIDISCIPLINARY TAPHONOMIC APPROACHES REVEAL MUMMIFICATION PRACTICES IN THE MESOLITHIC, SADO VALLEY, PORTUGAL

**Abstract author(s):** Peyroteo Stjerna, Rita (Human Evolution, Dep Organismal Biology, Human Evolution, Uppsala University; UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Nilsson Stutz, Liv (Department of Cultural Sciences, Linnaeus University) - Mickleburgh, Hayley (Department of Cultural Sciences, Linnaeus University; Forensic Anthropology Center, Texas State University) - Cardoso, João (Universidade Aberta; Centre of Archaeological Studies, Oeiras Municipal Council; ICArEHB, Universidade do Algarve)

**Abstract format:** Oral

Recently rediscovered photographs of the remains of thirteen individuals excavated in 1960 and 1962 at the Mesolithic shell middens of Arapouco and P. S. Bento in the Sado Valley, Portugal, show the potential of revisiting excavation archives with new methods.

We analysed this documentation using a combined taphonomic approach by integrating archaeoethnology and actualistic taphonomic research. Our analysis indicates that some bodies may have been mummified prior to burial, a phenomenon possibly linked to their curation and transport, highlighting the significance of both the body and the burial place in Mesolithic Portugal, c. 8000 years ago. Here we present what we believe to be evidence for intentional mummification through desiccation thus adding a new dimension to our understanding of Mesolithic mortuary practices. This research was only possible through the transfer of knowledge from experiment to application and demonstrates how different taphonomic approaches can be usefully combined to address complex archaeological problems.

## 9 DE-COMMINGLING PREHISTORIC AEGEAN MORTUARY ASSEMBLAGES: A MULTIDISCIPLINARY METHODOLOGICAL APPROACH TOWARDS THE STUDY OF COMMINGLED UNBURNT AND BURNT HUMAN REMAINS

**Abstract author(s):** Chatzikonstantinou, Ioannis (School of History and Archaeology, Aristotle University of Thessaloniki) - Papakonstantinou, Niki (School of History and Archaeology, Aristotle University of Thessaloniki; Fitch Laboratory, British School at Athens)

**Abstract format:** Oral

Reconstructing mortuary practices from the prehistoric archaeological record of the Aegean region is challenging. In many cases, these practices represent different stages from a complex ritual sequence, involving tomb reuse, mul-

multiple interments, visits by the living, differential use of fire, as well as, secondary manipulation of the dead, resulting in masses of commingled, fragmented, and poorly preserved bones. Despite the abundant evidence of mortuary loci from Crete and the Greek mainland, commingled skeletal assemblages, often with traces of fire, had, until recently, remained marginalized, being perceived of minor importance, further complicated by issues of equifinality.

This paper presents a systematic methodological approach in the study of commingled bones deriving from collective Minoan tholos (Koumasa B) and Mycenaean chamber tombs (Kolikrepi, Spata). The meticulous examination of osteological and taphonomic data (e.g., weathering, erosion, plant, animal, and insect damage) and the identification of heat-induced changes (e.g., discoloration, fractures, warping, shrinkage), combined with contextual mortuary information, are further supplemented by microscopic analysis (histotaphonomy), as well as, isotope (C, O, Sr) and infrared measurements on burnt bones. This multidisciplinary perspective enhances our perception of the depositional history of the remains and the formation mechanisms of skeletal assemblages (human actions and natural processes) during the Bronze Age in the Aegean.

## 10 SOILS AND BONES – HOW IT WAS AND HOW IT GOES. CULTURAL AND NATURAL TAPHONOMY OF ROMAN PERIOD CREMAINS

**Abstract author(s):** Wolska, Bogumila (Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Dudek, Michał - Bednik, Magdalena (Institute of Soil Science, Plant Nutrition and Environmental Protection, Wrocław University of Life and Environmental Sciences) - Krupski, Mateusz (Institute of Soil Science, Plant Nutrition and Environmental Protection, Wrocław University of Life and Environmental Sciences; Archeolodzy.org Foundation)

**Abstract format:** Oral

It is known that the study of cremains provides insights into the life and death of individuals. However, the distinction between cultural and natural factors that affected the bones is sometimes difficult, since many stages of taphonomy have bearing on their final preservation: 1) pre-burning condition of the body, 2) combustion, 3) post-burning activities, 4) post-depositional processes and also, 5) urn exploration.

On the example of an urn grave from the prehistoric (Roman Period) necropolis in Czarnówko (North Poland), we'd like to present the taphonomic processes that have acted on the bones since the death of the individual. This was possible following osteological and FT-IR analysis of burned remains as well as the quantitative geochemical characterization of soil/sediment infill of the urn.

The results show that: 1) the deceased was probably burned shortly after death, 2) oxygen availability/ temperature varied in the pyre, 3) the bones were collected meticulously from the pyre debris and no further cultural actions occurred, 4) mechanical fragmentation (powdering) of trabecular bone is responsible for enhanced P and Ca levels in the urn soil, 5) the presence of organic carbon results from microcharcoal and "soot", allowing microbial activity in the vessel's infill, 6) pH was non-aggressive for bone preservation, 7) percolating water affected the bronze artefacts in the urn and induced wetting/drying conditions in its bottommost part.

The bones were generally well-preserved and two main taphonomic processes can be indicated: combustion on the pyre and powdering of the burned bone epiphyses in the urn. The soil conditions were neutral for bone preservation in this case. As it turns out, the degree of post depositional alteration was relatively low in the Czarnówko burial. Having such knowledge allows to concentrate on cultural taphonomic factors (i.e. the peculiarities of burial rites), aiding interpretation of past funerary practices.

## 11 HOW CAN TAPHONOMY HELP WITH BURIAL RITUALS UNDERSTANDING. CASE STUDY BASED ON THE CHILDREN'S GRAVES WITH GRAVE PIT STONE LINING

**Abstract author(s):** Prichystalová, Renáta (Department of Archaeology and Museology, Masaryk University)

**Abstract format:** Oral

The church graveyard with 152 graves was discovered at the early medieval site Pohansko near Břeclav (CZ). Among these graves were 27 with grave pit stone lining. In more than 59 % of these graves were buried children, in age brackets from Infans Ia to Infans II. Majority of these children's graves belongs to the category Infans Ib, children between the ages of 1 and 7. We can distinguish three basic forms of the stone adjustment of grave pit's perimeter: 1) complete stone lining; 2) almost complete or partial stone lining; 3) symbolic (suggestive) stone lining, which belongs to prevailing typ. All these categories incorporate the children's burial. What were these children? What social rank could they be included in? We try to answer these questions on the basis of a complete archaeological assessment of the graves (grave location within the churchyard, grave pit adjustment, presence of grave goods). Archaeological outcomes are compared to results of the tafonomical analysis (presence / absence of the primary hollow space). The results are also supplemented with findings from paleopathology. The outcomes of this research we present on case studies of all mentioned types of grave pit stone lining.

## INSIGHTS INTO MORTUARY PRACTICES OF CHALCOLITHIC HUMAN REMAINS FROM TOMB 3 OF PERDIGÕES (PORTUGAL) THROUGH BIOANTHROPOLOGICAL AND TAPHONOMIC ANALYSIS

**Abstract author(s):** Relvado, Cláudia (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, University of Algarve) - Almeida, Nelson (Uniarq, Centro de Arqueologia da Universidade de Lisboa) - Valera, António (Era Arqueologia SA; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, University of Algarve) - Evangelista, Lucy (Era Arqueologia SA; Research Center in Anthropology and Health, University of Coimbra; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, University of Algarve) - Maurer, Anne-France (HERCULES Laboratory, University of Évora) - Godinho, Ricardo (Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, University of Algarve)

**Abstract format:** Oral

The archaeological site of Perdigões (Reguengos de Monsaraz, Southern Portugal), dated between 3500-2000 BCE, is a large (16ha) and complex set of ditched enclosures. The site has been extensively studied by the ERA archaeology team for the last ~25 years, revealing different funerary contexts that exhibit a variety of body treatments (primary and secondary depositions, cremations), among other contexts. Of the four fully excavated funerary tombs, this study focuses on Tomb 3 (2800-2600 BCE). It applies taphonomic and bioanthropological analyses to provide an integrated biocultural understanding of funerary, demographic and health profiles, thus enabling a deeper appreciation of the funerary rites practiced during the Chalcolithic.

Although some possible partial anatomical connections were detected during fieldwork, most of the bones were disarticulated, raising several questions about the use of this tomb as a primary or secondary deposition site, or both. Preliminary analysis allowed an estimate of a minimum number of 15 adults and 5 non-adults. The low magnitude of dental wear, along with the absence of degenerative pathologies, suggests that even the adult individuals would be relatively young when deceased. Morphological analysis and sex diagnosis was strongly influenced and limited by the poor preservation of the osteological material.

The human remains in Tomb 3 are poorly preserved, displaying numerous taphonomic alterations, including recent and not recent post-depositional bone fragmentation. Other observed alterations include the presence of significant erosion and concretions in some bones, while others present an almost unaltered cortical surface. This may indicate different taphonomic processes occurring within this structure or that the human remains were originally deposited in different contexts.

Overall, these remains are "more than just bones". Indeed, the study of human remains, even when poorly preserved, is crucial to understand past human populations and their funerary behaviour, especially when combined with other approaches (e.g., archaeological and archaeometric studies).

### A. MICROBIAL BIOEROSION OF BONE: THE USE OF TRAINABLE WEKA SEGMENTATION FOR BSE-SEM IMAGE ASSESSMENT

**Abstract author(s):** Pankowska, Anna - Žižková, Andrea (University of West Bohemia)

**Abstract format:** Poster

Human bones from archaeological context in Moravia were studied to reconstruct their post-mortem histories based on the distribution of their microbial destruction. BSE-SEM was used for visual assessment of bioerosion in total number of 19 bone thin sections. Visual data from histological analysis were transformed to quantitative data through Waikato Environment for Knowledge Analysis (WEKA) in ImageJ software. During the analysis we specified three classes of visible areas (1st class: unaltered bone, 2nd class: altered bone, 3rd class: background, and in some cases 4th class: soil inclusion). Finally, we calculated area of each classifier relative to the total field-of-view (in percent). WEKA was applied three times per sample. The intra-observer error was low; the mean deviation between two measurements was 0.86 (95% CI was -8.887, 7.157). The time spent on each image was depending on the number of original SEM images (from 12 to 60 per sample) and computer properties, about 20 minutes per image on average. The WEKA toolkit was found to be a suitable method for quantity assessment and spatial distribution of the bone microbial destruction.

### B. THE QUESTION OF THE BAD PRESERVATION AND DISAPPEARANCE OF BONES IN THE EARLY MODERN CEMETERY OF SZÉCSÉNY (HUNGARY)

**Abstract author(s):** Líbor, Csilla (Szent István Király Museum) - Balogh Bodor, Tekla - Laczkó, Virág (Hungarian National Museum) - Grynæus, András (Pázmány Péter Catholic University)

**Abstract format:** Poster

Human skeletal remains from archaeological contexts show the most direct picture of the health, well-being, and lifestyles of past populations. In recent years, there has been an increasing amount of literature on how the taphonomic changes enhance the interpretation of funerary practices in the bioarchaeological field.

In general, bones are most affected by the chemical composition of the soil where the bodies were buried. In fact, the pH of the soil has the largest influence on bone preservation. Due to human intervention, the pH level can easily change.

In 2019, we had the opportunity to excavate a late medieval-modern cemetery in Szécsény (Hungary). In the bone material of the nearly 300 graves, in most cases, the entire upper body had dusted off, only the long bones remained from the skeleton. There were a few remains in remarkably good condition, next to the poorly preserved individuals in the cemetery.

Each buried individual laid in a coffin, therefore we assumed that the answer lies in the type of woods of the coffins. Thus, we took samples from the wood of the coffins, and we identified the types. In parallel, the pH level of the soil samples (taken from the graves) was also examined. Finally, we compared the results with the preservation status of the skeletons.

Overall, our results indicate that the dusted bones hold information for the archaeologists that should not be ignored.

## CAMPAINING STRATEGIES FOR ARCHAEOLOGY AND CULTURAL HERITAGE - PRINCIPLES, STRATEGIES, AND PRACTICAL EXPERIENCES

**Theme: 1. Archaeologists and Archaeology Here and Now**

**Organisers:** Siegmund, Frank (DGUF - Deutsche Gesellschaft für Ur- und Frühgeschichte; Univ. Münster) - Scherzler, Diane (DGUF - Deutsche Gesellschaft für Ur- und Frühgeschichte) - Wait, Gerry (GWHeritage; ISDAf - Institute for Sustainable Development in Africa) - Bejko, Lorenc (Univ. Tirana)

**Format:** Regular session

Archaeology and the protection of cultural heritage often diverge or even conflict with other, equally legitimate interests of the economy or the society. Decisions have to be made about where funds go, how laws are formulated, who receives political and public support - and who does not. In democratic societies, it is common to create attention for one's own interest with the help of campaigns or petitions; to put pressure on decision-makers; to convince citizens and to organise democratic majorities. Archaeology is often not very successful in this; it usually reacts too late and too little to expected crises. Looking back on such initiatives, typical shortcomings of such campaigns - as well as weaknesses of the archaeological community - can be identified on the basis of failures or partial successes. Recommendations for a more effective approach can be derived from the successes. The session does not want to exclude the presentation of (significant) individual cases, but it does want to look at the topic in a more fundamental way, and to compile existing experiences from all over Europe. It will also not be about lobbying, but will focus on campaigns that have cleverly combined several approaches to convince other stakeholders and successfully take advantage of the different roles within archaeology.

### ABSTRACTS

#### 1 ADVOCACY AND CONSTITUENCIES

**Abstract author(s):** Wait, Gerald (GWHeritage)

**Abstract format:** Oral

Archaeological and cultural heritage organisations, whether they are more academic membership groups (think EAA, SAA, SAFA) or professional associations (e.g. RPA, ClfA) or indeed trade organisations (FAME, ACRA) all choose to devote time and energy to representing what they see as the best interests of their subject matter or their members. Such representation may be more or less overt and may be variously focussed. We often think this means efforts to affect how governments or international organisations by, for example, advocating that politicians enact legislation with specific characteristics that we consider will have the most beneficial effects upon our chosen fields such as archaeological heritage management. For some years a loose network of members of various archaeological and cultural heritage organisations have undertaken advocacy aimed at some of the international organisations that are funders of extremely large projects with considerable archaeological impacts. Experience suggests clarity of authorship, membership - who the constituency represented is, and desired outcomes are important.

#### 2 EXPERIENCES AND LESSONS FROM A COMPLEX, SUCCESSFUL CAMPAIGN IN GERMANY FOR ARCHEOLOGY AND THE PRESERVATION OF HISTORICAL MONUMENTS

**Abstract author(s):** Scherzler, Diane - Siegmund, Frank (DGUF)

**Abstract format:** Oral

In the spring of 2013, the government of the German State North Rhine-Westphalia (NRW) surprisingly announced drastic cuts in federal state funding: The previous state subsidies for archaeology and the preservation of historical monuments were to be reduced to zero in three annual steps. A DGUF campaign was based on three approaches:

1. A petition spoke out against these cuts. It met with broad public support and was signed by 27.000 citizens from all over the world. 2. We committed ourselves and gave advice to an elaborate new version of the Heritage Protection Act, especially with regard to the polluter pays principle, in order to use public resources sparingly. 3. In the medium term, we planned election benchmarks for the next state election (in 2017). As a result of the approaches 1 and 2, the funds for archaeology in NRW were gradually increased again and brought to the level of 2012. The Heritage Protection Act particularly introduced a treasure trove regulation and the principle of developer funding. But the boost this gave to archaeology in the federal state has until today only limited effect, because the implementation regulations for law do not exhaust its potential. Approach 3 reminded political parties in 2017 to reflect on their medium-term weighting of archaeology. In the budget of 2018 the funds for archaeology in NRW were even around EUR 0.5 million higher than in 2012. To date, our petition is the largest that has ever existed in German monument preservation. The campaign is the only one that was able to achieve a clear, positive result of this scale for archaeology and the preservation of historical monuments in Germany. Based on this case study, the paper discusses about the main procedures and the requirements for the protagonists.

### 3 "ELECTION BENCHMARKS": A TOOL TO BRING ARCHAEOLOGY CLOSER TO POLITICIANS AND VOTERS

**Abstract author(s):** Siegmund, Frank (Univ. Münster, Germany; DGUF) - Scherzler, Diane (DGUF)

**Abstract format:** Oral

Election benchmarks" are a special tool in the context of political elections to promote and debate archaeological issues. The DGUF – serving as the NGO for archaeology in Germany – was already using this tool for the seventh time since 2009 in the run-up to an election this May. What are such benchmarks, how does such a process work? In the run-up to an election, the DGUF formulates questions on archaeologically relevant topics. It sends these questions to the political parties standing for election and asks them to answer the DGUF and the electorate on how they would decide and act on these issues in the coming legislative period in case the party wins the election, for example in legislation or in the funding of archaeology. The DGUF then collects the parties' responses and makes them known to voters in the run-up to the election, so that voters who care about archaeology have another basis on which to make their decisions. The DGUF also contextualizes the answers for the electorate. Since at least one of the addressed parties will be later on in government, there is an opportunity to check a few years later to what extent election promises were kept. DGUF's strategic approach and modus operandi were adapted by the EAA Political Strategies Committee ahead of the European Parliament Elections in May 2019. Unlike other forms of campaigning, such as petitions, election benchmarks work slowly. But election campaigns are times when politicians reach out and listen to citizens more than usual. Therefore, election benchmarks are a good tool to make politicians (and voters) aware of issues and to establish them in the long term. The paper will explain the process and discusses the challenges and needs for other archaeological bodies who might be interested in this form of campaigning.

### 4 #SAVESHEFFIELDARCHAEOLOGY: CAMPAIGNING AS SOLIDARITY

**Abstract author(s):** Albarella, Umberto (Dept of Archaeology, University of Sheffield)

**Abstract format:** Oral

On 19th May 2021, the Executive Board of the University of Sheffield, announced its intention of closing its internationally renowned Department of Archaeology. In the five days between then and the time when this decision was formalised, a massive campaign to save the department was launched. The international community responded robustly and c.1,500 letters of complaint were sent to the University Vice-Chancellor, while an online petition to support the department attracted more than 48,000 signatures. Several rallies were organized, local and national media followed the story with interest and concern, and the Union, as well as the major political parties in Sheffield, unambiguously sided with our campaign. The social media conversation was on fire. To date, the campaign continues and, though the University Executive has mitigated its hostility, the determination of closing the Department remains in place. It will be argued in this paper that the campaign was - and is - worth fighting regardless of its outcome. The feeling of solidarity and outrage that has been generated represents a valuable asset for the international community of archaeologists and beyond. Archaeologists have demonstrated that they can mobilise when they want, and they will not remain indifferent to further acts of cultural vandalism.

### 5 THE POWER OF ATTENTION: CAMPAIGNING ARCHAEOLOGY IN SOCIAL MEDIA

**Abstract author(s):** Agolli, Esmeralda (University of Tirana)

**Abstract format:** Oral

Attention has never been anymore measured, qualifying and crucial as it is nowadays. Constantly in the social media expressions like views, likes, loves, sadness, comments, shares, or even subscribes define in various the ways how perceptions are created, followed and cherished. Beyond any skepticism or even strong views expressed against, the virtual social media has succeeded in an irreversible way to revolutionize, communication, socializing, expectations

and connectivity. This innovative setting however not always translates into joyful and promising ground in which posts, appearances, reporting and publication secure attention and by default success. Archaeology is increasingly developing in an interdisciplinary focus and especially in the last few decades has produced rather captivating scientific results for the understanding of the many dimensions of human behavior. Indeed, in the social media with simple research engines is easy to notice the presence of posts or pages with archaeological content. However, the discipline struggles to convey such promising message outside its narrow network and community. Not to mention the growing pressure that academic institutions encounter against systematic long-term research, education and professional training. Culture heritage even so very intimately associated with the archaeological exploration, has managed much easily to maintain a growing interest and attention from decision-makers, public and professionals. In this presentation, I seek to analyze to what extent the visibility of archaeology and culture heritage in social media contribute to create perceptions about them. Where is the attention going and how does it reach to the general public? How are problems addressed in social media and do they influence the policies and interest of the stakeholders?

## 6 THE WEIGHT OF PROFESSIONAL WEAKNESS AND THE DREAM TO REACH SOMEONE BEYOND THE "CULTURAL TRIBE"

**Abstract author(s): Almansa-Sanchez, Jaime (Incipit, CSIC)**

**Abstract format: Oral**

Historically, fortunately improving nowadays, academic archaeological practice has been disengaged from society. Focusing only on the(ir) past, with very limited outreach activities, it overlooked public interest, opening the door to alternative views that fed the public. These views ranged from nationalistic discourses to ancient astronauts in a variety of attractive narratives empowered by the "archaeoappeal" transmitted in popular culture and big heritage sites.

The development of big new infrastructures from the mid 20th Century changed the working model and shaped a new profession aside from Academia, led by daily work and with little collective cohesion, which resulted in a weak professional body in most of the world. The surge of new media amplified all discourses, especially with the irruption of social media, but academia and the wider profession were quite late to it.

The structural weakness of the profession is still grave in most places, making it difficult to confront efficiently the many menaces that archaeology and archaeological heritage face in a daily basis. Campaigning is essential to advance towards success, but what are our chances?

Archaeology lacks a real impact in (the perception of) society. If nobody dies and no major site is destroyed, people will apparently not mobilize. Far from true, the satisfaction with daily outreach (death by success), the weak existing networks (inside and outside archaeology), as well as the limited resources to hand, are to consider when the three main bodies confronted are: big media, big development companies and governments.

Throughout some experiences of success, but mainly failure, over the last fifteen years in Spain, this paper aims to discuss the need to overcome our structural burdens and embrace larger networks of activism to advance towards more successful campaigns that can impact positively in archaeology and archaeological heritage.

## 7 COUNCIL OF EUROPE CONVENTIONS – CAMPAIGNING FOR CIVIL SOCIETY WITH THE CONFERENCE OF INGOS

**Abstract author(s): Hueglin, Sophie (University of Tuebingen) - Ermischer, Gerhard (Council of Europe, Conference of International NGOs)**

**Abstract format: Oral**

Archaeologists know Council of Europe (CoE) Conventions by their place-related nicknames: Valetta, Faro or Florence. Similarly, organizations from nature protection, education or human rights have their own canon of CoE Conventions they relate to in their engagement. These conventions are ready to be used because so many countries have signed them. All it needs are administrations and organizations insisting on their implementation in national law and practical politics.

The Florence or Landscape convention is important because it can solve conflicts of aims in the current climate crisis. In the European Green Deal, politicians see the importance of speeding up planning processes in order to increase the percentage of CO2-neutral energy. On the other hand, groups from culture and nature protection are anxious to lose essential heritage and environmental assets to sun collectors and wind turbines. The Landscape Convention was made to mediate conflicting interests and create legal certainty.

Unfortunately, Germany and Austria have not signed the Landscape Convention yet. There is a chance the new government in Berlin will reconsider if enough awareness is created for this deficit. The Conference of INGOs Thematic Committee on Environment, Climate Change, Heritage & Health has started campaigning with an appeal to experts across institutions and organizations. While there is a lot of support already, there are also many hurdles when trying to unite organizations from culture and nature.

For civil society, the conventions are important because they focus on citizen participation. This has increased with time: recent conventions emphasize participation more than older ones. Also, they are complementary and can be used as a toolbox in different contexts. As the conventions are legal instruments and administered by different ministries/branches of administration it is up to civil society to pick them up to use them efficiently and in combination.

## 8 FROM ARCHAEOLOGICAL EDUCATION TO PROTECTION OF CH SITES: CAMPAIGNING ON ARCHAEOLOGY AND CH IN A RAPIDLY CHANGING SOCIAL CONTEXT

**Abstract author(s):** Bejko, Lorenc - Pojani, Iris (University of Tirana)

**Abstract format:** Oral

This paper discusses several case studies of campaigning for archaeological and cultural heritage issues in Albania during the last two decades. The topics of the campaigns range from the need for formal higher education in the country, to specific threats of heritage sites from development projects, or confronting the dramatic increase in looting of sites and illicit trafficking of cultural property. The analysis of the case studies aim at identifying the strengths and weaknesses of the respective campaigns, successful strategies for conveying the message and failures to reach the target objectives. This analysis will serve as a reflection on the learning curve of the local archaeological community towards improvement of its engagement with the general public and the representatives of different levels. It also shows the progressive increase of the discipline's relevance in a society that is continuously changing its structure, consciousness, and the vision of its own future. The paper tries to identify the special place that the public perception of the past has in the success or failure of the campaigns, as well as its important role in building campaign strategies.

## 9 DIGITAL APPROACHES TO THE PROMOTION OF ARCHAEOLOGICAL LANDSCAPES IN THE DANUBE REGION - EXPERIENCES FROM THE DAEL-PROJECT

**Abstract author(s):** Fera, Martin (University of Vienna, Department of Prehistoric and Historical Archaeology) - Mele, Marko (Universalmuseum Joanneum) - Jancsary, Nika - Doneus, Michael (University of Vienna, Department of Prehistoric and Historical Archaeology) - Črešnar, Matija (Department of Archaeology, University of Ljubljana) - Dolinar, Nejc (Institute for the Protection of Cultural Heritage of Slovenia) - Kiszter, Sarah (Universalmuseum Joanneum) - Scoppie, Sarah (State Office for Cultural Heritage Baden-Wuerttemberg) - Balen, Jacqueline (Archaeological Museum in Zagreb)

**Abstract format:** Oral

In July 2020 the project Virtual archaeological landscapes of the Danube region (Danube's Archaeological eLandscapes), co-financed by the Interreg Danube Transnational programme, started and involved partners from 10 countries of the Danube region. The project's major goal is to regionally, nationally and internationally increase the visibility of the cultural heritage, and in particular the archaeological landscapes of the Danube region, making them more attractive for an integration into the region's tourism offers. In order to achieve this goal, new technologies are employed throughout the project.

Within the framework of the project, a strategy has been adopted by the partners, developed by a group of experts amongst them. The strategy approaches the topic of archaeological heritage from an archaeological, social and a technological standpoint. By using SWOT (Strengths, Weaknesses, Opportunities, and Threats) analyses conducted by the working groups, major challenges in the sector were defined, leading to two main strategy units. The first unit focuses on working processes from the archaeological discovery to a virtual visualisation, and the second on the potential of archaeological heritage in the digital world. To support the further adaptation and development of new technologies for the archaeological sector, the strategy concludes with 12 recommendations for heritage stakeholders. Priority lists are adopted for the implementation of the recommendations at national level for each participating country.

---

## 108 THE TIMES ARE A CHANGING - SOCIO-CULTURAL AND ECOLOGICAL CHANGE DURING THE ATLANTIC BIOZONE AND THEIR IMPACT ON HUMAN LIFE [PAM]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Posch, Caroline (Natural History Museum Vienna) - Groß, Daniel (Museum Lolland-Falster)

**Format:** Regular session

The Atlantic is a period of severe environmental and social changes in Europe. Against the background of the Holocene thermal maximum, widespread forests were dominating the landscapes, reaching heights, where glaciers and alpine grasslands formerly dominated, whereas at the coasts the global sea-level was rising, inundating increasingly large areas. Within these constantly alternating and challenging landscapes, human impact became increasingly profound, as has been shown by the archaeological and paleo-environmental record of the last decades. They show different modes of adaptation and problem solving strategies in the various different climate zones of Europe, with some of these strategies reaching over the shift from a foraging to a producing way of life.

In this session we want to address the archaeological evidence for the Atlantic biozone from ca. 7,000 to 3,700 cal. BC and cast light on different aspects of socio-cultural change, adaptation, and impact. We aim at discussing processes that have started in the Mesolithic and reached over to the Neolithic but similarly “dead-ends” of cultural development. In particular, we would like to address the way humans in the period have utilised their landscapes and available resources and discuss to which extent and level they have caused alterations in natural systems.

We invite researchers from different disciplines to present studies and discuss human-environment interactions during the Atlantic from a diachronic perspective. A wide range of topics will be accepted and may cover, material culture studies, palaeoenvironmental developments, theoretical endeavours, as well as demographic analysis. We do, however, ask for the submitted papers to explicitly address the given chronological frame as completely as possible and refrain from addressing only Mesolithic or Neolithic case studies. To address human reactions in different ecosystems, no regional limitations are given.

## ABSTRACTS

### 1 FROM TRAVELLING LONG DISTANCES TO BUILDING STRONGER FISH FENCES. CHANGES IN COMMUNICATION THE WESTERN BALTIC AREA

**Abstract author(s):** Groß, Daniel - Söderlind, Sandra (Museum Lolland-Falster)

**Abstract format:** Oral

In this contribution, we present selected case studies that inform us about the changes in communication in the western Baltic area during the Atlantic biozone. Recent studies on lithic technology and social learning within northern Europe have indicated that the handle core pressure concept (HCPC) was invented within southern Scandinavia and that knowledge and know-how diffused rapidly to adjacent areas soon after, at the same time as various large-scale environmental and landscape-related changes occurred in northern Europe.

The spread of knowledge and know-how related to this technological concept also seem to have followed similar, but not identical, communication networks as some previous technological diffusion processes. These, however, apparently had a more limited extent. Consequently, social networks in northern Europe may have changed in regional scale throughout the Mesolithic period. Possibly, these patterns were partly affected by rising sea levels and consequential changes of the landscape, specifically relating to the fragmentation of the western Baltic area (during the creation of the Danish isles) into a more segmented “islandscape”. To round off our presentation, we want to hypothesize, based on the results from the presented case studies, to which extend socio-cultural aspects and environmental conditions are relevant for the spatial interaction spheres of human groups and their archaeological traceability.

### 2 (IN)VISIBLE INTERACTIONS BETWEEN HUMANS AND WILD BOAR DURING THE MESOLITHIC-NEOLITHIC TRANSITION

**Abstract author(s):** Brusgaard, Nathalie (University of Groningen)

**Abstract format:** Oral

The Atlantic period in northwest Europe witnessed the transition from foraging to farming. Throughout this time of pivotal changes, wild boar (*Sus scrofa*) are a constant presence at sites in the Dutch wetlands. Their remains indicate continued hunting of wild boar populations from the earliest evidence in this area (ca. 5500 BC) to the latest (3500 BC). Yet, simultaneously, this species is entangled in the fundamental shift towards animal husbandry, either through their local domestication by foraging-early farming communities and/or their coexistence with their cousin of Near Eastern descent, the domestic pig. While various studies have endeavoured to uncover the domestication process, the nature of the human-wild boar relationship throughout this period remains elusive. This paper offers a diachronic perspective on the role of the wild boar in the Atlantic period in the Dutch wetlands. It presents new zooarchaeological and stable isotopic evidence on wild boar hunting and palaeoecology at Swifterbant Culture sites. Based on this evidence, this paper discusses the visible interactions between humans and wild boar, and contemplates the invisible interactions that may have made up the ecosystem of relationships that humans and wild boar were part of in this period of change.

### 3 TRADITION OBLIGATES. OCCUPATION, ADAPTIVE PROCESSES AND THE PERSISTENCE OF HUNTER-GATHERER COMMUNITIES IN THE NORTHERN ALPS DURING THE ATLANTIC BIOZONE

**Abstract author(s):** Posch, Caroline (Department of Archaeologies, University of Innsbruck; Naturhistorisches Museum Wien)

**Abstract format:** Oral

The period of the Atlantic climatic optimum introduced profound changes in the ecosystems of the Alpine environment. The compositions of the woods changed from the mixed deciduous forests of the Boreal to the ever-thickening

fir and spruce woods. Furthermore, the inner alpine forest line reached an unprecedented maximum, with heights at the main alpine divide around 2,300 m asl.

However, although several studies have been published concerning human life and adaptation to the changing conditions during the Atlantic Biozone in the Western Alps and the southern half of the Eastern Alps, a comparative study of the northern half of the Eastern Alps is as yet lacking.

This is unfortunate insofar, as the number of archaeological sites dating to the Atlantic increases profoundly, indicating a peak in occupational activities during the first half of this period. Furthermore, several of these sites seem to be stretching over the proposed Mesolithic/Neolithic divide of the region around 5,500 calBCE, whereas the available pollen records do not suggest any anthropogenic impact into the northern alpine landscapes well into the second half of the 5th millennium BCE.

This paper proposes a first introduction into the northern Alpine region during the Atlantic period, introducing its main sites, adaptive processes, and problems, as well as a discussion of a possible persistence of a Mesolithic way of life in a time, when the Neolithic was already in full force to the south and north of the Alps.

#### **4 POPULATION AND NUTRITION IN ATLANTIC SOUTHERN BAVARIA AND NORTHERN TYROL**

**Abstract author(s):** Pechtl, Joachim (Institute of Archaeology University of Innsbruck)

**Abstract format:** Oral

After a period of massive climatic and ecological change, most ecosystems in southern Bavaria and northern Tyrol settled into a relatively stable state during the Atlantic period. In sharp contrast, continued socio-cultural changes led to a profound transformation of people's living conditions. Two interrelated key elements of this systemic change were population size and nutrition.

The development of population size can be plausibly estimated during the 7th and 6th millennium BC. Therefore, especially for the time period of primary Neolithisation, an enormous increase in population can be demonstrated. For the more recent periods, on the other hand, only rough estimates are currently possible.

Increasingly detailed information is available both for the type and quality of the diet and for the strategies of food production. The reconstruction of the development of nutrition during the Atlantic period is based on a survey of currently available archaeological, archaeometric and biological data. In some aspects, this also provides indications of anthropogenic environmental change.

#### **5 TESTING HYPOTHESES OF SOCIO-ENVIRONMENTAL CONNECTIVITY IN FOSTERING DEMOGRAPHIC DYNAMICS ACROSS LATE NEOLITHIC AND BRONZE AGE EUROPE**

**Abstract author(s):** Großmann, Ralph (Kiel University; Cluster of Excellence ROOTS)

**Abstract format:** Oral

It is evident that environmental hazards recurred throughout the Holocene. Episodes of heightened socio-environmental stress combined with resource narrows have probably fostered demographic busts and possibly triggering migrations. Here we test hypotheses of socio-environmental dynamics from a European perspective and presents the results regarding the impact of climate and environmental hazards to past societies. In concrete, this project aiming to calculate demography based on <sup>14</sup>C summed probability distributions on three Central European regions and to compare the different demography developments.

The project focuses on the time period between 3500 and 1500 B.C.E. In focus are several regions with high diachronic agglomerations of archaeological records and radiocarbon dates (Central Germany, Alpine foothill, and Czech Republic). In comparing these regions, enable to identify Late Neolithic to Bronze Age demography dynamics, which were probably accompanied by migration processes between those regions. Additionally, these results are correlated with regional climatic data to evaluate the impact of environmental hazards and especially of the 4.2 kyr climate event.

---

#### **109 ANIMAL AND PLANT MANAGEMENT IN PREHISTORIC HUNTER-FISHER-GATHERER COMMUNITIES [PAM]**

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Mjaerum, Axel (Museum of Cultural History, University of Oslo) - Boethius, Adam (Department of Archaeology and Ancient History, Lund University) - Groß, Daniel (Museum Lolland-Falster) - Živaljević, Ivana (BioSense Institute, University of Novi Sad) - Mansrud, Anja (Museum of Archaeology, University of Stavanger)

**Format:** Regular session

The aim of this session is to challenge the conceptual dichotomy between the "Mesolithic" and "Neolithic", by focusing on animal and plant management in prehistoric hunter-fisher-gatherer communities. The shift from foraging to farming and animal husbandry is often narrated as a turning point where humanity's relationship with the environ-

ment was profoundly altered. Resource management is fundamental to concept of the Neolithic and further linked to aspects such as storage, surplus accumulation, and social complexity. Recent findings however show that human involvement with the environment was biologically, socially and economically complex long before the transition to agriculture. Multiple archaeological records point towards the existence of various resource management practices among hunter-fisher-gatherers long before, and independent of, the Neolithization process. Rather than being just "ecologically adapted" Mesolithic foragers actively engaged with, intervened, transformed, and cultivated the flora and fauna in their local landscapes. Examples include introducing novel plants to their environments, transferring fish fry between rivers and lakes, altering habitats attract grazing animals by burning and weeding, and constructing permanent trapping systems for various fish species and deer species. We invite papers addressing this topic independent of geographical scope and spatial scale. Contributions may focus on specific methods, models, case studies or theoretical frameworks such as niche construction theory and multispecies archaeology.

## ABSTRACTS

### 1 DEVELOPMENTS IN THE CONCEPT OF RESOURCE MANAGEMENT IN THE ARCHAEOLOGY OF SOUTHERN NORWAY

**Abstract author(s):** Mjaerum, Axel (Museum of Cultural History, University of Oslo)

**Abstract format:** Oral

Archaeologists at the beginning of the 20th century considered the Mesolithic period in the southern part of Norway as "raw"; originating in the most primitive of all civilizations. Based in new empirical and theoretical perspectives, this view has been modified and challenged during later research. Considering the comprehensive archaeological record, it is now commonly argued for the existence of semi-sedimentary complex hunter-fisher-gatherer societies as far back as the Middle Mesolithic (c. 8000 BCE). It is also believed that the Mesolithic inhabitants of Southern Norway were, to some extent, capable and willing to control and regulate their ambient ecosystems.

The changing perspectives on past resource management capture the quintessence of archaeologists' views on Mesolithic societies and how they look at the dichotomy between the "Mesolithic" and the "Neolithic". This paper presents an overview of the last 150 years of research on foragers' ability to actively intervene, transform, and cultivate flora and fauna in Southern Norway, and recapitulates overall trends in the perspectives on the early past. Besides offering this general review of existing data on the topic of resource management, this paper will present a summary of previous positions and arguments concerning early management of nature and place them in the proper research context. Finally, these previous studies will be used to point out questions for further research.

### 2 MESOLITHIC AND EARLY NEOLITHIC OF SOUTHWESTERN ROMANIA. A VIEW FROM ARCHAEOZOOLOGY

**Abstract author(s):** Balasescu, Adrian - Boroneant, Adina ("Vasile Parvan" Institute of Archaeology, Bucharest) - Bonsall, Clive (University of Edinburgh) - Radu, Valentin (Research Institute of the University of Bucharest, Division of ArchaeoSciences, University of Bucharest)

**Abstract format:** Oral

The Mesolithic and Early Neolithic sites in southwestern Romania were investigated over 50 years ago by field surveys and excavations carried out on the occasion of the construction of the Iron Gates I -II dams and hydro-power stations. For several Mesolithic and Early Neolithic sites (Icoana, Cuina Turcului and Ostrovul Corbului) faunal studies were undertaken soon after the excavation. Given the new archaeozoological methodologies these faunal collections have been re-visited recently, alongside previously unstudied collections (Cuina Turcului, Schela Cladovei, Răzvrata and Ostrovul Banului). New approaches such as slaughtering curves, ageing and sexing, biometry, cut marks, butchery patterns and palaeogenetics were employed aiming to obtain a more accurate image of the Mesolithic and Early Neolithic period in the area.

This has resulted in a new interpretation of the local fauna and the Mesolithic and Early Neolithic activities. All the faunal remains represent food waste, with high fragmentation ratios. The list of taxa identified includes molluscs, fish, reptiles, birds and mammals. Dog (*Canis familiaris*) is the only domestic mammal present at the Romanian Mesolithic sites. Cut marks on certain bones at Icoana show that dog was occasionally part of the food supply, a fact also observed at Lepenski Vir, Vlasac and Padina in Serbia during the Mesolithic period. Fishing is another economic activity discussed here.

During the Early Neolithic period, the appearance of new domestic animals with origins in the Middle East (cattle, ovicaprids and pig) is observed. Hunting still plays an important role and at the dawn of the Early Neolithic in the area, so does fishing.

This work was supported by a grant from the Ministry of Research, Innovation and Digitization, CNCS/CCCDI – UEFIS-CDI, project number PN-III-P4-ID- PCE-2020-2369, within PNCDI III.

### 3 RESOURCE MANAGEMENT AND EXPLOITATION AT THE EARLY HOLOCENE COASTAL SITE OF HUSEBY KLEV, SWEDEN

**Abstract author(s):** Boethius, Adam (Lund University) - Robson, Harry (University of York)

**Abstract format:** Oral

Resource management in foraging contexts is notoriously difficult to trace. While some form of "harvesting" behaviour can be related to mass catches of temporally limited resources, e.g. fish and migrating birds etc., and mass capture equipment, many forms of mammalian resource management goes unnoticed in archaeological investigations. In an attempt to study how and from where different mammal species were exploited, we applied laser ablation technology to analyse the  $87\text{Sr}/86\text{Sr}$ -ratio of 28 different mammal teeth from the Early Holocene site of Huseby Klev on the west coast of Sweden. The mammal ablation data and individual mobility patterns from each investigated animal were related to the bioavailable strontium ratios in the landscape surrounding the site to establish where the different species resided and were presumably hunted. This information was further related to the zooarchaeological record from the three different occupational contexts at the site to enable discussion of how humans exploited various animals in the landscape surrounding a Mesolithic coastal settlement. Our results suggest that it is possible to study the extent of land required to sustain the human population at the settlement. Our study advances our knowledge of how the landscape surrounding the site was managed to allow long-term occupation in the area and how the "territories" used might have affected neighbouring groups of people.

### 4 TAKE ME TO THE LAKE: THE UTILISATION OF LACUSTRINE RESOURCES AT THE NEOLITHIC WETLAND SITE OF JÄRVENSUO 1, SOUTH-WEST FINLAND

**Abstract author(s):** Koivisto, Satu - Lempiäinen-Avci, Mia (University of Turku) - Mannermaa, Kristiina (University of Helsinki)

**Abstract format:** Oral

Lakes have constituted important environments for human habitation and their abundant resources have been utilised intensively over the long term. In north-east Europe, certain similarities may be discerned in the setting and long-term use of Neolithic settlements located by the shores of shallow and small lakes with fluctuating water levels. One example of such sites is Järvensuo 1, located by the shore of the overgrown and drained Lake Rautajärvi in south-west Finland. The water-level fluctuation and sedimentation have resulted in formation processes that have aided the preservation of rare organic archaeological and palaeoenvironmental remains from the Neolithic (c. 4000–2000 calBCE). The assemblage points to various daily-life activities practised in the shore zone, such as fishing (with nets and stationary wooden structures), gathering of plants, and dumping of waste, yet with a possible ritual element related to the use of the lakeshore. The Järvensuo populations based their economy to seasonally abundant freshwater resources, especially fish and nutrient-rich plants (hazel and water chestnuts in particular), yet with suggested cereal cultivation as an addition to the diet during the Late Neolithic settlement phase. Eurasian elk, beaver and various waterfowl had also economic importance. Need to intensively use various lacustrine and surrounding woodland resources was an important factor in determining the location of settlement, food- and raw material-getting strategies and social organisation of labour. The scales of inundation and the drying up of the littoral zone have varied through time and people have adapted to the changing environmental conditions. The active and long-term use of similar lake environments may be linked to the economic shift towards more intensive utilisation of freshwater resources in large geographic area in north-east Europe, beginning in the mid-5th millennium BCE and continuing to the Early Metal Age and Bronze Age.

### 5 PLANNING FOR THE HUNT

**Abstract author(s):** Bergstol, Jostein - Friis, Ellen Kathrine - Post-Melbye, Julian (Museum of Cultural History, University of Oslo)

**Abstract format:** Oral

In this paper, we will look at hunting for large ungulates (reindeer and elk/moose) in the Mesolithic in the inland of Southern Norway and discuss evidence for resource management. Did the hunter just go into the woods and mountains looking for big game, or did they invest in the landscape for future visits and expeditions?

The large-scale migrations of reindeer may have consisted of thousands of animals, while the elk migrate in much smaller numbers. These migrations follow very constant routes, often determined by geographical barriers, such as large lakes and steep mountainsides. Hunters could therefore return to, and invest in, these places with a high expectation of meat-rich yields. We will discuss the location of the traps and hunting sites in connections with the animals' migration routes and migration behavior. During the centuries after 7000 BCE, there is an increased use of the inland in southern Norway, and excavations have shown that strategically placed locations have been used repeatedly.

We will look at hunting traps and archaeological material from hunting sites connected to the hunt of the seasonal migration routes for ungulates. There are evidence of release of fish (trout) into watercourses where they could not

possibly migrate unaided. We will also discuss paleobotanic evidence of forest fires in areas with high density of inland settlements in the Mesolithic.

## 6 WHAT WE CAN LEARN FROM EACH OTHER: THE HYPOTHESIS OF THE SUBSISTENCE STRATEGY FROM MESOLITHIC TO NEOLITHIC IN MORAVIA

**Abstract author(s):** Cerevková, Alžbeta (Moravian Museum) - Malíšková, Johana (Institute of Archaeology, Czech Academy of Science, Brno)

**Abstract format:** Oral

One of the tasks of archaeology as a science is to examine the facts of the past in order to try to enlighten the present world. We can apply the same principle to past communities and their mutual relations. When studying the subsistence strategies of the first Moravian farmers, we can thus use as one of the starting points also information about the nature of the previous subsistence, ie Mesolithic. Unfortunately, Moravia does not belong to the territories with a very developed state of research about the Mesolithic period. In order not to draw hasty conclusions based on a small amount of information, we will use the available data primarily to implement a hypothetical model of settlement development and subsistence at the turn of the Mesolithic and Neolithic in the focused area of Moravia. We will continue to work with this model in the future to verify the outlined hypotheses. The basis for our research has become mainly published and new absolute data, which we compare with relative chronology. We create the model using GIS to place our survey and findings in a narrower and broader geographical context.

## 7 WE HAVE ALWAYS DONE IT LIKE THIS! FORAGING SUBSISTENCE MODELS IN EARLY NEOLITHIC COASTAL DENMARK AND RESULTING IMPLICATIONS

**Abstract author(s):** Groß, Daniel (Museum Lolland-Falster)

**Abstract format:** Oral

In this contribution, I will present different examples for fishing subsistence models in coastal Denmark around 4000 cal. BC. Based on the extensive archaeological work in the context of the Femern-Belt-tunnel constructions, several examples will be shown that highlight how the acquisition of wild resources – fish in this context – has played a relevant role during the final Mesolithic and Early Neolithic. I aim to discuss the chronological setting of the excavated fishing equipment, for instance leisters, fish-fences, and fish-traps, and contextualize them with bone assemblages from settlements in the area. This will highlight that the timeframe under consideration rather reflects a transitional period during which several external influences were integrated into the cultural contexts, while several older traditions remained part of the daily routines. Consequently, I will address the relevance of integrating more integrative approaches and perspectives for creating chrono-cultural narratives. As a part of this, I advocate for reflecting our use of a priori-taxonomic concepts that implicitly come with explanatory models.

## 8 POSSIBLE WILD BOAR MANAGEMENT DURING THE LATE MESOLITHIC. A MULTI-ISOTOPE INVESTIGATION OF WILD BOAR FROM DENMARK

**Abstract author(s):** Maring, Rikke (Aarhus University; Museum Østjylland) - Riede, Felix - Mannino, Marcello (Aarhus University)

**Abstract format:** Oral

Based on carbon and nitrogen isotope analysis on samples of wild boar (*Sus scrofa*) from the Late Mesolithic shell-midden Fannerup F in Denmark, a previous study (Maring & Riede 2019) argued for the possible management of wild boar by local Ertebølle groups. Indicated by a dietary intake of substantial amounts of marine food, some wild boars were most likely foraging on and around the Fannerup F shell-midden. The isotope ratios of the wild boar are almost indistinguishable from that of contemporaneous humans and dogs, substantiating such a relation since neither wild boars nor dogs are known to actively procure marine foods. The omnivorous behaviour of wild boar allows them to exploit human food waste, which in turn may have facilitated more direct contact between the two species, eventually resulting in a form of soft management. Building on previous work, this paper presents a new multi-isotope investigation of wild boar feeding on marine protein to explore similarities and differences to the diet of Ertebølle hunter-gatherer-fishers, and to so achieve a better understanding of precisely how similar their diets were. Ultimately, this study seeks to evaluate if the wild boars were consciously provisioned and hence managed by Late Mesolithic humans or if the refuse-rich shell-middens simply served as a synanthropic feeding ground for some intrepid *Sus* leading to a form of commensalism; either constellation offers clues to local processes of domestication among Late Mesolithic hunter-gatherer-fishers.

Maring & Riede (2019). Possible Wild Boar Management during the Ertebølle Period. A Carbon and Nitrogen Isotope Analysis of Mesolithic Wild Boar from Fannerup F, Denmark, *Environmental Archaeology*, 24:1, 15-27, DOI: 10.1080/14614103.2018.1516328.

## DAIRY WITHOUT DOMESTICATES

**Abstract author(s):** Kim, Alexander (Department of Anthropology, Archaeology Program, Harvard University; Department of Genetics, Harvard Medical School)

**Abstract format:** Oral

I articulate ethnohistorical and anthropological data from North America, Eurasia, and Africa to highlight an under-appreciated possibility in the prehistoric exploitation of animal milk: dairy without domesticates. The consumption of the stomach contents of mammalian prey, including nursing young, and the processing of udders are two recurrently documented routes of access to milk that are known to and even especially sought out by terrestrially hunting forager groups — without necessity for adult lactase persistence or stimulus from milking food-producers. I suggest that this acquaintance with wild (and, when extracted from digestive tracts, already quasi-"secondary") milk products is a conceptual and behavioral viaduct between non-milking and milking lifeways, recasting vast spans of time and subsistence as potential bearers of the prelude or predaceous alternative realizations of dairying. I close with a prospective consideration of these practices' archaeological visibility and a call to probe for them worldwide through new analyses of ancient biomolecules and less narrowly culture-bound outlooks on milk in prehistory.

## PREHISTORIC INTER-SOCIETAL DYNAMICS ALONG THE ATLANTIC FAÇADE II. NEOLITHIC TO THE IRON AGE

**Theme:** 2. [Re]integration

**Organisers:** Carrero-Pazos, Miguel (UCL Institute of Archaeology; University of Oviedo) - Higginbottom, Gail (Incipit, CSIC)

**Format:** Regular session

Following on from last year's dynamic session discussions, we are back to discuss the social interactions and activities that occurred along the Atlantic Façade from the Neolithic to the Iron Age. We also intend to continue this as working group and will explain this at the meeting.

We see this session helping to uncover the ongoing enigmas of cultural encounters, transitions and even (re)integration along the Façade through different times and places, which can include environmental signatures as either cause or effect. We see the location of the Atlantic regions as an anchor for long-distance connections and as a vector for developing strong social identities, which included the circulation of ideas, innovations and people that started in prehistory. Whilst certain groups applied idiosyncratic changes through a variety of material culture and behavioural forms to express social and political identity, people along the Atlantic repeatedly shared cultural phenomena for more than several millennia, as communities became sedentary.

As for last year, presentations can be regional or local case-studies related to maritime and terrestrial movement, social networks, environmental connections (place, landscape, territory), ritual experiences, cultural practices, material creations and so forth. Specifically, we would like to see papers coming from a variety of backgrounds that contribute towards a greater understanding of this region of Western and Northwestern Europe. These include: excavation results to computer modelling and archaeogenetic approaches to landscape archaeology, especially interdisciplinary.

We invite presenters with future projects or ideas as well as those already begun or completed. Together these studies will enable this session to foster future investigations and relationships with emerging research synergies between contributors and participants. With such things in mind, we will look to publishing this session (in combination with last year's) and coordinating a yearly session connected within this dynamic geographical region.

## ABSTRACTS

## FROM BIG STONES TO A BIGGER PICTURE: THE DEVELOPMENT OF THE MEGALITHIC PHENOMENON IN NORTHWESTERN EUROPE

**Abstract author(s):** Brinkmann, Johanna (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

The megalithic tradition is one of the most iconic features of the Neolithic along the Atlantic Façade. Not only restricted to burial architecture, these monuments have been built in Britain and Ireland during the 4th and 3rd millennium BCE. Similar but less elaborated megaliths are known for example from Southern Scandinavia across the North Sea. The role of these monuments in the Neolithic transition has been discussed in these two regions which lie at the fringe of a continent which had already adopted the Neolithic way of life for over a millennium before this new practice first appeared in the Northwest at the beginning of the 4th millennium BCE. Using a synergetic approach, the development of the megalithic monuments and related material culture in Britain, Ireland and Scandinavia is described in terms of architectural development and burial rites. An increased use of absolute dating methods enables a large-

scale examination of the phenomenon in time and space that goes far beyond the question of diffusion or acculturation. This approach facilitates a view on long-distance connections, but also recognises nuances in the bigger picture in the form of regional identities. This shared cultural phenomenon highlights the role of the Atlantic as a medium for contacts and as a mediator for social interactions that occurred along the Façade. It becomes apparent that the megalithic monuments do not belong to material entities which are fixed in time and space, but are part of a dynamic mosaic of interactions and transitions. Their variability bears witness to fluid and changing social identities, which are expressed in the circulation of ideas, innovations and people.

## 2 DOLMENS OF IBERIA: THE PLACE WHERE TECHNOLOGY, NATURE AND COSMOLOGY MEET

**Abstract author(s):** Higginbottom, Gail (El Instituto de Ciencias del Patrimonio - Incipit, CSIC) - Cesar González-García, Cesar (Incipit, CSIC) - Vilas-Estévez, Benito (University of Vigo - Pontevedra; Abore Arqueoloxia) - Criado Boado, Felipe (Incipit, CSIC)

**Abstract format:** Oral

We look into the relevance of the astronomical phenomena in the Middle Neolithic of NW Iberia, in particular those that are indicated by the orientations of the dolmens and how these orientations were related to the landscapes in which people chose to erect their monuments. This paper investigates two continuing Galician enigmas: (i) exactly what might have been the astronomical phenomena of interest for the dolmen builders (like Crossover Full Moons in Autumn and Spring or Last Winter Crescents based upon Silva and Pimenta's 2012 Model for solar and lunar behaviour at 40o latitude) and (ii) what might be the relevance to Neolithic societies for such astronomical foci. We argue that there was a perceivable connection by Neolithic people between the celestial orientations of the dolmens and the following: landscape topography, regional seasonal changes and the concomitant environmental-landscape changes, as well as resource use and management, fertility, coming into being and the passing away of things and that all of these are channelled through the materiality of the dolmens.

## 3 REGIONAL IDENTITIES AND CULTURAL VARIATION IN THE SOUTH NORWEGIAN NEOLITHIC (CA. 4000–1700 BC)

**Abstract author(s):** Olsen, Dag Erik (Museum of Cultural History, University of Oslo)

**Abstract format:** Oral

At the onset of the Neolithic, the people in South Norway were well-adapted hunter-gatherer-fishers with distinct differences in settlement patterns and material culture between western and southeastern groups. This is due to adaptations to unique natural and climatic regional variations and to participation in different cultural networks. The regional variation became more pronounced after 4000 BC with the spread of the agricultural practicing Funnel Beaker Culture (TRB) into South Norway. The southeastern coastal groups became integrated in this network reflected by the presence of imported pottery and polished flint axes, although with little evidence of agriculture. In contrast, this new cultural network did not have major impact on the western Norwegian societies, where novel local technologies became important instead. This is interpreted as a choice in order to preserve the existing social traditions and reflects the degree of contact with groups from eastern Norway. One area of possible direct contact between people from the two regions is the high mountains of Hardangervidda and Nordfjella where seasonal hunting for reindeer has a long tradition. Here, distinct regional technological traits indicate a low presence of western groups while the majority of activity can be related to eastern Norwegian coastal and inland groups. This changed after ca. 2800 BC with a more prominent western Norwegian presence and led to more contact and interaction between different cultural groups. This coincides with a marked cultural change in western Norway integrating the region to southern Scandinavian networks via eastern Norway. This paper aims to discuss how various groups developed distinctive social traditions that changed to various degree partly related to fluctuating participation in networks where cultural knowledge was transferred. This also opens for discussing how new ideas was implemented or integrated into existing social structures as reflected by the material culture found at the settlement sites.

## 4 TRACING CONNECTIONS ACROSS THE IRISH SEA – ORGANIC RESIDUE ANALYSIS OF MIDDLE AND LATE NEOLITHIC POTTERY FROM NORTH WALES

**Abstract author(s):** Olet, Lilly - Evershed, Richard (University of Bristol - Organic Geochemistry Unit) - Smyth, Jessica (University College Dublin - School of Archaeology)

**Abstract format:** Oral

Organic residue analysis is a useful technique to study ancient diet and subsistence practices via the use of pottery vessels for cooking and storing. However, few studies have been conducted on prehistoric pottery from Wales. In this paper, we report the results from 111 potsherds from 5 Middle Neolithic sites on Anglesey and the adjacent coast (Parc Bryn Cegin, Parc Cybi, Llanfaethlu, Clynnog and Penmynydd). Ongoing work also includes compound-specific radiocarbon dating of 15 vessels, which belong to the Mortlake, Fengate and Grooved Ware traditions. First results of lipid residue analysis show a predominance of dairy fats among all three pottery types. In this paper, we explore how

these results can be used to study the connection between communities in Anglesey and other regions on either side of the Irish Sea. We are addressing questions regarding similar subsistence strategies and maritime connections. Whilst peripheral as a landscape from an inland point of view, Anglesey is a prominent location from a maritime point of view and could have been a more focal landscape in the past. Radiocarbon dating work on lipids extracted from pottery can further increase our knowledge about dissemination of cultural traits and directions of movements.

This research is part of the Passage Tomb People project, which aims to study connectedness and subsistence practices in the Middle Neolithic. The focus is on the social drivers behind a phenomenon of the Atlantic façade – passage tombs – and the contemporary societies in Ireland, Orkney and Wales.

## 5 GOING NORTH: TIN, MOBILITY AND INTERACTION IN ATLANTIC IBERIA DURING THE LATE BRONZE AGE

**Abstract author(s):** Rodríguez Corral, Javier (Departament of Prehistory and Archaeology, Universidad de Sevilla) - Rodríguez Rellán, Carlos (Department of Prehistory and Archaeology, University de Granada)

**Abstract format:** Oral

Western Iberia is the main tin region in Europe. Both the archaeological evidence and the geographical and geological features of the region suggest that the place mentioned in the classical sources is located in its northwest corner, where Mediterranean navigators sailed to establish trade relations with the local communities and obtain tin. The estuaries and their islands and peninsulas provided direct access to the resources of the extensive western tin region of Iberia. However, archaeological evidence shows how tin sources were exploited and traded supra-regionally much earlier. This paper explores the correlation between the distribution of object types and material forms with tin sources in order to show how, during the Late Bronze Age (1400/1200-700 BC), this critical resource encouraged Atlantic-Mediterranean interaction, terrestrial mobility and processes of interchange under gift economies along the entire western regions. The material evidence analyses comprises specific objects such as bronze axes, statue-men-hirs and stelae, which sheds light on the ways in which the social identity of the Atlantic people shifted or was altered through these encounters, and to what extent the people adopted and adapted socio-material practices within a shared cultural milieu.

## 6 ZOOMORPHIC SCULPTURES FROM THE II IRON AGE IN THE IBERIAN PENINSULA-NEW CONTRIBUTIONS TO THE STUDY AND UNDERSTANDING OF THE PHENOMENON

**Abstract author(s):** Soares, Inês (Mestre em Arqueologia e Território pela Faculdade de Letras da Universidade de Coimbra) - Osório, Marcos (Instituto de Arqueologia da Faculdade de Letras da Universidade de Coimbra, CEAACP)

**Abstract format:** Oral

During the Second Iron Age, the communities that lived in the central territory of the Iberian Peninsula from Zamora, Ávila, Cáceres and Salamanca (Spain), to Trás-os-Montes and Beira Interior (Portugal), revealed their own cultural expressions.

Several zoomorphic sculptures made of stone were found in this region, with different dimensions, representing wild boars, bulls and, in sporadic cases, other species such as bears. This form of social expression is called "Cultura dos Berrões" (in Spanish "verracos").

In part, these sculptures are associated with "castros", which are settlements positioned in prominent places, with natural defenses and large walls, fortified or not with ditches or/and chevaux de frise.

The interpretations of these zoomorphic representations are multiple: from the religious meaning of protection of cattle to funerary nature. The lack of well-defined contexts for the findings does not make it easier to determine their meaning.

The observation of the sculptures also raises some questions about the represented species and its gender. In this way, we focused our approach in the morphological/sexual characterization of some sculptures from Trás-os-Montes and Beira Interior. Furthermore, in the few cases that interpretation is uncertain, we will use photogrammetric technology to clarify in a clear way some of these questions.

There are also known a few examples of zoomorphic sculptures in the region of Silesia (Poland) with the same chronology and associated to walled enclosures. From an aesthetic point of view, these sculptures are similar to those found in Portugal. Yet, those sculptures from Poland representing bears encourage the revision of the previous interpretations and suggest a connoted semantic with power and bravery in Portuguese cases.

This approach to the anatomy of peninsular sculptures and the intersection with eastern specimens of this culture allow us to move forward in a broader interpretation of these monuments for these Iron Age communities.

**Theme:** 2. [Re]integration

**Organisers:** Yamasaki, Mari (Johannes Gutenberg University Mainz) - Speck, Sonja (Philipps University Marburg; Johannes Gutenberg University Mainz) - Meneghetti, Francesca (Independent researcher)

**Format:** Regular session

This session aims to explore the liminal qualities of spaces deriving from human interaction with the surrounding environment. By inhabiting/occupying/frequenting/building spaces, humans attribute meaning to them, setting them apart from others and creating boundaries. The creation of meaningful places is thus inseparable from their delimitation through a variety of methods that go from identifying specific intrinsic spatial properties, to the construction of built architecture.

A boundary or border may be perceived through a change in the materiality of space (e.g. solid earth vs. water vs. air); the erection of surrounding walls bears the conceptual distinction between an "inside" and an "outside", while architectural changes affect the very features of space through the use of light and darkness as well as of different materials. For instance, a space filled with water or sand may not be intended as a place for the living, but such spatial features may instead be perceived as delimiting, defining and spatially identifying a border beyond which other entities - be it gods, spirits and the dead - have their place. Tightly connected with the concept of border is that of the material and/or immaterial passageway devised to go across, from one space into the next. Considering that beyond every border lies a different kind of space, we are interested in the types of spatial properties attributed to them, may it affect particular activities or even time itself.

We encourage the participants to propose reflections on spatial properties as border-creating features; the role of built architecture in characterizing and defining the space within it - and its ability to transform its spatial properties; the function of gates, doors and thresholds in transitioning between spaces with different properties.

In the hopes of comparing spatial concepts from a global perspective, we welcome contributions on all premodern cultures.

## ABSTRACTS

### 1 FROM FLOOR TO ROOF: BOUNDARIES ON THE VERTICAL AXIS AND THEIR ROLE IN THE CONCEPTUALISATION OF BUILT SPACES

**Abstract author(s):** Speck, Sonja (Mainz University)

**Abstract format:** Oral

In archaeological research ancient spaces are largely remapped in two-dimensional ground plans. In these we take notice of delineating features like standing walls and wall faces while floors and ceilings are upstaged. However, boundaries on the vertical axis are of course as crucial to the use, perception and conceptualisation of spaces as any other horizontally delineating feature. Indeed, our concept of a room includes a space surrounded by surfaces at six sides but a room without a roof would become a courtyard.

This paper is supposed to increase awareness of the 3D-structure of spaces, especially on aspects of vertical depth. For this purpose, floors/the ground can't be taken for granted as a natural surface to things and ceilings/roofs shouldn't be considered only as a means to block light, weather and animals. They must be understood as equal spatial boundaries which influence the conceptualized properties of spaces. Also, different kinds of coverings and litter need to be considered as delineating features. A focus on the three-dimensional structure of spaces becomes crucial when we start analysing fillings and massive structures as spaces too. They can be both, spaces with boundaries and boundary-spaces, taking on functions of supporting, covering, blocking and letting through.

As archaeological remains around the world often share the trait of not being vertically well preserved (at least aboveground), this paper will choose tombs with sufficiently preserved sub and super structures as a starting point.

### 2 DIVING THROUGH THE MIRROR: THE LIMINALITY OF WATER SURFACES

**Abstract author(s):** Yamasaki, Mari (Johannes Gutenberg University Mainz)

**Abstract format:** Oral

Few elements are as intrinsically liminal as water. Rivers and oceans are an interruption of the walkable land and as such often mark the limit, the border beyond which some kind of perceived otherness exists. But water surfaces are borders also in the vertical dimension: they separate a space filled with air, where humans can live, from the liquid depths of seas, lakes and wells. Throughout cultures and ages, the deceivingly reflective surface of water has often been perceived as a gateway, an access point to a different realm. But how was the spatial transition through these

passages conceptualised and perceived? In which measure did the experiential factor play a role in representing the transition between above and under water?

This paper discusses the ways in which the water passageway affects the spatiality beyond it and addresses the differences between the space "beyond" and the "normal" space through examples from ancient Eastern Mediterranean cultures. In particular, I will focus on the impact that real-world sensory experience had on literary and material representations of underwater spatiality, in tension between mirroring the upper world and describing original underwater spaces.

### 3 **MORE THAN A BOUNDARY: WATER AS STRUCTURING ELEMENT IN THE SPATIAL EXPERIENCE OF ANCIENT GREEK INITIATION**

**Abstract author(s):** Ward, Andrew (Indiana University)

**Abstract format:** Oral

The importance of demarcating sacred and profane space in the context of ancient Greek ritual practice is well documented, with the temenos that separates the built environment of a sanctuary from its surroundings only one in a series of successive physical and metaphysical boundaries crossed by an ancient worshipper. Recent scholarship has demonstrated the importance of water in the articulation of such boundaries in Greek cult. Passage over water and lustration symbolized a shift in a worshipper's state, but water could also be an impediment. Rivers and artificial water conduits seem to have been sited frequently along a worshipper's path, signifying through kinesthetic experience the approaching of sacred space.

This paper seeks to consider how the idea of water as a boundary was adapted and transformed within the context of Greek initiation rituals. Beginning with the well-known use of water in the Eleusinian Mysteries, our understanding of the use of water as a literal and symbolic boundary within Greek ritual be nuanced with two geographically and chronologically disparate case studies: the sanctuaries of Demeter Malophoros at Selinunte and of the Great Gods on Samothrace. In all three sanctuary contexts, water systems exceed the demands of simple purification at a single boundary, a visitor's repeated encounter with water spatially paralleling the serial structure of initiatory ritual. The pairing of water features with spaces of spectacle like the newly studied theater in the Sanctuary of the Great Gods on Samothrace reinforces the idea that water served not only as a boundary to be crossed but also as a facilitator of sublime sacred experiences.

### 4 **ANCIENT EGYPTIANS LIVING ABROAD IN THE NEW KINGDOM**

**Abstract author(s):** Rocha da Silva, Thais (University of Oxford; University of São Paulo)

**Abstract format:** Oral

This paper explores new methodologies to understand domestic space in Egypt during the New Kingdom taking into consideration the sensorial elements of the dwelling. It is intended to identify the main architectural features and domestic activities in the settlements that housed a specialized workforce. These sites were usually planned and allocated by the Egyptian state and their archaeological evidence shows various types of interaction between the government and the inhabitants of these settlements. Various sensory aspects of the houses, such as light, ventilation, maintenance and control of temperature, visibility, odours, and sounds show how the constitution of domestic space was dynamic and collectively negotiated in these settlements. These elements can be understood as creative responses of these communities to a model of state housing. These sensorial experiences are fundamental to understanding the ways of living and how individuals establish boundaries within their houses. In this paper, I explore how dwellings can be effective in constituting both physical and social boundaries.

### 5 **ON THE THRESHOLDS OF SOCIAL SPACE IN SWAHILI TOWNS OF EAST AFRICA**

**Abstract author(s):** Baumanova, Monika (University of West Bohemia, Pilsen)

**Abstract format:** Oral

The coastal towns of East Africa have been well-known for their distinctive coral rag architecture, which preserves on the archaeological sites from the precolonial era and its transformed versions continue to be used today. Within the urban space, the concept of boundaries has been an important feature in situating social relations since the beginning of the 2nd millennium CE. In terms of material culture, there is for example an abundant evidence of low walls circumscribing zones within Swahili towns and acting on sensory perception, especially in facilitating and obscuring specific views.

This paper expands on the routinely discussed elements of boundaries on Swahili sites and focuses on thresholds, especially associated with doorways, as places of transition between social and residential space in densely built-up zones such as house blocks. Recent surveys, using advanced scanning technologies, are presented to show possible means of street identification, where their existence has long been either doubted or disregarded for lack of evidence. The social space is represented by streets and passageways outside the houses and by open-air courtyards situated

within. It is argued how the social and residential/private space complemented one another and that thresholds with distinctive features were used on the boundaries between these two types of space. The specific properties of these thresholds in Swahili urban space, including their architectural form, building material and capacity to act on sensory experience, are discussed to show how space was compartmentalised and attributed with meaning.

## 6 **DEFINING HOUSEHOLD AND MORTUARY BOUNDARIES IN IRON AGE (SAKA-WUSUN) SETTLEMENTS AND BURIAL BARROW (KURGAN) COMPLEXES IN SE KAZAKHSTAN**

**Abstract author(s):** Chang, Claudia (Independent scholar; Research Associate, Institute for the Study of the Ancient World, New York University)

**Abstract format:** Oral

Survey and excavation projects on the Talgar alluvial fan in SE Kazakhstan have defined both mortuary complexes and settlements of agropastoralists of the Iron Age (800 BCE to 400 CE). Linear clusters of burial kurgans (earthen mounds) could mark either kinship or land-use territories during the first millennium BCE of Saka occupations. Accompanying excavations conducted from 2008-2018 at the Late Saka-Wusun site of Tuzusai where the herding of sheep, goats, cattle and horses, and the cultivation of wheat, barley, and the two millets have been well-documented. Awareness of how space was divided between household habitations and the realm of the dead involves an approach to sensory information that can enhance our archaeological interpretations.

A house form can either be semi-subterranean and round in shape or above ground rectangular mudbrick buildings, depending on phase designations. A simple formulation is: Saka = round houses and Wusun = rectangular houses. The Late Saka period burial mounds (earthen or stone) are above-ground barrows, round or parabolic in configuration, while the burial chambers themselves are usually rectangular. Large barrows have a dromos or an underground passageway into the center of the barrow where the grave shaft is most often located. What invisible boundaries exist between the world of the living and the world of the dead? The opposition between above ground burial barrows and below ground pit houses for the Late Saka phase (ca 400 to 200 BCE) is an important nomadic feature of these agropastoralists.

Sensory archaeology may help explain our empirical findings that suggest visible and invisible boundaries on the landscape and at excavations of enclosed pit houses and mudbrick dwellings. The liminality of life and death, as well as the cosmic forces of natural elements, often embedded in the contemporary Kazakh yurt (round wood and felt house), serves as an analogy.

## 7 **ENTRANCE TO THE BUILT ENVIRONMENT – PERCEPTION OF SPACE ON THE EARLY NEOLITHIC GÖBEKLI TEPE**

**Abstract author(s):** Waszk, Benny (Johannes Gutenberg-Universität Mainz; Graduiertenkolleg 1876 "Frühe Konzepte von Mensch und Natur")

**Abstract format:** Oral

The Early Neolithic site of Göbekli Tepe in southeastern Turkey is known for its special buildings with the characteristic T-shaped pillars. Since the beginning of the systematic research of the phenomenon in 1995 the focus has been on the monumentality of the buildings and the richly decorated pillars. In the interpretation of the iconography, its structural context was included only to a limited extent. But even less attention has been paid to the importance of pathways, access and thus the overall perception of space. The hitherto undeveloped group of door-hole stones therefore offers an opportunity to deal with the dividing line between the built environment and the natural environment. Together with walls and possibly roofs, doorway stones also form a dividing line between light and darkness. The architecture thus has a direct influence on the human body and forces specific movements of the visitor. The aim of my work is to understand the spatial experience and the deliberately designed transitions and to make them experienceable in suitable formats – by means of 3D models and "multisensual" reconstructions.

## 8 **THE GATES OF THE COSMOS. LIMINALITY IN THE ARCHITECTURE AND FUNCTIONS OF CENTRAL EUROPEAN NEOLITHIC PALISADED ENCLOSURES (RONDELS)**

**Abstract author(s):** P. Barna, Judit (Hungarian National Museum / Magyar Nemzeti Múzeum) - Kalla, Gábor (Eötvös Loránd University – Institute of Archaeological Sciences)

**Abstract format:** Oral

Built over a large area in a short period (1st half of the 5th millennium BC), the Neolithic circular ditched/palisaded monuments (rondels) of Central Europe are perhaps the most typical prehistoric examples of uncovered spaces with special functions, clearly delimited by visual signs. Usually located at a distance from settlements and placed at a meaningful point in the surrounding landscape, the circular constructions were surrounded by deep ditches, raised earth rampart often in several concentric circles, and, internally, by palisades. These clearly marked the boundaries between the inner, ritualised space (inside) and the outer world (outside), interrupted by nearly symmetrically arranged entrances or gates.

It is now clear to research that the rondels were used only occasionally, in communal rituals, and their astronomical orientation suggests that they were perceived as cosmic symbols. The space, which was well isolated from the outside world, could have been given a special meaning by the outstanding acoustics, confirmed by experimental archaeology, which amplified the magical power of the magical words, the songs and the music. Their very construction may have been also performative, as was their approach. Our earlier suggestion is that they could have been processional sites, where the community could march in spectacular venue, but with only a few chosen ones allowed to enter. They had to undergo a qualitative transformation on entering the gates, and inside they emerged as a new person, through rites of passage.

Research has so far paid little attention to the prominent role of the gates and their liminal character. We would like to focus on the architectural elements and rituals that mark the interaction of persons with spaces of different qualities. Among ritual phenomena in the districts of entrances, traces of depositions, and especially rites related to fire will be evaluated.

## 9 TOMB BOUNDARIES AND THE CREATION OF MEANINGFUL SPACE

**Abstract author(s):** Beek, Nicky - van de Beek, Nicky (JGU Mainz)

**Abstract format:** Oral

Ancient Egyptian tombs are often considered sacred places where the cult took place and only the initiated dwelt. Set apart in the desert landscape, cut from the bedrock or constructed in the shape of a 'mastaba', they overlooked the fertile 'black land' of the living.

While the tomb functioned as an enclosed space guarding the body and memory of the tomb owner, its decorated surfaces refer back to an outside, worldly environment inhabited by people, cattle, fish, birds and wildlife. The association and placement of these scenes within the architecture hints at meaning: trees full of songbirds perched above doorways, walls devoted entirely to marshland scenes while others show the cultivated land. Although wooden doors probably blocked the tomb entrances, the images were devised to invite the visitor in to admire its artistry, in return asking for the favour of pronouncing the offering formula.

Internal 'rooms' invoke the idea of a house concept, with a courtyard, storerooms and a 'serdab' (enclosed space with a peephole to protect the statue of the tomb owner). The false door with the offering table served as a focus for the offering cult and an 'interface' through which to interact with the deceased. Shafts, though filled with sand, were 'virtually' connected to the outside world as the soul of the tomb owner could take flight in the form of a Ba-bird. The necropolis, called 'sacred land', was also a profane place where construction went on, priests practiced their jobs and families came to share a meal. In this paper I will examine various aspects of the private tomb environment, and the way in which accessibility, visibility and the setting of boundaries was used to create a 'meaningful place' that was perhaps more of this world than it was of the next.

## 10 FROM TIMBER TO EARTH: BOUNDARIES, ENTRANCES AND THE CREATION OF LIMINAL SPACES AT CASTELL HENLLYS IRON AGE FORT, WALES

**Abstract author(s):** Mytum, Harold (University of Liverpool)

**Abstract format:** Oral

The phases of Castell Henllys Iron Age fort, from a timber palisade and chevaux-de-frise to stone-faced earthen ramparts and an entrance with guard chambers, have been considered as experiments in monumentality. However, the main and subsidiary entrances were differently treated, and had varied forms of approach that created contrasting visual impacts by those approaching the fort interior. The access route to the gateway with guard chambers could be argued had a military defensive aspect, but at least as important was its symbolic significance. The partial reconstruction of the Castell Henllys gateway, and consideration of the experience of a full reconstruction, raises issues regarding the roles of guard chambers at hillforts and the liminal nature of the entrance passages at hillfort gateways. The creation of boundaries, and controlled access points through these, was part of the occupants' placemaking activities as they established their settlement and then lived on the same site continuously over several generations. The changing forms of the boundaries created a genealogy of placemaking that could establish a coherent history for the occupants which was imbued with meanings formed through repeated domestic practices within the settlement.

## 11 LATE PREHISTORIC ARCHITECTURE AS A PARADIGMATIC CONSTRUCT

**Abstract author(s):** Igljic, Sara - Kulenović, Igor - Vrkić, Šime - Kulenović, Neda (University of Zadar)

**Abstract format:** Oral

In later prehistory of Adriatic, hillforts have had a prominent role in most prehistoric settlement research. It is a theory-laden term that is under the influence of traditional culture-historical framework and as such is thoroughly defined in said terms. Hillforts, as constructed concepts, have an important role in perpetuating ideas of cultural change,

insecurities, and violence. It is a highly visual concept that presents a focal point in the landscape and boasts massive walls or ramparts. All the characteristics that are contributed to such sites should be studied as a research assemblage with focusing on all the relations it produces. That being said, several examples of different sites have been documented in northern Dalmatia in recent years through various archaeological methods, such as analysis of areal and satellite imagery and field survey. Said sites are surrounded and bounded by low walls that are not so visible as walls of their contemporaries (hillforts). Drywall structures encompass smaller or larger areas and form a border. These sites do not correspond to the concept of a hillfort, they do not have a prominent position in the landscape, also they are lacking monumental fortifications and rich cultural layers. As such they are not documented throughout earlier archaeological records. Said walled structures show evidence of different kinds of land usage. How is the space inside the structures defined? What is the purpose of limiting said spaces that do not correspond to the usual divisions visible in prehistory of Dalmatia? Do the closed drywall structures have a role in marking environment and defining authority over land? How do these prehistoric enclosures correspond to hillforts and to the interpretation of late prehistoric landscape? These are some of the main questions that will be tackled in order to define such land divisions and limitations.

## 12 LIMINAL STRUCTURES AS SACRIFICIAL SPACES: A STUDY OF RING DITCHES OF SCYTHIAN BURIAL MOUNDS IN NORTHERN AZOV

**Abstract author(s):** Demina, Alisa (National University of Kyiv-Mohyla Academy)

**Abstract format:** Oral

This study presents the analysis of the burial mound's ring ditches on the territory of the Northern and North-Western Azov regions in the 6th-4th centuries BC.

Although "The Histories" of Herodotus paint a grand picture of the Scythian farewell ceremonies, the archaeological evidence for them is more sparse. Given that the surface of the mound is subject to the destructive effects of time, any traces of human activity reach researchers in a limited form. However, funeral traditions are usually a very conservative, stable system, repeated by its bearers, almost without changes, for a long time, that allows researchers to trace its patterns. The purpose of this study is to examine the ritual significance of the burial mound's boundaries. Particular attention is paid to the frequency and correlation analysis of the findings of animal bones and their location. The results show that a burial feast cannot always serve as an explanation for the entire spectrum of ceremonies associated with the ring ditches, the most widespread among which is the sacrifice of horses' heads at the ditch breaks. This work intends to draw attention to further field studies of the ritual actions on the territory of the burial mounds and their surroundings.

## 13 IS A WALL REALLY A BOUNDARY? FORTIFICATIONS AND THEIR RELATIONSHIP TO SETTLEMENT AT BRONZE AGE ROCAVECCHIA, SOUTHEASTERN ITALY

**Abstract author(s):** Iacono, Francesco (Dipartimento di Storia Culture Civiltà, University of Bologna) - Alessandri, Luca (Institute of Archaeology, University of Groningen) - Magrì, Alessandra - Agostini, Giovanna - Ceccato, Zoe (Dipartimento di Storia Culture Civiltà, University of Bologna)

**Abstract format:** Oral

Fortified sites of Bronze Age Southeastern Italy have long been recognised as a crucial category of settlements for understanding the 2nd millennium BC of the central Mediterranean. Their emergence and continued importance through the centuries has been variously ascribed to economic dynamics, and/or the development of internal or external conflict. While elements undoubtedly connecting these monuments to moments of increasing tension do exist, it is important not to transform such episodes into a universal explanation for the phenomenon. The first and foremost issue that needs to be critically assessed has to do with the very significance of these stone fortifications. Are these monuments really about closure and protection or there is more to them? How can we reconcile the "inward" looking image of settlements closed by an imposing line of fortifications, with our basic knowledge that these same settlements were also particularly open to, and involved in external relations on the short, medium and long range? In this paper, we will try to address this basic question through the analysis of the archaeological record of Rocavecchia, one of the most important fortified sites in Apulia, that has both the largest example of fortifications in the region (measuring some 20 meters in width) and the largest amount of Aegean type (Minoan/Mycenaean) ceramics ever recovered west of Greece. We will combine our knowledge coming from over 30 years of systematic excavation of the site with new exciting data coming from a new survey project (the Roca Archaeological Survey) in the landscape surrounding the site.

## 14 YOU HAVE TO BELIEVE IT TO SEE IT

**Abstract author(s):** Gourgouletti, Eleni (National and Kapodistrian University of Athens)

**Abstract format:** Oral

The end of Bronze Age finds Crete under a process of transformation marked by the collapse of the palatial system and the abandonment of the related locales which are succeeded by the emergence of the so - called refuge sites, located in new, more defensible positions. Social change engages and thus affects the relationship between landscapes, seascapes and people. As a result, during this period architecture appears to be taking a new purpose in defining spaces leading to reshaping the surrounding world. Therefore, this paper seeks to understand the ways that spatial, temporal, conceptual and even cultural boundaries were established, their range and meaning. How active or passive was topography itself in this process remains the focal point of this exploration of the creation of Late Minoan III B-C settlements and cemeteries.

For this venture, this paper attempts to follow a complementary use of phenomenology and GIS, questioning what each method can provide for the nature of change and the creation of meaningful places in the 2nd millennium BC. The potentials as well as the limitations of such a relational approach are yet to be discovered, proposing an alternative ground for future research.

## 15 LANDSCAPE AND DELINEATION: ENVIRONMENTAL CHANGE AND PERCEPTIONS OF BOUNDARIES IN THE HELLENISTIC WORLD

**Abstract author(s):** Lord, Maria (University of Wales Trinity St David)

**Abstract format:** Oral

This paper considers how changes to landscapes – whether through natural processes or human impact – during the Hellenistic period undermined the perception of spatial delineation. Where progressive or seasonal changes occurred to landscapes, delineation of land and political borders would have had to follow suit in order to adapt to the new topography. In some locations this would have been a constant process of renewal or renegotiation. Areas where such effects might be seen include: the river valleys and deltas of Anatolia which were subject to high sedimentation rates; the floodplain of the Indus with its shifting channels; and Egypt, where agricultural land was remade on an annual basis as a consequence of the flooding of the Nile. This change or remaking of space, especially as perceived from the perspective of local non-elite populations, has the potential to challenge elite ideologies that rely on the delineation of territory for legitimacy and the construction of power. As such, this paper moves towards a non-elite conception of space that is based more on use and movement, than the construction of boundaries and borders. It brings together evidence from geoarchaeology and ancient history to argue that when, seen from below, the delineation of Hellenistic space was often contingent, irrelevant or non-existent.

## 16 LIMITED PERFECTION - REGULAR MEDIAEVAL TOWNS IN CENTRAL EUROPE, WANDERING OF IDEAS, LAWS AND MEASURES

**Abstract author(s):** Leguť-Pintal, Maria (Institute of Archaeology - University of Wrocław) - Kubicka, Anna (Faculty of Geodesy and Cartography - Warsaw University of Technology) - Fokt, Krzysztof (Faculty of Law and Administration - Jagiellonian University in Kraków) - Klír, Tomáš (Department of Archaeology - Charles University, Prague)

**Abstract format:** Oral

The thirteenth and fourteenth century in Central Europe is a period associated with increased colonisation action, even referred to as an urban revolution. The transition from the traditional system of princely law to the advanced feudal economy involved, inter alia, the transformation of old settlement structures and the establishment of new settlements - towns and villages with a new legal status. New settlements, as long as they did not arise on older structures, took a regular form. The division of space initially reflected the pursuit of an ideal program reflecting the legal and social order. The way of limiting the space was an element of the cultural transition - it was transferred along with the legal regime from one centre to another. The ideal program, even if it was entirely implemented, was from then a subject of numerous modifications related to the transformations of the social and spatial structure of cities or villages. The original boundaries were shifted and blurred. In this paper, we try to present, using the example of several Central European cities and villages, research methods that facilitate retrospective analysis of given structures, and research problems related to the way of delineating borders. Historical, cartographic and archaeological data will support spatial analyses. The studies undertaken are to help to understand the importance of boundaries in the functioning of the former urban and rural communities.

## 17 OBSERVING BORDERS WHERE HUMANS HAVE TRIED TO BUILD BOUNDARIES

**Abstract author(s):** Jané, Oscar - Banica, Costina Adriana (Autonomous University of Barcelona)

**Abstract format:** Oral

This work is a study and a reflection on the concept of border. The border is a constantly evolving dynamic element. Therefore, beyond cartographic or physical boundaries, border processes are mental and internal. In this sense, borders are human and, if they succeed, they can go beyond the political fact: culture, language, architecture, religion, and so on. However, the differences are gradual, and despite the border, it doesn't always exist. We will provide a vision of the border of the Pyrenees over the last centuries by elements such as: adaptation to the border (assimilation, resilience, visual transformations), the perception of a non-border (by architecture, religious uses, traditions, etc.) or transgression of the unborder. We will expose various physical elements and especially perceptual and cultural, in which the formation of state identities have tried to influence, to see how this border has been formed and how people coexists in it, from a vertical versus local identity within these border spaces. In this sense, we will do the study of these spaces thanks to history, archeology, geography and other disciplines which can be very useful.

## 18 WARRIOR STATUES ON THE EDGE: MOTIVED SYMBOLISM AND SITUATED ICONOGRAPHY IN THE NORTHWESTERN IBERIA DURING THE IRON AGE

**Abstract author(s):** Rodríguez Corral, Javier (Departament of Prehistory and Archaeology, Universidad de Sevilla)

**Abstract format:** Oral

Social identity and limits is always enacted in specific contexts. Due to its evolving character, concrete material points of reference in the form of landscapes, places, artifacts and people are always required. Through a particular study case, the warrior statues from the so-called 'Castro culture' in northwestern Iberia, this article reflect on the role of the material images as an important medium through which issues of identity and social relations are created, contested, and resolved. To this regard, it is explored how these monumental images of warriors, which emerged in the context of large hillforts in this region by the late first millennium BC, actively build their own meaning and sense in the socio-material contexts where they belong. More specifically, it is focused on how, in this process, their materiality and theatrical power, in connection with architectural and spatial properties, plays a part in the creation of meaningful places where the indigenous identity was experienced and boundaries defined.

## 127 INTEGRATIONS, INTERACTIONS, AND INTERSECTIONS IN ISLAMIC ARCHAEOLOGIES OF AFRO-EURASIA

**Theme:** 2. [Re]integration

**Organisers:** Shingiray, Irina (University of Oxford) - Belyaev, Leonid (-) - Carvajal Lopez, Jose (University of Leicester)

**Format:** Regular session

Archaeologists who focus on the Islamic pasts in Europe, Asia, Africa, and beyond are keenly aware of the need to examine and understand those pasts in the context of the wider (globalized) worlds and of interconnected activities, communities, and material cultures. For archaeological researchers of Islam, the paradigm of a simple dichotomy between a single core and periphery, between Muslims and non-Muslims, between urban and rural landscapes, has been shifting toward new perspectives which acknowledge the existence of multiple centers, networks, activities, and actors with multiple voices, identities, and modes of life—all of which composed the fabric of the Islamic culture as a whole over time. This session invites contributions which explore the processes involved in integration or re-integration and connectivity (as well as disjunctures), between and within Islamic culture/s across Afro-Eurasia. We welcome a wide range of approaches: from global, comparative, transregional, to local case studies, and studies within Islamic communities, including intersectional identifies based on the politics of class, gender, subsistence, diasporas or minority status. We are also interested in material studies and landscapes which contributed to re/integration, connectivity, de/territorialization, conflict, and transition in Islamic cultures over time. For instance, how boundaries were negotiated, constructed, reconstructed, and eliminated; how materials were assembled, reassembled, exchanged, and reused; and how landscapes were created, re-appropriated, reclaimed, and re-integrated, contributing to the intrinsic interconnectedness of the Islamic world.

**1 THE UNBEARABLE LIGHTNESS OF AL-ANDALUS: POLITICS, ARCHAEOLOGY AND INTANGIBLE FRONTIERS**

**Abstract author(s):** Govantes Edwards, David (University of Córdoba)

**Abstract format:** Oral

The historiography of al-Andalus (Islamicate Spain) was for a long time, and remains, to a large extent, marked by otherness. During the 19th and 20th centuries, Spanish historians, archaeologists and Arabists struggled to find a balance between the other that the Reconquista endeavoured to remove from Spanish soil, and the unquestionable cultural achievements of Andalusí polities between the 8th and 15th centuries. While standing behind the Reconquista as the foundational process of the Spanish nation, antiquarians, academics and cultural managers were keen to emphasise the unique and splendid monuments left by the Muslim presence. World-famous monuments were there to be displayed and turned into a touristic asset (e.g. Madinat al-Zahra, the Alhambra), and unmistakable examples of cultural synergy were too prominent to be ignored (e.g. the cultural movement built around Alphonse X of Castile). The way historiography went about this, especially during Francoism (1939-1975) and its state ideology of National-Catholicism, was to appropriate the cultural achievements of al-Andalus for Spain, understood as an essential, immutable and eternal construct, attributing it to an alleged secular Spanish genius rather than to al-Andalus per se. In this way, the real frontier between Islamicate and Christian Spain (understood as monolithic realities) was not only made a lot harder and neater than it was in reality, but was also compounded by an invisible internal frontier in al-Andalus, which separated those elements that the modern Spanish nation-state could safely assume as "ours", while keeping the Islamic "them" out. This presentation will examine the historiography of the Caliphal city of Madinat al-Zahra (Córdoba) as an illustration of this historiographical phenomenon throughout the 20th century, and the opening decades of the 21st century.

**2 NEW DIACHRONIC APPROACH AND THE ISLAMIZATION OF THE MOUNTAIN LANDSCAPE**

**Abstract author(s):** Berrica, Silvia (Universidad de Alcalá)

**Abstract format:** Oral

Within the framework of studying the formation of the early medieval landscape, examining a series of sites such as hilltops, villages, farms, churches, and monasteries shape the rural landscape of the northern area of the Sierra de Guadarrama (Madrid, Spain). From the 700 CE, it is recognisably a change in the landscape thanks to the development of new constructions in rural areas. These structures, founded by aristocrats or the Church, are probably designated private buildings. Furthermore, the archaeological evidence shows a dynamism of planning new constructions in pre-existing villages and the previous rural churches, monasteries, and villages.

Studying the landscape and the material culture allows recognising various social aspects of villages such as Cancho del Confesionario, La Cabilda, Dehesa de Navalvillar, Placer de Ver. In addition, different economic activities (mining processes, metallurgical activities, textile productions and food production chain) reveal essential aspects of the early medieval society within the central Iberian peninsula.

In conclusion, studying this mountain landscape is very important because it is unaltered over time, telling us a story of a changing society of the 8th century at the arrival of the Arabs. Furthermore, this site is interesting for the various artisanal (glass, metallurgical and textile) and commercial activities allowing us to debate the early medieval economy. Therefore, the following archaeological results have the object to show the transformations in this site and its hierarchical position over the rest of the region.

**3 MOSQUES, OTHER PLACES OF WORSHIP, AND THE LANDSCAPE DURING EARLY ISLAM: ARCHAEOLOGICAL, EPIGRAPHIC, AND HISTORICAL PERSPECTIVES**

**Abstract author(s):** Nol, Hagit (Université libre de Bruxelles)

**Abstract format:** Oral

Mosques are an important feature of Muslim faith. They represent Islam in the physical sphere along with burials and specific inscriptions or graffiti. Mapping mosques by chronology advances the understanding of the processes and directions of the spread of Islam. In theory, the presence of an early mosque in the archaeological record would support certain historical narratives in the written sources. Moreover, stratifying mosques in relation to former and successive places of worship might reflect social and political dynamics – locally and regionally. A number of source corpora provide information about the earliest mosques, from the first to the third century of Hijra (seventh-ninth centuries AD). The central ones are Arabic chronicles, excavations, and inscriptions. However, an independent examination of each corpus paints different pictures. This paper will focus on two subjects and the different results each source type presents for them. The first topic is the spread of mosques over the Islamicate world until the late ninth century. The second subject involves cases where an alleged mosque was erected over, or within, a church, a synagogue,

or a temple. These inquiries point to the challenges in relying on each of the sources (texts or archaeology). More broadly, they reflect the difficulty with understanding interactions between individuals and groups during early Islam or the process of integration.

#### **4 NOMADS OF QATAR? THE EMERGENCE OF BEDOUIN COMMUNITIES IN THE PERSIAN-ARABIAN GULF**

**Abstract author(s): Carvajal Lopez, Jose (University of Leicester)**

**Abstract format: Oral**

In this paper I will present an overview of the material remains of communities living in Qatar in the early Islamic period. Although sometimes it is difficult to differentiate between sedentary and nomadic communities with the scarce remains that we have, I will focus on the emergence of so-called Bedouin (i.e. desert-inhabitant) communities in the Islamic period.

Whereas communities have been documented in Qatar as early as the Neolithic period, a strong mark of human presence in the North of the peninsula is evident mostly from the Tylos period (300 BC to 300 CE) in the form of very distinctive tombs. However, no inhabitation sites have been detected in this area until the late Sassanian-early Islamic period (circa 500-900 CE). The first sites to be detected are small villages that have the same outline as nomadic encampments. One of these, Yoghbi (radiocarbon dated between the 6th and the 8th centuries CE), was excavated in 2018. A later village of a larger scale, Murwab (dated between the 8th and the 9th centuries) has also been investigated across several seasons of excavations. Many others have been recently mapped with aerial images.

The villages of the early Islamic period present a chance to analyse Bedouin settlements and lifestyle in a particular way: they are fossilised becomings of Bedouin to settled populations, a still picture of the dynamic process of change of communities in Qatar. I will argue that this is not by chance: we are able to document these communities in this particular historical moment because they are in themselves the result of the period of Islamization, of the intersection of different ideas and flows of what becoming Islamic is.

#### **5 MORE THAN MEETS THE EYE: EARLY ISLAMIC NOMADIC AND URBAN INTERACTIONS AND INTERSECTIONS IN THE NORTH CASPIAN STEPPE REGION**

**Abstract author(s): Shingiray, Irina (University of Oxford)**

**Abstract format: Oral**

Islam spread into the North Caspian Steppe Region by the tenth century CE. And the first early medieval urban sites are reported to have emerged there by the same time. Although the process of Islamization in this region is still poorly understood, conventional explanations for the rise of Islam in this region treat this historical process as an urban phenomenon. Such suppositions are mainly based on available medieval textual sources and compilations, the authors of which never visited the Northern Caspian territories in person. In contrast to these sources, available archaeological evidence suggests that the spread of Islam in this region was more likely a product of extensive nomadic networks which expanded far beyond any permanent settlements. This paper will address archaeological evidence derived from urban and non-urban contexts and explore extant and potential interactions and intersections between nomadic non-urban and city populations focusing on the Lower Volga Region of the Caspian Steppe. The paper will highlight variations in Islamic practices of these communities based on their diverse cultural preferences and connections.

#### **6 BEYOND SULTANATES: MUSLIM NARRATIVES IN THE MEDIEVAL HORN OF AFRICA**

**Abstract author(s): de Torres Rodríguez, Jorge - Cornax Gómez, Carolina (Incipit - Institute of Heritage Sciences)**

**Abstract format: Oral**

The history of medieval Islam in the Horn of Africa has usually been built around the long-term conflict between the Christian kingdom of Abyssinia and a succession of Muslim sultanates which controlled large areas of what is now Somaliland, Djibouti and southwestern Ethiopia. However, this powerful narrative of a religious clash between two cohesive, religion-driven polities has overshadowed the complexity and variety of Muslim realities which existed in the Horn of Africa between the 13th and the 16th centuries AD. Based on historical and archaeological data, this paper will briefly approach four of the multifaceted ways and expressions through which Islam arrived, interacted, materialized and consolidated throughout the region.

The first case will analyse the arrival, expansion and consolidation of Islam among the Somali nomads, paying especial attention to the role of trade and missionaries and their impact in the developing a highly adaptative and successful system which has lasted until our days. The second case will approach the interactions between state and Islam during the medieval period, analysing its influence on internal politics, international diplomacy, expansive strategies and cohesion force. A third case study will propose the existence of regional differences in Muslim materiality through the study of urban medieval mosques. Finally, the presence of non-Muslim communities within the

Sultanates borders will also be approached, from both its material expressions and the perdurance of non-Muslim traditions in the current populations of the region. The combination of these different case studies aims to provide a more sophisticated -and accurate- perception of medieval Islam in the Horn of Africa, and a better understanding of the historical dynamics which accompanied its arrival, spread and consolidation to one of the most dynamic and complex regions of Africa."

## 7 **ARCHAEOLOGY OF THE ITALIAN PRESENCE IN MEDIEVAL ISLAMIC MURCIA (12TH-13TH CENTURIES)**

**Abstract author(s):** Hernández Robles, Alicia - Eiroa Rodríguez, Jorge A. (University of Murcia) - Gómez Ródenas, Mariángelos (Servicio de Museos y Exposiciones. Dirección General de Bienes Culturales de Murcia) - Guillermo Martínez, Martín (Museo Teatro Romano de Cartagena)

**Abstract format:** Oral

The relationships between the Italian maritime republics and al-Andalus are well documented by written sources from the middle of the 12th century. Taking these texts as a starting point, one of the lines of work of the research project The Origins of the Italian Presence in Murcia (12th to 15th centuries) (OPIM) has been to deepen the study of the relationships between the republics of Genoa and Pisa with medieval Murcia through the analysis of the material record.

The aim of this paper is to analyse some archaeological data that allow for an in-depth study of the Italian presence in the southeast of the Iberian Peninsula. On the one hand, we will present the study of the buildings destined to the reception of travellers and foreign merchants in the Andalusí cities, the fanadiq, paying attention to the case of Murcia; we will also present some archaeological data that allow us to establish a comparison between the Iberian and Italian territories in the 12th and 13th centuries, especially those coming from the analysis of the palace of Santa Clara in Murcia. Finally, the first data extracted from the study of the medieval Italian productions present in the stratigraphic sequence of the Roman theatre of Cartagena, understood as a representative example of the main port of access to the south-eastern territory, will be presented.

The results of these case studies allow us to conclude the integration of the territory of Murcia in the networks of the medieval Mediterranean, understood in its broadest sense, both economically and commercially, as well as in terms of cultural exchange and transfer between the different actors involved.

## 8 **INTEGRATION, INTERACTION AND INTERSECTION IN ISLAMIC CULTURE AT THE END OF XIII- XV CENTURY IN THE NORTH BLACK SEA AREA**

**Abstract author(s):** Biliaieva, Svitlana (Institute of Archaeology of National Academy of sciences of Ukraine; Uman State Pedagogical University)

**Abstract format:** Oral

From the end of the 13th to the 15th centuries, the Islamic culture of the North Black Sea region was formed as a result of interactions between different kinds of influences from East and West. Some cultural attributes of Chingiz-khan's Empire included elements absorbed from the art of the Jurchen Empire transmitted in the course of conquests from China to Eastern Europe—for example, the image of a doe. The presence of bronze molds of this image at archaeological sites of the Black Sea region assured the survival of this traditional representation of the early Mongol state despite its transmission over long distances. Under Mongol rule, the material culture and art of this region integrated elements of the cultures of different peoples. In the Western part of this territory, one finds Byzantine provincial culture together with other Western impulses from Venice, Genoa, and Spain. The Juchid cities of the North Black Sea region are characterized by syncretic features. Some of these cities became local centers of different kind of production, such as ceramic workshops in Crimea and in the Dniester region (Bilgorod). Archeological investigations in Crimea (Solhat) and in the Lower Dnieper region (Zaporizhzhya and Kherson) revealed the strong influence of the Seljuk culture in applied art and architectural monuments of the Juchid, Lithuanian and Crimean Khanate periods during the 14th-15th centuries. Due to cultural integration, interactions and intersections, a syncretic Islamic culture appeared in the North Black Sea region as a phenomenon of global significance.

## 9 **ISLAMIC ARCHITECTURE AND DIVERSITY OF BURIAL RITES OF THE JOCHI KHAN MAUSOLEUM IN CENTRAL KAZAKHSTAN**

**Abstract author(s):** Usmanova, Emma (Buketov Karaganda University Saryarka Archaeological Institute) - Panyushkina, Irina (University of Arizona, Laboratory of Tree-Ring Research Tucson) - Kozha, Mukhtar (Research Institute of Archeology of the H.A. Yasawi International Kazakh-Turkish University) - Uskenbay, Kanat (Institute for Humanitarian Studies, ABDI) - Dzhumabekov, Dzhambul (Buketov Karaganda University) - Akhatov, Gaziz (Margulan Institute of Archeology)

**Abstract format:** Oral

Folklore, legends and historical chronicles dating back to the 16th-19th centuries designate the burial of Jochi Khan, the eldest son of Genghis Khan, in the eponymous mausoleum in Ulytau, Kazakhstan. The mausoleum (48°09' N,

67°49' E, Karaganda oblast) is built in the style of Islamic funeral architecture of the 14th-15th centuries. It is a single-chambered building with a raised portal made of burnt red brick, decorated with spherical dome mounted on a star-shaped drum and lined with glazed blue tiles. Based on the historical and folk designations, the first excavation of the mausoleum's grave in 1946, suggested that the burial belongs to Jochi Khan. Although Jochi as Chinggisid practiced Tengrism with its canon of sacral and secret burial. The recent AMS 14C dating of construction and burial wood confirmed two phases of the mausoleum construction throughout the 14th century, whereas the 14C date of the mortuary stretcher's plank appears to be decades later after Jochi Khan death in 1225. The chronology of the mausoleum, re-analysis of the historical literature and original field notes of the excavation suggest that Jochi's burial is not in the mausoleum. The burial combines both Islamic and pre-Islamic traditions (Zoroastrian archaic tradition of leaving funeral stretchers, Turkic cult of camel) and was most likely performed for a person of Islamic faith from the Golden Horde. The mausoleum was built shortly after Islam became an official religion of the Golden Horde (1313 AD) and shows high diversity of the burial rites mingling Islamic and pre-Islamic mortuary variants. Ulytau has 36 more medieval Islamic mausoleums. The grouping of large mausoleums, some of them well preserved and revered for 500-700 years, may not be accidental and carries a special historical memory of the Turkic tribes. We discuss problems of commemoration and identity of Islamic mausoleums in central KZ.

## 10 UNDOCUMENTED VESSELS FROM THE NATIONAL MUSEUM OF ALEPPO

**Abstract author(s):** Hamwi, Rahaf (Pázmány Péter Catholic University; Directorate General of Antiquities and Museums - Syria)

**Abstract format:** Oral

In the very early period of the opening of the National Museum of Aleppo and the Islamic Department, most of the artifacts were gifts or were purchased from antiquities merchants or Aleppo's elites, who used to buy antiquities and make their own collection to show off their well-being and wealth. The documentation and period determination process was not possible. For this reason, it remained undiscovered for decades before the archaeological missions became more accurate and documented, thus, these vessels could be compared with counterparts from identified archaeological sites and periods.

This paper is presenting three masterpieces from the Islamic Department in the National Museum of Aleppo, that are recorded in the official records as gifts without determining the production period or the excavation documentation. In this study, by comparing with other museums collections. Moreover, analyzing the decorations and general typology, we could know that the study case vessels are covering the Seljuk-Atabeg and Ayyubid periods. In addition, one of them has some features related to the typology of Persian vessels, the two others are typical Raqqa ware, and all of them are glazed.

## 11 FROM THE BYZANTINE TO THE OTTOMAN CITY: THE INTEGRATION AND CONTINUITY OF URBAN CERAMIC PRODUCTION IN THESSALONIKI (THE 13TH-19TH CENTURIES)

**Abstract author(s):** Živkovic, Jelena (The Cyprus Institute)

**Abstract format:** Oral

Thessaloniki was one of the major urban centres of the Eastern Mediterranean and the Balkans in the Ottoman period. Although populated by the non-Muslim majority, the city was well integrated into the Islamic world and served as a hub of intersecting networks in the Ottoman Empire. Archaeology is yet to explore many aspects of this integration, especially those concerning the bottom-up approach. This paper seeks to discuss the transition of urban ceramic production from the late Byzantine to Ottoman periods as well as the integration and continuity of this production within the context of Islamic World.

The paper presents the results of macroscopic, petrographic and chemical analyses of common pottery from the site of Hamza Bey in Thessaloniki, dated between the late 13th and late 19th centuries. Archaeological and scientific analyses of pottery were used for the reconstruction of urban production technology, workshops and technological traditions over the longue durée.

## 12 CONNECTION AND DISCONNECTION: RECONSTRUCTING ROUTS THROUGH AND BEYOND THE RANIA PLAIN, IN IRAQI KURDISTAN

**Abstract author(s):** Németh, Fruzsina (Eötvös Loránd University)

**Abstract format:** Oral

For centuries, the Kurdish region has been at the intersection of several cultural zones, which have contributed to the development of the Kurdish identity known today. The area was a connecting point and melting pot of Arab, Persian, and Turkish cultures, while retaining the local customs of its own. On the eastern side of this area, on the foothills of the Zagros Mountains, near the present-day Iranian border, stretches the Rania Plain. During the early-modern period, the microregion was located right on the border of the two great powers of the region, the Ottoman, and the Persian Empires, while simultaneously belonging to the territory of the semi-autonomous Kurdish Emirates.

The Rania valley is located close to the main trade route connecting Baghdad with the main Kurdish cities and leading north towards Anatolia. The picture is further nuanced by the fact that the Little Zab river, which flows through the area, has formed a natural connecting route between the inner Zagros Mountains and the Mesopotamian Plain. Nevertheless, it does not appear on the geographical maps of the era, and written sources also stay silent regarding its role during the Ottoman period.

Based on the archaeological field surveys and excavations of the past fifty years a complex and varied topographic image of the valley could be drawn, which, together with the lines of streams and rivers that densely enclose the area, determine the main routes of population movement. During the examination of the historical significance and complex use of the territory, one of the most important questions that arises is how the routes through the microregion can be reconstructed using historical, archaeological, topographical, and GIS data. Furthermore, based on these data whether the valley played a connecting or separating role in the wider scope of the Ottoman Empire's eastern borderlands.

### 13 OTTOMANS IN KAMIANETS-PODILSKYI

**Abstract author(s):** Vynogrodska, Larysa (Institute of Archaeology National Academy of Sciences of Ukraine)

**Abstract format:** Oral

After Kamianets-Podilskiyi has been captured by the Turkish troops in 1672, the city becomes a part of the Ottoman Empire as the center of the Kamenets eyalet. The Turkish authorities attach great importance to Kamianets as to a strategically important fortified military post, as well as to the socioeconomic and administrative center of Podolia. From here it was possible to control the eastern territory of the Polish-Lithuanian Commonwealth de facto. That is why a special significance is attached to the renovation of old and the construction of new fortifications in the city. Under the guidance of French military engineers constructed fortifying in the city and the territory of castle: wood-earth and stone. Stone fortifications were constructed in the stone masonry form with two front sides and a stone backfilling on the lime mortar in the middle of masonry. Wooden and earth-filled reinforcements were constructed with a thickness of earthen breastwork up to 6,0 meters and with a height from 1,6 to 1,8m.

The notion about the construction of the Ottoman fortifications in the Old Castle is given by a half-bastion in the New Eastern Tower area and the New bastia. To protect the city, mainly beluards, fieldworks and sconces were used. The bridge, as a communication between the castle and the city, was brick lined by the stone walls 2,3m in height. The sacred buildings of the city were adapted for mosques and minarets.

### 14 PERSIAN STONE CARVERS IN THE 17TH CENTURY MOSCOW KREMLIN

**Abstract author(s):** Belyaev, Leonid (-)

**Abstract format:** Oral

There is a unique cemetery in the Moscow Kremlin - the Archangel Cathedral. It contains the burials of Moscow princes and tsars starting from the beginning of the 14th century. They are marked by tombs with ornaments and inscriptions carved in limestone. They have never been studied from the point of view of archaeology and art. The appeal to them yields interesting results. The cathedral was completely rebuilt in the early 16th century. New monuments were placed over the graves. It is not known when exactly. The stones of those who died in the 16th century are definitely later than their time. For example, the tombs of Ivan the Terrible and his sons do not belong to the 16th century. All the more so for those who died in the 14th or 15th century. But the monuments of the 17th century correspond to their dates. They are mainly the slabs of the first Romanov Tsars - simple, almost without decoration, but with a long text. The ancient tombstones, on the other hand, are very richly decorated. The oldest bear Islamic carvings. These carvings are too complex to be reproduced without special training. It is believed that the slabs were carved during or after the construction of the Terem Palace (1636-1639). It is also decorated with carvings, but they are not as sophisticated. The nearest centers, where such ornaments are known are in the east of the North Caucasus and Derbent, connected with both Moscow and the Safavid dynasty. A group of carvers might have come here with one of the embassies of Caucasian rulers, or directly from Persia. They left a trace not only in the Kremlin: in Kazan, Nizhni Novgorod and Moscow Islamic ornamentation appears on traditional tombstones, then disappears.

---

## 128 ABOVE AND AROUND 60 DEGREES NORTH: MOVEMENT OF IDEAS, PRACTICES, MATERIALS AND PEOPLE AD 300-1300

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Hillerdal, Charlotta (University of Aberdeen) - Ilves, Kristin (University of Helsinki)

**Format:** Regular session

Recent archaeological studies have drawn attention to the regions above and around 60 degrees North, repeatedly perceived as peripheral and dependent on southern innovations as a driver for change. However, when looking beyond traditional presumptions it becomes clear that northern regions are equally dynamic, and often act as central

players in the developments of past infrastructure and the economic as well as social processes that stimulated it. There is an increasing number of examples demonstrating the centrality of the North; from the importance of forested outlands in Sweden within the context of an over-regional economy already starting from the Migration Period, to the nodal role of northern coastal regions in long-distance interactions well beyond Viking Age; from the rise of distant settlement districts in Norway focussing on interregional trade, to indigenous agency in Norse diaspora settlement frontiers. Despite this, the awareness of the impact of the North is far from being properly explored. In this session we want to discuss the dynamics of interaction and movement within the far northern hemisphere - within and across borders, specifically focusing on the time period of AD 300-1300. We would like to investigate the northern areas as important venues for, and instigators of, the movement of ideas, practices, materials and people. We also aim to explore dynamics of identity creation at the intersection of difference and sameness within these environmentally marginal areas.

## ABSTRACTS

### 1 NEW MATERIAL EVIDENCE TO MIGRATION FROM THE SIBERIAN NORTH TO THE TRANS-URALS

**Abstract author(s):** Zelenkov, Alexander (-) - Matveeva, Natalia (-) - Tretjakov, Evgeniy (-)

**Abstract format:** Oral

The significant factors of historical and cultural transformations in the Siberian North, in particular, the Ob and Irtysh valleys (Tyumen and Omsk regions, Russia) during the hundreds of years were climatic changes, which led to the destabilization of the social order and migrations into southern territories. One of the first migration impulses has been in the Late Bronze, connecting with movements of the population with "cross ceramic" in the Indo-European ecumene (Andronovo culture). In the Iron Ages, the Ancient Ob-Ugric population (Kulayka culture) have interacted with the ancient Iranian population (Sargatka culture) settled in the forest-steppe area of the Trans-Urals until the 400 BC to 300 AD. Next, during the 400–600 AD, the ways of the northern migrants (Nizhneobskaya culture) have been saved, and their influence has fixed in the Bakal culture archaeological sites– heir of the ancient Iranians.

The current excavation in the Kurgan region is to shed light on the latest migration impulse from the Siberian North to the Trans-Urals. The Vodenikovo-I cemetery with 30 collective and single graves under 17 kurgans demonstrate symbiose burial tradition of forest Samoyed migrants (Potchevash culture) and forest-steppe (Bakal culture) population in the 600–700 AD. The innovations are defined by ceramics with figure-stamped decoration, wooden coffins, the West orientation of skeletons, specific ornaments: bracelets with snake ends, torcs, and pendants. The native features were expressed by skull's deformation, pottery with carved ornaments, square tombs under kurgans. The same heterogeneous process we see in the Low Kama and South Ural territories, in the Ancient Udmurt (Nevolino culture) and Magyar (Karayakupovo cultures) areas. Probably, the whole Ural-Siberia region had influenced by Turkic Khaganate, in which political and military power launched new ethnic and cultural transformation processes.

Funding: The research was funded by RFBR and Tyumen Region, number 20-49-720001.

### 2 INDICATIONS OF EASTERN CONTACTS IN LATE IRON AGE NORTHERN SWEDEN

**Abstract author(s):** Hillerdal, Charlotta (Department of Archaeology, St. Marys Building, University of Aberdeen)

**Abstract format:** Oral

In the last decade we have seen a complete reevaluation on the position of Saami communities in Northern Norway from marginalised tributaries to important autonomous players in the Viking Age trade network. Contacts further north, to the mysterious Bjarmaland in the Saga literature, have consequently been imagined as a continuous push along the northernmost seacoast, in accordance to Othere's travel accounts. The inland areas of northernmost Sweden and the coast of the Bothnian Bay are still considered isolated and of little consequence for long-distance contact networks. This is partly underpinned by a scarcity of Late Iron Age archaeological material, but more prominently by a lack of focus on this area and time period in northern research. Archaeological finds from the northernmost municipalities, including two unique Viking Age graves located along the Luleå river valley, suggest intense contacts with Finland and Russia, as well as Norway and the Baltic, and finds of eastern character most notably suggest a different point of contact than Ladoga and Viking Age Rus'. Here, it is suggested that it is time to revisit ideas of an inland trans-arctic trade network linking northern Sweden and Finland with Arkhangelsk Oblast and the White Sea.

### 3 PASTORAL GRAVE GOODS IN CENTRAL SWEDEN DURING THE VIKING AGE AND THEIR IMPLICATIONS

**Abstract author(s):** Rose, Samantha (University of Aberdeen)

**Abstract format:** Oral

The establishment of Norse economic urban centres in Scandinavia produced concentrations of skilled artisans to support the expanding trade & settler networks emerging in the Viking Age. It was, however, the Scandinavian hin-

terlands which kept the requisite raw materials flowing into these centres, such as the vast amounts of wool needed for textile production. Textiles, including sailcloth, facilitated the economic and cultural boom of the Viking Age and their importance has only recently been emphasized, though the academic focus has been centered on the production aspects of spinning and weaving. Through examination of previously overlooked grave goods such as wool shears in the Central regions of Sweden and at Birka, this research aims to explore the complex relationship between hinterland and urban areas. Of particular interest are the cultural and economic implications of these shears and other pastoral equipment placed into graves in Dalarna and Jämtland, an area previously associated most strongly with iron ore.

#### 4 IDENTIFYING LOCAL CERAMIC 'FINGERPRINT' THROUGH GEOCHEMICAL ANALYSIS ON ÅLANDIC LATE IRON AGE POTTERY

**Abstract author(s):** Holmqvist-Sipilä, Elisabeth - Ilves, Kristin (University of Helsinki)

**Abstract format:** Oral

The society on the Late Iron Age Åland Islands has been commonly interpreted as displaying Scandinavian cultural identity, while certain types of material culture, ceramics in particular, is often understood to represent the shared cultural values with the north-eastern coasts of the Baltic Sea. In this study, 54 Late Iron Age ceramic vessels from four settlement sites (Kvarnbo-Kohagen, Lagmansby, Gölby and Grelsby) and two cemeteries (Långängsbacken and Kvarnbacken) on Åland were geochemically characterised via energy-dispersive X-ray fluorescence spectrometry (ED-XRF) to investigate whether and to what extent the pottery was manufactured locally and/or imported to the archipelago from other regions. As there is a strong stylistic resemblance between the Late Iron Age Ålandic pottery and the Finnish ceramics, pots from a Viking Age site Anivehmaanmäki on the Finnish mainland coast were analysed for a comparison. Our data suggests that most of the Ålandic pots were locally produced on Åland. Manufacture of pots with certain decorative styles, zig-zag lines in particular, appear to be centralised in the archipelago, representing specialist products that were distributed to the consumer communities on Åland. When it comes to the ceramics, the sites and communities investigated in our study mainly relied on local products, apart from the Gölby settlement, where the ceramic record has a distinctively more international character. This, on the other hand, correlates well with other archaeological data from Gölby pointing towards import of materials such as iron and slate, and indicating that this settlement might have had a special function in the trade and redistribution networks of the period.

#### 5 CLAY PAW BURIAL RITE OF THE ÅLAND ISLANDS AND THE MEANING OF CLAY

**Abstract author(s):** Ilves, Kristin - Holmqvist, Elisabeth (University of Helsinki)

**Abstract format:** Oral

Clay paws are small paw-shaped figurines of clay found in the Nordic Late Iron Age burial mounds of the Åland Islands, interpreted as made in connection with the burial rite. Clay paws - that display considerable variation in the design - are distributed widely over Åland, but are documented in only about 12% of the excavated grave mounds. The clay paw burial rite seems to have emerged on Åland in the middle of the first millennium AD and the tradition was in use for over roughly four centuries. Outside of Åland, the rite is mainly attested along the rivers in north-western Russia, though it emerged there several centuries later. Clay paws are clearly bearers of symbolic meaning. Following the idea of this burial rite being connected to the creation of a new cultural identity developed in the wake of immigration to the archipelago, in this study, 25 paws from both geographically and chronologically different burials on Åland were subjected to geochemical analysis by non-invasive portable X-ray fluorescence spectrometry (pXRF). We aimed to compare and evaluate the clay geochemistry of the paws. For further provenancing purposes, mundane ceramic pots from multiple sites on Åland were included in the pXRF analysis as a comparative material. The results show that all the analyzed paws share compositional patterns suggesting that they originate from a single source area, presumably somewhere in Åland. It is curious, however, that the clay geochemistry of the analyzed ceramics is not a match with the paw material. This implies, following the fact that the pots were also produced locally, that the paw production was separated from the making of the everyday ceramics. Furthermore, our results are pointing towards clay paws being produced by following regulated practices in material processing and using a specific clay source for ritual artifacts.

#### 6 WHAT STABLE ISOTOPES TELL ABOUT THE EARLY MEDIEVAL PEOPLE BURIED INTO THE LUISTARI SITE IN FINLAND?

**Abstract author(s):** Etu-Sihvola, Heli (Laboratory of Chronology, University of Helsinki) - Salo, Kati (University of Helsinki) - Arppe, Laura (Laboratory of Chronology, University of Helsinki)

**Abstract format:** Oral

Luistari in Eura is a multiperiodic site that has a large, excavated inhumation cemetery (>1300 graves). This paper examines the early Medieval diet (ca. 600–1100 CE) in Luistari. Because human skeletal remains were most often preserved only near metal objects the temporal focus of the study is on the Viking Period graves that had the largest

number of burial artifacts. The results of carbon and nitrogen isotope analysis on bone and dentine collagen (37 individuals in total for CN) show a continuous reliance on freshwater fish. On the other hand, there is individual variation and some of the studied individuals with seemingly high status had more terrestrial isotope values compared to the mean. Sulfur isotope results for 22 individuals show that the mean for the local range is ca. +8.2 ‰ but there are also four individuals with distinctively low values. They can be considered isotopically as "outliers" but their burial artifacts are similar to others. Enamel carbonate carbon data for 65 Luistari individuals could be tentatively interpreted as showing a possible trend towards a more carbohydrate-rich diet during the Viking Period – potential explanations such as the change in livelihood are discussed.

## **7 ADAPTATION OF CULTURAL FEATURES IN A DECENTRALIZED NETWORK – BURIAL PRACTICES OF NORTHERN FENNOSCANDIA BETWEEN 9TH AND 16TH CENTURIES AD**

**Abstract author(s): Puolakka, Hanna-Leena (University of Oulu) - Kuusela, Jari-Matti (The Regional Museum of Lapland)**

**Abstract format: Oral**

The Late Iron Age and Middle Ages of northern Fennoscandia (ca. 800–1600 AD) have until recently been in many ways a problematic period to study due to scarce and poorly understood archaeological record. In the past, scholarly studies have followed a general pattern of interpretation where northern Fennoscandia has been utilised as a usufruct by people from the regions of southern Fennoscandia and modern-day Russia. Characteristic for these studies is the inherently passive role and the lack of agency they ascribe to local northern communities.

Recently this view has been severely criticized. As the local character of the northern communities has become evident, so has the observation that they clearly differ from the southern communities, while also exhibiting local variation indicating that the northern communities did not form a unified cultural group. This is most evident in the burial forms in use in northern Fennoscandia during the study period.

Burial sites offer a unique perspective on examining social structures and social change, as they are focused on the present of the community while still being rooted in tradition. We will present an overview of known burial practises in the region comprising of present-day northern Finland, Sweden, the Murmansk oblast and the White Sea coast in north-western Russia during the study period. We discuss how they represent the multicultural environment and the fluidity of adaptation of cultural features in the north, as well as the distinct similarities between the communities. We will also examine how the decentralized network, that the northern Fennoscandian communities formed, caused and maintained this multicultural environment during the Late Iron Age and the Middle Ages.

## **8 MEDIEVAL MOVEMENTS ALONG THE FJORD AND BEYOND IN ARCTIC ICELAND**

**Abstract author(s): Harrison, Ramona (University of Bergen)**

**Abstract format: Oral**

This paper presents on long-term archaeological investigations of centuries of farming and fishing activity in North Iceland. Special focus is placed on data sets from the Settlement Era in the late 9th/early 10th centuries to the High Middle Ages in the 14th century AD. Eyjafjörður Ecodynamics research addresses human-nature interactions in inland valley systems, fjord areas, and the very exposed coastal regions close to the Arctic Circle.

Scales of analysis range from land- and seascape investigations to site-focused chronologies to address localized cultural activities. Finally, data resulting from biochemical analysis of marine and terrestrial faunal remains are discussed. Scales of interpretation range from site context-level to North Atlantic-region impacts, providing insight into regional long-term exploitation of marine fish, mammals and birds, and the development of targeted codfish exploitation practices in Iceland connected to medieval international trade systems. Further focus is placed on the importance of chronology and context in establishing reliable baselines for multifaceted stories on settler communities in the North Atlantic Frontier.

## **9 MIGRATION, SETTLEMENT STRATEGIES AND MARITIME RELATIONS IN NW ICELAND DURING THE VIKING AGE**

**Abstract author(s): Guðmundsdóttir, Lísabet (Institute of Archaeology Iceland) - Ramstad, Morten (University Museum of Bergen)**

**Abstract format: Oral**

Iceland was settled around 870 AD by Norse settlers. Written sources indicate that the settlers were of predominantly Norwegian origin, however genetic and isotopic studies suggest a wider geographical background. General assumptions have been that the primary settlement sites were places optimal for agriculture while coastal sites were secondary and generally settled later. However, there has not been any systematic research to support these claims. It is important to take into account the fact that coastal sites are generally under-represented in the Icelandic ar-

chaeological record. Even though not always suited for animal husbandry, these sites had access to extensive marine resources– including fish, seal, whales, birds, and driftwood which were highly valued and sought-after commodities. This talk takes its starting point from an ongoing research project into early maritime sites in Strandir in NW-Iceland. The study has produced new data which highlights the importance of marine resources during the settlement period, giving a broader and more complex picture of subsistence strategies and trade networks. In order to understand local adaptation and technological development in Iceland we will draw attention to similar, earlier and contemporary maritime hunting-fishing sites from Øy garden, Western Norway. Our aim is to address the research bias in the study of the settlement of Iceland, where the extent and importance of maritime resources has not, in our view, been fully recognised. Furthermore, discuss the management and utilisation of these resources from a wider geographical perspective.

## 10 THE BASILICA OF EDSLESKOG - THE OLDEST BRICK BUILDING IN MEDIEVAL SWEDEN

**Abstract author(s):** Lazarides, Anton - Mühlenbock, Christian - Beckman, Anna (Lödöse museum)

**Abstract format:** Oral

The medieval basilica of Edsleskog was one of the largest and most impressive buildings in the late 12th century Scandinavia. The basilica was constructed as a response to a local cult of the Saint Nils, that drew worshipers from near and far. Located in the province of Dalsland, today a wooded, sparsely populated, and remote area of south-western Sweden, the church was built in a location that is rather unusual for such a grand building. Dalsland, during the early Middle Ages, has often been described as a no man's land in-between the emerging kingdoms of Norway and Sweden.

The church was constructed as a large Romanesque basilica made of brick. The lower destruction layers have been dated to the late 12th century. This makes the basilica the oldest brick building in medieval Sweden – several decades before the arrival of the Mendicant orders, previously acknowledged as the introducers of brickmaking in Sweden.

Extensive interregional networks, such as the catholic church and its bishops, must be considered as the driving force behind the erection of the brick-built basilica of Edsleskog. However, the manifestation of the church is also a testament of infrastructural, economic and religious centrality. Between the 12th and 14th centuries, Edsleskog was a hub for pilgrimage and ecclesiastical administration, in the areas of Dalsland and Värmland.

Based on the results of recent excavations at the site, we want to demonstrate how local and regional factors came into play when this important site was elevated to become an important religious site in the fringes of the Catholic world. Further, we aim to emphasize how archaeological research provides new knowledge about peripheral places that historically were of greater importance than previously known.

---

## 129 POPULISM, AUTHORITARIANISM, AUTOCRACY AND OTHER KIDS OF NEO-LIBERALISM – IN ACADEMIA AND ARCHAEOLOGY

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Karl, Raimund (Universität Wien; Forum Archäologie in Gesellschaft - FAiG) - Meier, Thomas (Käte Hamburger Center for Apocalyptic and Post-Apocalyptic Studies; University of Heidelberg, Institute for Pre- and Protohistoric and Near Eastern Archaeology; Forum Archäologie in Gesellschaft - FAiG) - Babić, Štaša (University of Belgrade, Department of Archaeology)

**Format:** Round table

Currently populism is debated as a political development in many countries. The meaning of the word differs between languages as does its connotation. For this RT, we adopt a formalist definition, considering populism as a style, which produces and uses general moods for its own purposes e.g. by polarisation, personalisation, arguments ad hominem and moralisation. It behaves anti-intellectual, anti-institutional and anti-elitist and claims to implement common sense; sometimes combined with conspiracy theories and an imagery of crisis and break down. Autocracy we take as the uncontrolled rule of an individual person, which is (almost) unlimited by institutional restrictions. The ruler legitimises themselves by their perfection and are hardly interested in consent or support by their subalterns.

These and other depraved forms of government seem to be in diametrical opposition to academic governance; explicitly not being based on competition for the better argument and on rationality – let alone predictability, reliability and legitimising institutionalism. But are we too quick ruling out that populism and authoritarianism play a growing role in academic governance? That they do not correspond to academic rules of research does not exclude their influence in governance structures. The neoliberal weakening of academic self-governance seems to foster if not produce a populist and/or autocratic functional elite. And the populist style in politics together with a growing demand for immediate, i.e. monetary „usefulness“ „outreach“ and „transfer“ promote populist production and presentation of knowledge among academics as well. Are such intra-academic populism, autocracy and authoritarianism threats to „proper“ research and academic freedom?

In this RT we want to critically reflect recent developments in academic governance and behaviour all over Europe. We invite short incentive contributions of about 5 mins. for stimulating discussion among participants. Case studies should be anonymised and pay proper respect to each individual's right to dignity.

## 130 NEW INTERACTIONS AND RELATIONS WITH HERITAGE. DIFFERENT APPROACHES BETWEEN HERITAGE AND STAKEHOLDERS

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Loy, Aida (Leiden University) - Martínez Espinosa, Isaac (Universidad de La Rioja) - Larrauri Redondo, Sergio (Instituto de Estudios Riojanos)

**Format:** Discussion session

Nowadays the dissemination of archaeology and heritage is as important and interesting as the research itself. New digital tools and projects focused on learning and teaching about heritage, archaeology and humanities are becoming increasingly participative, including immersive 3D models, interactive maps, and the use of video games. These new approaches to dissemination change the relationship between knowledge, stakeholders and communities. Through these approaches we can try to identify and share archaeological and heritage research in a more cooperative way, and involve a more diverse group of stakeholders.

Digital tools are an important part of the research process, but also part of its ability to present the results. Some digital methods are exclusive to a specific site, for example the digital record of an excavation, while others, like interactive maps or 3D models, can be utilised and reused in several scenarios, such as in schools, museums, and scientific meetings.

This session is aimed at those researchers who use new and diverse ways of sharing, disseminating and teaching archaeology and heritage, and who wish to share their knowledge and experience working with innovative dissemination methods.

## ABSTRACTS

### 1 UIST UNEARTHED: COPRODUCING AN AUGMENTED REALITY APP

**Abstract author(s):** Gal, Emily - Rennell, Rebecca (University of the Highlands and Islands)

**Abstract format:** Oral

Uist, in the Western Isles of Scotland boasts internationally-significant archaeological sites, many of which have been exceptionally well researched and published in academic terms. Nevertheless, Uist's archaeological resources remain poorly understood by Uist's communities and visitors, with a lack of on-site interpretation and limited material in museums. Led by archaeologists at Lews Castle College UHI, the Uist Virtual Archaeology Project developed in response to community desires to improve access, interpretation, and promotion of Uist's rich archaeological resources. There has long been an aspiration to see more benefits for local communities and economy developing from archaeological resources and research, as well as a keen interest for Gaelic language and culture to play a more integrated role in archaeological research and interpretation.

Central to the project is the creation of a mobile app, Uist Unearthed. Uist Unearthed reimagines important archaeological sites along the Hebridean Way in stunning Augmented Reality (AR). It is the first of its kind in Scotland – presenting location-based, GPS triggered, AR experiences of archaeological sites. The app presents complex archaeological data through a variety of media, from lifesize AR reconstructions of sites and bilingual information to animations, audio, and 3D models. Community participation and co-production has been central to this project since its inception, with school groups and local heritage organisations working alongside archaeologists to reimagine Uist's archaeology through the creation of digital content, and beta testing.

The project's success is due in no small part to the strong support it has received from local heritage organisations, community groups, local councillors, commercial archaeologists, and academics. This presentation will highlight the importance of cooperation and partnership in creating a collaborative multivocal archaeological resource. It will also highlight the potential of Augmented Reality as a tool for heritage interpretation in rural and island landscapes.

## 2 3D TECHNOLOGIES, CULTURAL HERITAGE AND PUBLIC OUTREACH: SHARING EXPERIENCES FROM THE MAYA AREA

**Abstract author(s):** Horcajada Campos, Patricia (Departamento de Historia de América y Medieval y Ciencias Históricas- Universidad Complutense de Madrid) - Vidal Lorenzo, Cristina (Departamento de Historia del Arte-Universidad de Valencia)

**Abstract format:** Oral

In 2012, as part of the La Blanca Project, we introduced the application of 3D digital technologies for the documentation, analysis, and valorization of the remains discovered during the archaeological digs at the ancient Maya urban settlements of La Blanca and Chilonché in the Department of Petén, Guatemala. We also developed a novel method consisting in the day-to-day digital documentation of the excavations. The application of these 3D digital tools in the fieldwork was an important innovation, since it was the first time that this methodology had been incorporated in the excavations carried out in the Maya area. The interest and value of the results obtained encouraged us to undertake other projects focused on the use of 3D technologies for research into the Maya archaeological heritage and its dissemination.

In this paper we present the results obtained so far, describing the data collection strategies and highlighting the advantages of this new method, which performs a 3D digital survey by combining photogrammetry and two different types of scanners: a laser scanner for architectural remains and a structured light scanner for artefacts. We stress its potential for generating new approaches in archaeological research. In addition, the high-precision three-dimensional models obtained can be used later to create immersive digital experiences designed to widen the interest in archaeology, thus contributing to the social dissemination of the rich Mayan cultural heritage.

## 3 ARCHAEOLOGY IN SWISS SCHOOLS. A WEBSITE ON ARCHAEOLOGICAL TOPIC AS DIGITAL TEACHING TOOL

**Abstract author(s):** Marti, Cynthia (University of Bern)

**Abstract format:** Oral

Archaeological topics like the Neolithic Revolution, early Mesopotamian civilizations and the classic antiquity are part of the history curriculum in most Swiss secondary schools. Nevertheless, these topics occupy a marginal position in the classroom and teachers therefore have only a limited selection of teaching materials available. As part of my master thesis, I explored the place of archaeology in schools and attempted to create a digital teaching tool that addresses both students and teachers. Digital tools are increasingly in demand and gained importance especially during the pandemic. Furthermore, they are free of charge and easy to access. The final product of the thesis is a website that provides teachers with teaching material (<https://archaeo4schools.wordpress.com/>). The website is intended as a digital teaching tool with essays on various topics related to archaeology that can be used by teachers for lesson planning or to be handed out to students directly. Since the target groups are secondary school students, the essays are written in a way that no previous archaeological knowledge is required. Since almost each secondary school in Switzerland has its own individual syllabus, the papers cover a wide range of topics including archaeological research methods, dating methods, activity of archaeological institutions as well as the legal situation of archaeology and illicit antiquities trade. Other topics cover an overview on epochs from the Palaeolithic to the Iron age, early Middle Eastern civilizations and the classical antiquity. The website is intended to provide teachers with a comprehensive teaching tool that they can use according to their individual lesson plans and to give students a deeper insight into archaeology. Since textbooks and learning aids on archaeology are rather rare in Switzerland, I aimed to make a contribution to archaeological education and to close this gap in the market to some extent.

## 4 A NEW MODEL OF ARCHAEOLOGICAL AND HERITAGE DISCLOSURE FOR SCHOOLCHILDREN

**Abstract author(s):** Espinosa, Isaac (Universidad Autónoma de Madrid & Instituto de Estudios Riojanos)

**Abstract format:** Oral

Archeology and Heritage are two issues that are being studied more and more and earlier in school curricula. The need to find diverse, attractive, original and understandable ways for archaeological and heritage disclosure have led to the creation of innovative systems for educational centers, museums, educational classrooms and even tourist places.

Due to the interest in these new dissemination methods based on transversality, innovation, inclusion and scientific precision aimed at schoolchildren of all ages, Urraca Historiadores in La Rioja has developed in recent years a new model based on the personalization of activities depending on the element to study.

This session will analyse some of his most innovative projects that have been carried out, such as the Davalillo Castle or the Fitero Monastery and the relationship with wine. In the same way, the most original and interesting activities for archaeological and heritage dissemination, their application and the results obtained during their implementation will be explained.

## 5 THE MONASTERY WHERE THE SPANISH LANGUAGE WAS BORN: EXCAVATIONS, RESTORATIONS AND DIDACTIC USES IN SAN MILLÁN DE SUSO

**Abstract author(s):** Jiménez Hernández, Enrique (University of La Rioja)

**Abstract format:** Oral

In the heart of the ancient medieval kingdom of Castile, a small monastery still remains: San Millán de Suso. This construction, created shortly after the collapse of the Roman Empire, was the place of retirement of the hermit San Millán, who founded a monk congregation between these walls. However, the true fame of the monastery comes from its scriptorium, where the first written words in Castilian appear in the 10th century.

Since the passing of San Millán, the monastery has experienced the turbulent times of the history of Spain: late antiquity collapse, visigothic kingdom, muslim conquest, born and expansion of the christian kingdoms, late middle ages crisis, abandonment, building deterioration, 19th century confiscations, civil wars, but also restorations in recent years.

The objective of this proposal is to analyze the criteria that have guided the restorations suffered by the monastery during the last decades, which have illuminated certain stages of the history of the building, while hiding others. Following this approach, a didactic proposal will be added in order to use the visit to the monastery as a didactic resource for high school students.

## 6 HERITAGE DIVULGATION AT THREE LEVELS. AN EXPERIENCE FROM A SMALL REGION (LA RIOJA)

**Abstract author(s):** Larrauri Redondo, Sergio (Instituto de Estudios Riojanos)

**Abstract format:** Oral

For some decades now, digital transformation has been the new scenario for human development. The cultural reality is marked by the revolution of Information and Communication Technologies (ICTs) that reach practically all areas of society and our private lives. In this new scenario, the social networks are a valuable tool that encourages conversation, dissemination, exchanges and reactions to scientific knowledge and cultural heritage.

From La Rioja, a small region in the north of Spain, has proposed a digital strategy in social networks based on three levels, from the most specific to the most general, without neglecting the activities of the territory in which they were born. The profiles for the dissemination of heritage are: "Urraca: History, Education and Innovation", "Rioxa Nostra" and "Taracea of History and Cultural Heritage".

The active presence in the networks allows us to create a community through contents of interest in Heritage, Archaeology and Culture. These virtual profiles allow us to generate spaces of current affairs, but also of knowledge and even pedagogical spaces through which people can connect with their heritage, get to know it, learn to value it and feel the need for its preservation.

## 7 HERITAGE AT YOURS FINGERTIPS - INNOVATIVE METHODS FOR DISSEMINATION OF ARCHAEOLOGICAL HERITAGE

**Abstract author(s):** Byszewska-Lasinska, Agata (National Institute of Cultural Heritage)

**Abstract format:** Oral

National Institute of Cultural Heritage is engaged in disseminating knowledge and promoting socially useful attitudes towards cultural heritage in order to support its protection and its use in sustainable social and economic development. In order to conduct effective projects and campaigns to increase awareness and interest in archaeological heritage, it's necessary to investigate people's knowledge and attitudes, as well as their expectations. It's also important to obtain data on the awareness of archaeologists themselves as to their responsibility for popularization and the effectiveness of the undertaken popularization activities. Last year a public survey was conducted, both among stakeholders and among archaeologists. Its interesting results allow to modify the current dissemination activities and choose the right tools to make the message more effective and reach the larger number of recipients.

One of the popularization projects carried out by the Institute is a website which great value lies in the fact that it's co-created by the Institute staff and its users. The possibilities of the portal make it possible to get acquainted with the historical resources not only in a passive way, but also to use its potential in an active way. Digital tools of the portal allow to search according to the interests, the chronology, themes, a particular region etc.. The integration with the map portal allows to plan e.g. thematic tours, which can be published on the portal or using a mobile device to navigate between the successive points of the trail. It's an excellent tool for the individuals as well as for e.g. cultural educators, all those who use new and different ways to disseminate knowledge about archaeological heritage.

Thanks to the abovementioned social research, it will be possible further refine the portal's capabilities to meet public expectations.

## 8 THE REGIONAL PRESS AS DOCUMENTARY HERITAGE: THE CONSTRUCTION OF THE AUTONOMOUS COMMUNITY OF LA RIOJA THROUGH NUEVA RIOJA

**Abstract author(s):** Galilea, Diego (Instituto de Estudios Riojanos)

**Abstract format:** Oral

The study of the press as an educational tool is essential to achieve a greater capacity for learning and understanding. Using the press as a documentary source is a tool with great application capabilities to disseminate heritage and make known elements of the society of each era, such as clothing, fashions, tastes, customs or ideologies.

Among the multiple forms of analysis that can be worked with the press, we can consider the regional question, especially in specific cases in which the development of democracy and regional autonomy had a great propaganda loudspeaker through the press.

The Nueva Rioja newspaper allows us to learn about the progress and development of the Rioja autonomic process, a small Spanish province that knew how to assert itself by mobilizing the population and using the press as the cause of jokes and popular demands.

Thus, in this communication we will try to bring the vision of the regional press closer to the analysis of a historical event such as the construction of the Autonomous Community of La Rioja, which involved the development of towns and people who never thought of reaching levels of freedom and independence stories that would allow them to self-govern.

## 9 SOCIAL MEDIA TO APPROACH THE HERITAGE. THE CASE OF AN ONLINE JOURNAL

**Abstract author(s):** Loy, Aida (Independent Researcher)

**Abstract format:** Oral

Social media has turned to be part of our daily life and one of the main ways to communicate with each other. Everything is accessible from our phones which allow us to spend more and more time on these networks.

Being known on social media has turned out to be an important part of public life. And Heritage is not an exception. Like many other experts, heritage professionals have found themselves working more and more with different social media, using them as part of the tools to share the heritage. For example, we all expect that our favourite museum has an Instagram account that informs us about their pieces and the tasks carried out by the curators.

But not only museums can be found in these digital spaces. Heritage projects have also found in the social media network a way to share and develop their work.

It is within one of these heritage projects that we can find the online journal European Heritage Times. This online journal presents, periodically, articles written in a journalistic way by authors from different professional and personal backgrounds. These authors write about different topics keeping in mind the common key that joins all the topics, the articles are always related to European Heritage.

## A. THE ARCHAEO TRAIL APP – OPENING A WINDOW INTO THE PAST

**Abstract author(s):** Loges, Luise (University of Glasgow) - Döpfer, Stephanie - Ludwig, Matthias - Gurjanow, Iwan - Oehler, Deng-Xin Ken (Goethe University Frankfurt)

**Abstract format:** Poster

Archaeological sites offer valuable insights into the past. Without a good presentation, however, it is difficult to communicate this knowledge to the general public. The newly developed ArchaeoTrail App does just this and offers the opportunity for visitors to discover the archaeological sites on their own.

The ArchaeoTrail App is based on the successful two-folded system of MathCityMap, which entails a web portal and an actual app for mobile devices. The portal aims at the scientists and research institutions that want to generate archaeological tours for sites all around the world. With just a few clicks, texts, photos, audio files and videos can be uploaded in the web portal. By doing so, a new tour is automatically created. In the smartphone app, visitors are guided by their GPS along a suggested route to the various stations of the tour. They receive brief information in the form of texts and multimedia and, for school groups and families, small quizzes are even provided.

ArchaeoTrail was initiated and is currently run by Stephanie Döpfer in collaboration with Matthias Ludwig and his team, who are responsible for the project's technical realisation. The project is sponsored by the Volkswagen Foundation within the framework "World Knowledge – Structural Support for 'Rare Subjects'". Luise Loges is the public relations officer of the project.

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Tejerizo, Carlos - Stagno, Anna Maria (Laboratorio di Archeologia e Storia Ambientale - Università degli Studi di Genova) - Svensson, Eva - Karlsson, Catarina (Karlstad University)

**Format:** Regular session

Since its emergence as an archaeological discipline in mid 20th century, Industrial Archeology has expanded its scope from the history of technological developments to the social implications of the process of industrialization in a global perspective. This development has, nonetheless, been regionally diverse, and there is still a lack of dialogue between different academic traditions regarding Industrial Archaeology. Moreover, only in the last decade and in close relation to the increasing social awareness of topics such as the Anthropocene, climate change or food sovereignty, has this discipline begun to tackle the social and environmental impact of industry as a historical (and political) process. From this point of view, the material and historical dimension that Industrial Archaeology provides may serve as a key element for present and future debates regarding the relation between production, consumption and the environmental milieu from the perspective of resilience, resistance and change of landscapes and human communities. This session will welcome papers and projects that deal with the archaeological analyses of the impact of industry both in the human communities and in the environment. Thus, it will tackle issues such as the material changes from pre-industrial to industrial communities, the transformation of prior environments and landscapes, the diversified preservation of historical common-lands or the role of industrial heritage in contemporary landscapes, among others. Furthermore, this session aims at establishing new networks for the analyses of Industrial Archaeology and Heritage.

## ABSTRACTS

### 1 AN ARCHAEOLOGY OF A MOMENT OF DANGER: THE IMPACT OF WOLFRAM INDUSTRY ON LOCAL SOCIETIES AND LANDSCAPES IN NORTHWESTERN IBERIA

**Abstract author(s):** Tejerizo, Carlos (Università degli Studi di Genova)

**Abstract format:** Oral

Traditional approaches to the process of industrialization have tended to analyse it as a long duration process, whose impact on local societies and landscapes developed as an extense (and tense) dialogue between resistance, resilience, acceptance and resignation. These analyses stem from the adoption of the English industrialization process as a paradigm, and thus generally understanding that the overall process developed from the Late Medieval Ages into the Modern and Contemporary Eras. However, although these models are not fully incorrect, they tend to blur other more traumatic processes by which the imposition of the industrial economy impacted local societies and landscapes in a very short period of time. It is precisely in these short-term processes where the analyses of materiality may offer an alternative narrative of the deeper dimension of the level of transformation that industrialization implied for local societies and landscapes. In this paper, based on the idea of "moments of danger" developed by archeologist C. Matthews, I will present an archaeological reflection of the deep transformation that the process of industrialization, within the general process of modernity, had to the local social and natural milieus through a case study based in northwestern Iberia. This case study is based at the local village of Casao (Ourense, Spain), one of the hot spots of the so-called "Wolfram War", an event which took place during the 1940s and totally transformed local economies and landscapes in less than one generation time.

### 2 WHEN INDUSTRY CAME TO THE COUNTRYSIDE. SOCIO-ENVIRONMENTAL IMPACTS OF THE IRON MILLS INDUSTRIES IN THE 17TH TO 19TH CENTURIES

**Abstract author(s):** Svensson, Eva (Karlstad University) - Petterson, Susanne (Norskt Maritimt Museum)

**Abstract format:** Oral

In this paper archaeological and paleobotanical traces of changes in landscape, environmental impact and growth of non-proprietor settlements due to industrial establishment will be presented. The 17th century saw a growth of the Swedish iron industry. In the Mining District the shortage of forests for charcoal burning and rapids for hydroelectric power became a bottleneck hampering further growth. Therefore, iron mills were increasingly moved out from the Mining District to other areas rich in forests and rapids. For the hitherto rural areas, the establishment of the iron mills meant great changes. The owners of the new iron mills often came from the urban bourgeoisie, and the employees at the iron mills consisted of both blue and white collar workers. Surrounding the iron mills, new non-agrarian villages with urban traits, and a manor for the patron of the iron mill, were established.

The iron mills, and the new villages, quickly changed life, economy, demography, social structure and environmental conditions in the so far rural areas in which the iron mills were established. New social groups became part of communities dominated by peasants, and the iron mills presented new economic possibilities. The iron mills and the people

in the new non-agrarian villages required food, transportation, charcoal and other necessities to keep both industry and workers with families going. Different strategies for subsidiary earnings such as providing transport of goods and people, charcoal burning and delivery of various commodities were quickly adopted. The new possibilities also opened up for crofters with only a little agrarian land to earn a living, and the numbers of crofters grew quickly. The growing number of people and the demands of the iron mills on natural resources, eg. for charcoal and hydroelectric power, had consequences for the environment and traditional economies previously relying on these resources.

### 3 **FEMALE PRESENCE IN ALENTEJO'S (PORTUGAL) INDUSTRY DURING "ESTADO NOVO": AN ARCHAEOLOGICAL ANALYSIS THROUGH PHOTOGRAPHS**

**Abstract author(s): Pacheco, Susana (Independent Archaeologist)**

**Abstract format: Oral**

The role women performed in industry is often forgotten in historiography and archaeology. It is usual to see authors that analyse working-class as a whole, but it is now common knowledge that several differences and particularities existed, especially between men and women, concerning their activities and the way they were treated/seen in industrial units.

This presentation aims to question that paradigm, analysing how women's lives were, the inequalities/discrimination they faced, their contributions to the proper functioning of factories, and how they were and still are seen by societies.

To achieve these goals photographs will be used as materiality, analysing them with archaeological methodologies, but never forgetting that they are extremely subjective objects, capable of telling us stories of the subjects represented on them, seen by the photographer's perspective.

Photography will also, inevitably, affect individual and collective memory of a situation, in this case of women's presence in industrial places, so the idea societies had and still have of these people is obviously conditioned by the photographs that we see.

In the Portuguese case special attention must be given to this question because photography was frequently used as propaganda during the dictatorship period called "Estado Novo", so this presentation will show that a photograph does not necessarily corresponds to reality, their use demands an extremely cautious analysis.

The case study will be Alentejo, one of the largest and less industrialised regions of Portugal (and one of the most affected by "Estado Novo"), where women's work is always associated (by historiography) with agriculture instead of industry, while it is now known that women from this region were present in both sectors.

### 4 **TRADITIONAL ARTISANSHIP IN INDUSTRIAL LANDSCAPES: POSTMEDIEVAL POTTERY AND TILE PRODUCTION IN LES GAVARRES (CATALONIA, SPAIN)**

**Abstract author(s): Travé Allepuz, Esther (Universitat de Barcelona) - Vicens i Tarré, Joan (Universitat de Girona)**

**Abstract format: Oral**

Pottery and tile production has been a major economic activity in many centres around the Gavarres Mountains, in north-eastern Catalonia, most of them extinguished during the 19th and 20th centuries. It is still important in some places where these artisanal activities shift between traditional practices and industrial production modes in emblematic centres as La Bisbal or Quart. In this contribution, we aim at understanding how this productive activity has shaped industrial and human landscapes from an archaeological perspective. Our research approaches the transformation of production processes and distribution strategies by means of landscape archaeology and within a diachronic framework, starting from the Late Middle Age and enduring until the present day.

Despite the increasing technification of workshops and processes within an industrialized world, potters, ceramicists, and tile-makers have preserved traditional expertise that is vindicated and upheld as an identity-building value for human communities in this area still today. The general decrease of pottery consumption due to the social change occurred in the second half of the 20th century has jeopardized such a production, while the production of tiles and other building materials has fulfilled its industrialization process and concentrated in specific areas. The impact of these societal changes in the landscape and the rich material culture generated by this activity are topics worth exploring.

Our contribution introduces an up-dated state-of-the-art about postmedieval pottery and tile production in Les Gavarres (Catalonia, Spain) in the Modern and Contemporary Ages as mean to [re]integrate the material culture and the industrial development of this area within archaeological studies. We also aim at addressing the strategies for the preservation of social and cultural heritage of these communities as a legacy for the 21st century."

## 5 **BUTTON - AN INCONSPICUOUS INDICATOR OF INDUSTRIALIZATION: ANALYSIS OF MODERN BUTTONS OBTAINED DURING ARCHAEOLOGICAL RESEARCH IN GDAŃSK**

**Abstract author(s):** Dobek, Mikołaj (3rd year student of Nicolaus Copernicus University in Toruń)

**Abstract format:** Oral

One of the fundamental issues at the heart of archaeology is the study of everyday objects in the context of cultural changes over the centuries. It is the evolution of what surrounds man every day that testified to the progress, changes in cultural thought and production. Despite the changes taking place in modern archaeology, the most frequently analyzed objects are still the most popular: ceramics and metal products.

In a way, on the sidelines there are other objects, also present in the life of every person, related to the everyday and festive clothes of the inhabitants of modern cities. These are not only fabrics, but also the inherently related fasteners - buttons and hook-and-eye closure. A large and representative collection of these items was discovered during archaeological works carried out in Gdańsk, in places closely related to the industrial sphere - in the former shipyard, in the place where rope workshops operated, and in the grounds of centuries-old granaries. The analysis of over a hundred items in terms of form and raw material allowed for the systematization of the fasteners, which made it possible to draw a number of conclusions regarding the changes taking place in the production of these products. The buttons turned out to be a perfect mirror in which we can find a reflection of the changes taking place in the dynamically developing, modern city.

## 6 **TOKENS AS A MEANS OF PAYMENT IN GDAŃSK**

**Abstract author(s):** Jasiak, Krzysztof (Nicolaus Copernicus University in Toruń)

**Abstract format:** Oral

Industrial archeology is an intensively developing branch of archeology, which includes the search, recognition, re-research, interpretation, protection and conservation of industrial-related material culture objects. It is safe to say that trade was developing in line with industry. In turn, along with trade, various types of payment systems, not always synonymous with monetary systems, developed.

In many urban sites, researchers discover items that have the characteristics of means of payment. These are finds that have been classified as tokens. During the archaeological work in the city of Gdańsk, many objects were found that testify to the intensive functioning of trade, including monetary funds, such as szeląg, liczman or półgrosz as well as the above-mentioned tokens. The analysis of this group of means of payment from selected archaeological sites located in the former Hanseatic city of Gdańsk contributes to a better understanding of how trade operated. The tokens in Gdańsk were found, among others, at Długie Ogrody Street, Szafarnia, Angielska Grobla, Św. Barbara Street and Lastadia shipyard.

## 7 **CHASING THE RED DRAGON: ARCHEOLOGICAL AND HISTORICAL TRACES OF WELSH QUARRYMEN IN NEWFOUNDLAND**

**Abstract author(s):** Spiwak, Alexa (University of Oslo)

**Abstract format:** Oral

The turn of the 20th century was a time of great upheaval for the North Wales slate industry, mired by bitter labour disputes and the social division which followed in its wake. Once the greatest exporter of slate roofing tiles on earth, the output of the quarries surrounding Eryri (Mt. Snowdon) was drastically reduced. Fearing that the industry would never recover, the quarrymen of Gwynedd county began to look elsewhere for work in the hopes of escaping poverty and finding better working conditions. The same bands of Ordovician and Cambrian slate which transformed the hinterland of northwest Wales, laid down before the separation of the Pangean supercontinent, were also found in the area of Trinity Bay on the island of Newfoundland, off the east coast of Canada. Welsh quarrymen and their families followed the stone and soon began to appear on Newfoundland's shores to work in the small quarries of the then-peripheral and rugged island. Houses and churches followed, and the population of the area grew as new workmen arrived and already-established families added to their numbers. Eventually, Newfoundland's slate industry suffered the same fate as many others, succumbing to low demand and economic depression, but the industry and its quarrymen had a profound local impact. So, too, did the unsuccessful modern attempts at reviving the dormant quarries, dashing hopes of economic recovery after the devastating collapse of the cod fishing industry. This presentation follows the journeys of quarrymen from Wales to Newfoundland, tracing both historical and archeological evidence from the small colonial slate quarrying ventures of the 17th century, through the boom of the 19th and 20th centuries, and culminating in the now-abandoned quarries perched on the edge of the continent.

## 8 HISTORICAL ARCHAEOLOGY OF INDUSTRIALISATION IN THE MOUNTAINS. THE SPACES OF PRODUCTION IN THE LIGURIAN APENNINES (ITALY, 19TH-20TH CENTURIES)

**Abstract author(s):** Cristina, Giovanni - Panetta, Alessandro (Università di Genova)

**Abstract format:** Oral

The aim of this paper is the analysis of the industrialization process in the Ligurian mountains (NW Italy) between 19th and 20th century, through a historical and archaeological cross study.

In this period the European mountains underwent important transformations, including an attempt of industrialisation and productive and economic rationalisation promoted by the central states. Taking a local point of view, it is possible to test the widespread idea of a marginalisation of this area, investigating the specificity of an area traditionally considered marginal both in a geographical sense and because of its distance from the major urban industrial centres that were emerging at that time (Genoa and Milan).

At the centre of the research are some proto-industries that had a local genesis (ice, tinder but also minor manufacturing productions such as damask and cheese) and whose relevance emerges clearly from the observation of their material traces. The aim is to study from an archaeological point of view the temporality and character of this industrialisation process also in relation to contemporary top-down industrialisation interventions carried out in the same areas, such as the construction of reservoirs for the production of hydroelectric energy, highlighting how the conflicts at local level generated by these different industrial perspectives and their social, economic and access to resources relations.

It will also be investigated if and how the modalities and rights of access to the environmental resources used have changed over time, the topographical connections of these production areas with the road network, the spaces inside and outside the settlement and the short and long range commercial circuits.

## 9 A QUESTION OF CHOICE: OBSERVING SHIFTS IN BUILDING MATERIALS AT THE MONTE FASCE UPLAND SETTLEMENTS BETWEEN 19TH AND 20TH CENTURIES.

**Abstract author(s):** Bizzarri, Giulia - Piu, Caterina - Stagno, Anna (Laboratorio di Archeologia e Storia Ambientale - Università di Genova)

**Abstract format:** Oral

While the discussion on the interconnectedness between industrial production and rural contexts has been expanded and simplistic assumptions have been increasingly challenged, the questions surrounding how wider industrial production and products have been integrated into rural, and hypothetically non-industrial, milieus are still numerous. As part of a broader archaeological study on processes of marginalisation of European uplands in the post-Medieval period, settlements and landscapes stretching out to the east of Genova (Italy) - on the hillsides of Monte Fasce and its surroundings, have been surveyed and investigated. Through the Modern Age, the area was characterised by the presence of common lands, owned and used by social groups belonging to downstream villages. Archaeological surveys have identified material traces of agro-pastoral and woodland management activities, hinting at a complex organisation of these hillsides during the late-Modern period. With the late-19th century privatisation of these lands, however, these spaces, and the activities carried out on them, were gradually redefined. The current study considers a sample of settlements and architectural structures identified on Monte Fasce, which present complex outlines and stratified building phases, some of which likely corresponding to actions taking place during these lands' privatisation. While most structures at these settlements are built in local limestone, shifts in the use of building materials can be observed, e.g., the introduction of late 19th century serially produced roof tiles or early 20th century cementitious mortars. While these elements offer useful dating tools, their presence should also be considered as the result of choices performed by local actors modifying and constructing these structures. The analysis focuses on these materials, contextualising their production and use, to start asking specific questions about how these shifts can be connected to changes in resources management practices and how they might have influenced or been the result of social interactions.

## 10 CHALLENGES AND OPPORTUNITIES TO ENHANCE THE MINING-INDUSTRIAL LEGACY OF THE REGIONS OF EL BIERZO AND LACIANA (LEÓN. SPAIN)

**Abstract author(s):** Martínez, Laura - Balado, Francisco M. (UNED)

**Abstract format:** Oral

The closure of the last coal mines in El Bierzo and Laciana regions (León), the dismantling of the thermal power plants of Anllares and Compostilla (León), re-establish the significance of the legacy of the mining industry in these regions. Its short history highlights its social value and container of living memories.

Banditry, institutional neglect and weariness on the part of a society that lost everything from one day to the next, are part of the challenges we are facing in order to implement value enhancement projects in which the inhabitants of the mining territories are the main beneficiaries.

This communication provides an overview for the implementation of initiatives to enhance the legacy of the mining industry developed in the regions of El Bierzo and Laciana, placed in León. The low volume of heritage measures implemented to date as a tool to save iconic facilities from demolition or to protect the recent documentary legacy are discussed. Finally, are presented the actions promoted by the Working Group on Mining and Industrial Heritage of the Iberian Northwest (PMNI) of the Chair of Sustainable Territory and Local Development UNED - ULE of Ponferrada.

## 11 AN ARCHAEOLOGY OF PLASTICS, PEARLS AND POST-INDUSTRIAL ETHICS

**Abstract author(s):** Simpson, Ian (Leiden University)

**Abstract format:** Oral

This paper is concerned with how archaeological and sensory approaches can contribute to understanding the modern materialities of industrial and post-industrial ecologies. In order to investigate and develop an understanding of ecotoxic archaeology and heritage, the approach explores toxicity as a modern materiality related to microplastics and plastics, and how an industrial archaeology can illustrate the construction of sustainability and fostering environmental ethics through the promotion of industrial cultural heritage as negative heritage. These contrasting themes serve to grasp the forsaking of toxic materialities achieved through promotion of tradition as heritage over and above modern waste as non-heritage, as modernity's marginalised toxic heritage. It focuses on early-modern and modern industrial contexts in Bahrain, Qatar, the UAE and Oman, and suggests how the themes and methodology might fruitfully contribute to theoretical understanding applicable to other contexts. It seeks to produce a theoretical and grounded understanding of the ecotoxicities of modern materialities and addresses how heritage discourses and archaeology foreclose or enable an ethics of care concerning the ecology of plastics and environmental citizenship.

## A. DREDGING, PEATS AND PANDEMICS: ARCHAEOLOGY OF THE CONTEMPORARY IN SETÚBAL, PORTUGAL

**Abstract author(s):** de Camargo, Paulo (Federal University of Sergipe) - Fraga, Tiago (Tiago Miguel Fraga, LDA) - Romão, Andréia (Neptune Search) - Marcos San Fulgencio, Jesús (Universidad de Cádiz) - Blázquez Martínez, Jorge (Asociación Nacional de Arqueología Subacuática) - Gómez Rivas, Luis (Universidad Nacional de Educación a Distancia)

**Abstract format:** Poster

Preventive underwater archaeological works are common in Portugal, given that the country has been a signatory of UNESCO Convention on the Protection of Underwater Cultural Heritage since 2006. It is not rare for these works to come across material remains of a recent past, which are indicative of the industrialization potentialized in the XX Century. However, the archaeological approach of these vestiges of the productive activities of the last 250 years is quite uncommon.

The objective of this poster is to present the result of the research Acompanhamento Arqueológico da Dragagem do Acesso Marítimo e Bacia de Estacionamento do Cais do Terminal Teporset, in the county of Setúbal, undertaken between 2020 and 2021. During this work, material remains of ethnological and archaeological interest were located isolatedly in a context already quite altered.

This poster will focus on a specific kind of vestige: the peat for fuel, simple remains which are widely found in underwater archaeological surveys of this sort. In the case here examined, we managed to identify the original peat deposit a few kilometres away from the works, which allows us to examine some aspects of the contemporary history of Portugal: the search for an energy matrix that would reduce the country's dependency on imported fuel in the end of the 18th century; the seasonal peat extraction by the local population; and its use during both World Wars.

---

## 135 THE MEDIEVAL MARKETPLACE IN EUROPE - INTERDISCIPLINARY AND THEORETICAL APPROACHES TO ITS BIOGRAPHIES AND DEVELOPMENTS

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Rösch, Felix (University of Göttingen) - Kalmring, Sven (Centre for Baltic and Scandinavian Archaeology) - Mordovin, Maxim (Eötvös Loránd University)

**Format:** Regular session

The marketplace is one of the most distinct features of the European medieval town. It underwent manifold developments resulting in complex life trajectories and biographies that have a direct effect on their archaeological content as well as visibility.

The reasons for this relate first of all to the changing concepts and significances of what it means to hold a market. In the early medieval period markets were held ad hoc in open air, in the framework of assembly and ceremonial meetings. To hold a market would result in individual pits with residues of craftsmanship, or dark earths with organic deposits. From the moment ports and emporia developed, markets get not only associated with semi-permanent

infrastructure and deposits related to this infrastructure. In the late medieval period, many markets evolved into the monumental public space of towns, as well as "shops" and warehouses. In the latter case, written sources enlighten us about the merchants and their policies and products, without a clear view on the materiality of the traded goods. In the other cases, the archaeological signal will stand alone without detailed written sources about merchants and their agency which makes it much harder to interpret them.

In this session, we will focus on interdisciplinary approaches, implying geoarchaeology and environmental archaeology, and the study of crafts and trade or the use of cultural anthropology which can help us to understand the life trajectories of marketplaces and what it means to hold a market. Furthermore, specific "marketplace landscapes" and their development over the course of the Middle Ages shall be discussed.

We are looking for studies and approaches from all over Europe, relating to markets and trade in the broad medieval period (4th c – 18th c).

## ABSTRACTS

### 1 MEDIEVAL MARITIME ROUTES AND ACCIDENTAL TRAVELLERS

**Abstract author(s):** Panagiotakopulu, Eva (School of GeoSciences, University of Edinburgh)

**Abstract format:** Oral

From the days of the earliest maritime transport, people have accidentally ferried insects in cargo, dunnage and ballast. Some, as human lice and other ectoparasites of humans and domestic animals, were inevitable travellers on their hosts. Others, as wood borers, pests of crops and dung beetles would hitch a hike. Most of the insect data from shipwrecks come from the medieval and post medieval period, when ships became larger and less likely to be thoroughly cleared out between voyages, allowing beetles and flies to become residents in the ballast and dunnage. At that point, various species, taking advantage of the foul conditions in ships' holds, started spreading geographically, following the routes of colonisers and traders and providing interesting information about itineraries, goods traded and conditions on board. A number of post-medieval references provide some information, from mentions of cockroaches on a galleon off the Azores, to the complaints of weevily bread from James Cook's crew in the late eighteenth century. The fossil insect record from wrecks and other assemblages from ports and relevant contexts during the medieval period, show the process and a range of accidental imports, which are often strongly associated with exchange networks, give an alternative record for transatlantic trade.

### 2 EXPECT THE UNEXPECTED – FIND PATTERNS LINKED TO MARKET AND OPEN SPACE ACTIVITIES

**Abstract author(s):** Rösch, Felix (University of Göttingen, Seminar für UFG)

**Abstract format:** Oral

Marketplaces are usually identified by their topographical location. Historical town plans as well as written and onomastic information are the main sources for the late medieval and early modern European town. However, marketplaces and fairs at early urban settlements are often significantly less obvious. Prominent open spaces, be it by an interruption in the development, extraordinary wide streets or free shores, can be considered as indicators. Commonly finds associated with trade and exchange, e.g. coins, scales and weights, and imported pottery, serve as further evidence.

However, the fixation on these "expected" finds distracts from other indications. As a result, such find categories and distribution patterns indicating marketplaces and open spaces may easily be overlooked, or only revealed only at a second or third glance. Marketplaces were not only dedicated to buying and selling goods but, as they often were the only larger open space in town, they served for a whole range of different activities too. Furthermore, seasonal gatherings at fairs were social highlights, which, for instance, entailed a special makeup. Accordingly, the material evidence at markets and open spaces is diverse. It ranges from proof of animal husbandry over concentrations of children's toys or dress accessories such as hairpins to highly fragmented pottery.

The aim of this presentation is to give an overview over those finds and distribution patterns whose connection with market activities is not immediately obvious. Or - to put it short - to raise awareness of the "unexpected".

### 3 CUMULATIVE FINDS OF COINS FROM THE MARKETPLACE OF POLISH CITIES

**Abstract author(s):** Milejski, Pawel (Institute of Archaeology, University of Wrocław; Numismatic Department, Ossoliński National Institute, Wrocław)

**Abstract format:** Oral

The main aim of the paper will be to present coins and tokens that have been found during archaeological excavation on eight marketplaces of Polish cities. The main sites will be the Hanseatic cities – Gdańsk and Wrocław. Additionally, coins found during the research of two other Pomeranian cities – Puck and Skarszewy, two Silesian cities – Gliwice

and Racibórz, and one from Greater Poland and one in Masovia – Kalisz and Pułtusk will be presented. In total, 2,263 coins and 191 tokens were registered from all marketplaces.

I would like to present the chronological range of coins, thanks to which we will be able to see at what time the most money was used in individual marketplaces. It will also be interesting to analyse the denominations that occurred at individual sites, which will certainly differ between Pomeranian and Silesian marketplaces. However, the common denominator for all sites should be a small change that dominated commercial transactions at marketplaces. Furthermore, what is worth emphasizing, we also note few thick silver coins and gold coins. The geographic analysis of the discovered coins will be equally interesting, thanks to which we will be able to confirm which coins circulated in a particular area and which cities and countries had trade contacts with each other. Among all finds, many counterfeit coins were identified – both coins from official issues, which for various reasons were not put into circulation, and coins from counterfeit mints, which were minted illegally from the very beginning.

Acknowledgements

The paper is part of the research program, National Science Centre's, Poland, Preludium 14 – Role and circulation of Prague groschen in East-Central Europe from 1346 to 1547 (UMO-2017/27/N/HS3/00899).

#### **4 THE CERAMICS OF THE MEDIEVAL MARKET PLACE OF STENDAL AND ITS (SUPER-)REGIONAL CLASSIFICATION AND SIGNIFICANCE**

**Abstract author(s): Feike, Timo (Martin-Luther-Universität Halle-Wittenberg)**

**Abstract format: Oral**

Stendal, located in the Altmark region between Berlin and Hanover, was the first town to be granted town rights under Magdeburg town law in 1160 and was thus allowed to hold markets. At the end of the 15th century it was a prospering hub of cloth trading and the biggest and wealthiest town of the March of Brandenburg.

Numerous dendro-dates from the middle to the end of the 12th century bear witness to the establishment in the area of the market place and the expansion of the surrounding urban area. In addition, various diplomatic sources exist. For example, an early market hall is mentioned only a few years later in 1188.

One third of the market place was excavated during renovations in 2016 and due to dendro-dates and diplomatic sources most of the features could be dated to the 12th to early 14th century, the phase of rise and growth of the town.

The early dating of the founding of Stendal, the discovery of brick foundations associated with the market hall and the possibility of connecting dendro-dates and features led to the excavation results being submitted in a dissertation. The ceramic findings were processed simultaneously by the author in his master's thesis.

The analysis of the ceramics leads to interesting findings, which prove the existence of far-reaching trade relations. A skilfully mastered pottery craft even at the earliest stages separates Stendal from older or far bigger towns like the close located Magdeburg.

Therefore, this presentation will show and compare the results of the early dated ceramic analyses of this master's thesis with other marketplaces of other settlements in context of the high medieval Ostsiedlung.

#### **5 MARKETPLACES AND MARKET SQUARES IN DANISH MEDIEVAL TOWNS – THE CASE OF RIBE C. 700-1580.**

**Abstract author(s): Søvsø, Morten (Museum of Southwest Jutland)**

**Abstract format: Oral**

When looking at a map of Danish market towns from the Middle Ages their even distribution across the landscape is evident. This homogeneous picture developed during the 12th and 13th C. The market squares within these towns were situated at the town center and very resilient to changes. In many cases historical maps from the 18th and 19th C. combined with historical sources allow precise reconstructions of medieval market squares or market roads dating back to the founding phases of the different towns. Before the 13th C. the network of towns was fundamentally different both in terms of number, functions and geographical distribution. Towns were few and far between. Administrative functions relating to the king, or the church were based in the diocese towns – civitates – while trade was concentrated and controlled at a few trading towns – emporia. The early development of the Southern Scandinavian marketplace is best studied in the emporia: Reric/Haithabu/Schleswig, Åhus and Ribe.

The paper presents the physical framework within which trade took place in Ribe from c. 700-1580. The early phase is well known through lots of excavations since the 1970's. Less data – though still some – are available between 850 and 1050.

Ribe's High Medieval market square is known from written sources. However, the extent, the exact position and the relation to the two succeeding medieval town halls was not clear. Recent GIS-based studies using historical maps and moving further back in time through written records allows the reconstruction of a 14th C. market square five

times larger than the market square laid out after the 1580 town fire. And some signs indicate this market square may have been even larger in the 13th C. The demise reflects Ribe's changing role within national and international trade networks.

## 6 A POSSIBLE FREEPORT IN VIKING PERIOD SIGTUNA?

**Abstract author(s):** Runer, Johan (Uppdrag Arkeologi)

**Abstract format:** Oral

At home with master Nicolaus and other literates. The people along the shoreline in Sigtuna (Sw. "Hemma hos herr Niklas och andra skrivkunniga. Människorna vid stranden i Sigtuna") is a joint project by Sigtuna museum & Lund university that intends to compile, analyze, and publish the archaeology of the quarter Professorn 1 in Sigtuna. The archaeological investigations in the years 1999 to 2000 of the property here, between the main street running through Sigtuna (Stora Gatan) and the shoreline, generated a large amount of data for the period from about 970. Remains of three medieval plots was unearthed, including traces of circa 150 succeeding buildings and houses. Due to the high quality and resolution of the Professorn 1 investigation, even empty spaces were clearly discernible. Apart from paved alleys and pathways, this is also true for sequences where parts of the plots were unbuilt and instead used in other ways, for example for animal husbandry. A special and very persistent "empty space", in the form of a square structured widening of the alley in between two of the plots, could be determined to have been established around the year 1000. The square was heavily paved, with comprehensive layers of stones in the foundation and logs and planks on top. The square space remained unchanged for a long time. The paved alley connected to the square ran from the shoreline, and a probable jetty/quay, to the south, and up to the main street (Stora Gatan) to the north. An interpretation of the square assumes a connection to the fact that the handling and sale of imported goods was heavily regulated in the early medieval period.

## 7 WHAT MAKES A MEDIEVAL MARKET-PLACE? 'GOING TO THE FAIR' ON THE ISLE OF MAN

**Abstract author(s):** Johnson, Andrew (Manx National Heritage)

**Abstract format:** Oral

Lying near the centre of the British Isles, the Isle of Man is a largely rural island of 580km<sup>2</sup>. It now has half a dozen larger settlements, but there is still clear recognition of the seventeen historical parishes which have existed since the twelfth century.

Most parishes held several markets in the course of the year, which served a number of purposes – particularly the sale of perishable fresh produce, livestock, and the trading of manufactured goods. A few of these gatherings still persisted into the twentieth century as hiring fairs for farm labour.

Metal-detected evidence is meanwhile beginning to indicate the existence of medieval coastal / beach markets, an aspect of trade and communications in the later Viking Age which has been significant by its absence on the island until now.

Central to the creation, persistence and survival of market-places are the criteria that make the location attractive in the first place; obviously these must include the produce itself and the means of bringing it, but to these should be added topographical features and man-made monuments – landmarks – that denote the place as special to the surrounding community.

These market places were either associated with the parish church or with other, earlier chapels and burial grounds that predated the establishment of the parishes. In a small number of cases, an association with medieval assembly sites can also be identified. Map regression analysis and historic landscape study is showing that the same accessibility that enabled church-going played a significant role in place-making and going to market.

## 8 THE MEDIEVAL TOWN SQUARE IN LÜBECK – AN INTERDISCIPLINARY APPROACH TO ITS TOPOGRAPHY, APPEARANCE, AND FUNCTIONS

**Abstract author(s):** Renn, Lisa (University of Freiburg i. Br.; Department for Archaeology and Preservation of monuments in Lübeck)

**Abstract format:** Oral

Town squares seem to be a typical element in the medieval city, giving space for markets, gatherings, proclamations etc., but by taking a closer look upon this urban phenomenon, it quickly becomes clear that this is not necessarily always the case. In fact, these squares can have different origins and histories in the medieval town, presenting us with a vast variety of developments. Therefore, it is interesting to examine the individual town square for its appearances and developments and thereby outline regional and transregional tendencies, similarities, and differences for possible "marketplace landscapes". Furthermore, by using an interdisciplinary approach, through consulting the archaeological, written and pictorial records, the various aspects of the square's topography, appearance and function can be traced, showing a differentiated picture of the urban feature. Thus, this area can give important insights into

the city's development and structure as well as a reflection of the economic, social, and political changes in the city as they manifest themselves on the square. Shifts in importance and perception concerning this urban feature give a picture of the social, physical, and functional dynamics in the city itself.

The main town square in Lübeck will be the focus of my presentation. As "Queen of the hanseatic league" the city had an important standing in the medieval urban landscape, functioning as a role model for later city foundations in the area. The central square of Lübeck is shaped in the early time of the city's history and slowly develops into a monumental public space. By combining different sources the diversity of this main square as well as its development and appearance through time can be uncovered, giving us a detailed picture of this important lived space in medieval Lübeck.

## 9 DATING THE REORGANIZATION. THOUGHTS ABOUT THE DEVELOPMENT OF THE MEDIEVAL MARKETPLACES OF HALBERSTADT AND THEIR SURROUNDINGS

**Abstract author(s):** Schoo, Tobias (Martin-Luther-University Halle-Wittenberg)

**Abstract format:** Oral

At a past lecture, the reorganization of the early medieval city centre of Halberstadt (Harz County in Saxony-Anhalt, Germany) from a formerly populated area to a temporarily inhabited centre for trading was described as a transformation process, which could only be roughly dated. At the end of this process, two marketplaces had emerged – the so-called wood market (1275 AD mentioned for the first time under this name) in the west and the fish market (1478 AD first mentioned) in the east – which were separated from each other by the town hall (completed by the end of the 14th century).

In this paper I would like to highlight the existing dating possibilities of the market development. For this purpose, the features and – to a greater extent – the dating finds of the surrounding excavation projects, which were carried out in the 1990s, shall be used. In particular, the sale booths, which are documented in written sources, are viewed from an archaeological perspective. It will be shown that since the 12th/13th century until the modern age, an almost unchanged room layout can be seen in the surrounding plot structure.

In my presentation I aim to retrace the development of both marketplaces of Halberstadt and highlight the special characteristics of the market ensemble.

## 10 WROCLAW'S NEW MARKET SQUARE. BIOGRAPHY OF URBAN SPACE FROM 12TH TO 20TH CENTURY

**Abstract author(s):** Sawicki, Jakub (Institute of Archaeology, Czech Academy of Sciences in Prague) - Piekalski, Jerzy (Institute of Archaeology, University of Wrocław)

**Abstract format:** Oral

Wrocław is the historical capital of Silesia, the largest city in the region and, in terms of archaeology, one of the most thoroughly researched urban complexes in contemporary Poland. In 2010–12 on the New Market Square (Nowy Targ Square), rescue excavations were carried out within an area of approx. 0.4 ha, in which over 4 m of stratified deposits were documented. The remains of an early medieval settlement (of the 11th century) were recorded as well as the remains of a settlement with timber-framed buildings and wooden communication paths, dating to the mid-13th century. In the second half of the 13th century, and more specifically around 1266, as confirmed by historical sources, the market was located in this area and served this function until the second half of the twentieth century, when it was turned into a car park.

In this paper, we will show how this specific urban area has developed in time, and how this process is visible in archaeological sources. To understand these changes we will also discuss the material culture found on the market square – from the possible metal production, through numerous finds, to the traces of stalls and shops as well as constructions probably used for sorting animals.

## 11 A MARKETPLACE THROUGH THE AGES – THE ARCHAEOLOGY OF THE SZÉCHENYI SQUARE IN GYŐR, HUNGARY

**Abstract author(s):** Kolláth, Ágnes (Bölcsészettudományi Kutatóközpont) - Bíró, Szilvia (Iseum Savariense Archaeological Collection and Research Centre, Savaria Museum, Szombathely) - Tomka, Gábor (Hungarian National Museum)

**Abstract format:** Oral

The sprawling modern industrial hub of Győr lies at the confluence of the Moson Danube, the Rába and the Marcal rivers in the Small Plains region of Northwestern Hungary. Its highest point is the Káptalan Hill, which had been once the Roman auxiliary fort Arrabona, used between the 1st-5th centuries AD, then transformed into an administrative, later episcopal seat of the Hungarian Kingdom in the 10th-11th centuries AD. The fortified hill with the late medieval Bishop's Castle dominated the suburbium, which had been built on the planed ruins of the vicus, and ultimately

became the quaint baroque downtown of Győr. Its regular street-plan is mainly the result of an extensive urban reconstruction in the 16th century, carried out because of the settlement's transformation into a fortress city to protect Vienna against the Ottomans.

However, the central Széchenyi Square has maintained its borders more or less since the 13th-14th centuries and functioned as a marketplace in every period of time, when a permanent settlement existed at the foot of the Káptalan Hill. This is a consequence of the geography of the area, as land traffic had limited options to cross the rivers and the surrounding marshlands, while the hill offered an ideal location to guard these routes. The paper aims to examine the establishment and changes of this marketplace, the break in its history with the abandonment of the Roman vicus and the formation of black earth layers, which continued well into the Middle Ages, until the levelling and paving works of the 13th century. We compare the industrial practises carried out on and around the Roman and Medieval marketplaces, their infrastructure and territorial shifts.

## 12 DEVELOPMENT AND RECONSTRUCTION OF THE 16TH-17TH-CENTURY MARKETPLACE IN PÁPA

**Abstract author(s):** Mordovin, Maxim (Eötvös Loránd University)

**Abstract format:** Oral

The excavation of the Main Square in the west-Hungarian town of Pápa revealed a 1000-year long development history of an urban marketplace. A 10th-11th-century rural settlement was replaced by a paved market, most probably during the first half of the 14th century. Since then, the overall boundaries of the market did not change. However, the inner structure of the market underwent quite radical alterations two times in its history. First, during the Ottoman wars in the first half of the 16th century and second, in the late 18th century. The first, 16th-century transformation resulted in a significant decrease of its territory. It was the consequence of emerging of several large timber-framed buildings. After their destruction in the 1597-siege, the easily flammable structures were replaced by stone buildings. The second radical change in the 18th century, in fact, meant the removing of these structures, reconstructing thus the late medieval appearance of the market. In this paper, I focus on the 16th and 17th-century structures, which temporarily occupied the central place of the square. My goal is to interpret the function and the architecture of those buildings using archaeological, written and illustrative sources.

---

## 142 GENDER ARCHAEOLOGY AT THE CROSSROADS: THE FUTURE AND ITS CHALLENGES [AGE]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Gaydarska, Bisserka (Manchester Metropolitan University) - Mina, Maria (University of the Aegean)

**Format:** Regular session

Currently, there is little agreement amongst archaeologists as to whether gender archaeology is a mainstream part of our discipline or not. Moreover, in the light of approaches which favour an embodied approach, the relevance of gender as an analytical tool for the understanding of past societies and identities has been called into question. On the one hand there are numerous publications that explicitly (or less so) refer to gender issues. On the other hand, however, the effectiveness of these publications, and their underpinning research, remains limited and in recent years their assumptions have been challenged by neo-liberalist ideology.

The proposed session seeks contributions addressing the following questions:

- What is the current situation regarding gender archaeology taught courses, academic publications, or conference presence?
- Are traditional gender stereotypes and androcentric interpretations persisting to this day in archaeology?
- One of the scopes of gender archaeology is raising awareness about issues of equal opportunities and safety in the profession. Is there today a noticeable change in professional archaeology regarding equal access to employment, equal pay, and opportunities for career advancement for women and members of the LGBTQ+ community?
- Is the portrayal of a genderless past consistent with the scope of gender archaeology?
- How do we respond to approaches which replace the relevance of gender in archaeological interpretations in favour of unique embodied experiences of past identity?
- How effective is the influence of neo-liberalist ideology in minimising the relevance of deeply embedded social structures (such as gender) and the limitations imposed on social subjects by economic or political interests?
- How can we accommodate anthropological evidence for a predominance of binary gender systems in gender-focused archaeological research?
- How do we view the way forward for gender archaeology and what should its role be?

**1 NOW WHAT? GENDERING THE PAST IN A CHANGING PRESENT**

**Abstract author(s):** Skogstrand, Lisbeth (Department of Archaeology, Conservation and History, University of Oslo)

**Abstract format:** Oral

Nordic researchers were among the first to apply feminist theory and gender perspectives in archaeology already in the mid 1970'ties. During the next couple of decades the association between political concerns and archaeological gender research was close. By the early 2000's, third wave theories were incorporated in a number of studies, especially in Norway and Sweden, and during the last 10-15 years gender archaeology has expanded into a world-wide field of study. However, while inventive works within Classical or British archaeology question binarity in prehistoric societies and approach the intersecting identities of past individuals, archaeologists in the most equal countries in the world seem to have lost interest in gender studies. Is this a paradox, or is an inventive and progressive gender archaeology dependent on political engagement in the present? There is no doubt that the world from which Nordic feminism emerged has been changing and we need to re-think feminist theory and gender research.

In this paper I will explore how current discussions concerning gender have influenced Nordic gender archaeological studies the last ten years, discuss whether our research on gender in prehistory is still relevant in the present, and how we might revitalize gender archaeological approaches.

**2 FEMINIST GENDER ARCHAEOLOGY AND MAINSTREAM ARCHAEOLOGY: SHOULD THEY BE INCOMPATIBLE?**

**Abstract author(s):** Monton-Subias, Sandra (ICREA/Universitat Pompeu Fabra)

**Abstract format:** Oral

In this paper, I will discuss why I would respond with a nuanced “yes” to the previous question. I consider that “the mainstream” includes both hegemonic discourses about the past as well as the social logics that order the human relations that accompany their production. For years, gender archaeology has been considering how to become part of the mainstream. I propose to change this question and examine how not to become part of the mainstream. This is a challenge that many feminist archaeologists working within academia face today because they inhabit the uncomfortable juncture implied in working within an increasingly neo-liberal “fast academia” whose hegemonic research rationale is far from the ideal of a feminist depatriarchalization-decolonization of science.

Feminist gender archaeology has never been another “-ism” within the discipline. It was rooted in personal self-experience of sexism in the present, born in relation with others with the same experience, and situated in a commitment to subvert patriarchy and heteropatriarchy through investigations of the past. Discourses of the past are performative — they are instruments of socialization and practices of power that construct heteropatriarchy but can also subvert it. The old but vivid question, however, is how this drive may co-exist with working at institutions and programs of power-knowledge guided by antagonistic inner logics that sustain and recreate heteropatriarchy. How is it possible to navigate these structural discrepancies without being engulfed or politically deactivated by a high-speed academic culture of productivity whose rhythms and values are contrary to feminism? In my view, it is urgent to reflect on academic degrowth through a slow feminist archaeology that decelerates science and reunites, following feminist decolonial scholar Rita Segato, “what capitalism has disjointed”.

**3 NON AEQUAT OMNIS CINIS – OBSOLETE AND NEW APPROACHES ON GENDER IN MORTUARY ARCHAEOLOGY**

**Abstract author(s):** Schlegel, Valery (FU Berlin)

**Abstract format:** Oral

Death does not make us all equal – as is well known to Archaeologists; even in death wealth and health vary greatly, demonstrated in grave goods and human remains. Thus, on the question of replacing gender approaches with unique embodied experiences of past identities, there is to consider that the last decades of research brought developments to the study of identity in so far as identity is now seen in a holistic manner, as a combination of a number of social identities such as class/status/rank, ethnicity/multiculturalism, age, kinship, beliefs/religion as well as sex and gender. These aspects are inherent - to approach an experience of identity (unique or common) means to entail all or at least as many of them as possible. Still, it is certainly open to discussion how much weight should be given to each or one aspect, in this case gender; particularly because gender influences the interpretations of other identity traits heavily.

To support these preceding arguments and to nurture further debate, examples from Mortuary Archaeology are especially beneficial, since the interpretation of burials were and are often altered by assumptions of sex and gender. It poses a particular challenge to mediate between a biologically obtained sex of the bodily remains and the construed gender via grave goods. As the contribution aims to show, burials offer new approaches on gender, because

the latter is performed and presented in these staged rites, not only by the deceased but even more so by the kin responsible for the interment. Selected inhumations from different cultures, e.g. the Scythian burial of Ostrogozhsky, Maiden V, Mound 9, shall concisely elucidate obsolete, current and future methods on gender in Mortuary Archaeology.

#### **4 NEANDERTHAL RESEARCH, EARLY HUMAN HISTORY AND THE ISSUE OF MASCULINITY. THE ROLE OF GENDER IN NEANDERTHAL DISCOURSE.**

**Abstract author(s):** Peeters, Susan (Erasmus School of Philosophy - ESPhil, Erasmus University Rotterdam; Institute for Science in Society - ISIS, Radboud University Nijmegen) - Zwart, Hub (Erasmus School of Philosophy - ESPhil, Erasmus University Rotterdam)

**Abstract format:** Oral

Recently, Neanderthals have metamorphosed from the losers of the human family tree to people like us, full-fledged humans. However, the persistent quest for a minimal difference which separates them from us continues. Palaeoanthropology primarily studies ancestors from a distant past, but its findings also affect the identity and self-image of us, modern humans, defining what it means to be human today. This raises several questions, ranging from more general ones (e.g. How have we used Neanderthals to conceptualize ourselves as human beings?) up to more specific ones (e.g. How are gender issues constructed in narratives about Neanderthals and what does that reveal about current implicit views about gender identities?). This is not only visible in academic discourse, but also in popularisations of research. Popularised versions of Neanderthal research function as spotlights, conveying and amplifying the stereotypes and ideologies which are also at work in scholarly discourse more explicitly. Explicit attention will be given to how males and masculinity are presented. Implicit biases underlying our ideas and ideals of human and humanness, we argue, should be acknowledged and addressed. This will allow us to become open to more inclusive visions of the past, and of what it is to be human.

#### **5 ARCHAEOLOGICAL HERITAGE FEMINIST (RE)READING IN THE BASQUE COUNTRY: WALKING TOWARDS EQUALITY THROUGH ARCHAEOLOGICAL RESEARCH**

**Abstract author(s):** Campos-Lopez, Teresa (University of the Basque Country - UPV/EHU) - Aloria, Itziar (Deusto University) - Castrillo, Janire - Odriozola, Onintza - González, Aitziber (University of the Basque Country)

**Abstract format:** Oral

This proposal aims to present a project based on a research-action methodology, which proposes not only a (re)reading of the presence of women in history and historical discourse, but especially of the activities associated with women. How they are interpreted in terms of historical relevance, visualization in the generated discourse, exhibition notability, as well as its presence in research and in heritage education in three museums of the Basque Country.

Therefore, it analyses the assessment of why and based on what parameters the selection and interpretation of archaeological materials is done, and whether the archaeological reality documented in field work is adequately represented in museum exhibitions, in divulgation or in texts.

Thus, in this project we advocate for the (re)elaboration of a history in equality, with equal participation for women and men, far away from the one we know, in which part of its protagonists have been erased and stripped of a role and participation in historical facts that is not scientifically demonstrable.

It is proposal with a gender perspective, but above all, feminist, whose purpose is to be a true agent of socialization, proposing tools and lines of action to transform the discourses associated with the different historical periods, new patterns of approach to archaeological materials and for their divulgation.

#### **6 GENDER EDUCATION IN ARCHAEOLOGY. CASE STUDIES FROM BULGARIA, GERMANY AND THE UK**

**Abstract author(s):** Gutmiedl-Schuemann, Doris (Universität der Bundeswehr München, Department of Social Sciences and Public Affairs, Historical Institute) - Gaydarska, Bisserka (Manchester Metropolitan University)

**Abstract format:** Oral

In our paper, we will analyse archaeology study programs from 3 different countries (Bulgaria, Germany, UK), and search for lectures and courses with topics like gender, diversity, or identity especially in undergraduate study programs. University education in the chosen countries is part of the Bologna Convention, which makes them comparable; furthermore, they give a good geographical spread across Europe.

Our aim is not to discuss education in archaeology/gender archaeology in general or methods of teaching. By focusing on topic related to gender archaeology and their appearance in study program descriptions as well as in advertisements and syllabi of lectures and seminars, we want to discuss if study programs challenge students to question their perception of past societies, past people and gender roles, in order to participate in modern day discussions on gender, diversity and identity.

Our results show that gender teaching in archaeology in the UK is in decline, while it seems to be stable in Germany as well as on the low baseline of gender teaching we found in Bulgaria. As study programs are shaping future archaeologists and therefore the future of our profession, it is vital for the future of gender archaeology that this important topic is not side-lined during study time, but discussed from the beginning onwards.

## 7 GENDER, ARCHITECTURE, AND ARCHAEOLOGY: NEW CHALLENGES IN RESEARCH AND TEACHING ACTIVITIES OF THE ARSMAYA RESEARCH GROUP

**Abstract author(s):** Vidal Lorenzo, Cristina - Meijde Jansen, Erika - Feliu Beltrán, Núria (Universitat de València) - Horcajada Campos, Patricia (Universidad Complutense de Madrid) - López Bertran, Miriea - Marfí Bonafé, Àngels (Universitat de València) - Muñoz Cosme, Gaspar (Universitat Politècnica de València) - Parpal Cabanes, Esther - Vázquez de Ágredos, María Luisa (Universitat de València)

**Abstract format:** Oral

Gender archaeology has generated numerous publications that seeks to break down gender stereotypes based on androcentric worldviews. One of these views is the relation between women and architecture. From a patriarchal point of view, it is assumed a clear dichotomy between private, associated to women, and public associated to men. Although several studies have challenged this perspective in the academic sphere, we are aware that these gender bias division is still assumed by our students.

From the Arsmaya Research Group of the University of Valencia (Spain), we are challenging this topic by several actions both in research and teaching activities. In this contribution, we will present them to discuss the future of gender archaeology and its role. On the one hand, we will illustrate the different strategies and research questions to engender the use of architectural space in Antiquity (mostly in Maya culture and Ancient Mediterranean) and the research tools we are using to visualize the role of the community (women, men, elderly, children) in the process of building houses. On the other hand, we will present the teaching activities (Workshops, creative and reflexive writing, etc.) that our students prepare in relation to this topic. Finally, we will share how archaeology, ethnoarchaeology, arts, and teaching are unified by creating a series of drawings that recreates the construction process of a Mayan traditional thatched roof house based on verifiable and fairly accurate historical data where the involvement of all the community is highlighted.

## 8 ARCHAEOLOGICAL MUSEUMS AND GENDER ARCHAEOLOGY: CONTRIBUTING TO THE CONSTRUCTION OF A MORE EGALITARIAN SOCIETY. A SPANISH PERSPECTIVE

**Abstract author(s):** Romagnoli, Francesca - Prados Torreira, Lourdes - Castelo Ruano, Raquel (UAM - Universidad Autónoma de Madrid) - López Ruiz, Clara (INJUVE - Observatorio de la Juventud y la Mujer Joven, Instituto de la Juventud) - Gutiérrez Usillos, Andrés - Robledo, Beatriz (Museo de América, Madrid)

**Abstract format:** Oral

In the last two decades, Feminist Archaeology fostered an increasing awareness of gender issues in Spanish archaeology and museum studies. However, several biases are still limiting the narrative of past societies in the museums to truly be inclusive and make visible all the diversity of gender as it is mediated by age, ethnicity, and sexuality. That is especially the case with childhood, women, elders, and different ethnicities. On the one hand, it is about making visible such diversity in the exhibition design (they 'should be there'). On the other hand, it is about the construction of archaeological and museological narratives that highlights the active role of women, children and elders in the society and their participation in tasks that are essential in the collective development and social wellbeing. This challenge is crucial not only because the scientific data are clearly showing that our current narrative does not correspond to the complexity contained in the archaeological records, but also because the museums are thus neglecting their duties as inclusive and socially responsible spaces that have the role of educate in democracy, diversity, and equality.

In this presentation, the authors will present a novel research project aimed at analysing the current biases in archaeological and anthropological museums and proposing viable solutions and practical guidance to museums sector. The project is focused on Spain and Latin America to build a common perspective and shared solutions taking into account the intertwined history between these areas and the need for a decolonial archaeology. In this presentation, examples from Spanish archaeological museums will illustrate the current biases in the narrative of prehistoric, protohistoric and classical archaeology. Furthermore, in progress activities to improve gender and ethnicity perspectives in museums and promote an egalitarian social education will be discussed.

## 9 'MAKE MAPPINGS, NOT MUDDLES': GENDER ARCHAEOLOGY AND THE NEW MATERIALISMS

**Abstract author(s):** Kay, Kevin - Eriksen, Marianne Hem (University of Leicester)

**Abstract format:** Oral

New materialist approaches have promised a transformative approach to gender, placing analytic focus on difference rather than sameness or identity. While more conventional feminist and new materialist approaches converge on many paths (i.e. challenging 'Man' as the measure of all things, challenging assumed universal and essentialising

binaries such as male-female), there are also points of tension. Conventional gender archaeology has seen diverse application in archaeological epistemologies, whereas to date most new materialist approaches remain at a rather more conceptual level. New materialists in turn warn about seemingly pragmatic concepts (e.g. 'gender', 'identity') smuggling old binaries back into our narratives without sufficient reworking.

This paper argues that without serious pragmatic consideration of archaeological methods, new materialist gender 'revisionism' will only ever amount to a reminder that gender, like everything else, is relational. Drawing on Deleuze and Guattari's concept of mapping, we recommend a playful (yet dead serious) alternation between epistemes, even those with binary baggage. A refusal to retreat from the practice of gender archaeology—or to settle into methodological comfort zones—will help us to remain focused on the task at hand: to identify and understand gender difference as it shaped past lives and past worlds. Drawing on our work in Neolithic Turkey and late prehistoric Scandinavia, we will preview a mapping approach to gender, tying together epistemologies without losing sight of the stakes of the matter for people past and present.

## 10 BEFORE, DURING AND AFTER GENDER: TOWARDS A NON-ESSENTIALIST HISTORY OF RELATIONAL DIFFERENCE

**Abstract author(s):** Robb, John (University of Cambridge) - Harris, Oliver (University of Leicester)

**Abstract format:** Oral

This paper proposes a thought experiment, an adventure in ideas. Archaeologists often question gender: the bread and butter of gender archaeology is asking what it meant in an ancient society to be "male" or "female" or something else. But where should questioning stop? Are there things that are definitionally fixed about gender, that we can say are universal and unquestionable? This is clearly related to the scale of analysis: all gender analyses black-box their subject in a historical moment in which important definitional qualities of gender can be presupposed and analysis can focus upon the "content" of gender. But on the largest historical scale, we argue that gender cannot have fixed qualities; that insisting there is a fixed essence to gender reifies it as an ahistorical category. Taking our starting point from feminist theoretical critiques of the sex/gender (nature/culture) divide, from queer theory, and from intersectionality studies, we develop an alternative approach which sees gender as relational, as a protean, continually shifting form of difference which has a variable rather than fixed relationship to bodily difference. We exemplify this analysis with three brief examples: the potential pathways for the evolution of gender, the mutual relations between politics and gendered identities, and reconfigurations of intersectionality or the contextual constitution of gender difference. In this perspective, gender is not only continually redefined all the way down to its very definition; it is also a historically productive and generative form of difference.

## 11 THE FUTURE OF 'GENDER' IN ARCHAEOLOGY: INTEGRATING GENDER-APPROACHES INTO MAINSTREAM ARCHAEOLOGICAL PRACTICES

**Abstract author(s):** Pape, Eleonore (Georg-August-Universität Göttingen)

**Abstract format:** Oral

The concept of gender is becoming more and more relevant throughout the various archaeological disciplines and across borders. This is attested by the increasing number of national and international scientific publications focusing on gender and gender roles, as well as by the increasing visibility of archaeological gender-research disseminated through popular media.

The various publications deal with different aspects of gender, depending on the authors' expertise and the archaeological sources used. Some offer complex deconstructions of past theories and approaches, or present innovative, highly specialized interdisciplinary methods, while others illustrate occasional inconsistencies in specific small-scale archaeological contexts of different prehistoric eras and regions. Further others call out the marginalization of female and diverse researchers, and common stereotypes within past and present archaeological research environments. All these particularistic approaches are crucial and urge to think differently. However, they also struggle to implement the concept of gender into mainstream archaeological practices.

With this paper, I will focus on the challenges we are facing when attempting to grasp gender-conceptions of prehistoric social systems based on burials. I will demonstrate that these challenges do not only include theoretical, cultural or ideological issues, but foremost methodological problems that need to be addressed on a large scale to move forward and to integrate gender – one of the fundamental proxies for the understanding of prehistoric societies – more sustainably into common practice.

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Kapahnke, Sheri (Independent researcher) - Zak, Claire (Texas A&M University)

**Format:** Regular session

There is little doubt that climate change will continue to threaten many coastal archaeological sites globally, and it is equally known that humans have always thrived and depended on this boundary between land and sea. Some of archaeologists' most precious information about past interaction and trade comes from these sites found on the coast, such as harbours, trade settlements, and sites of production and ship construction. Changing coastlines have always affected archaeological sites, although today climate change threatens coasts on a larger scale and more rapidly. Submergence and coastal change take many forms, whether from purposeful water manipulation (to our benefit or detriment), to settlements that have been changed by erosion or sea-level rise. In addition to rising sea levels, coastal sites can be affected by an increase in sedimentation and extension of the coast line.

This session welcomes papers that discuss the significance of preserving and learning from coastal sites and that examine the effects of coastal change from societal adaptation in the past, to plans for managing change in the future. How have past societies purposely manipulated the coast? How have perspectives towards maritime landscapes fluctuated throughout time? What (and how much) can we learn from submerged archaeological sites? How do we bridge the gap between terrestrial and underwater features of a single settlement to approach it holistically? What approaches are being employed today to preserve and document sites threatened by coastal change, and what role do underwater archaeologists have?

Coastal communities are an incredibly rich study area to discern interactions between cultures, economic systems, and social structure beyond the readily visible elite. Coastal sites can be viewed as catalysts for cultural and social change, but also areas of rapid physical change, and therefore, deserve our immediate attention.

## ABSTRACTS

### 1 ANCHORAGES, WAYPOINTS: A PLACE TO REST YOUR WEARY BOW

**Abstract author(s):** Zak, Claire (Texas A&M University) - Kapahnke, Sheri (Independent Researcher)

**Abstract format:** Oral

In the ancient Mediterranean, the transport of people, goods, and ideas was facilitated primarily through seafaring. Ship's crews required places to dock; the coastline of the Mediterranean provided many natural harbors as protected access points to land. Some of these began as simple anchorages - waypoints that grew in importance as the Mediterranean cultures entered into complicated systems of exchange and trade. As sea levels rise and coastlines change through environmental factors such as sedimentation change, these anchorage sites became partially submerged. It is unreasonable to ignore the underwater portions of the site. While terrestrial archaeologists have excavated coastal sites for decades, it is only in recent years that attention has turned towards the submerged portions of these sites. Just as these collaborative spaces were important for the passage and transport of people and goods in the past, they remain valuable opportunities for terrestrial and underwater archaeologists to initiate interdisciplinary cooperation to gain holistic perspectives of ancient anchorages.

### 2 HUMAN-ENVIRONMENTAL INTERACTIONS IN THE GRADO-MARANO LAGOON (NE ITALY)

**Abstract author(s):** Vinci, Giacomo (Dipartimento di Scienze Storiche e dei Beni Culturali, Università di Siena) - Fontana, Alessandro (Dipartimento di Geoscienze, Università di Padova) - Mercuri, Anna Maria (Laboratorio di Palinologia e Paleobotanica, Università di Modena e Reggio Emilia) - Campana, Stefano (Dipartimento di Scienze Storiche e dei Beni Culturali, Università di Siena)

**Abstract format:** Oral

The Grado-Marano Lagoon, at the head of the Adriatic Sea, represents the northernmost sector of the Mediterranean Basin. The area is a low-lying coast that experienced a submerging evolution of about 10 m in the last 8000 years because of eustatic rise and land subsidence.

Since Neolithic communities interacted with amphibious environments and faced the sea-level rise in a long-term perspective. Several sites have been submerged by lagoon waters and deposits and/or eroded by coastal dynamics. The reclamation carried out in the 20th century drained about 400 km<sup>2</sup> of the lagoon rims between the Karst and Venice and led several sites to emerge and crop out. Currently, some archaeological settlements in the study area crop out at surface up to -2.5 m below sea level (bsl). Stratigraphic cores documented other buried sites up to -4 m bsl. The ongoing coastal retreat and near-future scenarios for sea level rise in the North Adriatic indicate that many documented archaeological sites are already at risk and urgently require investigation and protection.

Multi-proxy analyses carried out in the Grado-Marano Lagoon mainly based on remote sensing, historical cartography, geo-archaeological corings and pollen sampling allowed to integrate archaeological and paleo-environmental data in order to assess the human impact on the area and compare landscape and environmental changes with shifts in the settlement strategies.

By examining some case studies spanning from late Prehistory to Middle Ages, we propose a preliminary reconstruction of the modes of interaction between community and the environment which enlightens different ways of adaptations and manipulation of the coast through time. In particular, the data presented allow to reconstruct part of the history of coastal retreat and the lagoon submersion.

### 3 **Tsunami-Derived Sediments Identified in the Destruction Sequence of an 8th Century Warehouse in Caesarea Maritima, Israel**

**Abstract author(s):** Everhardt IV, Charles - Goodman-Tchernov, Beverly (Dr. Moses Strauss Department of Marine Geosciences, University of Haifa) - 'Ad, Uzi - Sharvit, Jacob (Israel Antiquities Authority) - Gendelman, Peter - Barkai, Ofra (Israel Antiquities Authority) - Jaijel, Roi (Dr. Moses Strauss Department of Marine Geosciences, University of Haifa) - Roskin, Joel (Ben-Gurion University of the Negev) - Robins, Lotem (Department of Geography and Environmental Studies, University of Haifa) - Dey, Hendrik (Department of Art and Art History, Hunter College, City University of New York)

**Abstract format:** Oral

Coastal archaeological sites have the potential to preserve evidence for past geological events in well-confined anthropogenic contexts. According to nearshore sedimentological records, a tsunami struck the coast of Caesarea Maritima, likely coinciding with a major earthquake in 749 CE during the early Islamic period. Archaeologists have found anomalous sand and shelly layers from the same time period during excavations of structures near the shore, and variously interpreted them as construction fill, dune development, or general abandonment. Recently, an excavation of a warehouse adjacent to the harbor uncovered this same deposit, allowing it to be analyzed in detail to determine its taphonomic history. The deposit is comprised of a thick, well-sorted sand layer with semi-articulated sequences of building stones followed by independent matrix-supported building stones. The entire deposit is sandwiched between an underlying abandoned early-eighth century floor and from above by a late-eighth century floor; thereby constraining its age to sometime mid 8th c. CE. Two sediment cores from the deposit, as well as reference samples representative of various nearby depositional environments, have been analyzed for grain size distribution, foraminiferal assemblage, and relative age by portable luminescence (POSL). The combination of results indicates that the sandy deposit was formed from the transport of offshore marine sediments during a single high-energy inundation event. The results of this study will contribute to the understanding of high-energy tsunami deposits preserved on land in Caesarea Maritima, and more broadly contribute to the understanding of tsunami sedimentological studies in geoarchaeological contexts.

### 4 **Seagrasses, Invasive Species, and the Changing Mediterranean: Protecting Our Maritime Heritage**

**Abstract author(s):** Kapahnke, Sheri (Independent Researcher) - Zak, Claire (Texas A&M University)

**Abstract format:** Oral

Seagrasses, specifically *Posidonia oceanica* (L.) Delile, are immensely important for the preservation of submerged archaeological remains. Swaths of *Posidonia oceanica* are present around the coastlines of the Mediterranean and create an anoxic environment and sealed protection for archaeological remains through naturally formed layers of grass mats and sediment. This creates the ideal environment to protect fragile artifacts such as wood and iron from degradation, as well as shelter a site from looters. However, the balanced ecosystem that supports the seagrasses ability to create ideal states of preservation is being threatened. Archaeologists are aware of the danger to seagrasses by rising water temperatures and acidification caused by climate change, but the Mediterranean has also experienced a drastic increase in invasive species which are threatening local species populations. Invasive species travel freely into the Mediterranean, moving through the Suez Canal and hitching a ride in ballast water of cargo vessels. The effects on seagrass by alien algal species are well studied in the environmental sciences, but archaeologists have yet to bring this, and many other environmental conversations, into our excavation and education plans. The Mediterranean Sea is undergoing drastic changes, and through discussing the threats to seagrasses, we hope to insight change in our responsibilities as archaeologists to protect not only known archaeological sites, but also the material culture still tucked away by including environmental education in our university programs, participating in community outreach, and collaborating with environmental specialists.

## 5 STEPS FORWARD REGARDING THE DEVASTATION OF TRAWLING ON ARCHAEOLOGICAL SITES AND FISH POPULATIONS

**Abstract author(s):** Jarvis, Charlotte (Ocean Foundation; Texas A&M University)

**Abstract format:** Oral

Since its first mention in a fourteenth-century parliamentary petition, trawling has been regarded as a catastrophically damaging practice with lasting negative consequences on seabed ecology and marine life. Trawling has also had dramatic impacts on maritime archaeology sites, though that side of trawling does not get enough coverage. All three trawling revolutions—invention, mechanization, and later deep-water expansion—have been met with controversy and pushback by the public and environmentalists alike. The practice has enabled humans to exploit the sea and destroy their own history at the same time. Maritime archaeologists and marine ecologists need to communicate and work together to lobby for trawl bans. Shipwrecks are as much part of the marine landscape, and thus of importance to ecologists, as they are to the cultural, historical landscape.

Yet nothing has been done to seriously limit the practice and protect the underwater cultural landscape and archaeological impacts and data are missing from biological reports on the process. No underwater policies have been formulated to manage offshore fishing based on cultural preservation. Some trawling restrictions have been placed after backlash in the 1990s and ecologists, well aware of the dangers of trawling, have lobbied for more restrictions. This research and advocacy for regulation is a good start, but none of this stems from concern or activism by archaeologists. UNESCO has not raised concerns, and, if anything, has policies that harm the trawling ban efforts. They advocate for in situ preservation yet have nothing in place to protect those wrecks from trawling damage. If in situ preservation is to be supported, moorings can be added and shipwrecks, if left in place, can become artificial reefs and places for more artisanal, sustainable hook-and-line fishing.

## 6 GIS MAPPING MARITIME CULTURAL LANDSCAPES IN LIBERIA AND SIERRA LEONE

**Abstract author(s):** Crutcher, Megan (Texas A&M University)

**Abstract format:** Oral

ArcGIS mapping can be a powerful tool to illustrate the history and importance of maritime cultural landscapes. This paper describes the use of ArcGIS to depict historic networks of contact and trade on the coast of West Africa from the 15th to 20th centuries, with a focus on modern-day Liberia and Sierra Leone. This region was home to many groups of indigenous seafarers. Prior to European contact and colonization, these groups had been manipulating the coast, creating and inhabiting what archaeologists would now call maritime cultural landscapes. Their interactions with land and sea encompassed economic, cultural, social, and political spheres. Indigenous seafarers utilized longstanding traditions and existing networks to broker trade with Europeans and to seek employment as laborers or navigators on European ships. Europeans, in turn, created maps and drawings that depicted these coastal networks and the people they encountered, and these records became more detailed and geographically accurate through time. Geographic information from multiple historical periods can thus be overlaid using ArcGIS. GIS maps can reveal spatial and temporal change and continuity in a rich maritime cultural landscape and show how the colonial legacy of inattention and inequality continues to affect heritage preservation in these coastal regions. Using GIS to document past coastal change allows us to implement plans for sustainable heritage management in the future, while digital dissemination removes barriers to access that have often prohibited stakeholder involvement and collaboration in formerly colonized regions.

## 7 PREHISTORIC COASTAL SITES IN BARBADOS, WEST INDIES. EROSION, SUBMERGENCE AND COASTLINE CHANGE

**Abstract author(s):** de Waal, Maaike (Faculty of Archaeology, Leiden University)

**Abstract format:** Oral

This presentation focuses on Barbados, a Small Island Developing State in the Caribbean. The earliest heritage of Barbados involves remnants of prehistoric, Amerindian occupation (ca. 3000 BCE and 1500 CE). These include permanent and temporary settlements, characterized by, often scattered, distributions of fragments of pottery, lithics, shell, and/or coral at the surface. As result of the fact that the sites are difficult to recognize for the untrained eye, and of the fact that the interest of Barbadians, tourists and archaeologists is strongly focused on the island's colonial heritage, the prehistoric sites go largely unnoticed. However, these sites are testimony of how the earliest inhabitants of the island used, inhabited, and modified the landscape, and of how they adapted their socio-economic organization strategies when environmental conditions changed.

Many prehistoric sites are located directly on, or very close to, today's coastline. Coastline changes, for example as a result of rising sea levels and extreme weather events, seriously threaten the conservation of these sites. Archaeological contexts get perturbed, materials are washed away, and complete sites disappear in the sea. Probably, this often happens without being noticed.

As coastal processes were also taking place in the past, site distribution patterns as archaeologists reconstruct them, are incomplete per definition, and settlement locations as we observe them today look very different compared to how they may have looked in the past. The question is: what did these prehistoric settlement locations and settlement patterns look like? What (and how much) information do we miss, when it comes to coastal, prehistoric, occupation? How can we fill in the blanks? And how can we test our ideas?

## 8 **ERODING COASTAL SITES IN SOUTH-CENTRAL VERACRUZ, MÉXICO: CHALLENGES AND SIGNIFICANCE**

**Abstract author(s):** Ensor, Bradley (Eastern Michigan University)

**Abstract format:** Oral

Coastal communities are integral to regional political economies. However, Mesoamerican "Gulf Coast Archaeology" is traditionally informed by investigations of interior areas rather than the actual coastlines. In addition to subsidence and sea level rise, a concern for coastal archaeology is the accelerating erosion of non-submerged sites from increased storm frequency and intensity. This paper describes the challenges of documenting eroding uplifted coastline sites in South-Central Veracruz, México and illustrates how their investigation can contribute new understandings of social, economic, and political organization. A 2021-22 survey of the Camaronera Lagoon margins and adjacent Gulf of México shoreline is presented. Many of the sites - covered by tall dune formations - are situated on volcanically-uplifted marine beds several meters above sea level where erosion cuts vertical cliff faces - a situation requiring portable scaffolding for documentation yet without the opportunity to observe site areas (only lengths along the erosional cuts). The results suggest a densely populated coastal landscape. Furthermore, the highest density is associated with a minor elite site, possibly suggesting a larger supporting population than around the better investigated minor centers of the interior alluvial plains. An additional discovery is textile processing tools and oysters at the Gulf shoreline, indicating economic integration among the inland farming, lagoon, and marine settlements separated by kilometers. Though imminently threatened and challenging to document, the investigation of coastal sites contributes new understandings of prehispanic Gulf Coast societies.

## 9 **SHELL DEPOSITION IN IRELAND: A PROCESS OF THE PAST AND OF THE FUTURE**

**Abstract author(s):** Howle Outlaw, Carolyn (University College Cork)

**Abstract format:** Oral

There has been c. 8000 years of near continuous coastal resource exploitation in Ireland, which remains little understood. Not long after Ireland was first inhabited by humans, shells began to be deposited in middens as a result of this exploitation. In 1912, Johanna Brunnicardi (Ní Holland) sought to investigate and catalogue these midden sites. She recorded 56 sites and interpreted the majority as 'Stone Age' food refuse sites and the remainder as evidence of a regression to a similarly primitive lifestyle, a theory which stunted midden interpretations in Irish archaeological research for some time. Over 100 years later, my current research has resulted in a new catalogue of over 600 shell bearing deposits at over 500 sites. Due to improved dating methods and less restrictive interpretations, the deposits have been dated from the Mesolithic through to the Modern Era, indicating that shell middens are a continuous aspect of the Irish cultural landscape. Using available dating evidence, my research has evaluated these sites diachronically in order to understand how the deposits have changed using statistical analysis of artefactual, ecofactual, and associated structural remains found in or around these features. Through an improved understanding of past coastal resource exploitation in Ireland, we can encourage the cultivation of a more widespread respect for this vulnerable landscape in the face of climate change and human interference and the erosional threats they bring. This paper aims to outline the findings of my chronological analysis, the current state of preservation of the sites, and future research and mitigation potential.

## A. **PRISM: PRESERVATION BY RECORD OF IRELAND'S SHELL MIDDENS**

**Abstract author(s):** Howle Outlaw, Carolyn (University College Cork) - Connolly, Rory - Moucheron, Martin (University College Dublin)

**Abstract format:** Poster

Coastal shell middens are an important archaeological resource with the potential to shed light on many aspects of human interaction with coastal environments over time. Over 500 sites containing these shell deposits can be found at various locations along the c. 7500km or so of the Irish coastline, dating from c. 6000 BC during the Irish Mesolithic to the modern era. Understanding past human-coastal interaction may assist researchers, policy makers, and community leaders in developing new approaches and building resilience along the coast today. However, these shell middens are rapidly being lost due to both natural — sea-level rise, coastal erosion, increased storm surges, and isostatic shift — and anthropogenic factors — trampling by footfall, removal of shells and other archaeological material, certain agricultural practices, and encroaching development.

The PRISM project, Preservation by Record of Ireland's Shell Middens, is a citizen science participatory mapping scheme devised to assist volunteers in recording midden sites and the effects of erosional factors in their own communities. An interactive website has been developed to include digital mapping tools and information for assisting such recording. The project aims to foster pride in local coastal heritage for the volunteer citizens along with creating a more complete record of shell middens for future research and mitigation. This poster will show the website and how to interact with it to continue to spread PRISM throughout the research community and the interested public. As the impacts of climate change are increasingly felt in coastal regions globally, the participatory mapping approach which will be shown will be of interest beyond the island of Ireland.

## 149 INTERACTIONS, INNOVATION AND COMMUNICATION IN THE LATE NEOLITHIC AND COPPER AGE

**Theme: 2. [Re]integration**

**Organisers: Siklósi, Zsuzsanna (Eötvös Loránd University) - Hofmann, Daniela (University of Bergen) - Szilágyi, Márton (Eötvös Loránd University)**

**Format: Regular session**

The period from the 5th to the mid-4th millennium BC in Central and South-Eastern Europe is a time of fundamental change. Larger-scale cultural entities fragment into small regional groupings, yet trends and innovations are shared widely and across such cultural boundaries. Due to this duality, our understanding of the period in question can be very diverse depending on whether we focus on the diversity of cultural entities or on the large networks outlined by for example copper or jade objects, stone knapping technologies, circular enclosures or formal cemeteries.

At this time, very different social formations were in intensive and sustained contact with one another, implying considerable personal and group mobility and intense social interactions. An ever increasing portfolio of methods and approaches means that we can now integrate a much wider range of information for understanding these than ever before, integrating site-based narratives and supra-regional connections. Our session aims to discuss the recent research directions in Late Neolithic and Copper Age studies along the following main axes:

1. Innovation, craftsmanship and specialized knowledge – the development of new technological systems, the networks behind them and societies' reaction to them;
2. Burials, cemeteries, ritual activities – the social importance of ritual spaces and landscapes and the purposeful deposition of human remains, animals and selected material culture;
3. Settlements and economy – organization of everyday life, the spread of economic innovations which enable life in new landscapes;
4. Cooperation and collective action – on a site-based, microregional, regional or supra-regional level;
5. Connections and boundaries – what form did long-distance connections take, what were the routes and actors involved, and at what times/points were boundaries created?

All contributions dealing with any of the above mentioned topics from Central Europe, the Carpathian Basin and the Balkan peninsula and adjacent areas are welcome.

## ABSTRACTS

### 1 INTRODUCTION: INTERACTIONS, INNOVATION AND COMMUNICATION IN THE LATE NEOLITHIC AND COPPER AGE

**Abstract author(s): Siklósi, Zsuzsanna (Eötvös Loránd University) - Hofmann, Daniela (University of Bergen) - Szilágyi, Márton (Eötvös Loránd University)**

**Abstract format: Oral**

In the 5th to the mid-4th millennium BCE widely shared innovations in burial, economy, technology, monument building and settlement organisation are established which cross-cut the increasingly confusing plethora of small-scale 'culture' groups which archaeologists have defined on the basis of pottery. Yet how these very different societies coped with the available innovations is still being hotly debated, with interpretations oscillating between large-scale narratives of increasing hierarchisation throughout the continent and small-scale studies concerned with the peculiarities of particular sites.

In this introductory paper, we want to outline some of the main themes and controversies that have shaped the debate during the last decades highlighting the theoretical and methodological milestones. After the traditional oversimplified "culture" interpretation of migrations, the obscure and often-invoked, but rarely specified "impacts" of archaeological cultures, and the generalized and scientific-based models of New Archaeology, the multidisciplinary research efforts of the last decades mean that our current knowledge about the social interactions between South-

east and Central Europe, as well as areas beyond, offer a more colourful and detailed view than ever. How to deal with this diversity is much less clear. We will use selected case studies to introduce some of the main models.

## 2 INNOVATIONS AND INTERACTIONS IN THE LATER NEOLITHIC FROM THE DNIEPER TO THE VOLGA

**Abstract author(s):** Vybornov, Alexander (-) - Doga, Natalya (-) - Kulkova, Marianna (-)

**Abstract format:** Oral

At the end of the 6th millennium BC in the Lower Volga basin, the Cis-Caspian culture appeared. The vessels of this culture have "collar" corollas and comb ornamentation. The quartzite tools made of the technique of strong push-up have characterized this culture. These innovations are evidence of the migration of carriers of this cultural tradition. Such technological traditions belong to the Azov-Dneprovskaya and the Nizhnedonskaya cultures from the Dnieper and Don steppes. Probably, at the end of the 6th-millennium carriers of these cultures began to move toward the southeast because they have husbandry animals. In the ceramics of the Northern Cis-Caspian, there is noticed the combination of local pricked made ornamentation with the "collar" corolla. This is evidence of local people and newcomer interactions. According to the Oroschaemoe I excavations, in the last of 5th ka BC the carriers of the Cia-Caspian culture moved to the North in the steppe zone. The artifacts which are analogies to the Cis-Caspian materials were found in the northern regions like the forest-steppe zone of the Middle Volga basin. It is the first stage of Samarskaya culture which is dated to the same period. In the Middle Volga region, the contacts between carriers of the first stage of the Samarskaya culture and the local Srednevolzhskaya culture took place. The second stage of the Samarskaya culture is the result of these interactions. As a result of the collaboration of different people groups at the turn of the 6th and 5th millennium BC the spreading of innovations including domestication took place from the Dnieper to the Volga.

## 3 WHERE THE WILD THINGS ARE

**Abstract author(s):** Csippán, Péter (Eötvös Loránd University) - Tóth, Zsuzsanna (Hungarian National Museum)

**Abstract format:** Oral

The role of large games definitely changed during the Late Neolithic in the Carpathian Basin. This fact is mirrored in both animal bone finds and raw material selection of the worked hard osseous tools. On one hand, this phenomenon ties closely to intensive agriculture: the defense of the fields and the herds of domestic species. On the other hand, it connects to the secondary Holocene wild fauna income into the Carpathian Basin. Both of these processes undoubtedly caused an extremely intensive effect, such as the role of large games changed in this period parallel to the more and more frequent contact between animals and human populations.

Our goal is to represent these special roles through the groups of grave finds from the Late Neolithic site of Polgár – Csószhalom, a unique site complex of a tell and a horizontal settlement in the 5th Millenium BC.

According to the meat-eating processes the proportion of venison almost equaled meat of domestic species on the horizontal settlement. Red deer and wild boar played the main role based on the analyzed NISPs, also the most represented species in the worked hard osseous grave goods. Red deer canine beads and their imitations appear in a great number reflecting a special connection of these communities to deer as a game animal and probably endowed with special meaning. On the other hand, tools made of wild boar and deer appear often at the horizontal settlement, too, showing increasing influence of wild species as chosen raw materials for hard osseous tools. The transformation of these animals seems to be general, not only based on the number of their bone fragments but also on their repetitive and conscious selection.

## 4 PATTERNS OF CULTURAL INTERACTION AND GROUP IDENTITY FORMATION AS REFLECTED BY A LATE NEOLITHIC COMMUNITY IN THE MIDDLE TISZA REGION

**Abstract author(s):** Sebok, Katalin - Csippán, Péter - Faragó, Norbert (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest) - Hajdu, Tamás - Köhler, Kitti (Department of Biological Anthropology, Eötvös Loránd University, Budapest) - Kreiter, Attila (Laboratory for Applied Research, Hungarian National Museum, Budapest) - Mörseburg, Alexander (Department of Archaeology and Anthropology, University of Cambridge, Cambridge) - Siklósi, Zsuzsanna (Institute of Archaeological Sciences, Eötvös Loránd University, Budapest) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, Research Centre for the Humanities, Budapest) - Tóth, Zsuzsanna (Hungarian National Museum, Budapest)

**Abstract format:** Oral

The unique character of the Late Neolithic settlement unearthed near Pusztataskony about a decade ago was apparent from the beginning. While the site is located on the western fringes of the Tisza culture's distribution area, a relatively high number of characteristic Lengyel-style vessel fragments have been found in its ceramic record. Furthermore, a fundamental element of the early Lengyel culture's distinct funerary practice was an integral part of the local rite. An interdisciplinary project was conducted to learn about the factors and actions behind the formation of this archaeological record, the connection network maintained by the community, and the character of social

identity on both personal and settlement levels. The results of independent analyses from diverse fields: anthropology and palaeogenetics, strontium and nitrogen isotope analyses, radiocarbon dates, archaeozoology, ceramic and lithic statistics, and ceramic technology were combined to provide answers. The three-year-long project ended in 2019. The results' relevance seems to go beyond the local level, contributing to understanding social relations and interaction of the communities residing in the Middle and Upper Tisza Region and the Northern Mountains around 4800–4500 cal BC.

## 5 PERIPHERY AND THE CENTRE: SOUTHEASTERN ALPS IN THE FIFTH MILLENNIUM BC

**Abstract author(s):** Mlekuž Vrhovnik, Dimitrij (University of Ljubljana; Institute for the protection of the cultural heritage of Slovenia)

**Abstract format:** Oral

The paper discusses the relationships between the Neolithic “core area” in Carpathian basin and the historical processes in South Eastern Alps in the fifth millennium BC.

Early Neolithic expansion into the Carpathian basin halted when it reached the Alpine foothills. This resulted in a stable frontier, with little evidence of interaction with local foraging groups.

Around 4700 BC there is a pronounced change in the settlement systems in the Carpathian basin with the appearance of stratified tell sites, large nucleated settlements and extensive cemetery grounds. This process is very well documented on sites like Alsónyék-Bátaszék in south-west Hungary, where the settlement experiences sudden large-scale expansion around. It is just one of several substantial Lengyel culture sites in the neighbourhood which include both cemeteries and settlements. These settlements became a large aggregations of people. However, those aggregation stayed in place for only one generation, followed by an equally fast dispersal.

This process coincides with the rapid Neolithic expansion into the SE Alps, especially area of modern Slovenia, which reached its peak around 4700 BC. It is marked by fast expansion along Sava river, establishment of settlements in the river valleys and plains. This is followed by the expansion along Drava and Mur river valleys deep into the Alps. Same pattern of breach of long standing frontiers is visible also elsewhere in the Eastern Alps.

The transition from Late Neolithic to Copper Age in the Carpathian basin is marked by a change from nucleated to a dispersed settlement pattern. Previous nucleated sites were replaced by smaller, flat settlements, largely characterised by shallow single-layer occupation deposits. In the SE Alps this process can be also detected, however it takes the form of an expansion from lowlands into the drier Karst hinterland and formation of enclosed upland sites and hillforts.

## 6 WE TURNED OUR GAZE FROM THE CASTLES IN THE DISTANCE: MAGNETIC PROSPECTION AT BODROGKERESZTÚR SITES IN SOUTHEASTERN HUNGARY

**Abstract author(s):** Ridge, William (University of Illinois at Chicago) - Sarris, Apostolos (“Sylvia Ioannou” Chair for Digital Humanities, University of Cyprus)

**Abstract format:** Oral

The Copper Age Bodrogkeresztúr culture found throughout the Great Hungarian Plain is best known from large, organized cemeteries and for the splendid metal artifacts, including gold pendants and heavy copper axe-adzes recovered from graves. However, these characteristics have overshadowed the fact that little is known about the settlements and social aspects of the period. To date, very few Bodrogkeresztúr settlements have been investigated and there is a significant dearth of domestic data. Over the last few years, an overarching goal of the Copper Age Settlement Project (CASP) has been to identify and investigate the settlements belonging to the Bodrogkeresztúr culture.

Together with colleagues from the Foundation for Research & Technology Hellas (FORTH) and the University of Cyprus, we conducted surface collection and magnetometry survey at three Bodrogkeresztúr sites in Békés County in south-eastern Hungary. From this work we were able to approximate the size of the settlements and to identify potential domestic structures. The magnetic features identified as potential structures were much smaller and less distinct than those associated with houses at nearby Neolithic settlements. The differences are due, in part, to changing strategies at the more ephemeral Copper Age settlements, such as less regular house burning and the possible use of subterranean structures.

## 7 THE FAINT TRACES OF AN ECONOMIC AND POLITICAL HUB AT 4000 BCE IN CENTRAL EUROPE

**Abstract author(s):** Gronenborn, Detlef - Antunes, Nicolas (Leibniz Research Institute for Archaeology - RGZM)

**Abstract format:** Oral

Today the Rhine-Main region is one of the major economic foci and indeed hubs in Central Europe with river-bound and land-bound long-distance networks interconnecting with the global world through Frankfurt Airport.

Looking back 6000 years, it well appears that the region has played a similar hub role, albeit obviously on much lesser scales. Nevertheless, it was tied into overland and likely river-bound networks, interconnecting with the surrounding regions in Eastern and Southern Central Europe.

Most of the major sites, like Urmitz and Schierstein are gone, with no accessible archaeological traces left. But one site, situated on a Taunus Mountain range promontory, is well preserved and has been the focus of continuous research attention.

The most recent results from the ongoing project at Kapellenberg are presented, together with an improved internal site age-model, connecting the various building and wall phases with the little information we have on the Michelsberg occupation of the surrounding eco-cultural niche.

## 8 CONNECTIONS AND INTERACTIONS: LASINJA CULTURE AND ITS NEIGHBORS

**Abstract author(s):** Cataj, Lea (Croatian Conservation Institute)

**Abstract format:** Oral

Lasinja, or Balaton-Lasinja is a well-known Copper age culture, which occupied parts of Central Europe at the end of the 5th millennia. Although it is usually considered that it developed from preceding Lengyel and Sopot cultures, some finds suggest it also had a little help from the East. At what rate did this influence happen is still a question unanswered. It is indicated by several aspects of Lasinja culture that it might have been a part of a bigger complex. Similarities in the way pottery were shaped and decorated can be seen in a wide area of central and southeast Europe, in cultures such as Jordanów/Jordansmühl and Ludanice but even in Bodrogkeresztúr and Bubanj-Sälcuța-Krivodol cultures, implying wide-range connections and interactions. At the same time, local differences can also be noticed. A detailed analysis of Lasinja culture in the central part of Croatia brought several new insights into this Copper age phenomenon. Large-scale excavations and calibrated radiocarbon dates have also helped to prove some „facts“ need to be reconsidered.

## 9 DISTRIBUTION OF RAW MATERIALS OF THE CHIPPED STONE INDUSTRY DURING THE 5TH MILLENNIUM BC IN THE MORAVA RIVER BASIN

**Abstract author(s):** Trampota, Frantisek (Institute of Archaeology of the Academy of Sciences of the Czech Republic)

**Abstract format:** Oral

Thanks to decades of specialization in the determination of stone raw materials, we now have over a hundred settlement sites with a relevant number of determined raw materials from the collections of the chipped industry in Moravia in the 5th millennium BC. In this paper I analyze diachronic changes in the raw material composition of the chipped stone industry in the area of the Morava river basin during ca 4900 - 4000 BC. Raw materials of non-local origin are then selected and their proportions compared with the settlement density. The amount of imported raw materials is also compared with the frequency of occurrence of radiocarbon data, which roughly corresponds to the frequency of population activities. Using these methods, we can find out to what extent the distribution of exogenous raw materials was conditioned by population density or another factor. Lastly, it is possible to compare how is the change in ceramic style associated with the character of the distribution of stone raw materials.

## 10 CONNECTING FRAGMENTS. BAVARIAN LATE NEOLITHIC POTTERY AND ITS NETWORKS

**Abstract author(s):** Szilágyi, Márton (Eötvös Loránd University) - Dunne, Julie (University of Bristol) - Helfert, Markus (Goethe University Frankfurt) - Ramminger, Britta (University of Hamburg) - Hofmann, Daniela (University of Bergen)

**Abstract format:** Oral

The Later Neolithic of southern Bavaria is characterised by an unusually elaborate pottery tradition, that of the so-called Münchshöfen culture. Compared to earlier and later traditions, we observe a profusion of shapes and sizes, as well as elaborate decoration and the deposition of pottery in special circumstances, for instance at enclosure sites. It has also long been appreciated that there are definite links to the south-east and east, as well as more mooted parallels with western traditions.

In this paper, we trace the development and use of the pottery from one particular site, the enclosure of Riedling, to explore the changing social importance of this material. By combining evidence on chronology, pottery use (through lipid analysis) and the likely local origins of the vessels (examined through XRF analysis), we uncover the role of pottery within conspicuous consumption events, which appear to be crucial theatres for the introduction of novelties. By putting these pieces of the mosaic together, we are able to construct a bottom-up model of the use and role of pottery at a single, but seemingly special site. We also reflect on the implications of this pattern for the mobility and connections of the Riedling inhabitants.

- 11**      **BETTER THAN OUR NEIGHBOURS? THE RIEDLING ENCLOSURE AS A SIGNIFICANT PLACE IN THE YOUNGER NEOLITHIC**
- Abstract author(s):** Hofmann, Daniela (University of Bergen) - Szilagyi, Marton (Eotvos Lorand University Budapest) - Griffiths, Seren (Manchester Metropolitan University) - Husty, Ludwig (Kreisarchaeologie Straubing-Bogen)
- Abstract format:** Oral
- The Münchshöfen culture of Lower Bavaria has long stood out as a somewhat exotic phenomenon. Although its pottery shows clear connections to the east, there are hardly any known copper artefacts, and few other signs of incipient hierarchy (such as rich burials or diversified domestic architecture). In contrast, enclosures and structured deposits of humans, animal remains and objects are an increasingly important part of the material record. As our models of the later Neolithic and Early Copper Age are becoming more complex, this leads to the question of whether some societies or regions underwent alternative historical trajectories in which the accumulation of individual status was absent, or at least partly masked.
- In this paper, we explore the biography of one such enclosure, that of Riedling, in order to address these questions. Pulling together the economic, artefactual and anthropological evidence, and on the basis of Bayesian statistical models of radiocarbon dates, we ask how enclosures could have functioned in a context of potentially unstable social relations and short-term aggregations at the local and regional level. Finally, we discuss how this pattern fits into our wider view of emerging hierarchies at the cusp to the Copper Age.
- 12**      **DEPOSITIONAL PRACTICES AT THE RONDEL-TYPE ENCLOSURE OF STAMBOLIYSKI IN BULGARIAN THRACE**
- Abstract author(s):** Katsarov, Georgi - Nikolova, Nikolina - Tsurev, Atanas - Bacvarov, Krum (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences)
- Abstract format:** Oral
- In advance of a gas pipeline construction in 2019, large-scale rescue excavations were carried out at the early Copper Age site of Stamboliyski in Bulgarian Thrace (early fifth mill. cal. BC). Three successive enclosure ditches were uncovered as well as the remains of several palisades that are closely comparable – both chronologically and typologically – to the Central European rondels: complexes of one or more enclosure ditches, usually featuring V-shaped cross-sections and one or more palisades within the enclosure. Nearly 50 pits of various shape and size were excavated in the area enclosed by the ditches.
- This presentation will discuss the different types of deposits revealed both in the ditches and the pits and their possible significance. The structured deposits in the ditches were located mostly around the enclosures' entrances but also in different places on their bottoms. They usually consisted of burnt house debris, disarticulated human remains, animal skulls and horn/antler cores, whole and fragmented pots and grindstones. Some of the pits display almost identical contents and arrangement of their deposits; they were sealed with a thick layer of burnt house ruins and a large number of ceramic sherds. On the basis of the deposits' position, it seems possible to identify features that mark the beginning or the end of the enclosure's use.
- 13**      **A QUANTITATIVE EXPLORATION OF FUNERARY ASSEMBLAGES AS AN ARCHIVE OF MORTUARY INEQUALITY IN THE CHALCOLITHIC**
- Abstract author(s):** Brummack, Sven (Freie Universität Berlin)
- Abstract format:** Oral
- Methodological accesses derived from Economic Sciences have made a firm impact on the study of Inequality in Archaeology. This has been exemplified by studies to track and map out relative inequality of mortuary assemblages (Schulting 1995, Grossman 2021), exposing and quantifying finely graduated differences in relative concentration present in the archaeological record. Because the Lorenz curve in its essence is a cumulative graph (the Gini-coefficient is a function derived from it), it naturally relates to the cumulative character of the burial sites studied. Those, too, represent imperfect and opaque outcomes of essentially iterative practices, which accumulated funerary assemblages over protracted times. Differences in taphonomy, source quality and the underrepresentation of formal burials varies over different regions and time-domains and compounds to the archaeological problem. While relative concentration measures do not necessarily depend upon the presence of a complete sample to describe the distribution encountered, the degree of information improves with enhanced data resolution as well as deeper understanding of the data structure. Presently, our information from formal relative inequality analysis in South-Eastern European burial sites within the period ca. 4800-3800 calBC was largely limited to Durankulak (Windler et al. 2012) and Gomolava (Porčić 2012). From such a limited number of case studies, a general increase of social inequality has been drawn (Kohler et al. 2017, Scheidel 2018). Therefore, the relative inequality analyses were expanded to mortuary assemblages from 60 burial site-units extending from Eastern Slovakia along Tisza and Danube to the western Black Sea coast. From this database, the degree of variance and conformity could be assessed, shedding light on

scales of inequality and how they developed along spatial-temporal frames of reference. This in turn allows forming ideas about the spatial extent of communally shared conceptions expressed through the mortuary domain and ultimately, helps constraining our social interpretations.

## 14 THE RISE OF METALLURGY AND 7000 YEARS OF ANTHROPOGENIC METAL POLLUTION IN SOUTHEASTERN EUROPE

**Abstract author(s):** Veres, Daniel (Romanian Academy, Institute of Speleology, Cluj-Napoca) - Longman, Jack (Marine Isotope Geochemistry, Institute for Chemistry and Biology of the Marine Environment - ICBM, University of Oldenburg) - Chauvel, Catherine (Institut de Physique du Globe de Paris, University of Paris, CNRS) - Tamas, Calin (Faculty of Biology and Geology, University Babeş Bolyai) - Haliuc, Arifina (Romanian Academy, Institute of Speleology, Cluj-Napoca) - Gogaltan, Florin (Institutul de Arheologie al Academiei, Cluj-Napoca)

**Abstract format:** Oral

Archaeological data document early cultural traits in southeastern Europe linked to ancient metalworking, but lack of data precluded a precise understanding of their long-term environmental impact. Here we report geochemical results from several Carpathian peat profiles showing evidence of lead (Pb) excess denoting anthropogenic metal pollution already by ca. 5200-4300 BCE. Our find directly corroborates the archaeological evidence, as the dazzling array of early metal artifacts considerably exceeds evidence from elsewhere making this a phenomenon largely exclusive to southeastern Europe. Using also Pb isotopic constraints and calculations of Pb accumulation, we conclude that the rise in Pb by ca. 5200-4300 BCE represents a direct record of environmental pollution during this era of primitive but widespread smelting and protometallurgical experimentation in the Balkans. We also observe another period of anthropogenic Pb pollution during the Late Copper/Early Bronze Age ~3,600 years BCE, to date one of the earliest such evidence documented in European environmental records. By 1000 BCE the environmental signal of excess Pb became ubiquitous in the Balkans, peaking during the Iron Age and the Roman period. A steady, almost linear increase in Pb concentration after 600 BCE, until ca. 700 CE is observed, documenting the development in both sophistication and extent of southeastern European metallurgical activity throughout Antiquity and the Roman period. A sustained medieval Pb pollution spanning 10th to 16th centuries AD reached pollution levels and a Pb flux comparable to the modern period.

Our reconstruction of environmental pollution contrasts and complements evidence from western Europe. We advocate this reflects regional variability in metal pollution output linked to developments attained by the different European societies for last millennia. Our results add crucial evidence to the long-range and long-lasting legacy cast upon the environment by past metal processing in Europe already from the Late Neolithic, c. 7000 years ago.

## 15 FIFTH MILLENNIUM BC MINIATURE CERAMIC BOTTLES FROM THE SOUTH-EASTERN PREALPS AND CENTRAL BALKANS: THE RESULTS OF THE MULTI-DISCIPLINARY STUDY

**Abstract author(s):** Kramberger, Bine (Institute for the protection of cultural heritage of Slovenia) - Berthold, Christoph (Eberhard Karls Universität Tübingen, Competence Center Archaeometry – Baden-Wuerttemberg CCA-BW) - Spiteri, Cynthia (Eberhard Karls Universität Tübingen, Institute of Prehistory, Early History and Medieval Archaeology)

**Abstract format:** Oral

The aim of this paper is to present the results of a study of miniature ceramic bottles with perforated handles, which entered the pottery repertoire of different Late Neolithic and Chalcolithic communities across the south-eastern Prealps, south-western Transdanubia and the Balkans in the 5th millennium BC. The starting point of our study was the realisation that some of the miniature ceramic bottles discovered in Slovenia in the last 15 years have preserved parts of their former contents, either as a solid filling or as residues on the inner surface. 14 of miniature bottles recovered from sites attributed to the Lasinja Culture in the south-eastern Prealps and the Vinča Culture in the Central Balkans were studied, by analysing the remains of their contents. A multi-method approach was applied, using local high-resolution X-ray microdiffraction ( $\mu$ -XRD2) and micro-X-ray fluorescence ( $\mu$ -XRF) to analyse visible residues in eight bottles, and Gas Chromatography-Mass Spectrometry (GC-MS) to test the absorbed lipid content in nine of them. The analysis showed that cerussite (lead carbonate) was the main component of the white material found in the bottle from Zgornje Radvanje, Slovenia. In the visible residues found in the bottles from Turnišče and Popava 1, the lead minerals plumbogummite and pyromorphite were identified as crystalline components. The identification of lead-containing minerals in this study coincides with the earliest use of lead in south-eastern Europe (ca. 4400–4300 BCE), as described in Hansen et al. (2019). Lipid analysis identified beeswax as the content of three of the vessels, which, together with the detection of lead minerals found in the same vessels, suggests its use as an organic binder, perhaps to form pigments as previously hypothesised, for cosmetic and/or medicinal purposes.

## SHAPING THE METAL. NEW WAVES OF DEVELOPMENT IN THE ENEOLITHIC PERIOD IN THE KODŽADERMEN-GUMELNIȚA-KARANOVO VI AREA

**Abstract author(s):** Darie, Adelina (Bucharest Municipality Museum) - Lazăr, Cătălin (Research Institute of the University of Bucharest - ICUB, University of Bucharest)

**Abstract format:** Oral

This study refers to the development of metallurgy in Southeastern Europe in the 5th millennium BC, focusing on the Kodžadermen-Gumelnița-Karanovo VI cultural complex.

During the early stages of metallurgy in the Balkans, the Eneolithic people started to learn how to produce metal items. The copper mining technology was based on previously existing know-how applied, for example, in the flint mining process. At first, the technological process was based on the cold working of the native copper (hammering, cutting, wrapping, perforating, polishing) (awls, beads, pins, bracelets). Then, significant innovations in the metallurgical process appear, such as the metal casting technique, the lost-wax technique, or serial production (e.g. gold beads, appliques, bucrania found in grave no. 36, Varna I necropolis).

The exchange networks in southeastern Europe have been known since the Early Neolithic (Boian, Hamangia cultures) by the exchange of Spondylus, flint, malachite, graphite.

The emergence of new raw materials (copper, gold) determines the intensifying of production and exchange of metal items, which is demonstrated by the many discoveries of copper tools or ornaments in Southeastern Europe (the first metal ornamental pieces appeared during the early Neolithic and the production of large-sized copper and gold pieces intensifies towards the end of the Neolithic period).

While various metal artefacts were used in everyday activities, some were deposited in the funerary context. Therefore, it is essential to discuss the particular examples of copper and gold items deposition in the KGK VI area (e.g., the copper tools assemblages, the Vidra type hammer-axes, the gold assemblages) and their possible significance to the prehistoric communities.

This work was supported by a grant from the Ministry of Education, CNCS - UEFISCDI, project number PN-III-P4-ID-PCE-2020-2369, within PNCDI III.

## SPREAD OF THE PRODUCTS AND TECHNOLOGY OF METALLURGY VIA THE CARPATHIAN BASIN IN THE 5TH MILLENNIUM BCE

**Abstract author(s):** Siklósi, Zsuzsanna (Eötvös Loránd University) - Virág, Zsuzsanna (Budapest History Museum) - Villa, Igor (Institute of Geology, University of Bern; Centro Universitario Datazioni e Archeometria, Università di Milano Bicocca) - Mozgai, Viktória - Bajnóczi, Bernadett (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, Eötvös Loránd Research Network - ELKH) - Hornok, Péter (Vas County Government Office Department of Construction and Heritage Protection) - Kiss, Péter (Savaria Museum) - Kraus, Dávid - Tóth, Márton (Budapest History Museum)

**Abstract format:** Oral

During the 5th Millennium BCE, copper metallurgy considerably changed in the Carpathian Basin. At the beginning of the period, during the Late Neolithic, malachite and small copper ornaments were found primarily in burials and hoards as prestige goods. These items were the products of the Balkan metallurgical centres and no trace of local metallurgy was found. Although potential use of local sources, e.g., Mecsek Mountains, was suggested even in the 1980s, this has never been explored further. At the end of the period, the Middle Copper Age is the time when the first traces of local metallurgy were revealed on settlements. Therefore, the studied period covers the timespan when communities, living in Transdanubia and on the Great Hungarian Plain, had learnt the technology of metallurgy. And this period is not only the time of learning and transmission of knowledge but the heyday of heavy copper axes and adzes in the Copper Age.

The presentation, based on the results of chemical compositional and lead isotope analyses and radiocarbon dating, discusses the potential raw material sources of copper artefacts in specific periods; the feasible communication routes via the artefacts and their technologies had spread; lastly the social interactions behind the spread of copper metallurgy from the Balkans to Central Europe via the Carpathian Basin.

The project is financed from the NRD Fund (NKFI-FK-124260 'The spread of the products and technology of metallurgy in the Carpathian Basin between 5000 and 3000 BC' PI: Zsuzsanna Siklósi).

## PROVENANCE, CHRONOLOGY AND POSSIBLE DISTRIBUTION ROUTES OF THE EARLY ENEOLITHICAL COPPER ARTEFACTS FROM LESSER POLAND. NEW FACTS, NEW INTERPRETATIONS

**Abstract author(s):** Wilk, Stanisław (Jagiellonian University in Krakow, Institute of Archaeology; The Karkonosze Museum in Jelenia Góra) - Stos-Gale, Zofia (University of Gothenburg Department of Historical Studies: Archaeology) - Schwab, Roland (Curl-Engelhorn-Centre of Archaeometry gGmbH) - Sych, Dawid (Independent Researcher)

**Abstract format:** Oral

The Early phase of the Eneolithic period in Lesser Poland, considering the new chrono-typological analysis, is dated between 4050/4000 BC and 3700 BC. It corresponded with the late stage of the Bodrogkeresztúr culture and the Hunyadhalom-Lažňany culture in the Carpathian Basin. The archaeological equivalent of the first groups of people representing an Eneolithic stage of development in Lesser Poland are the so-called the Lublin-Volhynian culture and the Wyciąże-Złotniki group. Both are characterised by the social system modelled on the Bodrogkeresztúr culture. In the funeral rites they emphasized gender and social differentiation of the deceased. The first feature was mainly demonstrated by the specific way the body was arranged inside the grave pit, while the second related to the special selection of grave goods. There is no doubt that the copper tools, weapons and jewellery were the most prestigious kind of grave goods used by the described cultures. In order to identify the possible provenance of the Early Eneolithic copper artefacts discovered in Lesser Poland, as well as the possible routes of their distribution, we analysed for their lead isotope and chemical compositions a set of 17 copper artefacts from 6 cemeteries (Kraków Nowa Huta-Wyciąże 5, Kraków Nowa Huta-Cło 7, Złota Grodzisko I and Grodzisko II, Książnice 2, Koniecmosty). Among the selected items, there were massive copper tools and weapons, such as the Şiria and Jászladány types of axes, the Szakálhát type of hatchet, a chisel, a dagger of the Cucuteni type and copper jewellery represented by 8 bracelets and 4 earrings. The interpretation of the analytical results has been based on comparisons with the published lead isotope and geochemical properties of the European and Near-Middle Eastern copper ore deposits. The results indicate good consistency with the ores and contemporary artefacts from the Western Balkans.

## A MISSED INNOVATION OR A COLLAPSED NETWORK? A "NEW" COPPER HOARD FROM NEUENKIRCHEN (NORTH-EASTERN GERMANY)

**Abstract author(s):** Skorna, Henry (Institut fuer Ur- und Fruehgeschichte Kiel; Cluster of Excellence Roots, Kiel University)

**Abstract format:** Oral

A major innovation in European Prehistory is the introduction of copper as a new material for tools, jewellery and weapons. One centre of metallurgy is the Carpathian Basin where the earliest hints for smelting can be traced back until roughly 5000 BC. In contrast, the regular use of copper/bronze in Northern Europe starts at roughly 1800 BC with the Nordic Bronze Age. As a result, it appears that this region is cut off from the innovation in South-East Europe but between 4600 and 3300 BC a range of copper objects can be found within the Funnel Beaker culture. While early on this limited to imports, also a local production formed around 3750 BC, which then came to a sudden halt with the end of the Funnel Beaker Culture. Metal finds became the exception until the beginning of the Nordic Bronze Age.

A prominent example of the "neolithic" copper is the hoard of Neuenkirchen (North-eastern Germany). During archaeological investigations for the construction of a highway, a hoard of several metal objects was found in 1998. It became clear that this was not a Bronze Age hoard but a much older one, and, thus the largest of such finds in the south-eastern Baltic region for 100 years. So far, however, only a short article had been published on the subject. Further scientific analyses were conducted within the framework of a master thesis in 2017. The results of the typological, trace element and lead isotope analyses are presented within this contribution. Following the topic of this session, these results will be discussed in the context of the innovation of copper metallurgy and possible reasons why that innovation didn't persist beyond the Funnel Beaker Culture. Furthermore the origins and possible routes through which the material and/or objects travelled to Northern Europe will be traced.

## THE LITTLE COPPER AGE OF SOUTHERN SCANDINAVIA

**Abstract author(s):** Johannsen, Niels (University Of Aarhus, Section For Anthropology)

**Abstract format:** Oral

The mid-4th millennium BCE saw a relatively sudden, remarkable peak in the import and cultural consumption of copper in southern Scandinavia. While this phenomenon in itself testifies to the integration of this region in a supra-regional network of exchange, particularly towards the south and southeast, the import of copper was only one of several manifestations of cultural exchange taking place on this geographical axis. Moreover, these clear aspects of supra-regional interaction coincide with a phase of internal and notable, almost dramatic economic, demographic and cultural expansion and growth within the Funnel Beaker communities that inhabited southern Scandinavia. Together, these elements comprise what we might - both in the narrower sense relating to metal, and in the wider sense relating to cultural dynamics - refer to as the "little" Copper Age of southern Scandinavia. This paper a) provides an overview of the import and role of copper in this region during the 4th millennium BCE, especially its second half,

along with other, potentially connected supra-regional exchanges of culture, including style and technology; and b) discusses the relationship between levels of supra-regional interaction and of internal cultural dynamic at a regional level. In addition to shedding light on the development in 4th millennium southern Scandinavia, this may also provide an interesting case for comparison and contrast with the antecedent, larger-scale Copper Age phenomenon of Southeast and Central Europe.

## 21 RECENTLY DISCOVERED MIDDLE COPPER AGE SETTLEMENT IN BUDAPEST

**Abstract author(s):** Kraus, David - Virág, Zsuzsanna - Tóth, Márton (Budapest History Museum) - Siklósi, Zsuzsanna (Eötvös Loránd University)

**Abstract format:** Oral

Budapest is located alongside the River Danube in a central position in the Carpathian Basin. The life of this area's populations has always highly depended on the river, which functions as an informational channel, transportation route and important base of everyday life as well. These statements are proved by a good example from prehistory discussed in this paper.

In 2019, archaeologists of the Budapest History Museum had a chance to investigate almost the entire area of a previously unknown Middle Copper Age settlement close to the Danube (Növény street, Budapest XXII, Hungary). The analysis of the excavated phenomena provided us with significant new information about settlement structure, buildings, economy and spatial activities of the period. The mentioned little village or rather a farm-like settlement was circled by a massive ditch interrupted by many entrances where traces of probable wooden gates or other unknown structures were found. Four houses with rectangular ground-plan and a few outbuildings stood in one group in the same period evidenced by postholes and foundation-trenches. Different economic activities can be presumed in the settlement by the density of pits and postholes. Pits in a dry river fork out of the rounded area can be interpreted as well-like water sources.

The analysis of the <sup>14</sup>C samples and the metal objects is financed from the NRD Fund (NKFI-FK-124260 'The spread of the products and technology of metallurgy in the Carpathian Basin between 5000 and 3000 BC').

## 22 INTERDISCIPLINARY ANALYSES OF LATE COPPER AGE CEMETERIES FROM SOUTHERN TRANSDANUBIA (HUNGARY)

**Abstract author(s):** Gerber, Dániel (Institute of Archaeogenomics, RCH, ELKH, Budapest) - Jakucs, János - Rácz, Piroska (Institute of Archaeology, RCH, ELKH, Budapest) - Somogyi, Krisztina - Honti, Szilvia (Rippl-Rónai Museum, Kaposvár) - Mende, Balázs (Institute of Archaeogenomics, RCH, ELKH, Budapest) - Bondár, Mária (Institute of Archaeology, RCH, ELKH, Budapest) - Szécsényi-Nagy, Anna (Institute of Archaeogenomics, RCH, ELKH, Budapest)

**Abstract format:** Oral

Microregional studies became more prominent in the past few years of archaeogenetics. In these, not large scale, but fine-scale and complete site analyses help recovering population histories and structure in detail. For this study, we sampled more than 70 individuals from southern Transdanubia, mostly connected to the prevailing Eneolithic Baden culture (3600-2800 BCE) of East-Central Europe. We were not only interested in the population structure of these individuals, but we aimed to recover social connections within and between archaeological sites, trace inheritable genetic diseases and to make assumptions on their biological appearance. Our preliminary results indicate surprisingly far travel distances of certain families within Europe most likely connected to the formation of high prestige elite casts, while we can observe on the spot arrival of steppe ancestry to the region, although the presence of other southeastern components yet can not be disclosed. Irregular mortuary practices, such as mass graves are also included in our research, for which bioarchaeological analyses could shed light on the causative reasons. In summary, our research provides valuable information on the social and economic situation of these communities in the Transdanubian region. This study was funded by the National Research, Development and Innovation Office: NKFIH K-128413 research program.

## 23 „THERE AND BACK AGAIN” – FROM PITS TO THE ECONOMY. SITE-BASED RESEARCH IN THE LATE COPPER AGE, CARPATHIAN BASIN

**Abstract author(s):** Rajna, András (Ferenczy Museum Center) - Fábrián, Szilvia - Berente, Zoltán - Czifra, Szabolcs - Klinga, Flóra (Hungarian National Museum) - Marton, Tibor (Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Priskin, Anna (Museum Déri, Debrecen)

**Abstract format:** Oral

Within the framework of our research project "Changing horizon..." funded by the NRD (NRDI Fund K\_129332), our team investigate the various practices associated with and carried out in Late Copper Age households.

The investigation is based on the analytical examination of the excavated settlement materials from the Baden Complex. All the examined sites represent different regions of the Carpathian Basin, our final goal of the research will be to draw micro-regional and regional connections and networks.

The present research interprets pottery finds and other artifacts associated with everyday activities (tools, utensils) from qualitative, quantitative, and semiotic aspects, with a special emphasis on the spatial distribution and density of the finds, and the relation between them. Through the analysis, we can draw higher-level regional conclusions, above the connections of everyday life of the settlement level.

The unified data recording process makes it possible for us to compare the sites in different geographical zones. We hope, that the comparative analysis of our project will help to reveal the knowledge of settlement organization and economic processes in the Late Copper Age, which served as a background of many innovations.

## 24 LIVING WITH CATTLE IN THE ENEOLITHIC OF EASTERN CROATIA

**Abstract author(s):** Pasaric, Maja (Institute of Ethnology and Folklore Research)

**Abstract format:** Oral

Disarticulated cattle remains, cattle burials and figural representations of bovine features (such as figurines, bucrania or vessels decorated with bovine heads or horns) have been registered on a number of Eneolithic sites in Eastern Croatia (e.g. Vučedol, Aljmaš- Podunavlje, Osijek-Retfala and others). Though the importance of cattle beyond their strictly economical value for Eneolithic human communities has been acknowledged, there is a need for new narratives about the prehistory of human-animal relations in the region with a focus on animal agency and inter-species socialities. The paper will reflect on settlements as contextual arenas of human-animal interactions and explore how cattle and humans might have affected each other. The contribution will examine human-cattle interactions, embodied shared experiences and affective encounters (such as joint working activities, everyday shared rhythms, care, the practice of burying the animals) negotiated and acknowledged through different forms of material culture (e.g. figural representations, architecture, burials patterns etc.).

## 25 INVENTIONS, INNOVATIONS AND THE ORIGINS OF SPELT WHEAT

**Abstract author(s):** Lechterbeck, Jutta (Arkeologisk Museum University of Stavanger) - Kerig, Tim (Roots CAU Kiel) - Bevan, Andrew (Institute of Archaeology University College London)

**Abstract format:** Oral

What turns an invention into an innovation? How, if at all, might we observe this process archaeologically? Loosely put, new varieties of plants or animals might be considered as inventions (whether from deliberate breeding or by chance), but ones that are only taken up by humans more systematically as innovations when certain social, demographic, economic and environmental factors encourage such take-up. The archaeobotanically-observed history of spelt wheat (*Triticum spelta*) is an interesting case in this respect. Prior to 3000 BCE, spelt is occasionally found in very small amounts at sites in eastern Europe and south-west Asia, but is usually considered to be a crop weed in such contexts, rather than a cultivar. However, rather suddenly across Central Europe around 2500 BCE, spelt appears more consistently at multiple Bell Beaker and contemporary sites, in quantities which suggest a shift to its use as a deliberate crop. By the full-scale Bronze Age in this region, spelt becomes one of the major crops. This paper discusses this Central European process in greater detail via macro-botanical evidence. It argues that demographic factors during the Neolithic may have inhibited the spread of Asian spelt into central Europe, and that while small amounts of local European spelt were probably present earlier on, it was only at the very end of the Neolithic, in tandem with human population increases and major technological changes such as the introduction of the plough that spelt was taken up as a cultivar. In particular, a shift by some communities in the region ~3000-2500 BCE to more extensive (and sometimes plough-enabled) agricultural strategies may have favoured deliberate cultivation of spelt on less productive soils, given this variety's relative robustness to harsher conditions. In other words, a combination of conditions was necessary for this innovation to really take hold.

## A. A UNIQUE MEGALITHIC FIND FROM THE GREAT HUNGARIAN PLAIN

**Abstract author(s):** Bóka, Gergely (HNM) - Gyucha, Attila (University of Georgia)

**Abstract format:** Poster

Large, complex megalithic monuments erected in great numbers on the Atlantic coast and in northern Europe during the 4th-2nd millennia BC have never been found in Hungary, and the architectural forms and decorative arts of passage and chamber tombs, dolmens, stone circles, and menhirs have not been linked to the archaeological heritage of the Carpathian Basin. This is what renders a stone stele, with engravings evoking some megaliths in western Europe, found near Kevermes in the southeastern Great Hungarian Plain so extraordinary. In this poster, we report the results of our research related to this unique object to clarify the circumstances of its discovery, to examine the possibility of forgery, to specify the raw material and provenance of the stele, and to explore the original context and discuss the

interactions and networks that may have led to the appearance of the motifs on the Keevermes stele on the Great Hungarian Plain.

## **B. THE DIETARY IMPACT OF THE YAMNAYA HORIZON ON CONTEMPORARY AGRICULTURALIST POPULATIONS IN THE BALKANS**

**Abstract author(s):** Sandoval, Elena (University of Bristol; YMPACT project)

**Abstract format:** Poster

The migration of Yamnaya people in the Early Bronze Age, ca. 3,300 BCE–2,800 BCE, into the Pontic-Caspian steppe changed the genetic fabric of Europe. However, how much of the existing societal fabric, if any, was influenced by this migration and subsequent genetic mixing has not been thoroughly explored. Determining the extent of the Yamnaya influence on prehistoric Europe requires an interdisciplinary approach that combines multiple lines of evidence.

This poster presents how this potential cultural flow is being investigated through the lens of diet, via both organic residue and stable isotopic analysis. As Yamnaya are represented exclusively by burial mounds, faunal bones and pottery are rare. Heavily pastoralist subsistence patterns of Yamnaya are generally assumed, based on the lack of settlement evidence. Here, dietary practices within the Yamnaya are directly reconstructed using bulk and compound-specific stable isotope analysis of human skeletal remains. Faunal baseline carbon isotope values will be modelled based upon lipids extracted from pots from local contemporary non-Yamnaya settlements, and Yamnaya faunal bones where available. The analysis of pottery sherds from a diachronic perspective also allows for an investigation of potential cultural exchange between migrating Yamnaya and Balkan societies. Samples of 166 skeletal remains and 238 pottery sherds were chosen to reflect this angle of inquiry creating a sample group that is comprised of Copper Age, Early Bronze Age, and Middle Bronze Age pots and skeletal remains from across modern day Bulgaria and Romania, creating an in-depth study of both spatial and temporal dietary trends.

This study will provide the first detailed picture of the subsistence patterns and change throughout the Yamnaya migration and subsequent contact with Copper Age Balkan societies.

---

## **153 APPS AND ARCHAEOLOGY. USE OF APPS AS ARCHAEOLOGICAL TOOLS**

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Espinosa, Isaac (Universidad de la Rioja) - Madrid, Aida (Leiden University) - Larrauri Redondo, Sergio (Instituto de Estudios Riojanos)

**Format:** Regular session

Archaeology as a science and discipline has evolved remarkably from its birth to the present day. It has gone from being an auxiliary discipline of History to a science with its own entity and personality. In recent years, new technologies have offered us a huge number of tools to facilitate our archaeological work.

In this session we would like to explore some of the most interesting mobile apps for the archaeologist's work, from photogrammetry to GIS systems, exploring which of them are suitable for each archaeological necessity, the implication of new mobile technologies in daily work, current dependence on many of these apps and the democratization of archaeology thanks to them.

Carrying out this session collaboratively in a regular session will help us to share experiences, learn about other uses that can be given to everyday applications that, a priori, are not intended for archaeology, as well as assess and create synergies and possibilities for developing new applications in the future based on the needs of professionals.

## **ABSTRACTS**

### **1 AN APP USING ARTIFICIAL INTELLIGENCE IN CERAMIC IDENTIFICATION**

**Abstract author(s):** Santos, Joel (NOVA University of Lisbon) - Nunes, Diogo (Technical University of Lisbon, Instituto Superior Técnico)

**Abstract format:** Oral

How do archaeologists identify the vast quantities of artifacts of Human Past? Why do archaeologists need to invest so much time in artifacts identification? Do I need to be able to identify each single artifact on the field? These questions are the starting point for our project, that intends to provide archaeologists automatic, reliable, and quick methodology for classifying ceramic sherds directly on the field using an App.

By using Deep Learning and CNN (Convolutional Neural Networks) based on a ceramic photos data base, our App and algorithm is a tool that may well represent one of the possible futures of methodology in Archaeology. We would like that the archaeologist's investment of time would change in a more intellectual and interesting direction instead of "wasting time" in counting and identifying sherds.

This project started by testing amphoras sherds, but in the meanwhile has evolved to other ceramic typologies. The first extended results shall be presented, as well as the perspectives of further uses of this technology in other archaeological problems.

## 2 VISITING ARCHAEOLOGICAL SITES FROM OUR PHONES

**Abstract author(s):** Loy, Aida (Independent Researcher)

**Abstract format:** Oral

The developing and spreading of new technologies have opened the door to their use within archaeological work. This work does not only mean that the in site register is done in a more digital way, but also, it means that the dissemination of the results happen digitally now more than ever.

These new archaeological tools have created new specialisations and experts. One of this specialisations is the 3D reconstruction of archaeological sites or artifacts, and the Virtual Reality models associated with them.

VR models are more and more common, and, when at first this type of reconstructions needed of expensive hardware to be useful, now they can be reproduced with a mobile phone and a VR adapteur that can be found in most everything-stores.

This project focus on the 3D reproduction of some of these archaeological sites and their adaptation to a VR model with the following digitally visitable archaeological site.

## 3 INNOVATIVE TECHNOLOGIES FOR THE USE OF MUSEUMS: THE CASE OF THE CIVIC ARCHAEOLOGICAL MUSEUM A C SIMONINI, CASTELFRANCO EMILIA (MO)

**Abstract author(s):** Neri, Diana (Museo Civico Archeologico A C Simonini; Soprintendenza Archeologia Emilia Romagna; Diorama snc)

**Abstract format:** Oral

On the basis of the Uniform Levels of Quality for the Quality Museums of the Emilia Romagna Region, the Municipality intended to increase the turn-out to the Museum by making it accessible to a large and young public: in this way the recent archaeological discoveries of the area can be enhanced by applying interactive technologies (NFC, animated 3d videos in videowall) and allowing a better reception.

The multimedia installation was created with the aim of recounting the historical, urban and anthropological transformations of the Via Emilia and its surroundings from the Roman age to the Middle Ages.

The start up included a projection from PC in 3D Real-Time rendering narrated with the Via Emilia axis that crosses the territory in the eras (Roman and medieval). It was accompanied by depictions / settings of the everyday in close relationship with the city, which depicts individuals dressed according to the style of the epochs, means of transport and significant subjects to understand the ancient population and the development of the territory. The installation consists of an initial menu that represents the map of the Castelfranco area and surrounding areas on which three sites of interest are highlighted:

- Necropolis of Madonna degli Angeli (Roman era)
- Mansio di Forum Gallorum (mansio in Roman times)
- Portaia tower (Modena side) and part of the city walls (medieval era)

NFC stickers have been applied in three showcases that convey texts and images by reading the smartphone. Visits are underway, greatly increased, by schoolchildren.

## 4 WHAT'S UP, INTRASIS?

**Abstract author(s):** Westergaard, Bengt (The Archaeologists, National Historical Museums)

**Abstract format:** Oral

Apps are getting more and more inevitable in everyday life. The world of archeological fieldwork is no exception, nor are the related offices and labs.

Apps are traditional software applied to mobile units such as surf tabs and smartphones. Intrasis is a software running on two decades now (intrasis.com), a powerful tool for creating and mapping information in a GIS environment - by archaeologists, for archaeologists. As such, it needed to be adapted to meet new demands from a change in environments and methodologies in our archaeological world. One such demand could, for example, be the need for lab specialists, or historians, to immediately interact with the staff in the field, and vice versa. Another example could be the use of 3D-models or historical maps while mapping in the field.

An example will be given from ongoing large scale excavations in the early modern town Gothenburg/Göteborg, Sweden. Being the first time in a major mobile environment, the methods used turned out to be not only time saving but making the complete documentation accessible to the users in a true real time fashion.

Gothenburg/Göteborg was founded as a fortified town in 1621. So far the excavations have yielded fortifications, maritime constructions, households and 9 shipwrecks.

## 5 DEPOPULATION AND HERITAGE LOSS: GIS AND APPS AS HERITAGE DOCUMENTATION TOOLS

**Abstract author(s):** Larrauri Redondo, Sergio (Instituto de Estudios Riojanos)

**Abstract format:** Oral

Depopulation resulting from rural exodus is a complex phenomenon suffered by many territories in Europe. Its dramatic consequences affect society as a whole, which is why it is one of the main concerns for the EU: territorial and generational imbalances and marginalisation, population ageing, demographic gaps, degraded landscapes... and loss/pillage of Cultural Heritage in rural areas.

In mountain areas such as in south of La Rioja, the loss of population is continuous and its harshest expression is uninhabited villages. The disuse and lack of life lead to the abandonment, ruin and gradual disappearance of an important immovable heritage, an example of a rich traditional architecture. The inventory and cataloguing of this heritage makes sense as witnesses and collectors of the current situation of a heritage which, like its inhabitants, is gradually disappearing. They are the main instruments for heritage management and assessment.

Geographic Information Systems (GIS) technology and numerous Apps offer a series of very useful tools for this type of heritage research in both field and laboratory work. GIS software (QGIS, Google Earth, Iberprix, etc.) as well as various Apps (GPS, altimeters, compass, maps, photography, Instant Messaging, etc.) serve as instruments for heritage documentation in rural secondary areas of complicated topography.

## 6 CO-CREATING KNOWLEDGE WITH THE INHABITANTS ULLDEMOLINS VILLAGE (SPAIN), DEVELOPING AND IMPLEMENTING A COLLABORATIVE SURVEYING WEBAPP

**Abstract author(s):** Carracedo Recasens, Robert (Universitat Autònoma de Barcelona; Universidad Austral de Chile Sede Puerto Montt) - Berrocal Barberà, Anna (Universitat Autònoma de Barcelona) - Palomo Pérez, Antoni (Museu d'Arqueologia de Catalunya) - Terradas, Xavier (Consell Superior d'Investigacions Científiques - IMF, Barcelona) - Piqué Huerfía, Raquel (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

This paper presents the results of the development and application of a WebApp in the village of Ulldemolins (Priorat, Tarragona, Spain), being part of the project of citizen science funded by Fundación Española para la Ciencia y Tecnología (FCT-20-16076) "Citizen participation and archaeology in rural areas". The archaeological team with the support of the city council, Lypsum-Enterprise and citizenship, which were involved during co-creation, led its construction. The aim was to link the new technologies with the population in order to build historical identity with the archaeological remains.

The village of Ulldemolins has multiple flint outcrops that are easily accessible as well as a rich archaeological heritage. Agriculture has been the main source of subsistence in the village for many centuries and the families know well the landscape where they usually find archaeological materials that appear during the agricultural fieldwork.

The involvement of citizenship has become a key for the documentation and preservation of this rich archaeological heritage of the village. In order to provide a new tool for the involvement of citizenship in heritage documentation and protection, we have developed a web application. This program allows interested people in the village to register their findings and enter them into the archaeological team's database. The collection of information includes GPS position, a photograph of the artifact and location, as well as different drop-downs (quantity, type, description) that help in its identification.

The project has shown the need to create links and listen to people's needs with the territory, at the same time that the population feels that it is developing an active role in some policies of recognition and preservation of the archaeological heritage associated with its cultural landscape. Technology should be used for a better archaeological record but also to democratize and create new collaborative knowledge of our past.

## 7 EVERYDAY APPS AND THEIR APPLICATIONS IN ARCHEOLOGY

**Abstract author(s):** Espinosa, Isaac (Universidad Autónoma de Madrid & Instituto de Estudios Riojanos)

**Abstract format:** Oral

Can we substitute our notebook for Whatsapp in our excavations? Is it necessary to waste a lot of time and money with expensive photo editing programs? Can we turn our phone into a precision scanner for old documents? The objective of this proposal is to solve all these questions and to facilitate new and original uses of the most popular Apps, focusing on archaeology. Some of them will be analyzed, proposing free solutions for the development of archaeological practice. This novel approach arises from the need to obtain fast, innovative and economic solutions to be able to develop heritage documentation or safeguard projects such as the one we develop in the La Rioja Biosphere Reserve (northern-centre of Spain). Conditions such as distance, the physical environment, difficult access

or time limitations entail the need to apply simple, effective, innovative and economical solutions for archaeological and heritage work thanks to the use of well-known Apps.

## A. **ÊTRE À LA TEMPS! THE USE OF MOBILE APPLICATIONS DURING FIELD SURVEYS IN YAMBOL DISTRICT, BULGARIA**

**Abstract author(s): Valchev, Todor (Regional historical museum)**

**Abstract format: Poster**

During the last decade the mobile computers such as tablets and smartphones conquered the world and at the moment the life without them is unthinkable. The development of mobile applications opened a lot of new opportunities also for scientists and we may say without hesitations that the mobile computers with their varied apps became the Swiss knives of the researchers.

The aim of the poster is to present two GIS-based applications used during archaeological field surveys in Yambol district. They are "Locus Map" and "UTM Geo Map". Both applications are freeware running on Android system. During the field survey the both apps are used simultaneous on one tablet. Bu this way they provide more information about the terrain and eliminate the risk of measuring mistakes.

The development of computer technologies, especially mobile GIS applications in the last decade, allows us to record both the precise position of archaeological sites as well as the status of these sites. Systematic documentation in combination with precise geolocation of archaeological sites is essential for culture heritage protection during development and infrastructure projects.

---

## 154 **TOWARDS AN ARCHAEOLOGY OF HOUSEHOLD PRACTICES – CURRENT ARCHAEOLOGICAL AND SCIENTIFIC CONTRIBUTIONS**

**Theme: 6. A Decade after the 'Third Science Revolution in Archaeology'**

**Organisers: Kienlin, Tobias (Institut für Ur- und Frühgeschichte, Universität zu Köln, Germany) - Fischl, Klára (University of Miskolc, Hungary) - Kovács, Gabriella (Hungarian National Museum, Budapest) - Röpke, Astrid (Institut für Ur- und Frühgeschichte, Universität zu Köln, Germany) - Pető, Ákos (Szent István University)**

**Format: Regular session**

Contrary to a widely held perception that associates methodological advances and the archaeological sciences with broadly speaking Processual Archaeology and its current successors in the so-called 'Third Science Revolution', it is the contextualised understanding of past social practices as already outlined by Post-Processual Archaeology back in the 1990s that imposes the much higher demands on the archaeological data at hand. It is the detailed reconstruction of social practices, invariably bound to practical understandings and the expedient manipulation of a material world, that requires application of the more fine-grained excavation techniques and scientific analyses – a prominent example being, of course, Ian Hodder's fieldwork at Çatal Höyük, whatever one may think about the specifics of his ensuing interpretations.

In this session, therefore, we will ask from a long-term, comparative perspective – from the Neolithic, via the Copper and Bronze Ages – what is our current state of knowledge on the various practices associated with and carried forward by the members of prehistoric households in the Carpathian Basin and South-Eastern Europe. Adopting a micro perspective, we employ a heuristic definition of household as the basic unit of social and economic life in prehistoric communities. Whether these were integrated by kinship or co-residence etc., that are often beyond our grasp, using a wide array of archaeological and scientific techniques we can reach a detailed understanding of their daily activities, decision making and consumption etc. from subsistence practices, raw material procurement, housing and architecture to the various crafts such as pottery making or metallurgy. We see here actually, in every specific case, a plenum of practices, that contains innumerable practices and countless material arrangements, and whose development through time we can trace including the numerous cross-linkages among such activities all too often discussed separately for purely heuristic reasons.

## ABSTRACTS

### 1 **KINSHIP AT ÇATALHÖYÜK**

**Abstract author(s): Ensor, Bradley (Eastern Michigan University) - Souvatzi, Stélla (University of Thessaly)**

**Abstract format: Oral**

Kinship is a most significant organizing principle of human grouping, social relations and identity cross-culturally. The kinship practices at Neolithic Çatalhöyük have been the subject of speculation using dubious associations between material culture (architecture, burial data, and artifacts) and social organization, leading to questionable interpretations of matrilineal or patrilineal descent (ancestry) and even moieties. Others who misunderstand "kinship" as solely

biological relatedness have rejected its role in structuring social relations across space and time. This paper applies archaeological kinship analysis of residence and descent to the sequence of five occupation levels at the northern summit of Çatalhöyük's East Mound (7100-6000 BCE). The repeatedly tested and confirmed strong cross-cultural associations between practices and dwelling configurations supporting this method lend high degrees of confidence to the inferences. The results rule out both matrilocality and patrilocality but correspond exceptionally well with the cross-cultural associations with cognatic practices. There was flexibility in negotiating residence: extended bilocal groups, neolocal groups, and stem families. Descent analysis was less conclusive. Though unilineal descent groups (e.g., lineages) could be inferred, the data at hand suggest bilateral descent was more likely. The results demonstrate the flexibility and agency involved in the negotiation of residence, affiliations, identity and time (e.g. continuity or discontinuity), and offer new explanations for patterns observed previously, including 'neighborhoods', 'history houses' rituals/burials and the co-ordination of socio-economic relationships.

## 2 EXPLORING THE MATERIALITY OF HOUSEHOLD AND COOKING PRACTICES AT THE NEOLITHIC SITE KLEITOS 1, GREECE. EVIDENCE FROM ORGANIC-RESIDUE ANALYSIS

**Abstract author(s):** Kalogiropoulou, Evanthia - Roumpou, Maria (University of Crete) - Ziota, Christina (Ephorate of Antiquities of Florina)

**Abstract format:** Oral

From the post-processual era to the advancements of the contemporary 'third science revolution', household has been holding a key place as seminal analytical concept of archaeological interpretations. It has been employed as a basic unit of social complexity, membership and status, as an indicator of community developments and settlement longevity, as an agent of economic strategies, and a producer of change. In this framework, approaches for the materiality of the household were integrated in architecture and the various craftsmanship operations.

This paper presents the case of a diverse assemblage of cooking facilities from the Late Neolithic site Kleitos 1 in Kozani (North-western Greece), through the lens of current approaches in household practices and the implementation of an integrated scientific methodology. Our study profits from the potential of organic residue analysis in the investigation of cooking practices, to re-approach questions of peoples' daily activities and consumptions practices in the context of household configurations. We aim at better understanding the use of cooking facilities -and also possible specialization in their use- through the application of organic residue analysis. Material was sampled from hearths and ovens found both indoors and outdoors to assess the nature of food processing activities including possible dominant cooking activities. We therefore, anticipate reconstructing part of the culinary preferences of Neolithic inhabitants at a local scale and adding an elaborate variable to the social practices of household. This research is conducted in the framework of BONDS - 'Beyond Oikos: Outdoor spaces, daily life and sociality in Neolithic Greece' Project (Number: 00229), funded by H.F.R.I.

## 3 DOMESTIC PRACTICES AT LEPENSKI VIR: LOCAL DEVELOPMENTS OR OUTSIDE INTRODUCTIONS?

**Abstract author(s):** Brami, Maxime (Johannes Gutenberg University Mainz)

**Abstract format:** Oral

Today, it is widely accepted that agriculture and settled village life arrived in Europe as a cultural package, carried by people migrating from Anatolia and the Aegean Basin.

The putative fisher-forager site of Lepenski Vir in Serbia has long been acknowledged as an exception to this model. Here, the Mesolithic-Neolithic transition - possibly inspired by interaction with the new arrivals - was thought to have taken place autochthonously on site.

While recent biomolecular studies point to the arrival of Aegean early farmers around the time of construction of the trapezoidal houses, ~6,200 BC, the newcomers' identification as predominantly female has given rise to a surprising narrative, in which Neolithic women 'married' into an established Mesolithic community.

This paper revisits evidence for interaction between early farmers and foragers at Lepenski Vir during the transitional phase, demonstrating how ancient DNA and stable isotopes alter the interpretation of the site to a far greater extent than currently accepted in the literature.

Here too, house construction, early village society and agriculture appear to be primarily associated with Europe's first farmers, thus challenging the long-held interpretation of Lepenski Vir as a Mesolithic community that adopted Neolithic practices.

#### 4 HIGHLIGHTING ECONOMIC AND SOCIAL INTERACTIONS WITHIN LINEARBANDKERAMIK HOUSEHOLDS: THE HOMES PROJECT.

**Abstract author(s):** Hamon, Caroline (CNRS - UMR 8215 Trajectoires) - Allard, Pierre (CNRS - UMR 8068 TEMPS) - Aubry, Laurent (CNRS - UMR 8215 Trajectoires) - Cayol, Nicolas (INRAP - UMR 8215 Trajectoires) - Couderc, Florian (CNRS - UMR 8215 Trajectoires) - Denis, Solene (Masaryk University; UMR 8068 TEMPS) - Gabriele, Marzia (CNRS - UMR 8215 Trajectoires) - Gomart, Louise (CNRS - UMR 8215 Trajectoires) - Hachem, Lamys (Inrap - CNRS - UMR 8215 Trajectoires) - Illett, Michael (Paris 1 Pantheon Sorbonne University)

**Abstract format:** Oral

The Neolithic Linearbandkeramik (LBK) colonisation is an exceptional phenomenon in European prehistory, in terms both of its wide geographical scope and of the cultural stability it displays over five or six centuries. Different theories have been put forward to explain the structure of LBK settlements and how this might help understand the social system of these first farming populations. Depending on viewpoints, a wide variety of factors have been underlined, ranging from migration, demography and economy to society and ideology. Several models of LBK social organisation have been proposed, based on spatial analyses of houseplans, settlements and waste from associated activities.

The interdisciplinary HOMES project (ANR funded, France) further explores LBK social and economic rules by modelling the interaction between and within the most basic units – the households. The focus is on nine settlements in the river Aisne valley, located in the Paris Basin (France), on the western margin of LBK expansion. Through a systemic approach, the ultimate goal is an anthropological definition of the multiple levels of economic, cultural, social and symbolic interactions within late LBK societies. This approach fully integrates a wide range of archaeological, technological and bioarchaeological evidence. The project tracks production and consumption among households, and examines how their organisation and relationships are reflected in village structure. Different aspects such as subsistence practices, raw material supply and technological know-how are integrated to explore household functioning and interrelationships.

By addressing the notion of household in its material, ideal, individual and collective dimensions in a geographically limited study zone, the project will test hypotheses centred on different levels of village integration. These hypotheses will be compared with previously proposed models, as well as with ongoing research into LBK settlements in central and eastern Europe.

#### 5 PLEASE TAKE OFF YOUR SHOES BEFORE COMING IN. GEOCHEMISTRY AND SEEING INVISIBLE HOUSEHOLD SPACES

**Abstract author(s):** Kovacik, Joseph (Eveha études archéologiques; Terrascope Thin Section Slides) - Save, Sabrina (Amélie études archéologiques; Terrascope Thin Section Slides)

**Abstract format:** Oral

All human activity generates waste and pollutes the environment, with this waste the stuff of archaeological investigation: broken ceramics, cut animal bones, or charred plant remains deposited in pits or scattered across sites. Activities, such as cooking, fabricating objects, storing 'stuff', tending crops, or even walking and sleeping, also produce waste. These wastes illustrating people's daily life become incorporated into the earthen floors of buildings and the non-built surfaces around them, and even the fields from which they obtained their food. From this waste and its interaction with the sediments on/in which it is deposited, a wide range of unseen chemicals penetrate, contaminate and transform – pollute – those same sediments, leaving chemical 'ghosts' of human activities which we can now detect.

Various geochemical techniques have been used to investigate archaeological sites and their internal organisation for more than a hundred years, but only during this third scientific revolution, with the advent of relatively affordable instruments, in particular portable X-ray fluorescence, have these tools become democratized. Used at landscape, site or building scales, geochemistry can make the invisible visible, evidencing the ghosts of human activity, determining and defining spaces, both indoor and outdoor, its uses, and transformations.

In this paper we present a series of buildings from sites across eastern France dating between the Neolithic and the Iron Age which illustrate the potential of the science of geochemistry in social archaeology. We show where people placed their ceramic storage jars within a room, how they transformed spaces with partitions, or where they cooked and made things (perhaps even identifying what was prepared), all within buildings that consist only of post-holes, pits, and trenches. Perhaps also we can 'see' that people took off their shoes before going inside.

## 6 JUST RUBBISH! SPATIAL DISTRIBUTION PATTERNS OF EVERYDAY MEAT PROCESSING DURING THE LATE COPPER AGE CARPATHIAN BASIN

**Abstract author(s):** Csippán, Péter (Eötvös Loránd University) - Daróczy-Szabó, Márta (Budapest History Museum) - Klinga, Flóra (Eötvös Loránd University) - Fábíán, Szilvia (Hungarian National Museum)

**Abstract format:** Oral

There wasn't any archaeological culture in the Carpathian Basin whose members didn't eat the meat of wild and/or domestic animals. The way from a living animal to edible meat is a special process.

Processing animal body is a culturally defined act, just like eating their meat. But these processes weren't stopped with cooking and eating. This is the point where they were connected to other systems, like rubbish management. In our research, we focused on the spatial aspects of the everyday life of the Copper Age settlements, like the management of rubbish. These latent systems have patterns that characterize the whole settlements through the handling of organic rubbish by contemporary households. In this presentation, we would like to show these patterns (similarities and differences) in the case of three sites from different parts of the Carpathian Basin.

The presentation is a part of the Changing Horizons of Material Culture: Spatial Aspects of Symbolic and Everyday Activities in the Late Copper Age Settlements research project (NKFIH 129332).

## 7 A MICROSCALE APPROACH TO HOUSEHOLD ARCHAEOLOGY: SOIL MICROMORPHOLOGY AND PHYTOLITH ANALYSIS

**Abstract author(s):** Kovács, Gabriella (Hungarian National Museum) - Pető, Ákos (Hungarian University of Agriculture and Life Sciences, Institute for Wildlife Management and Nature Conservation, Department of Nature Conservation and Landscape Management) - Vicze, Magdolna (Hungarian National Museum)

**Abstract format:** Oral

Households are one of the important scenes of everyday life. Our knowledge of everyday life of past societies is predominantly derived from the excavation findings, that are mainly in the macroscopic level. However, microscopic traces can add a new range of evidences to enlarge our knowledge of past activities. The traces of the choices of materials, space use, construction and maintenance techniques together with the remains of daily routines (e.g. cooking, threshing, firing etc.) can all be effectively studied under the microscope. By adding details of such a high resolution, everyday practices within the households can become visible from a new perspective. Thin section soil micromorphology and phytolith analysis will be used to demonstrate the effectiveness of studying the microscopic level. The Bronze Age tell settlement of Százhalombatta-Földvár, Hungary will be used as an example, where the detailed on-site work is conjoint with the microscopic techniques during the investigation of households. The methods can be applied to any era and settlement type so similar research of this type is encouraged.

## 8 HOUSEHOLD ACTIVITIES AS SEEN BY FLOORS – A COMPARISON OF TWO BRONZE AGE TELL SITES IN HUNGARY

**Abstract author(s):** Röpke, Astrid (Ur- und Frühgeschichte, Universität zu Köln, Germany) - Kovács, Gabriella (Hungarian National Museum, Budapest) - Fischl, Klára (University of Miskolc, Hungary) - Pető, Ákos (Szent István University) - Kienlin, Tobias (Ur- und Frühgeschichte, Universität zu Köln, Germany)

**Abstract format:** Oral

Analysing the composition and construction of floors by micromorphological, phytolith and archaeological analyses has been a meaningful tool to understand use of space and aspects of social life. Especially the study of floor sequences in multilayered settlements such as tells and tell-like mounds turned out to be promising due to its good preservation conditions. In this interdisciplinary study we compare floor sequences of two Bronze Age tell settlements in Hungary with different cultural background. The Bronze Age tell of Százhalombatta-Földvár belongs to the Vatyka culture while the Bronze Age tell Borsodivánka-Nagyhalom is related to the Füzesabony culture. They also differ in size and the environmental settings. Százhalombatta-Földvár was built at river bank above the river Danube and Borsodivánka-Nagyhalom is located in a swampy region in the wider area of the floodplain of the Tisza river.

We intend to explore to which extent the study of floors can be used to characterize household activities and to evaluate differences and or similarities between these two tell settlements sites.

## 9 HOUSE LAYOUTS AS MEANS OF UNDERSTANDING HOUSEHOLD ACTIVITIES

**Abstract author(s):** Lie, Marian (Iasi Institute of Archaeology; University of Cologne) - Cordos, Cristina (Institute of Archaeology Iasi)

**Abstract format:** Oral

It is not a novelty for archaeologists that the layout of dwelling structures can reveal valuable insights in regards to household practices. Building materials and techniques, dimensions, compartments, storage features or heating

sources, as well as the overall inventory, are only a few aspects which offer precious clues pertaining to daily household activities. However, the preservation of prehistoric structures is seldom ideal and interpreting such fragmented traces can be challenging.

Due to their particular formation process, prehistoric tell settlements offer the excellent opportunity to study the diachronic evolution of household features within a given community. With this in mind, in this presentation we will try to distinguish the transformations which occurred in time within the dwelling structures discovered at the Bronze Age tell site from Toboliu Dâmbu Zănăcanului and to understand if and how these transformations are related to changing household activities. As in most cases, the preservation of dwelling structures varies within the seven documented habitation phases of the tell settlement. For this reason, our focus will be on the better-preserved older phases and in particular on the spectacular dwelling of Phase 3.

## 10 FAUNAL RECORD AND TAPHONOMIC PROCESSES IN A MIDDLE BRONZE AGE HOUSE AT TOBOLIU (ROMANIA)

**Abstract author(s):** Nolde, Nadine - Zickel, Mirijam (Institute for Prehistory, University of Cologne)

**Abstract format:** Oral

During excavations at Toboliu-Dâmbu Zănăcanului, a Middle Bronze Age tell settlement in Bihor County in western Romania, house structures with special structural features were discovered, including wooden floors built upon compressed clay layers. In addition to large quantities of pottery, faunal remains were uncovered from homogenous layers with greyish sediment above the wooden floor, indicating domestic activities. As an expression of human diet, husbandry, and exploitation strategies, as well as references for the economic and social background of the inhabitants respectively the surrounding settlement, these animal bones also may act as indicators of site formation processes. Taphonomic features on faunal remains such as trampling and biting marks as well as fracture patterns allow conclusions about the genesis of the layers. This also includes the use of micromorphological methods, which primarily provide information about the general structure, composition, and formation of the greyish layer, but also may allow the evidence of taphonomic features such as decay and fragmentation of bones due to postsedimentary soil processes and trampling. Furthermore, the presence of special skeletal elements or butchery traces demonstrates the spectrum of activities from which the remains originate and thus offers possible explanations for their accumulation. Is it butchery waste brought into the house with other sediments from the settlement area to raise the habitation level, which is so typical for tell settlements? Or is it just kitchen or food waste that accumulated over time during the activities in the household itself?

## 11 METALWORKING AS A HOUSEHOLD PRACTICE ON THE BRONZE AGE TELLS

**Abstract author(s):** Gavan, Alexandra (Institut für Ur- und Frühgeschichte Universität zu Köln)

**Abstract format:** Oral

The aim of this paper is to present and discuss the find context of the archaeological evidence for metalworking uncovered within the Bronze Age tells in the Carpathian Basin. The data on which the discussion is based are the residues of non-ferrous melting and casting activities (tools and waste such as moulds, crucibles, tuyères, casting debris and installations) recovered from excavated contexts. Although the data regarding the find context of artefacts related to metalworking uncovered within these sites is scarce, whenever this information is available, it suggests that metalworking remains in Bronze Age tells were scattered in a variety of domestic contexts such as houses and refuse pits as well as other settlement features. This seems to indicate that metalworking was mostly practiced within domestic workspaces on Bronze Age tells, which matches the expected criteria for small, household production units. Moreover, there is no evidence of specialized bronze-casting workplaces set apart from the main settlement area. The absence of clear, auxiliary domestic workshop quarters or specialized areas dedicated to metalworking suggests that melting and casting happened mostly in a household context within the tell settlements.

The thorough contextual analysis of metalworking evidence provides the basis for a detailed reconstruction of the scale, context and organization of metalworking in the Bronze Age tells from Carpathian Basin. This in turn allows a re-examination of current theoretical paradigms and existing models (many of which have been based on ethnographic parallels or a limited selection of archaeological examples) starting from a strong empirical foundation.

## 12 MIDDLE BRONZE AGE HOUSEHOLDS AND DAILY LIFE AT THE WESTERN FRINGE OF THE CARPATHIAN BASIN (NORTH-WESTERN ROMANIA)

**Abstract author(s):** Zsolt, Molnár-Kovács (Babes-Bolyai University, Cluj-Napoca)

**Abstract format:** Oral

The presentation focus on the culturally-diverse Middle Bronze Age Carpathian Basin, the region incorporating the north-eastern part of Hungary, south-east Slovakia and the north-western part of Transylvania (Romania). This region sets the scene for the development of a specific culture displaying marked similarities in its bronze working, pottery production and the habitat system. In this so called 'tell society' the main unit of the settlement networks are repre-

sented by a fortified and multi-layered central settlements known as tells, surrounded by a satellite plain sites forming an economic and social unity with the tell. The tells are not only multi-layered settlements, but a 'package' connecting together central settlement structure, social, economic and certain environmental factors. The well-organized, fairly hierarchic tell-communities, with a complex social structure, composed of cooperating modular household units had mixed intensive farming economy based on agriculture and animal husbandry. The presentation analyzes a household found in Carei -Bobáld, north-west of Transylvania. Using different archaeological and scientific techniques we traced the patterns of housing and subsistence practices. The socio-economic and cultural phenomena of the less complex communities are multifunctional and have a strong dynamic interaction between each other. A given space such as outdoor activity areas, a house or part of it can be the place of cyclically changing ritual and profane events. Changing the place's function periodically shows the community's view about time and space.

### 13 PUTTING PEOPLE IN THEIR PLACE: PRIVACY AND COMMUNITY IN THE NEW KINGDOM EGYPT.

**Abstract author(s):** Rocha da Silva, Thais (University of São Paulo; University of Oxford)

**Abstract format:** Oral

Archaeological research about houses in ancient Egypt focused on typologies. Social life was explained based on artefact distribution and the division of internal spaces. This approach narrowed the possibility of understanding community life as it privileged house unities, usually framed according to a 19th-century Victorian fashion. In this paper, I explore how the investigation of the Amarna Workmen's Village, a special-purpose settlement from the New Kingdom (1550-1069 BCE), offers a new model to understand privacy and community life in ancient Egyptian settlements. This village housed the workforce engaged with royal building projects and it was maintained and supervised by the Egyptian administration. This presentation highlights privacy as social practice. I demonstrate how a holistic approach to the dataset allows scholars to a more nuanced interpretation about the presence of the state in the settlement. Furthermore, domestic life was dynamic, and individuals developed creative responses to specific conditions in which they lived. This model of investigation is being tested in other similar settlements in the ancient Egyptian domain during the New Kingdom, as part of a collaborative project that I intend to share some preliminary results.

---

### 157 FINDS STORIES: ARCHAEOLOGICAL BIOGRAPHIES IN CONTEXTS OF MOBILITY

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Marini, Christina (Australian Archaeological Institute at Athens) - Trimmis, Konstantinos (Department of Archaeology and Anthropology, University of Bristol)

**Format:** Regular session

Material artefacts across the various stages of production and circulation become intertwined with social processes, acquire layered histories, and affect in diverse ways how humans act, interact, and perceive themselves and the world around them. Formed at the intersection of anthropology and ethnographic studies, and grounded especially in Appadurai's and Kopytoff's influential concepts of the "social life" and "cultural biography of things", biographical approaches have been integrated in archaeological analytical frameworks and are a well-established tool in material culture analysis.

This session explores biographical approaches to contexts of mobility, such as mobility of ideas, styles, technological know-how, or in fact people. It is targeted towards papers addressing the current theoretical and methodological discourse in archaeological research on the topic of object biography and associated themes of entanglement and ontology. It seeks to introduce innovative cross-disciplinary perspectives into the broad scope of interactions between objects and humans across social, cultural, temporal, and geographical space. We welcome discussions on metanarratives, case studies applying biographical, life-history, and genealogical methodologies, as well as novel ways of writing and sharing object histories, including but not limited to object-biographical narrative structures and creative representational forms.

## ABSTRACTS

### 1 THE MANY LIVES OF CHIKABA'S JAR: BIOGRAPHY OF AN 18TH CENTURY POT FROM A CONVENT IN SALAMANCA, SPAIN

**Abstract author(s):** Canós-Donnay, Sirio (Incipit-CSIC) - de Groot, Beatrijs (University of Edinburgh)

**Abstract format:** Oral

Tucked away in a small cabinet in a convent in Salamanca (Spain) is a finely crafted little jar. Originally a filtered water jar of Islamic origin, it has since had a wide and diverse range of lives, from utilitarian object to Christian relic. In its life trajectory, it has woven together people, things, and historical processes across cultures, borders and religions, from its maker Halim to its most famous owner, the 18th century afro-hispanic nun, former slave, and renowned writer Teresa Chikaba. The jar's long and complex life trajectory thus illustrates and embodies a web of entangled lives,

material processes, and global encounters. Through a combination of archival research and the reconstruction of the jar's chaîne opératoire, we have started to untangle these complex webs and traced some of the diverse past lives of this curious object and the stories it tells about the slave trade, relics, islam, Christianity, court intrigues, politics, and racism in 18th century Spain and beyond.

## 2 UNWRAPPING THE GALLOWAY HOARD: OBJECT-BIOGRAPHY AND THE NARRATIVES OF A COMPLEX ASSEMBLAGE

**Abstract author(s):** Goldberg, Martin - Davis, Mary (National Museums Scotland)

**Abstract format:** Oral

The stereotype of Viking-age hoards in Britain is that they are products of an international context of mobility, migration and raiding, buried at times of stress or under duress. Initially heralded as a 'Viking' hoard par excellence, the ongoing conservation and research on the Galloway Hoard from southwest Scotland continues to surprise and disrupt expected narratives. An unusual variety of materials and artefact types beyond the silver bullion so often found in Viking-age hoards provides the basis: there are Anglo-Saxon runes with Old English name elements on the Hiberno-Scandinavian silver bullion; there are ecclesiastical items; feminine artefacts; relics and heirlooms; and the rare preservation of organic materials. The unusual structure of parcels within the deposit, bundled and wrapped with those organic materials, allows narratives to be created for distinct elements as well as inter-relationships between the different groups of materials. Through an object-biographical approach the 3-year project at the National Museum of Scotland, in partnership with the University of Glasgow, entitled 'Unwrapping the Galloway Hoard' will weave together narratives about this complex assemblage and the new stories it allows us to tell about Viking-age Britain and Ireland, and beyond.

## 3 THE UNEXPECTED JOURNEY OF A STONEWARE BOTTLE: WAYS OF APPROACHING THE BIOGRAPHY OF A SURFACE FIND

**Abstract author(s):** Marini, Christina (Australian Archaeological Institute at Athens)

**Abstract format:** Oral

The role of circulation and mobility in imbuing objects with meaning or transforming the ways they become entangled with the lives of people has been established ever since the introduction of the object biographical approach and has expanded even more with the growing recent discourse on the concept of object itineraries. The present paper explores this interplay of materiality, mobility, and agency, using as a case study a surface find from the survey project of the Australian Archaeological Institute at Athens on the remote island of Kythera in south-western Greece.

The paper delves into the life-history of the object, by examining its relational connections and the social interactions it was embedded in from its manufacture and its involvement in long-distance exchange networks, to finding its way to an island under British Imperial rule, and until its afterlife as a subject of ongoing research. We address the challenges posed by its nature as a surface find, the theoretical and methodological considerations in the documentation of its biographical parameters, as well as the potential community engagement can hold for producing richer and multi-layered biographical narratives.

## 4 TEXTILE BIOGRAPHIES IN CONTEXT OF MOBILITY. THE CASE OF ARCHAEOLOGICAL FINDS FROM PALMYRA.

**Abstract author(s):** Zuchowska, Marta (Institute of Archaeology, University of Warsaw)

**Abstract format:** Oral

Textile production is a complex process involving a series of production stages: sourcing of fibres, diverse ways of fibre processing, weaving and finishing. The product of each stage, starting with floss, through yarn, woven fabric, decorated textile (embroidered, stamped etc.) and ending with the ready textile products such as pieces of garment, blankets, or wall hangings could be traded, processed, used and reused in other locations. This is especially visible in early 1st millennium Eurasia where textiles were traded through the whole continent to cover the unlimited demand for luxuries.

Palmyra was an important trading post close to the eastern frontier of the Roman Empire and at the same time a textile production centre. Due to the very dry climate, over 500 fabrics dated to the 1st century BC – 3rd century AD were found on the site. They constitute one of the most important collection of textiles from the Roman period. Unravelling the biographies of individual textile finds from Palmyra gives an unparalleled glimpse into the complex processes related to textile production and trade in the first centuries AD.

## 5 STORIES BEHIND PERSONAL OBJECTS AS MUSEUM NARRATIVES: A PERSPECTIVE FROM THE YMCA BASKETBALL MUSEUM OF THESSALONIKI

**Abstract author(s):** Theodoroudi, Eleftheria (YMCA, Basketball Museum Thessaloniki; Aristotle University Thessaloniki) - Soumintoub, Valentina (YMCA, Basketball Museum Thessaloniki) - Kasvikis, Konstantinos (University of Western Macedonia)

**Abstract format:** Oral

The YMCA Basketball Museum of Thessaloniki opened its doors to the public in 2013 as part of an INTERREG "Greece – Bulgaria" project titled "Youth Mobilization – Cultural Heritage and Athletic Valorization". It is the first Basketball Museum in Greece and one of a few around the World. Since its beginning the Museum developed an open collecting policy to enrich the surviving collection and archive of the YMCA; the collection of the Museum hosts various types of material and immaterial traces. It also works as an arc of the history of basketball in Thessaloniki, and to that end as part of the sports', as well as, the social history of the city.

YMCA volunteers, veteran and active athletes have donated material from their own personal collections and also they have shared their stories and their memories enriching the archives of the Museum. This paper will explore selected objects of the collection, using biographical approaches as methodological tools. The different stories behind the objects navigate our understanding and interpretation, but also the narratives and the memories of those who once owned them. Within an interdisciplinary context, an exhausting recording of the selected material took place, followed by personal interviews of the people involved. Alternate narratives reveal to the public, through storytelling techniques, hidden stories that highlight the role of YMCA to the diffusion of basketball to Greece. The material identities could work as a trigger point to the understanding of social practices and manifestations of the palimpsest of the sports' and social history of Thessaloniki.

## 6 WHY TO DECORATE A POT? OBJECT BIOGRAPHIES IN IBERIAN CONTEXTS OF THE UPPER GUADALQUIVIR (SPAIN)

**Abstract author(s):** Moreno Padilla, María Isabel (Instituto de Investigación en Arqueología Ibérica. Universidad de Jaén)

**Abstract format:** Oral

The development of new theoretical and methodological approaches linked to Sensory Archeology (Skeates and Day, 2020), the Actor-Network Theory (Olsen et al., 2012) and ceramic sociology (Shanks, 1999; Gosden, 2005), has favored a profound renewal of studies on materiality in Archeology. Focusing our attention on Protohistoric ceramics, this proposal is based on the study of their iconography, also understood as an essential element for the study of mobility in the past. For this, our object of study focuses on the potteries of the Iberian societies of the Western Mediterranean during the Iron Age. Our analysis has shown that the different styles documented in this territorial area constitute a faithful reflection of the broad social biography of these objects, especially significant in the resignification that decorations acquire in certain symbolic contexts, such as necropolises and sanctuaries. These biographies, which range from the production and design of the decorations, their continued use (or not) in a given domestic space, and/or their amortization in discard processes or symbolic context, acquire greater complexity in those cases in which there is a second decorative program. This process is closely linked to the Iberian aristocratic ideology and aims to underline the legitimacy of the lineage through the history of use and reuse of the container.

On the other hand, the shape of the containers and the decorative motifs that make up their decorations become significant elements for the study of ceramic mobility in a broad sense: technological know-how, exchanges of aristocratic gifts or family inheritances, commercial exchanges or territorial iconographies that moves within its border limits. Thus, ceramic decoration acquires a profound complexity that goes beyond mere ornamentation, including itself in a complex framework associated with the social, territorial and cultural narrative of the object."

## 7 MOBILITY OF IDEAS: TWO ARCHAEOLOGISTS IN TOTALITARIAN CONTEXTS

**Abstract author(s):** Martins, Ana Cristina (IHC - Polo da Universidade de Évora; Uniarq - Centro de Arqueologia da Universidade de Lisboa; Proyecto 'ArqueologAs' - Universitat de Barcelona)

**Abstract format:** Oral

Between the late 1940s and the 1950s, during the 'Estado Novo' regime, Portuguese archaeology began to observe a greater internationalisation, especially with the award of scholarships to study abroad. João M. Bairrão Oleiro (1923-2000) and Maria de Lourdes Costa Arthur (1924-2003) can testify to that, both having specialised in Madrid and Barcelona, during the Franco regime, with some of the most important archaeologists of the respective archaeological museums and universities.

On their definitive return to Portugal, these two young researchers manifest similar ideas and procedures that are reflected in a concrete way of producing archaeological knowledge and heritage. A circumstance that contributed significantly to the development of archaeology in the country, especially regarding the methodology of fieldwork,

as well as the conservation and restoration of archaeological materials and their presentation, including musealization.

Using biographical approaches, we propose to analyse, comparatively, the contributions of these two Portuguese archaeologists to the increment and affirmation of science in the country according to some of the main international parameters. This contribution includes, among other aspects, ideas and methods learned on the international courses of archaeology of Ampúrias that they attended, in an obvious testimony of scientific mobility. A scientific mobility that, although of individuals, was mainly of theories and methods that ended up influencing the way of investigating, preserving, and disseminating the material culture in their country of origin.

## **8 THE ADOPTION OF THE IZALCO-USULUTÁN STYLE IN NORTHERN CENTRAL AMERICA AS A REFLECTION OF SOCIAL COMPLEXITY IN THE LATE PRECLASSIC**

**Abstract author(s):** **Martinet, Adrien (University of Bonn)**

**Abstract format:** **Oral**

The ancient communities beyond the southern fringe of the Maya world are seen as small cultural units loosely connected to their immediate neighbours. Their long-distance trade network mainly moved obsidian and jade. Starting in the middle of the last millennium BC and ca. AD 400, it began trading so-called Usulután Style ceramic ware, prominently featured in archaeological sites from El Salvador and western Honduras, also called the Uapala Ceramic Sphere. These vessels were most likely used during elite-oriented feasts and consumption rituals. The Usulután style found an excellent reception outside of the Uapala Ceramic Sphere: among the Maya communities of southern Mesoamerica, but also in some of the smaller communities of northern Central America.

This study investigated the spread of Izalco-Usulután style, a sub-type of particularly high quality, and its emulation during the Late Preclassic (ca. 200 BC to AD 250) in northern Pacific Nicaragua using methodologies borrowed from Classical Archaeology. Locally produced Usulután style ware proved to be almost indistinguishable from Salvadoran Usulután wares, thus suggesting an extension of the Uapala Ceramic Sphere in the south, but also a high cultural affinity among their elites. The Central American communities were much better connected than previously assumed.

Through its multitude of sub-types, Usulután style wares offer many research opportunities to understand the complex cultural patchwork of Central America. Further investigations will be essential in understanding these inter-regional relationships, especially at the non-elite level.

## **A. HEARTHES AS A CENTRAL FEATURE FOR THE SOCIAL ORGANISATION OF PAST AND PRESENT PEHUENCHE GROUPS IN SOUTH CHILE**

**Abstract author(s):** **Toro, Oscar (University College London; Universidad Alberto Hurtado)**

**Abstract format:** **Poster**

A defining characteristic of the Pehuenche, an indigenous people of Andean South America, is that some families divide their annual residence between lower valleys into colder seasons, and highland pastures in summer, where they take their livestock and collect pinenuts from the Araucaria trees. This research developed in the community of Cauñicú (Alto Biobío) and aims to reveal how socio-political organisation, economy, state policies and people's perception of the landscape and their own past influence the material culture arrangements and their functions within and between settlements, considering the multi-temporality of those material characteristics. This generates a landscape in which present and past material culture co-exist and can be explained from and through their mobility cycle and the sense of identity embedded in this aspect of Pehuenche culture. One of the materialities considered for the analysis were hearths, which are central in the daily life among past and current mobile groups. These features are possible to track back to archaeological contexts in the same area, although the surveys on the archaeology of mountainous areas are scarce to the west of the Andes. By adopting a diachronic and a multi-disciplinary perspective, including ethnographic, archaeological, and historical sources, from where I obtained several images that illustrate different contexts of use, I show how hearths played an important role for Pehuenche identity and their social organisation. Fireplaces are one of the sources from where the ancestral knowledge is transmitted, and although still do play this role, nowadays is being shared with the school. Also, these combustion elements are key to linking auto-determined identity feelings to concrete materiality located in domestic and ritual places. Another identified role of fireplaces, which supersede the previous two, is that they congregate people in their surroundings, marking the spatial organisation of settlements in which they are present

## B. "A HORSE! A HORSE! MY KINGDOM FOR A HORSE!" (WILLIAM SHAKESPEARE, RICHARD III)

**Abstract author(s):** Christakopoulou, Olga (Hellenic Ministry of Culture and Sports - Ephorate of Antiquities of Achaia) - Giamalidi, Maria (Hellenic Ministry of Culture and Sports - Ephorate of Antiquities of Piraeus and Islands)

**Abstract format:** Poster

The discovery of a complex of vases of the late Geometric period in Voula, Attica, consisting of a funerary amphora and a kantharos, with figurative representations of a horse, is the means by which the population and its culture, and specifically the ethnography of its daily life, are projected. At this time, metalwork and pottery are dominated by the ideal type of the warrior/hero, the charioteer and the horse which are symbols of power and nobility.

A mere means of transport or a means of conducting a war activity in which the dead was involved? Depiction of equestrian feat of the deceased or prize in a corresponding activity in which he participated? Representation of a mythological cycle and connection of the deceased with a mythical personality or a simple representation of the daily cycle of the deceased's life?

Apart from the figurative representations, however, it is the complex of vessels itself that exalts the status of the deceased, as both refer to vessels for pouring and drinking, indicative of the participation of the deceased in "symposia", thus indicating the range of his qualities on a political and social level. Therefore, whatever the interpretation of the illustration of the horse on the kantharos under study, its symbolic significance is indisputable as it does not only refer to the skill of the craftsman, but also to the classification of the deceased, in a symbolic way.

The complex of vases of Voula Attica constitute biographical evidence of a society from which the interaction between human and object is documented. The typology of these vase shapes and their painted surface with these particular iconographic motifs create a specific environment of communication through which the history of the social and cultural field, in which they were born, emerges.

## C. BELL BEAKER PACKAGE ON THE FRONTIER – RITUAL FEATURES IN NORTH-EASTERN POLAND

**Abstract author(s):** Klecha, Aleksandra (Antiquity of Southeastern Europe Research Center, Faculty of Archaeology, University of Warsaw) - Manasterski, Dariusz - Januszek, Katarzyna (Faculty of Archaeology, University of Warsaw)

**Abstract format:** Poster

The Bell Beaker phenomenon is identified in Europe, among other things, by a characteristic set of objects sometimes referred to as a cultural package. Such sets usually include: small S-shaped vessels with a distinctive decoration of repeated motifs organised in horizontal lines, stone bracers, daggers or arrowheads. They are found mainly in burials. In recent years in north-eastern Poland there have been discovered four features of ritual character, containing such objects. They were accompanied by other items such as amber ornaments, a "protoheraldic" plate, flint artefacts and small quantities of burnt human and animal bones. The analysis of the materials shows their western European origin. The aim of the paper is to present issues connected with the research on the artefacts and to discuss the migration undertaken by the groups to which the discovered objects belonged. This issue is all the more important as, in the late Neolithic, the territory was inhabited by the last hunter-gatherer groups in Central Europe. Archaeological records indicate that the Bell Beaker societies had a considerable impact on their transformation into a Bronze Age communities known as the Trzciniec Culture.

---

## 161 PERIPHERAL REGIONS IN THE PREHISTORY OF TEMPERATE EUROPE

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Vondrovský, Václav (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Ptáková, Michaela (University of South Bohemia) - Pechtl, Joachim (University of Innsbruck)

**Format:** Regular session

Since introduction of Wallerstein's world-system theory into prehistoric archaeology, core and periphery are recognised as relevant concepts of our inquiry. Their definition is, however, highly contextualised and should be perceived in terms of human-environmental networks. Operating on the meso-scale of regions and landscapes the periphery may cover various entities: sub-alpine zones, woody highlands, wetlands distant from the core as well as closer situated inner or semi-peripheries.

Peripheral regions of prehistoric occupation naturally remain aside from the main interest of scholars as the archaeological record in these areas is usually qualitatively and quantitatively limited in comparison to core regions. Although contemporary archaeology acknowledges a patchy structure of prehistoric occupation, we are still missing a comprehensive attitude towards the research of peripheral regions that would provide a complex image of past societies.

In our session we wish to go beyond Wallerstein's world-systems approach which is based mostly on economic dependency and surplus distribution. We will try to explore the environmental determination of periphery and subsistence strategies that local communities might adapt. Did communities on periphery undergo a loss of social and eco-

conomic complexity? Can we observe different dynamics of cultural processes on periphery and core? Are there any general patterns in periphery (re-)colonisation? Was the contact with core vital for communities living on periphery? We welcome papers that address these issues through various periods, socio-economic systems, and inhabited environments of prehistoric temperate Europe. We would like to invite researchers who study such themes not only in the scope of archaeology, but also in natural scientific methods. In particular, we welcome contributions that integrate these approaches synergistically to provide a holistic understanding of peripheral regions.

## ABSTRACTS

### 1 PREHISTORIC RURAL SETTLEMENT CONTINUITY ON THE NORTHERN FRANCONIAN JURA. ARCHAEOLOGICAL AND GEOARCHAEOLOGICAL INSIGHTS FROM THE SITE „GÖRAUER ANGER“ (BAVARIA, GERMANY)

**Abstract author(s):** Seregély, Timo (Pre- and Protohistoric Archaeology, University of Bamberg) - Kothieringer, Katja (Digital Geoarchaeology, University of Bamberg)

**Abstract format:** Oral

In prehistoric studies, Central European low mountain regions are usually described as unfavorable to settlement. A problematic water supply, low-yield soils, poor climatic conditions and a peripheral location that is hardly connected to trade routes are considered the main reasons for this. Since 2015, the University of Bamberg has been investigating rural settlement and land use in prehistoric times in a study area situated in the north-easternmost part of the Franconian Alb (Bavaria, Germany). The landscape is characterised by karstified plateaus with ridges, hilltops and depressions as well as deeply incised and narrow valleys. After the first part of the research project involved prospections and small-scale exploratory excavations to locate and date settlement sites, the work in the second part concentrates on two selected territories on the Alb plateaus. The lecture will present first results from one settlement area, where archaeological excavations took place at several selected sites along a prominent ridge in 2020. The so-called "Görauer Anger" revealed not only a strongly varying state of preservation of prehistoric settlement structures, but also an unexpected, long-lasting settlement continuity from the younger Middle Bronze Age to the Early LaTène period. Geoarchaeological investigations of colluvial deposits in footslope position south of the ridge confirm temporally matching landuse activities. Colluvial backfills in sinkholes and terrain depressions on the ridge that are no longer visible today also hold important information on landscape changes, their extent and chronology. Geophysical prospection methods such as magnetics or electrical resistivity tomography helped to find such structures, and a combination of find analysis, radiocarbon dating and OSL dating was used to differentiate the backfill history. The archaeobotanical data reveal a preferential use of oak and beech wood during the settlement period and a more open landscape from the Late Bronze Age onwards.

### 2 NEOLITHIC SETTLEMENT ON THE PERIPHERAL AREAS OF LOESS UPLANDS NORTH OF THE CARPATHIANS (A CASE STUDY FROM THE SANDOMIERZ UPLAND)

**Abstract author(s):** Szeliga, Marcin (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin) - Mroczek, Przemysław - Dobrowolski, Radosław - Chodorowski, Jacek (Institute of Earth and Environmental Sciences, Maria Curie-Skłodowska University in Lublin) - Liłyńska-Zajac, Maria (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Kraków) - Moskal-del Hoyo, Magdalena (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) - Pidek, Irena (Institute of Earth and Environmental Sciences, Maria Curie-Skłodowska University in Lublin) - Makowiecki, Daniel (Institute of Archaeology, Nicolaus Copernicus University in Toruń) - Furmanek, Mirosław (Institute of Archaeology, Wrocław University) - Plak, Andrzej (Institute of Earth and Environmental Sciences, Maria Curie-Skłodowska University in Lublin)

**Abstract format:** Oral

The current state of research on the Neolithic in Central Europe indicates an almost close relationship between the settlement of the early agricultural communities and the extent of loess cover in upland areas. The great geomorphological, hydrological and – especially – soil values, resulting from the presence of a fertile soil cover, formed on a loess ground, were undoubtedly one of the most important factors initiating the colonization, as well as determining the durability and very high intensity of the settlement processes during the 6th and 5th millennia BC.

Previous knowledge about the scale and range of the Neolithic communities settlement on the upland areas is significantly complemented and verified by the results of the interdisciplinary geoarchaeological research conducted at the borderland of the loess cover of the Sandomierz Upland and sand-clay formations of the Iłża Foothills in 2017-2021. They document the previously poorly known process of formation and functioning of the Neolithic settlement clusters in the areas situated on the edges of the uplands, especially outside the range of compact loess cover, i.e. within the ecological-landscape zones that differ from the basic settlement preferences of the of early-agricultural communities from the upland areas. Convenient, though specific, natural conditions of such areas and high adap-

tation abilities of early-agricultural groups allow to assume the existence of similar settlement concentrations, also in other areas on the borderland of loess uplands in central Europe.

The study was supported by National Science Centre in Poland (grant number: 2015/19/B/HS3/01720).

### 3 **FALLEN PERIPHERIES, FALLEN CENTRES. CULTURAL NETWORKS AT THE NORTHERN FRINGE OF THE LA TÈNE WORLD IN THE FINAL CENTURIES BC**

**Abstract author(s):** Markiewicz, Joanna (Uniwersytet Wrocławski)

**Abstract format:** Oral

The final centuries BC in north central Europe were featured with great cultural diversity, settlement instability and mobility. Intensified movement of people resulted in the emergence of new settlement clusters. The paper discusses the cases of the La Tène culture settlements north of the Carpathians and Sudetes and Przeworsk culture settlements in the Thuringian Basin. In both instances, the new settlement clusters emerged in specific, carefully selected ecological niches. They were separated from the centre (and one another) with areas of empty land or land inhabited by the communities utilising other types of ecological resources. While most of these fringe settlement zones disintegrated earlier than their core cultural areas, their disappearance significantly affected the centres, as the return migrants brought along new people and ideas. On the other hand, some of the former peripheries outlasted their fallen centres and in the turmoil around the turn of the eras became new, temporary centres of power.

### 4 **NEOLITHIC HINTERLAND IN SOUTHERN BAVARIA AND THE NORTHERN ALPS BETWEEN STAGNATION AND ADAPTATION**

**Abstract author(s):** Pechtl, Joachim (Institute of Archaeology University of Innsbruck)

**Abstract format:** Oral

Primary Neolithisation in the southern Bavarian region took place with the spread of the Earliest Linear Pottery Culture from about 5400 BC. Especially in the Danube region, flourishing agrarian communities soon established themselves. In fact, however, the process of penetration of the landscape with peasant economies was far from complete. Obviously, in some such hot spots a dense and apparently largely continuous settlement took place until the end of the Neolithic period (c. 2200 BC). In other areas of southern Bavaria and the neighbouring northern Alpine region, however, settlement began much later and remained sparse and discontinuous. Some areas even remained completely free of permanent settlements during the Neolithic.

In order to understand these processes, the natural characteristics of different areas are studied and the economic strategies of the respective settlers are analysed. It seems that in many cases there was little willingness to make economic and cultural adaptations and that the failure of colonial endeavours was rather accepted. On the other hand, there is evidence of successful economic adaptation and cultural opening, especially in the Alpine region. In both cases, relations with the core zones of Neolithic settlement are of great importance.

### 5 **'LIKE COMMON PEOPLE': BIOMOLECULAR RECONSTRUCTIONS OF THE SUBSISTENCE ECONOMY OF NON-ELITES IN LATE BRONZE AGE GREECE**

**Abstract author(s):** Vika, Efrossini (University of York) - Soncin, Silvia (Sapienza University) - Talbot, Helen - Craig, Oliver - VonTersch, Matthew - Presslee, Samantha - Alexander, Michelle (University of York)

**Abstract format:** Oral

The archaeology of Greece in the Late Bronze Age is dominated by the glory of the illustrious Mycenaean palaces and the rich warrior burials. The role of non-elites remains at large an enigma. Previous reconstructions of the Late Bronze Age supported a model of a central redistributive economy, reflecting the role ascribed to the palatial centres by the cultural historical paradigm. Recently, the exact extent of 'state control' has been re-addressed, but a strong tendency remains to model the entire political economy from the viewpoint of the palaces.

Our contribution discusses two weaknesses of the current research agenda: (i) the massive bias towards the palatial centres and the elite burials, that masks the strong effect of regional polities in the development of social complexity; and (ii) the inherent limitations of existing analytical approaches in subsistence studies, that mask the critical role of the variable Greek landscape in the development of economic advantages and behaviours.

With a regional focus on Western Greece and a local viewpoint, we employ a novel combination of stable isotope measurements (bulk and compound-specific) to reconstruct the daily economic activities as recorded in subsistence practices, in order to shift the attention from elite burials to non-elite lifeways and propose a more nuanced narrative of the political economy, that comprehends the role of peripheral communities in the development of social complexity.

## CULTURAL RESILIENCE OF PREHISTORIC PERIPHERIES: A CASE STUDY OF SOUTH BOHEMIA

**Abstract author(s):** Vondrovský, Václav (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Chvojka, Ondřej (University of South Bohemia) - Hlášek, Daniel (Institute of Archaeology of the Czech Academy of Sciences, Prague) - John, Jan (University of South Bohemia) - Šída, Petr (Institute of Archaeology of the Czech Academy of Sciences, Brno) - Pták, Martin - Šálková, Tereza - Ptáková, Michaela (University of South Bohemia)

**Abstract format:** Oral

The region of South Bohemia (Czech Republic) represents a specific area of prehistoric occupation. Generally higher altitudes, less fertile soils and local wetlands set certain limits for agricultural communities in comparison to those inhabiting the neighbouring loess lowlands spreading across drainage basins of the upper Elbe, Morava, and Danube. In our case study we track the cultural development of South Bohemia in a long-term perspective from late Mesolithic hunter-gatherers to complex society of the Bronze Age. Comparing a comprehensive dataset of radiocarbon dates, we have identified several periods of differences in cultural development of South Bohemia and neighbouring lowland regions. Despite new cultural systems with distinctive materiality and cultural manifestation emerged in lowlands, they reached South Bohemia with considerable delay, or they are even completely absent in local archaeological record. We argue that this trajectory was governed by the cultural conservatism strengthening a distinctive identity of South Bohemian communities rather than their physical isolation since the inter-regional distribution networks remained uninterrupted. The paper demonstrates that there can be more variable reality beneath blocks of archaeological cultures and their generalised spatio-temporal development. Even for temperate landscapes lacking extreme gradients of high mountains or arid areas it should be considered patchier image where progressive core regions interweaved by inner peripheries with different development.

## WHAT HAPPENS IN THE PERIPHERY... EVIDENCE OF PAST ACTIVITIES IN REGIONS WITH SPARSE ARCHAEOLOGICAL FINDS

**Abstract author(s):** Dreslerova, Dagmar - Demján, Peter (Institute of Archaeology of the Academy of Sciences of the Czech Republic, Prague)

**Abstract format:** Oral

Spatial studies in archaeology often refer to the modern concept of centre/core vs. periphery as a theoretical framework to explain variations in economic/subsistence strategies or find density, which is evaluated either on the basis of the amount of radiocarbon data relating to a certain time span on the basis of the analysis of archaeological finds using typological dating. Although it is debatable, whether the producers of these finds actually had any notion of such concepts, they can nevertheless be used - if clearly defined - to explore certain general or local phenomena related to a particular environment. In our contribution we first present, based on archaeological and geographical data from the Czech Republic, the division of the territory into so-called cores and peripheries mainly from the geographical and spatial perspective. Furthermore, we will demonstrate that the study of sparse finds in the periphery thus defined can produce interesting and exciting results, which could otherwise be lost amongst the mass of evidence present in the core areas.

## DIGITAL HUMANITIES AND MEDIEVAL ARCHAEOLOGY: RE-INTEGRATING ISOLATED, FRAGMENTED AND OVERLOOKED ARCHAEOLOGICAL EVIDENCE

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Vargha, Maria (Charles University Prague) - Eichert, Stefan (Naturhistorisches Museum Wien) - Parvanov, Petar (Central European University)

**Format:** Regular session

The proposed session aims to bring together researchers from Europe who create digital collections and analyses about diverse archaeological and historical evidence types, primarily archival archaeological data and bioarchaeological data.

Traditionally, archaeological research favours the deep investigation of a site or even a particular object or phenomenon. Apart from exceptional examples traditionally connected to landscape archaeology, medieval archaeology does not usually attempt to analyse a large-scale analysis of sites to investigate more extensive social or economic processes. Nevertheless, archaeology can often provide a much more significant amount of data that could be retrieved from written evidence and thus opens an opportunity to investigate certain parts of the process that has not been possible before. Besides, by applying new quantitative modelling approaches, archaeological evidence can often bring new light to even well-documented historical processes.

Nevertheless, dealing with large-scale archaeological data can also be rather challenging. Ethical issues, data normalisation, methods for analysis and interpretation all have their respective disputes, and the definition of 'Big Data', especially in the context of Medieval archaeology, is also debatable. Therefore, the session aims to give a platform to discuss the potential and the challenges that researchers face with 'Big Data' in Medieval archaeology, review best

practices and possible pitfalls, and have a comparative overview by exploring different projects and investigation directions.

The session welcomes papers focusing on the Middle Ages, within the range of the following topics:

- Digital collection of archaeological sites
- Digital collection and analysis with burial archaeology
- Digital analysis of large-scale archaeological data
- Digital analysis of Medieval processes by archaeological data
- Digital collections and analysis of Medieval material culture

## ABSTRACTS

### 1 **THANADOS - OR HOW TO PRESENT DEAD PEOPLE AND THEIR BELONGINGS IN A STATE OF THE ART FASHION**

**Abstract author(s): Eichert, Stefan (Natural History Museum Vienna) - Richards, Nina (Austrian Academy of Sciences)**

**Abstract format: Oral**

Since 2019, a small team of experts at the Austrian Archaeological Institute (ÖAI) of the Austrian Academy of Sciences (ÖAW), the Natural History Museum Vienna and the Austrian Centre for Digital Humanities and Cultural Heritage (ACDH-CH) has developed a web application - <https://thanados.net> for presenting and providing thanato-archaeological data online.

Here, already published anthropological and archaeological information as well as results of scientific analyses (e.g radiocarbon dating, stable isotopes) are made available as open data for researchers and the general public. The web application currently presents more than 430 burial grounds with almost 5000 burials and over 10.000 finds - a nearly 100% coverage for the Early Middle Ages in the area of present day Austria. New sites are added continuously. Various options for downloading the data allow far-reaching further analyses out of the box. Extensive visualisations and possibilities to create burial ground plots and queries tailored to interests and research questions additionally facilitate working with the presented data.

While THANADOS has so far primarily presented data on cemeteries of the early Middle Ages within the borders of present-day Austria, the focus is now expanding to other periods and regions.

### 2 **EMPOWERING THE VOICELESS – CHALLENGES AND APPROACHES**

**Abstract author(s): Vargha, Maria (Charles University Prague)**

**Abstract format: Oral**

The present paper introduces a research project funded by the PRIMUS grant scheme at Charles University, Prague. The project focuses on the process of Christianisation of East-Central Europe from the point of view of the archaeological heritage of the rural population. Christianisation in the examined region was a crucial agenda of state formation; however, the impact of the rural population is seldom examined.

The present paper focuses on the methodological approaches to investigate territoriality and reconstruct the earliest network of rural churches based on historical and archaeological evidence. Examining the early network and the 'area of influence' of churches and other religious and secular institutions and their comparative contextualisation with contrasting site types (such as field cemeteries) provides an excellent base to investigate the development of institutionalised Christianisation in the lowest level of society. The current project is developing a digital database of those archaeological features connected to this process, and the present paper showcases the upsides and challenges of the extensive, digital, geospatial database.

### 3 **EMPOWERING THE VOICELESS – GEOSTATISTICAL AND GEOSPATIAL ANALYSIS**

**Abstract author(s): Janovský, Martin - Fajta, Martin (Univerzita Karlova)**

**Abstract format: Oral**

The present paper introduces a research project funded by the PRIMUS grant scheme at Charles University, Prague. The project focuses on the process of Christianisation of East-Central Europe from the point of view of the archaeological heritage of the rural population. Christianisation in the examined region was a crucial agenda of state formation; however, the impact of the largest segment of the society, the rural population, is seldom examined.

An extensive, digital archaeological and historical database has been compiled to investigate the development of the rural church network, composing churches, cemeteries, settlements and ecclesiastical and secular power centres. By applying digital methods on a large spatial dataset, the investigation of what and how human and environmental factors have impacted the formation of the early rural church network becomes possible. The present paper shows the preliminary results of this material's geospatial and geostatistical analysis, conducting primarily catchment,

proximity analysis, and analysis of the intensity of a point process of spatial covariate, attempting to differentiate between the organic and the institutionalised development of Christianisation of the rural population. In conclusion, these analyses make it possible to define the different settlement practices of the early medieval period and to explain the absence of churches in sites with only early medieval burials.

#### 4 **BEYOND DOTS AND NUMBERS. THE POTENTIAL AND PITFALLS OF LARGE-SCALE SPATIAL APPROACHES TO MEDIEVAL TRANSHUMANCE**

**Abstract author(s):** Dahle, Kristoffer (NTNU University Museum; Møre & Romsdal County)

**Abstract format:** Oral

Summer farming was an integrated element of Norwegian agriculture and dairy farming up until the 20th century and is still practised in a somewhat more modern appearance. This system is known from medieval written sources, and was presumably exported to the North Atlantic isles during the Viking Age colonisation, yet our archaeological knowledge on this transhumant practice is sparse. The material traces are often fragmented and insubstantial, the sites rarely fully investigated due to low development pressure, and the subject is in general given little attention within current archaeological discourse.

According to Askeladden – the Norwegian database of Cultural Heritage Sites and Monuments – a vast majority of these early shieling sites are located to Western Norway. Can we trust that this spatial distribution displays a prehistoric 'reality'? On the basis of such a quantitative material, can we attempt to make large-scale analysis on outland use, regional variation, and economic specialization and trade?

In this paper, I want to go beyond the dots and numbers, and discuss the challenges relating to such quantitative and large-scale approaches – in particular relating to data generated through small-scale and development-led prospection – but also some of the possibilities.

#### 5 **CONSIDERING THE WAY FORWARD: DIGITAL DATA AND THE SEMANTIC WEB**

**Abstract author(s):** Jansens, Nicolas (Heidelberg University; Charles University)

**Abstract format:** Oral

In our emerging age of big data and the Digital Humanities, the understandability (i), usability (ii) and durability (iii) of data are major concerns for forward-thinking researchers and institutions. Yet, in the case of many digital data-based projects, solutions to properly address these aspects are neither truly sought nor implemented. The reasons for this are partially structural, relating to the finite nature of research projects, and partially legacy-based, relating to the knowledge and skillsets transferred within our disciplines. This presentation is primarily addressed to the latter.

Drawing on experience in the ongoing toponomastic and archeological project "Interlinking language and material culture – a study of European populations in time and space", I will discuss the above-mentioned issues and their potential resolution using the technologies of the Semantic Web.

Issues considered: (i) a lack of embedded meta-information to facilitate interpretation of data by humans or machines; (ii) project-specific data structures, which limit transferability beyond the original project; (iii) isolated release of datasets on local platforms subject to abandonment as maintenance efforts and resources are directed elsewhere.

Potential solutions: (i) use of object-oriented data structures enabling semantic elaboration of the data in relation to common metadata vocabularies (i.e. ontologies) defining types and typological relationships (cf. OWL Web Ontology Language); (ii) implementation of, and contribution to, stable, open ontological libraries (e.g. FOAF); (iii) integration of data with/into open, collaborative data platforms (e.g. Semantic MediaWiki).

Are these solutions reason enough for orientation towards the principles of the Semantic Web and its core technologies? How might that be engaged in collectively?

#### 6 **OLD WINE INTO NEW WINESKINS: LEGACY DATA, BIG DATA, AND A CASE STUDY FROM THE BYZANTINE PELOPONNESE**

**Abstract author(s):** Simoni, Eleni (University of Patras) - Papagiannopoulos, Konstantinos (Institute of Local History) - Dafi, Evangelia (Ministry of Culture and Sports, Ephorate of Antiquities of Trikala) - Makrypoulas, Christos (Independent Scholar)

**Abstract format:** Oral

Regional Medieval studies in the Eastern Mediterranean span a wide period of nearly 1000 years between the sixth and the fifteenth centuries. They also entail huge spatial coverage, with Greek territory being the epicentre of a large number of regional, extensive and intensive surveys. Even though ongoing archaeological research flourishes in Greece, legacy data forms the largest part of highly voluminous collections that are hypothetically available nowadays. Their easy digitalization and manipulation with GIS leads to ever-growing datasets. Furthermore, the proliferation of remote sensing images has been immensely facilitated through the accessibility of various means and, more recently, UAVs. Despite methodological limitations, this is the reality of today and tomorrow.

Our presentation sets the intensive survey of Western Achaia as its starting point, offering the stimulus to discuss these issues from various perspectives. On local scale, we use pottery analysis as a template for studying land use and performing spatial analysis in the medieval village of Kamenitsa. On regional scale we examine the distribution of both archaeological and historical sources that construct a huge and heterogeneous database in Achaia, consisting of excavations, stray reports, intensive and extensive surveys, old archives and place name registries. On interregional scale, we go through the collections of the major surveys of Byzantine Greece to seek common trends in identifying the most abundant primary data, i.e. ceramics. Finally, on temporal scale, we use UAV derived images to visualize a flood and seek interpretation of gaps in the medieval pattern with respect to habitation.

As a result, conclusions can be drawn for the opportunities big legacy data offer in Greek medieval research, despite the drawbacks of their ever-growing bulk and diversified methods of collection and processing, in order to examine broader extensive social and economic developments over time.

## **7 SMALL FINDS IN 19TH AND EARLY 20TH CENTURY SILK ROAD COLLECTIONS: THE OVERLOOKED ARCHAEOLOGICAL EVIDENCE**

**Abstract author(s):** Hoppál, Krisztina (MTA-ELTE-SZTE Silk Road Research Group, Eötvös Loránd Research Network)

**Abstract format:** Oral

By the end of the 19th century interest in collecting archaeological finds from various locations along the Silk Roads heightened among European travelers, resulting in a number of unique collections kept in several European museums. Most have been continuously studied since their arrival to Europe, however, different parts of these collections usually have not enjoyed the same scholarly attention. Especially household and everyday craft objects have often been overlooked compared to pieces of art which usually took priority. These small, portable artifacts that comprise the core of objects of daily life are particularly decontextualized and poorly documented thus present unique challenges.

The fate of these finds can be illustrated by two different yet similar collections of the late 19th- early 20th century: the Zichy Collection of the Ferenc Hopp Museum of Asiatic Arts, Hungary, and the Turfan Collection kept in the Museum für Asiatische Kunst – Staatliche Museen zu Berlin. While objects in the Zichy collection came predominantly from the Caucasus to where three expeditions were led by the wealthy and influential Hungarian politician, Count Jenő Zichy in the late 19th century, a remarkable number of the "Alltagsobjekte" or "Kleinfunde" from the Turfan Collection were collected near the modern city of Turfan, which gave the name to the German Expeditions (1902-1914).

Apart from certain differences, small finds of the Turfan and Zichy collections share several similarities. Both collection units contain multiple finds connected to nomadic cultures and settled civilizations of the 5th to the 13th centuries, and could only be approached by using archival archaeological data. Present paper aims to compare these two different collection units and show pitfalls and outcomes of analyzing such decontextualized materials.

## **8 DIGITAL APPROACHES TO BOARD GAMES IN THE MEDIEVAL WORLD**

**Abstract author(s):** Crist, Walter - Browne, Cameron (Maastricht University)

**Abstract format:** Oral

Board games as a cultural practice serve as a social lubricant—they help people to interact with one another across cultural, linguistic, and other social boundaries. Games often serve as a shared cultural practice within and across regions which provide a mechanism by which people cross these barriers to create and maintain networks of interaction. This paper explores game play as a tool of interaction in the Middle Ages as part of the ERC-funded Digital Ludeme Project, which seeks to document, reconstruct, and map the evolution of board games across the world from prehistory to the modern world.

Using archaeological, historical, and art historical data gathered in this project, it is possible to explore interactions in the Medieval world to expand and deepen our understanding of the ways ideas spread through networks of interaction. Games are conceptualized as groups of ludemes, or "game memes," that together create a functioning system that form the mechanisms of game play. The spread of ludemes and dispersion of games, when examined in the context of human interaction, provides a new line of evidence for discussing exchange of ideas and interactions that may not be visible in other forms of material culture. This talk highlights games of the Medieval period and the different variations in their rules under the lens of Social Network Analysis, in order to model the interactions through which people interacted and transferred ludemes to one another. The question of reconstructing the rules for medieval games will also be explored in this light, as the project's Ludii software allows for quantitative assessment of gameplay through the application of artificial intelligence to proposed rulesets.

## FROM CLOSED CATALOGUES INTO LINKED OPEN NUMISMATIC DATA IN FINLAND

**Abstract author(s):** Oksanen, Eljas (University of Helsinki) - Ehrnsten, Frida (National Museum of Finland; Finnish Heritage Agency) - Rantala, Heikki (Aalto University)

**Abstract format:** Oral

This paper will investigate the intersection between new challenges in digital archaeological collections management and the potential for national-scale 'big data' analysis of citizen science-generated databases using the national collections at the National Museum of Finland and the Finnish Heritage Agency as a case study. There is an increased need for digital solutions in archaeological cultural heritage management, in significant part stemming from the vastly increased amount of information generated by the public, specifically the growing number of archaeological finds recovered by metal-detectorists and other public finders in European countries; including Finland, where the activity is legal within certain restrictions. Concentrating on coin finds, we will discuss digital heritage challenges that stem from combining heterogeneous older and modern catalogues and data, and in designing sustainable institutional solutions that serve the needs of multiple user audiences (e.g. collections management, scientific researchers, non-professional numismatists, citizen scientists and the broader public). We will present the new project DigiNUMA, which aims to develop a new Finnish public data service for numismatic heritage through data harmonisation and Linked Open Data principles in concordance with the principles of pan-European undertakings such as Nomisma.org and AriadnePlus. The possibilities that such technological platforms offer for deploying digital citizen science/crowd-sourcing data enhancement will be discussed.

## UNDERSTANDING EARLY MEDIEVAL BURIALS THROUGH RADIOCARBON DATASETS

**Abstract author(s):** Brownlee, Emma (University of Cambridge)

**Abstract format:** Oral

An emerging method in archaeology is the use of summed radiocarbon dates as a proxy for population levels. Combining large datasets of radiocarbon dates, either using summed probability or kernel density estimates, allows us to see how activity fluctuated over time. So far most applications of this method have been in prehistoric archaeology, and have related to demography. However, recent work from early medieval Ireland shows that it can be successfully applied to historical periods and to other types of archaeological question.

This paper will present preliminary results from a meta-analysis of over 1000 radiocarbon-dated graves from early medieval England, collated from both research and commercial excavations. It will examine the potential of radiocarbon kernel density estimates to shed new light on how burial practices evolved across the early medieval period. This includes questions around the changing use of grave goods, the nature of cemetery space, and the extent to which mass death events can be identified. It will demonstrate the potential of this approach for overcoming problems with more traditional typological chronologies, and how limitations in the method itself might be minimised.

## HOW DIGITIZING OLD EXCAVATIONS IN ARCMAP AND ACCESS DATABASES CAN CONTRIBUTE TO A GREATER UNDERSTANDING OF PAST PRACTICES

**Abstract author(s):** Swensen, Elisabeth (NTNU University Museum)

**Abstract format:** Oral

Trondheim, a town in Norway, has been the object to many archaeological excavations, as it lies on top of both iron age and medieval cultural layers (protected by the Norwegian Cultural Heritage Law). These excavations have a variety of documentation of varied quality, as they involve more than 100 years of archaeological practice. In my PhD I study a set of excavations carried out between 1928 and 2016, exploring their documentation regarding water and waste management. By georeferencing field drawings and highlighting specific structures, I have been able to use ArcMap to visualize a fuller picture of medieval Trondheim both spatially and temporally. Newly digitized field diaries, photographs, and field reports give access to a vast quantitative and qualitative material which I have brought together in Microsoft Access databases. The databases make it possible to combine and arrange data in a myriad of ways, opening for new insights into old materials.

Visualizing such different archaeological practices in ArcMap and Access comes with some challenges. This can be regarding the dating of structures, different documentation practices, and other factors which will not be visible in statistics drawn from the databases or maps showing specific structures. However, the possibilities arising from such projects show that new insights are possible and make way for bigger studies with similar methods. Old excavations should not be forgotten, and new methods can place their invaluable work back in focus.

## EVERYDAY LIFE IN BORGUND AND THE REVITALISATION OF DATASETS ANNO 1950

**Abstract author(s):** Hansen, Gitte (University Museum of Bergen, University of Bergen)

**Abstract format:** Oral

The deserted town Borgund was found by archaeologists in 1953. Borgund is located on the west coast of Norway and was one of the countries only 16 towns during the Middle Ages. With the discovery Norway's first excavation of ordinary medieval peoples' settlement traces began and a new era of medieval archaeology was born with archaeologist Asbjørn E. Herteig as lead investigator. During the 50's and into the 70's, 5300 m<sup>2</sup> were excavated and today some 90.000 objects and faunal material, along with drawings, dairies, and other 'raw documentation' are stored in the University Museum of Bergen's repositories. Data has hardly been touched since the 1970's. How do we process these 'Big data' legacy sources to become assets in modern research? In the multi-disciplinary Borgund Kaupang Project our ambition is to study everyday life in this small town in the periphery of Europe. We treat the whole town as one site, so we are not satisfied with just sampling areas of the excavated site. The paper presents technical and intellectual challenges in transforming analogue handwritten datasets to a digital scientific platform and translation of datasets anno 1950 to state-of-the-art anno 2020s.

## RE-EVALUATING OLD ARCHEOLOGICAL EVIDENCE TO YIELD EXCITING NEW POTENTIAL: THE MEDIEVAL CASTLE OF PETRUS (CENTRAL SERBIA)

**Abstract author(s):** Milosavljevic, Monika (University of Belgrade) - Stefanović, Filip - Stojanović, Branislav (The Regional Museum of Paraćin) - Trajković, Lana (Independent researcher) - Manojlović, Nikolina (University of Belgrade)

**Abstract format:** Oral

Robert Chapman and Alison Wylie have stated, material evidence is a rich scaffolding for (re)interpretation that allows for revision based on novel (digital) tools, ranging from improvements in digital (re)documenting to opening new research questions. From this perspective, a critical re-examination of legacy data needs to be conducted of the Medieval Castle Petrus, a well-known archaeological site, which received repeated small-scale excavations throughout the 1970s to the 2000s to date its structures.

Petrus holds a valuable strategic position above the gorge of the river Crnica, which secluded nine churches/monasteries as well as one hesychastic cave. Prior archaeological work has shown the castle to consist of a lower town and an upper town in which there are the remains of a fresco painted palace. The castle was constructed in an area known by historical sources as that assigned primarily as a march to lord Crep Vukosavić (14th c.) and the "hesychastic desert" of the 14th and 15th centuries.

The excavations in the 1970s and 80s resulted in simplified technical drawings of the palace's foundations in the upper town, but were done only preliminarily. Moreover, after the small-scale excavations at the time, the areas excavated of the palace were then covered by soil. A new excavation campaign initiated in 2021 on the palace in Petrus included new documenting standards based on digital technologies such as photogrammetry, drone scanning and GIS, which pointed to great excavation potential. The archaeological record of the castle itself is more precise in its technical aspects. Furthermore, the animal bones that were not previously considered an important source of information were collected and recorded at this time. All these data and new methods to analyze them point to a promising wealth of potential that the site may yield upon further re-evaluation.

## BRIDGING THE GAP: A SEMANTIC-BASED ARCHITECTURE TO BRING TOGETHER THE ARCHAEOLOGICAL RECORD AND WRITTEN EVIDENCE

**Abstract author(s):** Medina Gordo, Sonia (University of Barcelona) - del Fresno Bernal, Pablo (Sistemes de Gestió del Patrimoni) - Travé Allepuz, Esther (University of Barcelona)

**Abstract format:** Poster

Either Big or Smart, HSS studies are dealing with digitalized data more and more frequently. This tendency leads scholars to the construction of information systems or digital repositories capable of managing datasets more properly. The issue is that these organisational information schemes often suffer from a lack of interoperability and stay isolated from other data collections. Technically, this sort of insular management framework occurs when the dataset is gathered as means of meeting the particular needs of someone's study, whilst it fails to exchange its information with others adequately. From a conceptual perspective, problems arise once our data model cannot go beyond the expertise domain nor employ the same concepts in other contexts.

In Medieval and Postmedieval contexts, this panorama is more noticeable, as the use of a heterogeneity of sources is very common in our day-to-day research. In our contribution, we aim at introducing a procedure that nourishes from analogous tools and projects, such as the cultural heritage management tool HORAI, or the integrated information system GREYWARE for pottery studies. Our approach does not only make use of archaeological working procedures, but also enhances them by extending and enabling abstract equivalences of its main concept: the Unit of Stratigra-

phy. In this poster, we will bring together various digital repositories as examples, emphasizing the integrated use of archaeological and written sources.

## B. THE VIRTUAL SCIENTIFIC MODEL OF GREAT MORAVIAN MIKULČICE

**Abstract author(s):** Poláček, Lumír - Krupičková, Šárka - Hladík, Marek - Mazuch, Marian - Hlavica, Michal - Stuchlíková, Eva - Šindelář, Jiří (Institute of Archaeology of the Czech Academy of Sciences, Brno)

**Abstract format:** Poster

The Virtual Scientific Model of Great Moravian Mikulčice is a newly published specialised map that gathers spatial information about Mikulčice – a key site for the study of Great Moravia in the Czech Republic with a history of more than 60 years of systematic archaeological research. The interactive map spatially visualises and provides access to information for the scientific community and the general public regarding the stronghold and its hinterland, artefacts and ecofacts, and the development of the site from prehistory to the Middle Ages. The data is published in a web map application on the ArcGIS platform, which is accessible to users (without needing to log in) at <https://mikulcice-valy.cz>. The map application is divided into four units: Hinterland (B1), Mikulčice-Valy Stronghold (B2), Structures & Features (B3), and Artefacts (B4). This interactive map is an active tool, which will be further developed and updated in accordance with the ongoing excavation of the site. The map application is linked to a book published at the same time – Mikulčice 900 atlas (Poláček et al. 2021). Both the map application and book are the outputs of the project Virtual Scientific Model of Great Moravian Mikulčice: A System of Interactive Documentation, Presentation and Archiving of Long-Time Systematic Archaeological Excavations (2018–2022).

---

## 170 THE HOUSES OF DEATH AS ANCESTRAL MONUMENTS. THE ARCHAEOLOGY OF NEOLITHIC LONG BARROWS IN EUROPE

**Theme:** 2. [Re]integration

**Organisers:** Turek, Jan (Center for Theoretical Study, Charles University, Prague) - Darvill, Timothy (Department of Archaeology and Anthropology, Faculty of Science and Technology, Bournemouth University) - Kristuf, Petr (Department of Archaeology, University of West Bohemia in Pilsen) - Przybyl, Agnieszka (Institute of Archaeology, University of Wrocław)

**Format:** Regular session

The construction and use of long barrows connected vast areas of Central and Northwestern Europe during the late fifth, fourth, and third millennia BC. But the purpose and meaning of these great monuments remain issues for debate. They are commonly interpreted as funerary and religious sites, perhaps erected as part of a system of ancestor cults. Their symbolism is closely connected with archetype Neolithic houses, representing crucial values of early farming communities in Europe. Sometimes they are viewed in economic or socio-political terms, as territorial markers delineating the areas controlled by different farming communities. In yet other perspectives they are perceived as landmarks of previous habitation; indicators of settlements or farming-friendly territories enduring for millennia after their construction. Indeed, all these interpretations may be valid and contribute dimensions to the original nature of the long barrows.

In this session we want to address a wide range of issues, starting with regional and chronological variability, construction, and the functional and symbolic interpretations of the structures and their use. We would welcome papers on these matters and also on the spatial relationships of long barrows with other funerary sites, settlement areas, and, more widely, ceremonial landscapes. Contributors are invited to given attention to the dynamics and time-span of the monumental traditions represented, and consider ancestral cults, activities at and around the barrows, and the abandonment and reuse of individual monuments. We would also welcome discussion on the multidisciplinary methods of long barrow research, and issues connected to their conservation and public presentation.

## ABSTRACTS

### 1 CULTURAL ADAPTATION, SOCIAL LEARNING, AND THE ADOPTION OF NEOLITHIC LONG BARROW CONSTRUCTION IN SOUTHERN SCANDINAVIA

**Abstract author(s):** Swenson, Dain (Lund University)

**Abstract format:** Oral

The tradition of construction of monumental mortuary sites was a common practice throughout northern and Atlantic Europe in the Neolithic (c. 4000 – 1700 BC in Scandinavia), and the introduction of the practice to Scandinavia reflects changing patterns in population size, ritual behavior, and relationships with the landscape. The adoption of monumental burials in southern Scandinavia can be examined through the lens of social learning and evolutionary anthropology. Through this lens, culture is an adaptive mechanism which allows us to thrive in different natural and cultural environments. We imitate the behavior of successful individuals if a clear solution to a problem is not readily

apparent. The acculturation process and the spread of technology is, in part, an extension of the social learning processes of imitation, modification, and adoption of ideas and behaviors, and rituals which appear to be advantageous. The spread of long barrow and other monumental traditions, and the rituals which were conducted around such structures can be viewed as advantageous behavior to Neolithic Scandinavians who adopted the practices. This paper examines Neolithic long barrow building in southern Scandinavia, contrasting it with similar traditions elsewhere in Europe, and discusses modern or near-modern monumental tomb traditions and rituals for a modern analogue. Furthermore, the paper explores if evolutionary anthropology can provide insights into any advantages Neolithic Scandinavians gained by adopting long barrow building, such as increased group cohesion, or a shift in territorial attitudes towards the landscape.

## 2 WORK IN PROGRESS – BUILDING A LONG BARROW THROUGH CENTURIES

**Abstract author(s): Beck, Malene (Østfyns Museer)**

**Abstract format: Oral**

The excavation of a long barrow on Funen/Denmark revealed the complex building history of a grave monument consisting of several phases, representing cycles of use during two centuries or more in the early Neolithic.

The barrow contained three non-megalithic graves corresponding to three phases of a wooden palisade at the eastern end of the barrow. A system of ditches, recut several times, predated the barrow and probably marked what was later to become a burial ground. Beneath the barrow ard-marks were discovered.

The long barrow was a complex structure, and during its lifetime it was constantly altered, some parts were destroyed and new elements were added. The different elements – ditches, burial chambers and palisades – probably did not coexist for a very long time, if at all. The central piece of the monument seems to be the wooden palisade. The palisade was a reappearing element, the function of which was to mark a boundary or contact point between the living and the dead.

All though the long barrow was extended and altered over more than a century, it seems that the idea of the final appearance of the barrow was present all the time. The earthen long barrows in Denmark have a lot of architectural elements in common, but none are identical. They are variations on a certain idea or theme, and the different appearances can perhaps be ascribed to the fact, that what we excavate may be earthen long barrows at different stages of construction. Perhaps the importance of the barrow did not lie in the physical barrow itself but in the actions performed during the burial or while building or tearing down parts of the structures. The barrow then became a transformer of land and people from wilderness to culture landscape and from living to ancestor.

## 3 MOUND OVER MOUND – LONG BARROWS AT BYGHOLM NØRREMARK, DENMARK

**Abstract author(s): Gebauer, Anne Birgitte - Nielsen, Poul Otto (National Museum of Denmark)**

**Abstract format: Oral**

Long barrows were the earliest monuments constructed by the first farmers in Northern Europe. These barrows continued to be erected over more than half a millennium (3800-3200 BC) although the architecture of the funerary structures changed. Early long barrows were associated with complicated burial structures, often timber-built, while later long barrows included megalithic chambers and were often delimited by kerbstones. The well-preserved long barrow at Bygholm Nørreremark is an example of the prolonged social and ritual significance of many barrows as the earthen long barrow was remodeled as a megalithic monument where votive offerings continued for centuries. The site was completely excavated in the 1970s and is now being reanalyzed in relation to the final publication. The complicated and long-lasting rituals generally associated with funerals at long barrows are illustrated by a series of wooden structures related to the Early Neolithic Bygholm long barrow including two graves, one or two mortuary houses, a timber façade, division of the mound by internal fences, and a palisade enclosing the entire funerary site. The second stage of the mound belongs to Middle Neolithic. It is particularly striking in terms of size and an unusual double line of kerbstones. The scale of the construction at both stages compared with limited number of graves suggest that these were elite burials. Votive offerings of pottery and polished flint axes demonstrate that the long barrow retained its significance as an ancestral monument throughout the Funnel Beaker Culture. Furthermore the Bygholm barrow is part of a landscape heavily populated with tombs and hoards from the Funnel Beaker period. The use and purpose of long barrows is examined based on the detailed information from Bygholm Nørreremark as well as the role of this barrow within the ceremonial landscape.

## 4 LONG BARROWS AND FAÇADES

**Abstract author(s): Larsson, Lars (Department of Archaeology and Ancient History)**

**Abstract format: Oral**

For decades the Early Neolithic earthen long barrow was not known in Sweden as a burial type despite a large number of excavations of Early Neolithic settlement sites and the identification of a considerable number of earthen

long barrows in nearby Denmark. A project was initiated to find out whether earthen barrows actually existed in the southernmost part of Sweden. The eastern parts of two long barrows, regarded as long dolmens, were excavated, and both presented features, such as a façade, similar to Danish earthen long barrows.

In recent years a number of earthen long barrows have been identified within sites with large areas of topsoil removal. In addition to the earthen long barrows, a number of excavations have shown that façades seem to be common, with a very low barrow or in most cases without any barrow at all. In some cases, a number of façades have been identified without barrows and dolmens seem to have been built directly on top of the remains of facades. Façades made of erected stones instead of wooden posts have also been identified. These different aspects will be discussed.

## 5 A MOUND OF MEMORIES

**Abstract author(s): Søndergaard, Louise (Museum Skanderborg)**

**Abstract format: Oral**

During the winter of 2020 Museum Skanderborg excavated a burial mound in the central part of Jutland Denmark. From outside the mound appeared rather insignificant due to ploughing, but as the layers were peeled off, so were generations of attentive activities. The mound was not the initial stage of the feature. A very rare example of a late Neolithic/early Bronze Age house was completely covered by the mound. Parallel to this house was another one – dated to the early Bronze Age, and right next to the hearth of this house, there was a burial.

The deceased was a woman of aristocratic descent, who had been buried in a hollowed-out oat log which was the most exquisite burial in this specific period in Denmark (1500-1300 BC Early Bronze Age p II). This burial no doubt initiated the erection of the actual mound, but unlike common behaviour this elaborate burial was not the central point of the mound. It was actually placed on the perimeter of the feature indicating that the ancestral dwellings were equally important to seal below this monument.

Later Bronze Age activities at the mound; burials and pits with deposits of finds that evokes suggestions of ritualistic behavior further strengthened the sense of belonging, legitimized ownership of the area as well as reproduced ancestral affiliation.

## 6 LONG BARROWS AND RELATED MONUMENTS IN THE COTSWOLDS IN THE LIGHT OF RECENT WORK

**Abstract author(s): Darvill, Timothy (Bournemouth University)**

**Abstract format: Oral**

Scattered across the Cotswold Hills in the mid-west of England are more than a hundred stone-built long barrows dating to the period 3800 to 3300 BC, one of the most dense concentrations of such monuments in north-west Europe. They have been the subject to study for more than three centuries, but few have been excavated in modern times. Some, including Hazleton North (Gloucestershire) and Ascott-under-Wychwood (Oxfordshire), are clearly single-phase constructions. Others, including Notgrove (Gloucestershire) and Wayland's Smithy (Oxfordshire) are multi-phase monuments in which changing preferences are expressed through successive architectural forms and structures. This lecture will briefly explore what we currently know about the range of monuments dating to the early fourth millennia BC in the Cotswolds, considering issues relating to construction, form, and sequence, before moving on to reflect on the nature and content of the burial deposits and the key matter of identity as expressed by the monuments themselves. The paper draws on the preliminary results of on-going excavations at a multi-phase long barrow at The Sisters near Cirencester in Gloucestershire.

## 7 NEOLITHIC LONG BARROWS AS LONG TERM ANCESTRAL MONUMENTS IN THE RITUAL LANDSCAPES OF BOHEMIA

**Abstract author(s): Turek, Jan (Center for Theoretical Study, Charles University) - Kříšťuf, Petr (Department of Archaeology, University of West Bohemia in Pilsen) - Hejčman, Michal (Czech University of Life Sciences Prague)**

**Abstract format: Oral**

Our recent long barrows project focusses on reconstruction of the sequence

of Neolithic ancestral worship and representation of communal and personal identities in the landscape of North Bohemia. The long barrows are commonly interpreted as funerary/religious sites, perhaps erected as part of a system of ancestral cult. They can also be perceived as territorial markers delineating the areas controlled by different farming communities and perceived as landmarks of previous habitation enduring for millennia after their construction.

The long barrows in Bohemia are dating between 4000-3300 BC. Unlike the burials in contemporary enclosures, the barrows usually contain single burials, particularly emphasizing the familial local ties and more private and intimate relationships towards ancestors. The barrow recently excavated at Dušníky is 86 m long orientated east–west. Its width is 26 meters (E) and 17 meters (W). The mound was piled of dark earth exploited along the barrow. Its current height is still around 1 m in the ploughed field! The barrow was built over the timber burial chamber containing remains of

an 11 year-old child. The tomb was made of wooden planks and contained a small jug (dating to Baalberge phase of the TRB) and a flint arrowhead. Upon the primary burial and completion of the barrow construction, it probably served as an ancestral shrine. The evidence of sacrificial activity consists of several broken ceramic vessels near the eastern frontage. Such ceremonial activity lasted up to 100 years. Similar (Michelsberg Culture) barrow excavated in Vražkov was reused even 2000 years later in EBA for both funerary and sacrificial purposes. The chemical analyses suggest these barrows were located outside of the habitation areas.

In our view the Neolithic long barrows were not only funerary structures but also important ancestral monuments structuring the prehistoric ritual landscapes over long period of time.

## 8 PERSPECTIVES OF LONG BARROWS RESEARCH IN MORAVIA (CZECH REPUBLIC)

**Abstract author(s): Kalabková, Pavlína (Palacký University Olomouc)**

**Abstract format: Oral**

Thanks to research at discovered necropolis we were able to come three stages of development of tumulus burial grounds in Moravia. The oldest FBC tumuli in Central Moravia were found on east-facing slopes of Velký Kosíř, near the village Slatinky. They contained the remains of human torsos which were not cremated, placed in crouched position in stone cists and covered with stone enclosures and layer of clay. These graves contained Baalberg pottery and therefore the stage is called Baalberg phase. The second group is represented by tumuli with significantly reduced volume of stones used. They were used for the perimeter structure of various and size. The cremation burials were placed on the inner surface surrounded by stones, or on the eastern side of the structure. The first tumulus of rectangular structure was discovered at the site Luthóž near village Drahanovice and therefore the stage is called Drahanovice phase. The contents of these tumuli are generally attributed to the early stage FBC with some signs of Boleraz Group and the emerging Baden Culture. The third group was lacking stone structure. Stones were only used to cover individual cremation graves. The traditional habitus of FBC vessels is replaced by shapes and decorations attributed to the Boleraz Group or Baden Culture. Tumuli of this type belong to the group of first tumuli to be studied at sites Slatinky and Ohrozim, which is why this stage was named Ohrozim phase. In addition to these three types of tumuli structures, extremely long mounds are also identified on the necropolises. They have a slightly trapezoidal ground plan and a length 40,80–120m. They are known from two sites – Ludéřov and Slatinky. They have the same E–W orientation as other mounds on the necropolis. However, their research has not yet been done.

## 9 FROM THE NEOLITHIC LONG BARROWS TO THE EARLY MEDIEVAL BURIAL MOUNDS. THE RITUAL LANDSCAPE OF THE MUSZKOWICE FOREST (SUDETEN FORELAND)

**Abstract author(s): Przybyl, Agnieszka (University of Wrocław)**

**Abstract format: Oral**

An almost perfectly preserved ritual landscape is represented in the small wooded area near the Muszkowice village, in the Sudeten Foreland in south-western Poland (Lower Silesia). The most distinguishable feature of the area is the presence of dozens of prehistoric and early medieval burial mounds. In the Muszkowice forest there are as many as 35 archaeological sites, representing separate burial places. Among them 16 sites represent places with the Neolithic earthen long barrows and 19 represent clusters of much smaller, round burial mounds. All of the latter are probably much younger than the former. Some of them are certainly of an early medieval origin.

During the archaeological excavations, at one of the Neolithic sites (Muszkowice 18), a late Neolithic inhumation grave were recorded. It was located inside a mound of the long barrow of an earlier origin. At another of the Neolithic burial sites (Muszkowice 45), two, not very large round barrows with the remains of the cremation burials, were discovered. They are related to the Early Middle Ages. In this area this is not the only one example, where small mounds were imposed onto the Neolithic monumental barrows.

In my presentation, I want to outline the issue of continuity of burial grounds confirmed by several cases of such a distant use of cemeteries in that area.

The studies presented were conducted with the financial support of the National Science Centre, research project No. 2017/25/B/HS3/01442.

**Theme: 3. The Carpathian Basin: Integration, Mobility and Diversity**

**Organisers: Vicze, Magdolna (Hungarian National Museum) - Sorensen, Marie Louise (Cambridge University) - Sofer, Joanna (Southampton University) - Kovács, Gabriella (Hungarian National Museum)**

**Format: Regular session**

The many nuances of life on prehistoric sites and the questions they raise about lifeways and the influences of various forms of temporalities and seasonal cycles sit behind this session proposal. These aspects of prehistoric life are obvious, yet rarely discussed. Our work at the Bronze Age tell at Százhalombatta (Hungary) has made us realise that archaeological notions of seasonality are often underdeveloped and sometimes banal. For example, how the behaviour of fish or birds may have directed community attention towards seasonal opportunities. Nor do we take into account the difference between using plants that enabled two annual harvests rather than just one when we discuss our prehistoric agrarian communities. Which activities filled the cold winter months, and which could be distributed to any available time during the year? For example, how are pottery making versus spinning and weaving dependent on the weather and temperatures? Having paid scant attention to these aspects means that we may have ignored some of the major factors that influenced community life, including for example labour divisions, the necessity of choice, and whether ideas of the 'right' time were linked to certain activities. It also means that we have neglected to grant prehistoric people planning and foresight, such as the need for storage or having the right kind and amount of grain for seeding. Drawing inspiration from late Medieval annual calendars that typically illustrate the distribution of tasks over the year, including both those that were dependent on seasons and those that were irregular and opportunistic, we call for discussion of how we may bring more attention to these dimensions of prehistoric settled life. In turn, we aim to recognise more of the agency at play between individuals, communities, environments, and materials.

## ABSTRACTS

### 1 PLANNING AND FORECASTING AS STRUCTURING GUIDANCE IN THE PREHISTORIC 'EVERYDAY'

**Abstract author(s): Sorensen, Marie Louise Stig (University of Cambridge)**

**Abstract format: Oral**

In this paper, I consider some of the traditional means of forecasting and planning and argue that such means provided foundational structures to prehistoric lives; that they became essential parts of habitus (aiming at order rather than randomness). I will explore the different temporalities of planning and forecasting, and their varied influences on domestic life. To reflect on the typical concerns of planning I look to different traditional calendrical systems – what are their emphasis and how do they provide guidance for practical actions. This brings attention to seasonality and how changes are best responded to. For forecasting, my focus will be traditional weather lore and similar practices – what are their concerns and how are they formulated. This brings attention to the close connection between observations and forecasting as the behaviour of animals, birds, plants, clouds, or the surface of waters are used to propose changes within the short term. My aim is not to suggest these as direct analogies. Rather, by focusing on these two common forms of guidance for the arrangements of tasks and activities, I aim to move attention to the regulative mechanisms of the 'everyday' within different temporal scales

### 2 ANNUAL ACTIVITY DIAGRAMS AS A TOOL FOR UNDERSTANDING THE COMPLEXITY OF DAILY LIFE ON A FARM

**Abstract author(s): van Amerongen, Yvonne (Archol - Archaeological Research Leiden)**

**Abstract format: Oral**

In West Frisia (The Netherlands), the Middle and Late Bronze Age (1800-800 BC) were characterized by a dynamic landscape in which subsistence was dominated by farming, but wild resources were also exploited throughout the year. In order to capture the complex concepts related to subsistence such as activity, distance, landscape type, and climatic influence year cycles were constructed. These were made based on extensive research on seasonality of each of the activities related to the different subsistence strategies (crop and animal husbandry, hunting and gathering). Furthermore, the distance from the settlement required for each of their related activities was assessed, as well as the influence of (changing) environments over time. In the resulting activity diagrams, the work required in a farming system on an annual basis, the adaptability to environmental change, as well as the interconnectedness and complexity of a farming system that includes wild resource exploitation are captured in one image.

### 3 RHYTHMS OF HEATHLAND LIVING IN THE NORDIC BRONZE AGE

**Abstract author(s):** Houghton, Mark - Caple, Zac (Aarhus University)

**Abstract format:** Oral

By the end of the Early Bronze Age, heathlands created and maintained by the grazing of livestock and regular controlled burning expanded to become a major feature of the Northern European landscape. This was particularly so in Western Jutland, Denmark, where heathlands continued to be the dominant landscape form until the nineteenth century. This inherently unstable landscape form entangled humans and other species in cyclical relations of pastoralism, grazing and burning that mark out heathland living. While mobility is an established part of our understanding of the European Bronze Age, our focus is often drawn to long distance 'heroic' travel, rather than the annual rhythms of movement that pastoralism entailed for these communities.

This paper explores the temporalities of heathland living in the Danish Early Bronze Age, with a particular focus on how humans and other species co-created seasonality and rhythms of life that operated across multiple scales. By considering events on different timescales and their archaeological signatures alongside larger patterns of settlement and social organization, we open up our understanding of these communities and the different social dynamics which they brought about. These cyclical timescales were both seasonal – particularly those relating to the management of herd animals such as sheep – and something unique to this landscape – relating to the cycle of heathland plant species sprouting, maturing, burning and recovering. We can thus explore the critical difference in temporality between communities living in different parts of Denmark, the practices and rhythms of life to which they were exposed, and the forms of multispecies social organization that resulted.

### 4 THE POLYRHYTHMS OF THE IRON AGE HEATHLAND FARM: A VIEW FROM WESTERN DENMARK

**Abstract author(s):** Caple, Zac - Houghton, Mark (Aarhus University)

**Abstract format:** Oral

In the Early Iron Age, the heathland areas of Western Denmark transformed from a winter grazing commons to a site of semi-permanent agricultural settlement. Extensive networks of Celtic fields enveloped the heathlands. In contrast to earlier seasonal migrations, the rhythms of everyday life in the Iron Age were dictated by the field. Iron Age farmers practiced a mixed mode of agriculture combining swidden cereal production and livestock husbandry. Fields rotated between cereal plots, pasture, and heath-fallow. Without manuring, the fields may have required a fallow as long as 35 years, but the incorporation of dung, household waste, and other manures significantly shortened the fallow cycle. In addition to these longer cycles, farm life was punctuated by the seasonal rhythms of livestock and crop needs. While we might imagine the farm's rhythms following the predictable schedule of the harvest, the harsh environmental conditions of heath may have subjected the farming communities to the temporalities of disaster. Given the heath's sandy oligotrophic soil, a 3-week period of drought could ruin the crop, forcing people to adopt emergency strategies.

This paper will examine the composition of this polyrhythmic agrarian landscape as it is revealed through archaeological and palynological remains. The rhythms of the Iron Age farm are traced through several case studies which attend to the varied uses of heather as fuel, fodder, and building material. The consequences of the failure of these cycles are also explored. Thus, the farm is seen to extend beyond the in-field zone which is often the focus of archaeological investigations. We also draw out the ontological contrasts with earlier periods that this evidence suggests.

### 5 SIGNS OF SEASONALITY IN BRONZE AGE AGRICULTURAL PRACTICE AS SEEN IN THE ARCHAEOBOTANICAL RECORD

**Abstract author(s):** Peto, Ákos (Hungarian University of Agricultural and Life Sciences) - Kovács, Gabriella - Vicze, Magdolna (Hungarian National Museum, Budapest)

**Abstract format:** Oral

One of the main factors of success for contemporary human populations was the understanding how nature functioned and also the capability of adopting agricultural know-how to the surrounding landscape. Seasonality within the agricultural cycle was highly important. This part of the agricultural knowledge and environment exploitation must have been the art of knowing 'when to act', and so much the art of 'how to act'.

In the lack of written sources, bioarchaeological remains – among which archaeobotanical remains are one of the most significant ones – can tell us stories of how people coped with seasonality in the Bronze Age. The cultivation of plants, storage of the harvested material all have an interpretation placed within the notion of seasonality.

In the current presentation we undertake an attempt to interpret archaeobotanical material in the light of the changing seasons and by acknowledging that most of the agriculture related actions were strictly linked to a given period of the year, but the survival of human populations depended on their long-lasting effect.

Case studies and phenomena from the site of Százhalombatta-Földvár will be under investigation to reflect on seasonality within the contemporary agricultural practices.

## 6 DETECTING SEASONAL ACTIVITY AT PREHISTORIC SITES THROUGH THE STUDY OF SKELETAL REMAINS FROM FISH, BIRDS AND JUVENILE LIVESTOCK

**Abstract author(s):** Bartosiewicz, Laszlo (Stockholm University) - Gál, Erika (Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network)

**Abstract format:** Oral

The study of temporalities using animal remains includes seasonality. The occurrence of migrating wild animals as well as the reproduction patterns of domestic livestock can offer indication of the season when a deposit was formed. The likelihood of successful fishing also increases during known periods of spawning. Such regularities have certainly directed attention towards the seasonal exploitation of animal resources during prehistory.

The number of usually small remains of birds, fish and juvenile livestock recovered from archaeological sites strongly depends on the methods of excavation. Without wet sieving and/or dry screening it is hopeless to obtain sufficiently large numbers of such delicate finds.

Animal remains from the Early Neolithic settlement of Ecsegfalva and the Bronze Age tell at Százhalombatta (Hungary) have been recovered with sufficient precision to guarantee a reliable representation of small animal remains of key importance in determining seasonality in the find material. Extensive reliance on domestic mammals at both sites is indicative of the opportunistic exploitation of seasonal animal resources which brought variability in the meat diet.

## 7 CHILDREN AND SEASONS IN PROTOHISTORIC SETTLEMENTS IN THE SOUTHERN CARPATHIAN BASIN

**Abstract author(s):** Ložnjak Dizdar, Daria (Institute of Archaeology, Zagreb) - Drnić, Ivan (Archaeological Museum in Zagreb)

**Abstract format:** Oral

The moon, the sun, the stars and water were the most important elements of the first calendars. They served to confirm and validate the seasons. They were also crucial for the main economic activities of the protohistoric communities in the Carpathian Basin.

Agriculture was a major economic activity of the communities in the southern Carpathian Basin; sowing and harvesting must have influenced the cycles and production of food. Traces of the participation of children in agricultural activities are very rare, but some traces in settlements indicate that children were involved from an early age in food preparation activities, from producing and collecting to storing and keeping food. Many scenes from the life cycle of a settlement have not been preserved, not even in the smallest archaeological traces, but certain objects make it possible to reconstruct the life in these cycles and the roles that the youngest community members had in these rhythms. Aside from the seasons that depended on weather and the environment, the settlements had their own life cycles, and the transfer of knowledge about these cycles had an important role in the common life of different generations. Children could take part in the everyday activities in the settlement, learning from adults and taking on various tasks suitable to their age – planting, sowing, scaring away birds, helping with the harvest, storing food, preparing meals. The finds from chosen protohistoric Bronze and Iron Age settlements in the southern Carpathian Basin can help us try to reconstruct these scenes from the settlements.

## 8 MICROSCOPY OF SEASONALITY

**Abstract author(s):** Kovács, Gabriella (Hungarian National Museum) - Pető, Ákos (Hungarian University of Agriculture and Life Sciences, Institute for Wildlife Management and Nature Conservation, Department of Nature Conservation and Landscape Management) - Vicze, Magdolna (Hungarian National Museum)

**Abstract format:** Oral

Even today with high skills and techniques, people are greatly affected by the difference in seasons. Thousands of years ago this must have been even more challenging, so people had to adapt, just as we do today. In this paper seasonality will be investigated on the microscopic level. This will be carried out with the application of thin section soil micromorphology and phytolith analysis on the example of Százhalombatta-Földvár Bronze Age tell settlement in Hungary. Sustainability was not a trend 4000 years ago, but was just 'simple' life. People were dependent on their surrounding and they were well aware of this, so activities were adjusted to the possibilities and challenges of nature. Earthen materials were used for construction for example. Accessing the required raw materials several natural and environmental circumstances had to be taken into account. Preparation of wattle and daub walls, where clay is tempered with great amounts of vegetal remains is also likely to have been taking place seasonally. The maintenance of houses, with fine re-plasterings must have been carried out under carefully chosen conditions as well. It will be demonstrated how seasonality can affect a range of activities that can best be investigated under the microscope.

## 9 THE TEMPORALITY OF A POT

**Abstract author(s):** Sofaer, Joanna (University of Southampton)

**Abstract format:** Oral

Archaeologists frequently focus on the process of ceramic manufacture, such that the various steps of production are understood as a series of technical actions set within a chaîne opératoire. Using the single example of a fine ware bowl from the Bronze Age tell at Százhalombatta, Hungary, in this paper I argue that vessels can also be understood as embodying a series of nested scales of time that both complement and intersect with technical understandings. Reflecting on these different scales offers insights into the complexity and temporality of human interactions with materials. In turn, this allows consideration of the ways in which the Bronze Age potters of Százhalombatta worked with, and against, time in satisfying the demands of their craft. It shed light on how they may have been aware of time and duration as an integral part of their practice, and the varied nature of temporality for this prehistoric community.

## 10 'THOU KNOWEST, WINTER TAMES MAN, WOMAN, AND BEAST.' – THE ARCHAEOLOGY OF LIGHTING IN MIDDLE BRONZE AGE HOUSEHOLDS

**Abstract author(s):** Vicze, Magdolna (Hungarian National Museum)

**Abstract format:** Oral

One's long-term involvement in studying the daily routines of prehistoric settled life, inevitably takes one to such questions that are rarely discussed. The determinant nature of the seasons and their challenges for prehistoric mankind is an axiom. Probably this is why the imprints of seasonality and temporalities are rarely investigated. However, our work at the Middle Bronze Age settlement of Százhalombatta-Földvár (Hungary) allows us to approach some of these issues in certain detail. This paper aims to search for answers within the archaeological material that can be linked to some aspects of temporality. One of these is the rhythm of day and night. Darkness must have played a greater role than we tend to acknowledge. What kind of activities could be pursued after sundown or during the long winter nights and how did they produce illumination for these? The question is more complicated than it appears as it is not so straightforward how this was solved on a daily basis in a typical Middle Bronze Age house.

---

## 176 ORNAMENTS AS A KEY TO UNDERSTANDING THE HUNTER-GATHERER TO FARMING TRANSITION IN EUROPE

**Theme:** 2. [Re]integration

**Organisers:** Martínez-Sevilla, Francisco (University of Alcalá) - Baysal, Emma (Ankara University)

**Format:** Regular session

The transition from hunter-gatherer to farming-based subsistence systems involved both group mobility and the transmission of ideas and associated practices from western Asia across Europe over the course of several millennia. As mobile artefacts closely associated with the human body, personal ornaments accompanied humans as an element of identity. The expression of personal and group identities as well as technological knowledge and knowhow were a crucial part of ornamentation related practices and it seems that people kept this knowledge alive during processes of change. For example, stone bracelets associated with early farming communities during their spread from western Asia to western Europe have already shown that material culture was important for the structuring of Neolithic identities for settlers in different regions and that these expressions of identity were temporally and spatially persistent. Technologies and knowledge were adapted to different environments, material sources and lifeways to create regional styles.

This session intends to gather Mesolithic and Neolithic specialists in the same place to discuss all the issues related to ornaments and their links with changes, continuity and interactions in the Neolithization process. We will explore evidence for changes and continuities in ornamentation practices, technologies and materials through this complex period of economic and social transformation using examples from across Europe and western Asia. We invite papers exploring any aspect of ornamentation production, use, theoretical and practical approaches to their interpretation particularly with reference to the human-ornament relationship, construction of identities, consideration of environments and material choices, and interactions engendered by or shaped using personal ornaments in their many forms. This session aims to place ornamentation at the centre of the Neolithization process as a vital source of information about the relationship between hunter-gatherer and farming communities.

**1 THE ORIGINS OF POTTERY ORNAMENTATION**

**Abstract author(s):** Gralak, Tomasz (University of Wrocław)

**Abstract format:** Oral

The oldest ceramics were discovered in southern China and eastern Asia. In the beginning, pottery was used by Mesolithic hunter-gatherers. It was an innovation particularly useful in a cold climate. The acceptance of the new technology was also an intellectual process. This aspect will be analyzed – from the cognitive point of view. The vessels were given a previously chosen shape and covered with specific ornaments. It was already noted that the newly developed pottery technology referred to previously functioning forms of vessels made of organic materials. This phenomenon (skeuomorphism) was also noted in the case of Neolithic ceramics in Europe and was recorded in many prehistoric cultures. This is the reason why pottery surfaces may imitate wooden bark or lather. Another issue is the connections between pottery and basketry. It seems that these relations were of fundamental importance for creating the geometrical ornamentation covering the vessels. Characteristically, this type of ornamentation was created on stone and bone objects from the Paleolithic, Mesolithic, and Neolithic periods in Europe. Thus, transferring wickerwork patterns to products from other raw materials is a long-lasting process over huge areas. As an example of the phenomenon of skeuomorphism, we can also consider vessels covered with impressions of a cord. Characteristically, this surface treatment method was known in large areas of northern Eurasia. Its appearance may be associated with the widespread pottery technology in the early Holocene among hunter-gatherers. Lately, this type of ornamentation was used by Neolithic populations. Another issue is the meanings given to ceramic ornaments and the vessels themselves.

**2 TRANSFORMATION AND CONSERVATION: LEARNING AND MEMORY AT THE EPIPALAEOLITHIC/NEOLITHIC TRANSITION IN TURKEY**

**Abstract author(s):** Baysal, Emma (Ankara University) - Yelözer, Sera (Istanbul University)

**Abstract format:** Oral

The Epipalaeolithic in Turkey, and western Asia more widely, is notable for the mobility associated with ornamentation practices – shells were gathered and moved around with mobile hunter-gatherer groups, and ornament-related technologies were relatively limited. With time, technologies used in ornamentation proliferated, and the variety of artefacts, as well as their number increased. In this paper we ask what happened to ornamentation practices during the slow process of the Neolithic transition to settled life when human-landscape relationships underwent profound change and some groups, or members of groups, moved from mobile hunter-gathering to sedentary subsistence. While we know that new materials and techniques were added to the ornamental repertoire of the early sedentary groups, we see temporal and spatial persistence in some practices, juxtaposed with innovation and transformation in others. The contextual associations of different kinds of ornaments suggest their centrality in the construction and display of identities. Through examples from Late Epipalaeolithic and Early Neolithic sites in Turkey we will explore the scale of change and endurance in ornament-making and use processes as well as human-ornament relationships. We will discuss how these mobile items served as a medium of interaction between individuals and groups, and their place in identity and memory-making throughout the transition from mobile hunter-gatherer way of life to year-round sedentism.

**3 PERFORATED BEADS AND ORNAMENTS FROM THE NEW EPIPALAEOLITHIC-NEOLITHIC SITE OF ABRIGO DE ZACATÍN (CASTELL DE FERRO, GRANADA, SPAIN)**

**Abstract author(s):** Gutiérrez Frías, Ismael (University of Granada) - Martínez Sánchez, Rafael M (University of Córdoba)

**Abstract format:** Oral

This communication will describe a set of adornment elements from the new archaeological site of Zacatín Rockshelter, placed on the coast of Granada (Spain). It has a chronological sequence placed between the Epipalaeolithic and the Early Neolithic B (VII-V millennia cal BC). This location is one of the few multi-layered archaeological sites on the coast of southern Iberia allowing us to track the transition between the last hunter-gatherers and the first farming societies. The assemblage is made up of around fifty elements, mainly pierced small gastropods, both from marine and freshwater origin, and discoidal lithic beads, among other decorative elements made on malacological raw material. The first study of these elements allows us to trace the chaîne opératoire used in the production of these elements, involving the removal by percussion, pressure of the apical part, wall perforation by abrasion, or pressure. In any case, it is likely different techniques depending on the specific features of each gastropod species, its morphology, or wall thickness. Finally, we have observed both specific and technical variations and selection criteria in terms of species, regarding the chronological phases, observed in the site.

#### 4 ORNAMENTS AS A KEY TO DEFINE THE ORIGIN OF CULTURAL IDENTITIES IN THE MESOLITHIC-NEOLITHIC TRANSITION IN THE IBERIAN PENINSULA

**Abstract author(s):** Martínez-Sevilla, Francisco (University of Alcalá)

**Abstract format:** Oral

Body ornaments represent visual tokens or badges that define an individual's membership of a social group. As such, ornaments play an essential role within the ethnic or cultural identification of human societies, and are a means of acculturation. In the Iberian Peninsula the transition from hunter-gatherer to farming societies coincides with an increase in the presence of ornamental objects. The cultural complexity of personal ornaments increased in terms of quantity, technology, raw materials, and aesthetics from the Late Mesolithic (6600-5600 cal BC) to the Early Neolithic (5600-4800 cal BC). The ornaments change between two periods from perforated shell and deer teeth in Late Mesolithic to a broad variety of pendants, drilled teeth, necklace beads, rings, and bracelets made of different rock types and seashells in Early Neolithic. Therefore, ornament became an object of crucial relevance for the study of the origin of cultural identities in the first farming communities. This communication presents an analysis of the origin of the first farming cultural identities in the Iberian Peninsula and the link with previous traditions using the ornaments as principal element of distinction. The study involves not only ornament typology but also technological processes, workshops presence and circulations networks. The conclusions show how the ornament distribution could be related with different social groups.

#### 5 LET'S HANG TOGETHER! VISUAL IDENTITY OF MESOLITHIC GROUPS IN THE EASTERN ADRIATIC REGION

**Abstract author(s):** Cvitkusic, Barbara (Institute for Anthropological Research, Zagreb) - Cristiani, Emanuela (Sapienza University, DANTE - Diet and ANcient TEchnology Laboratory, Roma) - Vujevic, Dario (University of Zadar, Department of Archaeology)

**Abstract format:** Oral

During the Late Upper Palaeolithic, various raw materials were used to produce ornaments across the Eastern Adriatic region. Production trends persisted throughout time but varied in typology. During the Mesolithic period, ornaments are well documented at many regional sites. Their analysis has revealed Holocene hunter-gatherers settled in this area shared a specific visual identity based on the selection of unique bead types.

Here, we present three prehistoric sites characterized by long-lasting archaeological sequences documenting Upper Palaeolithic and Mesolithic occupations: Pupičina cave in Istria, Vlakno cave on Dugi Otok island, and Vela spila cave on the Korčula island. These sites yielded a wealth of material evidence, mainly ornaments, and decorated items. Besides the presence of various forms of beads in the ornamental assemblage, such as perforated marine gastropods *Tritia neritea*, *Nassarius* sp., or freshwater gastropods *Lythoglyphus naticoides*, or mammal canines of *Cervus elaphus*, one type is dominant – beads made of marine gastropod *Columbella rustica*. Vlakno cave, in particular, has yielded an abundance of entire, unused perforated *Columbella* shells as well as manufacture accidents, suggesting this site could represent a workshop for specialized production and distribution of these specific shell ornaments in the Eastern Adriatic region. Detailed analyses of ornaments from the Mesolithic layers of Vlakno cave indicate intensive communications and connections to the hinterland and the mainland. Aspects of continuity in manufacturing techniques and the selection of raw materials across the Eastern Adriatic and the central Balkan regions suggest the existence of wide social networks based on shared modalities of social and personal identity."

#### 6 NETWORK ANALYSIS APPLIED TO THE SPREAD OF SYMBOLIC PRODUCTIONS DURING THE MESOLITHIC-NEOLITHIC TRANSITION IN EUROPE

**Abstract author(s):** Pereira, Daniel - Rigaud, Solange (CNRS; Centre National de la Recherche Scientifique - CNRS, UMR5199 PACEA; University of Bordeaux) - Manen, Claire (CNRS; Centre National de la Recherche Scientifique - CNRS, UMR5608 TRACES; University Jean Jaures Toulouse)

**Abstract format:** Oral

We explore how connectivity affected two symbolic productions, personal ornaments and pottery decoration, during the Mediterranean Early Neolithic and how network structure impacted the diffusion of symbols and belief systems. We have applied Social Network Analysis to our datasets (39 archaeological layers with pottery data and 49 with ornament data) attributed to the Mediterranean Early Neolithic (Rigaud et al. 2018). By using refined absolute chronology, we have defined 3 main phases of the Early Neolithic diffusion: 1) the emergence of farming societies; 2) a period of cultural diversification and site densification; 3) a period of fixation of the settlement pattern and of a gradual loss of pottery decoration diversity (Manen et al. 2021) counterbalanced by an increase in personal ornaments diversity (Rigaud et al. 2015, Perlès and Rigaud 2021). Networks were constructed for each two sequential time period sequence using the BR coefficient at a similarity threshold that allows for no disjointed nodes. The networks were created in the R software using various centrality indexes (degree centrality, eigenvector, clustering...). Results show significant differences between pottery decoration and ornament networks topology, suggesting that different

transmission mechanisms ruled the circulation of the two cultural traits between communities. Moreover, the networks differ within each chronological phase of the Neolithic diffusion, suggesting that interaction patterns changed significantly over time. Pottery decoration networks show that at the end of the Neolithic, networks are highly consolidated, suggesting the movement of communities into geographically delimited areas. Personal ornament networks appear less structured, indicating that beads were widely shared and linked people with different cultural affiliations. The two symbolic productions express different degrees of cultural interaction and the adoption of common personal ornament associations over large areas can be seen as a social strategy to cooperate and spread within a territory already occupied by foraging communities.

## 7 THE HEAD AND THE CROPS. BODY ORNAMENTS AND ADOPTION OF AGRICULTURE IN NORTH-CENTRAL CHILE

**Abstract author(s):** Armstrong, Felipe (Universidad Alberto Hurtado)

**Abstract format:** Oral

The transition from hunter-gatherer communities to proper agricultural ones took roughly 1,000 years in North Central Chile (ca. 300 – 1200 CE). During this time, new ways of experiencing and inhabiting the human bodies appeared. Archaeological evidence shows that the human body started appearing as images in rock art and pottery and new body ornaments were produced and used throughout this time.

Transition to agriculture seems to have promoted new engagements with material culture as part of the body, as well as with bodies as part of material culture. These engagements can be addressed considering their ontological bases and consequences, shedding light on the body-as-social-phenomenon and its position within socio-historical relational webs. From stone pendants and bone and shell necklaces used by hunter-gatherers, body ornaments went through important changes, while economies increasingly depended on vegetal resources. New body technologies were developed, from stone lower lip piercings (tembetás) to disc earrings, to metal earrings and possible headpieces. In this process, an increasing importance seems to have been given to the face or head, as seen mainly on rock art.

This presentation discusses how the transformation of body ornaments in the Elqui and Limarí valleys can offer a new understanding on how the body itself changed in the process that eventually led to agriculture. Through the exploration of body ornaments as parts of bodily experiences of these communities, as well as participants in sociohistorical relational webs, I offer an ontologically informed approach to the broader social and economic transformations leading to the adoption of agriculture. Although not a European case study, this contribution can offer some insight into the ways in which human communities dealt with this transition, with differences, but also similarities with the European Mesolithic-Neolithic transition.

## 8 FROM SEASHELL TO EGGHELL: BEADS FROM THE NEOLITHIC OF KAF TAHT EL GHAR (TETOUAN) AND MAGHARAT EL KHIL (TANGIER, MOROCCO)

**Abstract author(s):** Martínez Sánchez, Rafael (University of Granada; University of Cordoba) - Vera Rodríguez, Juan Carlos (University of Huelva) - Perez Jordá, Guillem (Universitat de Valencia) - Peña-Chocarro, Leonor (Instituto de Historia-CSIC)

**Abstract format:** Oral

Bearing in mind that the Neolithisation process of the Mediterranean Maghreb is part of the wider processes Neolithization of the Mediterranean European shore, there are however, differences in terms of research interests. In fact, despite a history of almost 150,000 years, one of the less studied aspects of the Neolithic in Mediterranean Africa, is that of ornaments. Being physical artifacts made from biotic or abiotic raw materials, these elements are one of the most interesting aspects linked to the creation of individual and collective identities in human cultures, with a key significance among the first productive societies. Between 2011 and 2012, within the framework of the ERC AGRIVESTMED project, archaeological work was carried out in the caves of Magharat el Khil (Tangier) (Caves B and C, from Early to Late Neolithic) and Kaf Taht el Ghar (Tetouan) (from Palaeolithic to Historic times). A limited but very interesting number of decorative elements have been found in the Epipaleolithic and Neolithic levels. These include especially beads made on small marine gastropods, as well as discoidal beads, most of them made on ostrich eggshells. The latter has a long history across many African hunter-gatherer cultures.

## 9 VARISCITE ADORNMENT PRODUCTION, DISTRIBUTION AND CONSUMPTION IN NORTH-EASTERN IBERIA DURING THE MIDDLE NEOLITHIC: NEW DATA AND A REVIEW

**Abstract author(s):** Garrido Cordero, José Ángel (Departamento de Prehistoria y Arqueología, Universidad de Sevilla) - Odriozola, Carlos P. (Departamento de Prehistoria y Arqueología, Universidad de Sevilla; UNIARQ. Universidade de Lisboa) - Borrell Tena, Ferrán (Institutió Milà i Fontanals, CSIC) - Sánchez Muñoz, Habana (Departamento de Prehistoria y Arqueología, Universidad de Sevilla)

**Abstract format:** Oral

Variscite is a well-known alluminophosphate used in the production of personal adornments, with a long historiographical debate about its origin, exploitation and circulation dynamics due to its recurrent presence in the Iberian Peninsula and Western Europe during the Neolithic and Chalcolithic periods, where this bright green mineral was highly demanded. In the Iberian peninsula, different sources are known to date, pointing to a down-the-line model of distribution and provenance in different geographical regions in different chronological moments.

The Gavà municipality (Barcelona) hosts one of the few outcrops of this semi-precious mineral with prehistoric exploitation in a mining complex with subterranean galleries and pits that existed at least from 5th to 4th millennia BCE. The unpublished materials from the recently excavated Ferreres sector provides a new insight on the spaces of extraction and production of variscite mineral and other phosphates used and on geochemical variability composition both on the raw material and the finished objects deposited in the funerary record of Middle Neolithic fossa necropolis.

More than 700 geochemical analysis have been performed in the last years from 12 sites, most of them well-known necropolis representatives of this period in Catalonia. Among the sites studied, we present and discuss the inedit analysis of the variscite beads from Cova dels Lladres, which could point to a first exploitation of variscite during Ancient Neolithic.

## 10 CALCITE PENDANTS IN SOUTHERN IBERIAN PENINSULA FROM 6TH TO 5TH MILLENNIA BCE: TRANSLUCENCY AND SYMBOLISM IN EARLY NEOLITHIC

**Abstract author(s):** Garrido Cordero, José Ángel (Departamento de Prehistoria y Arqueología, Universidad de Sevilla) - Odriozola, Carlos P. (Departamento de Prehistoria y Arqueología, Universidad de Sevilla; UNIARQ. Universidade de Lisboa)

**Abstract format:** Oral

Calcite is a common mineral used in diverse repertoires of symbolic artefacts during Late Prehistory, which a high degree of translucency and white to orange colour. During the spread of the Neolithic populations across the Mediterranean, a high number of caves with funerary records in Southern Iberia evidence new spaces and ritualization, in which an increase of use of personal adornments stands in the development of social roles and complex identities. Translucency should stand as a key organoleptic property (together with colour, brightness, texture...) in the techno-cultural choices concerning the personal adornment selection and production (Garrido-Cordero et al., 2020). Several pendants stand out from the common black and white discoid beads typical from 6th to 5th millennia BCE because of its raw material and organoleptic properties.

Characterization study of translucent pendants from Ancient Neolithic layers from Cueva de Los Mármoles, Cueva de la Pulsera and Abrigo 6 de La Araña revealed its nature as yellow calcite, probably originated on the same caves that were deposited as ornaments or votive items. The use of translucent calcite and the use of other ritualized elements (as stalactites) in Ancient-Middle Neolithic is discussed here compared with other examples from the Late Prehistory of Iberia and Western Europe.

Garrido-Cordero, J. A.; Odriozola, C. P.; Sousa, A. C.; Gonçalves, V. S.; Cardoso, J. L. 2020. "Distribution and consumption of fluorite and translucent beads in the Iberian peninsula from 6th to 2nd Millennium BC". *Trabajos de Prehistoria* 77 (2): 273-283. <https://doi.org/10.3989/tp.2020.12256>

---

## 177 ORGANIC MATERIALS IN TOMBS: THE QUIET PROTAGONISTS

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Andrianou, Demi (National Hellenic Research Foundation) - Kwaspen, Anne (Center for Textile Research, Copenhagen)

**Format:** Regular session

Remnants of textiles and other organic materials (cellulosic and proteinaceous, apart from bones) are often found in tombs of the Classical and Hellenistic/Roman periods in the eastern Mediterranean. Apart from clothing, organic materials provide care for the deceased and decorate the tomb. Hangings, textiles, pillows, mattresses, ribbons, leather covers or bags, reed mats, aromatic resins woven into fabrics, vegetal matter, etc., all contribute to transform the

tomb into a homey environment. At the same time, for those left behind, all five senses are stimulated by the organic materials, aiding in the construction of personal evocative memories.

Organic materials in funerary settings provide us with invaluable evidence for the burial customs of the time, details that hardly ever come down to us through the literary sources. They signify both the care and comfort that the relatives wished to provide for the deceased. The journey to the Otherworld is equipped with familiar images and smells, in the hope that it continues uneventful. In cases where the tombs are sealed, never to be opened again, this setting becomes a memory of the life once lived and allows for some sort of continuing existence of the soul in the Afterlife.

This session aims to attract scholars working on organic materials (other than bones) in funerary contexts in the Greek and Roman Mediterranean (including Ptolemaic Egypt), to discuss issues regarding their use and re-use, their significance in burial customs, and cross-cultural connections.

The proposed session is based on work conducted within the COST Action "Europe through Textiles: Network for an Integrated and Interdisciplinary Humanities" (EuroWeb) CA 19131, WG 2 and 3.

## ABSTRACTS

### 1 ORGANIC FINDINGS FROM THE INFANT BURIALS AT THE NECROPOLIS OF THE PHALERON DELTA, IN SOUTHERN ATTICA, GREECE

**Abstract author(s):** Panagoupoulou, Aikaterini (Hellenic Ministry of Culture and Sport) - Zacharias, Nikos (University of Peloponnese) - Pappas, Ioannis (University of Crete)

**Abstract format:** Oral

At the eastern part of the Phaleron coast, a spatially extended cemetery has been partly excavated since the 19th century. During the three periods of rescue excavations (1911, 1915, 2012-2019) over 2115 burials were unearthed, mostly pit graves, pot burials, funeral pyres, cist graves, larnakes, and animal burials. Apart from the individual burials, mass graves have been excavated, offering aspects of violent death. The use of the cemetery spanned over a period of four centuries (8th – 4th century BC), with the main use in the archaic period. Except for the two thousand vases, the clay figurines, the stone tools, the amulets, the various metal objects, and the beads, a considerable number of organic finds have been also found in many graves, especially the pot burials.

This paper is dedicated to the organic material evidence recovered from the Archaic child burials of the Phaleron Delta cemetery, which will be presented here for the first time. Except for the information provided for the funerary treatments of infants and children in Attica at the time, these pot burials preserved unique remains of textiles as well as traces of substances, owing to their preservation state to the coastal sandy environment.

### 2 ORGANIC MATERIALS IN LATE CLASSICAL AND HELLENISTIC TOMBS IN GREECE: THE EVIDENCE OF FURNISHINGS

**Abstract author(s):** Andrianou, Demi (National Hellenic Research Foundation)

**Abstract format:** Oral

Our ancient sources provide very little information on the subject of life beyond death, and none too consistent information at that. We are not in a position to determine whether with regard to the question of their ultimate fate the ancient Greeks were fatalistic or indifferent, or, whether to a greater or lesser extent, belief in an afterlife of happiness was common. Perhaps it is, as many scholars maintain, that a given attitude depended on the historic occasion and the specific individual concerned.

What is undisputed, however, is that the dead were cared for by their relatives. Furnished and decorated funerary interiors (as in Hellenistic Macedonia and Alexandria) or funerary possessions deposited with care on furniture and not simply on the ground, prove that this stage of the burial practice was not insignificant. Even further, care for the dead involves stimulating the senses: touch, sight, hearing, smell and, even, taste.

Other than clothing, organic materials provide care for the deceased and decoration for the tomb. Hangings, bedding, pillows, mattresses, reed mats, branches, ribbons around urns, individually wrapped offerings, etc. are used in order to create a homey environment and create a memory of the life once lived. At the same time they are not mere indications of conspicuous consumption, as has been previously thought, but indispensable part of funerary customs and transmute into sensory cues of the personal evocative memories that the deceased will take with him/her to the Otherworld. Textiles relate to the senses that trigger feelings and create memories to the relatives that stage the funeral.

### 3 ORGANIC FINDS FROM A TOMB IN VERGINA, NORTHERN GREECE

**Abstract author(s):** Stamatopoulou, Vasiliki (The Greek Ministry of Culture / The Hellenic Open University) - Faklaris, Panagiotis (Aristotle University of Thessaloniki)

**Abstract format:** Oral

The preservation of organic materials from antiquity is not frequent in the soil and climatic conditions of Greece. The extensive grave looting practiced for centuries has also drastically reduced the chances of their preservation. Therefore, the information provided by these rare finds is invaluable for research. The subject of this paper is the organic materials preserved in a sumptuous Early Hellenistic tomb excavated at Vergina, Northern Greece. These are remnants of wood, fabric, string, leather, green shoots and flowers, which demonstrate either care for the remains of the deceased or are remnants of personal objects that were deposited in the tomb as grave goods, as offerings to the deceased from loved ones, or are parts of the exterior and interior decoration of the tomb. These remains, today much deformed and shrunk, caught only a few stages before their total loss, preserve the closest possible approximation we can achieve of the complete picture of the burial ensemble before the sealing of the tomb, a picture hardly approachable without the organic materials and one that reflects a deeply moving meticulous care for accommodating as comfortably as possible the deceased into his new environment with the transfer of the domestic environment into his burial space.

### 4 ORGANIC MATERIALS ON WEAPONS AND ARMOR FROM NORTHERN GREEK WARRIOR BURIALS

**Abstract author(s):** Stamatopoulou, Vasiliki (The Greek Ministry of Culture and Sports)

**Abstract format:** Oral

A significant category of personal objects that accompany their owner in the afterlife placed in tombs as grave goods are weapons and armor. At the heyday of their kingdom in the Early Hellenistic period, the Macedonians, who had long accorded their dead men offering arms as grave goods, came to bury their warriors with entire panoplies, sometimes even more than one or two, as with those from the unlooted grave at Vergina and the graves at Derveni near Thessaloniki.

Weapons and armor were manufactured of various organic materials combined with metal, mainly iron sheets. In contrast to the weaponry that was offered at funeral pyres and all their organic materials were lost in the fire, the weapons deposited in cist-graves and Macedonian tombs of Northern Greece give a completely different picture. Products of iron corrosion have saturated the organic materials of these pieces, having thus preserved organic materials which in different conditions would have been lost providing invaluable information for the construction of this type of military equipment. Remnants of leather and textile lining, stitching along the edges, sponges, and wood components of armor will be presented focusing on the finds of Vergina and Derveni.

### 5 TEXTILES AND TEXTILE WORKING IN ROMAN PERIOD SLOVENIA

**Abstract author(s):** Stemberger Flegar, Kaja (PJP d.o.o.) - Kovačič, Ana (Independent researcher)

**Abstract format:** Oral

The elusive phenomenon of Roman period textile can for the most part, at least in the case of Slovenia, only be traced indirectly. Random mentions of scraps of fabric, golden hairnets, and other metal components can sometimes be chanced in grave descriptions, where they were included as curiosities, but never properly studied.

Items related to the production of textiles are found in greater frequency, either in settlements or, more often, in graves. Distaffs, needles, spindle whorls, loom weights, and tool boxes can be studied in order to reconstruct the Roman period process of making textiles. Moreover they can be used to study the symbolical meaning of textile working for the people associated with it.

This paper aims to present the preliminary results of the first comprehensive study of textile working tools from Roman period Slovenia focussing on typo-chronology. In addition, the paper explores the role of textile working in creating identities in the mortuary sphere.

### 6 FUNERARY TEXTILES IN PTOLEMAIC TOMBS AT EL-DEIR, KHARGA OASIS, WESTERN EGYPTIAN DESERT

**Abstract author(s):** Letellier-Willemin, Fleur (CRIHAM 4270 University of Limoges)

**Abstract format:** Oral

At first, we must set these textiles inside their archaeological context. Various associated studies pursued upon the site oblige to dissociate, as far as possible, Greek period from Roman period, even if they are too often associated.

By proper study of textiles, we try to bring out Greek cultural influence on everyday life and funerary practices inside an Oasis of Upper-Egypt, El-Deir. The site was closely linked to the Theban area of the Nile Valley, where recent ar-

chaeological researches testify Greek influence on daily life. We should like to show how far textiles could express various identities amongst people on our site, in a country of strong tradition as is Egypt.

The study of textiles concerns human mummies coming from the Ptolemaic tombs of the site, as well some mummies of dogs which were found in some disused tombs; they came likely from a local temple dedicated to a canine god, Wepwawet or Anubis. Our work consists in studying fibers, weaving technique, decoration. Analyzing local textile channels, it's possible to evaluate, partly at least, the economic system of the site at that time and possibly its management, with the help, of course, of all other artefacts coming from the tombs as well as information from some rare texts. Exploring the site, which was occupied from 5th century B.C., at least to the 5th century A.D., we were able to throw light upon Ptolemaic period as the most prosperous of all.

## 7 PTOLEMAIC TEXTILES FROM THE NECROPOLIS OF FAG EL-GAMUS, EGYPT

**Abstract author(s):** Kwaspén, Anne (CTR - SAXO - UCPH; BYU excavation) - South, Kristin - Muhlestein, Kerry (BYU Excavation)

**Abstract format:** Oral

Burials from the Ptolemaic Period (332-30 BCE) in Egypt are neither as numerous nor as frequently studied as those from the eras preceding and following it, but they are a necessary link in the continual evolution of Egyptian burial practices. This study presents an overview of Ptolemaic burial architecture and furnishings at several sites throughout Egypt, including a look at burial goods, coffins and their contents.

Archaeological work in the 1980s revealed multiple Ptolemaic burials located within "Hill B" of the necropolis of Fag el-Gamus on the edge of Egypt's Fayum. Tombs at this site dating to the Ptolemaic period were carved into rock hills and have yielded multiple burials of variable preservation, including some richly decorated with cartonnage and gold as well as simpler mummies only wrapped with linen. The paper ends with a close examination of four of these burials, describing their find locations, coffins, and burial goods, including basketry and textile wrappings.

---

## 180 MULTI-PROXY MICROARCHAEOLOGICAL APPROACHES: STATE OF THE ART, NEW ADVANCES, LIMITATIONS AND FUTURE PERSPECTIVES

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Albert, Rosa Maria (ICREA Research Professor; Dept. of History and Archaeology. University of Barcelona) - Berna, Francesco (Dept. of Archaeology. Simon Fraser University)

**Format:** Regular session

In recent years, the study of the archaeological record invisible to the naked eye (microarchaeology) has, through the application of microscopic and spectrometric techniques, contributed to the improvement of the investigation and interpretation of archaeological sites. Fine-resolution multi-proxy studies of soils and sediments have been essential for reconstructing the landscapes and environmental conditions of many regions in given chronological periods. Furthermore, they have also allowed a better understanding of the social, economic and cultural aspects that have driven many prehistoric and protohistoric societies.

The microscopic study of the intact sedimentary context, based on micromorphology, is one of the first steps in carrying out a high-resolution microarchaeological study. Micromorphology helps us understand the spatial context and the formative process of sediments. Furthermore, their study provides us with a precise description of the context of any other microscopic and molecular remains present in the sediments, such as phytoliths, diatoms, pollen, stable isotopes, organic residues, etc. This allows a precise and holistic reconstruction of the activities carried out by past populations, and reconstruction of the environmental conditions present at a given moment.

The proposed session aims to bring together different academics to present the results of their microarchaeological research from a multi-proxy perspective. Specifically, we seek case studies that address the challenges of integrating micromorphology and other high-resolution methods, to assess how they contribute to the advancement of archaeology and scientific methodology, their complementarity, strengths and weaknesses, and future perspectives.

## ABSTRACTS

### 1 THE INTEGRATION OF FOURIER TRANSFORM INFRARED MICROSPECTROSCOPY (MFTIR), PETROGRAPHIC ANALYSIS, AND SOIL MICROMORPHOLOGY IN ARCHAEOLOGY AND PALEOENVIRONMENTAL STUDIES

**Abstract author(s):** Berna, Francesco (Simon Fraser University)

**Abstract format:** Oral

The integration of Fourier Transform infrared microspectroscopy (mFTIR), petrographic analysis, and soil micromorphology allows the simultaneous optical, textural, mineralogical, and molecular characterization of organic and in-

organic particles at the microscopic level in their intact original context, with a wide range of applications in archaeology and paleoenvironmental research. In this talk I will showcase a few important applications of the integrated multi-analytical approach that significantly contributed to the understanding of bone taphonomy, the preparation and function of archaeological materials and features, the formation processes of archaeological sites, and the reconstruction of palaeoenvironments. Examples will include work on lime plaster, the use of space and site formation in caves and rock shelters, and the identification of extinct landscapes in northern South Africa. The archaeological periods covered will include the Oldowan (Wonderwerk and Kathu Pan 6), Middle Stone Age (Florisbad), Mousterian (Oscurusciuto and Skhul), Upper Paleolithic (Manot Cave), the Bronze Age (Kalavassos Ayios Dhimitrios), and the pre-Classic Maya (San Bartolo).

## 2 A MICROARCHAEOLOGICAL APPROACH TO THE EARLY UPPER PALEOLITHIC SITE OF MUGHR EL-HAMAMAH (JORDAN)

**Abstract author(s):** Alonso-Eguiluz, Mónica (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona - ERAAUB) - Toffolo, Michael (Université Bordeaux Montaigne) - Albert, Rosa María (Institut Català de Recerca i Estudis Avançats - ICREA; Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona - ERAAUB) - Boaretto, Elisabetta (Kimmel Center for Archaeological Science, Weizmann Institute of Science)- White, Chantel (University of Pennsylvania) - Asouti, Eleni (University of Liverpool) - Nilsson Stutz, Liv (Linnaeus University) - Stutz, Aaron (Bohuslans Museum)

**Abstract format:** Oral

Mughr el-Hamamah is located in the Ajlun Governate, Jordan. Archaeological evidence, showing a large number of lithic, faunal, and botanical remains, indicates that the cave was occupied by hunter-gatherers mainly in the Early Upper Palaeolithic period (EUP; ca. 47-30 ka cal BP). Radiocarbon dates, which point to an occupation mainly from 45-39 ka cal. BP (Marine Isotope Stage 3), make this site a key place to better understand how the earliest Upper Palaeolithic differed from the Late Middle Palaeolithic in the Levant.

During the 20th century, the cave was used by local shepherds, severely altering part of the deposits. Recent radiocarbon (post 1955 AD) date was obtained from charred remains. Yet, microarchaeological analyses (phytoliths, fecal spherulites, ash pseudomorphs, Fourier transform infrared spectroscopy of sediments, and micromorphology) reveal pockets of a very rich, well-preserved EUP stratigraphic unit. Microarchaeological work has identified the microscopic content of the deposits forming during 45-39 ka interval; the modes of deposition of the archaeological layers; and the post-depositional processes that took place afterwards, including those derived from modern pastoral activity.

The mineralogical characterization of the intact EUP layers shows that terra rossa clay forms the sediment matrix. Micromorphological analyses identified four depositional facies that occur repeatedly throughout the deposits and represent a complex interplay of natural (e.g., sheetwash) and anthropogenic (e.g., combustion) processes. Additionally, postdepositional processes affected unevenly to the deposit, being the western area of the site better preserved in terms of charred remains and bones. Although phytoliths were not abundant in the deposits, their identification did indicate a vegetation composition characteristic of humid environments with dry periods. Finally, the identification of fecal spherulites allowed us to better limit the deposits altered by pastoral activity, even in those areas where this alteration was not visible to the naked eye.

## 3 DECIPHERING DEPOSITIONAL HISTORIES: PHYTOLITH ANALYSIS ON ARCHAEOLOGICAL SOIL AND SEDIMENT THIN SECTIONS FROM MEDIEVAL CULTIVATED FIELDS IN BRUSSELS (BELGIUM)

**Abstract author(s):** Vrydaghs, Luc (MARI - VUB Department of Art Studies and Archaeology Faculty of Arts and Philosophy) - Ball, Terry (Department of Ancient Scripture, Brigham Young University, Provo) - Devos, Yannick (MARI - VUB Department of Art Studies and Archaeology Faculty of Arts and Philosophy)

**Abstract format:** Oral

Understanding the origin of the opal phytoliths and the processes that were involved in their deposition within archaeological soils and sediments is a crucial aspect to come to a reliable interpretation. Micromorphology, the study of soil and sediment thin sections, is a very suitable technique to address this issue. It permits to observe all microscopic components, including the phytoliths, in their original position and thus to detect distribution patterns that would get lost using traditional methods, involving concentration and mixing of sediments. Documenting these patterns can help researchers to answer questions concerning their depositional history. Over the last 20 years a specific research protocol has been developed to describe and interpret the phytoliths observed in soil and sediment thin sections (Vrydaghs and Devos 2018; Kaczorek et al. 2018). Present contribution intends to introduce this protocol through the example of the study of medieval cultivated fields in Brussels (Belgium). Furthermore, it will be argued how it opens perspectives for phytoliths analysis and as such complement classical phytolith analysis.

#### 4 **CHEMICAL AND MICROBIOLOGICAL ANALYSIS REVEALS ANAEROBIC PRESERVATION SIGNATURES AT THE ROMAN SITE OF VINDOLANDA, NORTHUMBERLAND, UK**

**Abstract author(s): Taylor, Gillian - Orr, Caroline (Teesside University)**

**Abstract format: Oral**

Vindolanda is a Roman auxiliary fort situated south of Hadrian's Wall near Bardon Mill, Northumberland, UK. The site is well known for its excellent preservation of leather and wooden artefacts. Between Roman occupation periods, wooden and stone buildings were repeatedly destroyed, and sealed with thick layers of clay, which were then re-built upon, this formed layers in which oxygen was excluded from the decomposing material underneath. This created waterlogged, anaerobic areas above the dense clay layers which are ideal preservation environments. Unravelling and understanding the exact chemical and microbiological signatures from these anaerobic layers can be challenging but could allow increased understanding of decomposition and preservation within these sites. This study presents data from the multiproxy approach undertaken which utilised both microbiological and elemental parameters. In this study, soil characterisation, bacterial diversity and community structure from excavation trenches were identified using pXRF and 16S RNA gene amplicon sequencing. Microbial communities were dominated by Firmicutes, Bacteroidetes and Proteobacteria at a phylum level. Furthermore, Methylophilus might be associated with favourable preservation in these anaerobic layers, which are linked to elemental concentration of iron, sulphur and phosphorus.

#### 5 **MAGNETIC MICROARCHAEOLOGY: METHODOLOGICAL DEVELOPMENTS IN THE INTEGRATION OF ARCHAEOLOGICAL SOIL MICROMORPHOLOGY WITH ARCHAEOMAGNETIC ANALYSIS**

**Abstract author(s): Dinckal, Ada (Archaeological Micromorphology and Biomarkers - AMBI Lab, Instituto Universitario de Bio-Orgánica Antonio González Avenida Astrofísico Francisco Sánchez; Universidad de La Laguna Departamento de Geografía e Historia) - Arguinzones Elvira, Amiel (Archaeological Micromorphology and Biomarkers - AMBI Lab, Instituto Universitario de Bio-Orgánica Antonio González Avenida Astrofísico Francisco Sánchez) - Carrancho Alonso, Angel (Área de Prehistoria. Dpto. Historia, Geografía y Comunicación. Laboratorio de Prehistoria. Edificio I+D+i. Universidad de Burgos; Laboratorio de Paleomagnetismo Dpto. Física, Escuela Politécnica Superior. Edificio A1 Universidad de Burgos) - Mallol, Carolina (Universidad de La Laguna Departamento de Geografía e Historia; Archaeological Micromorphology and Biomarkers - AMBI Lab, Instituto Universitario de Bio-Orgánica Antonio González Avenida Astrofísico Francisco Sánchez)**

**Abstract format: Oral**

Here we present preliminary results for new methodological approaches to integrating archaeomagnetic methodologies with archaeological soil micromorphology. Recently, more scientific methods utilized in archaeological research are being directly integrated with micromorphological analysis through the subsampling of micromorphological blocks. This integration strengthens both the micromorphological interpretations as well as provides contextual information to the integrated scientific analysis. One type of geoarchaeological and microanalytical method which is yet to be succinctly integrated with micromorphology is archaeomagnetic analysis. Our experimental work provides two different approaches which aim to update the way in which archaeomagnetism can be combined with thin section analysis. The first approach involves creating thin sections by directly subsampling oriented and structural intact archaeomagnetic samples using both sodium-silicate resin and epoxy resin substitution. This approach allows for thin section observations of microstructural features directly associated with the characteristics measured in the archaeomagnetic analysis. The second approach involves understanding the magnetic characteristics associated with embedding organic resins, as well as identifying the potential impact the process of producing micromorphological thin sections may have on the magnetism of a sample. This approach would have the added benefit of allowing for microstructural analyses along with most archaeomagnetic methods, as well as opening the possibility of returning to the large reserves of archived micromorphological material which can be subsampled for new magnetic analysis. Our primary aim for this methodological development has been to closer integrate archaeomagnetic analysis with other micro-archaeological techniques, to improve the interpretation of magnetic analysis in archaeology while also improving the understanding of ferric material in micromorphological analysis.

## 6 MEASURING COROLLARY TEMPERATURES IN FIRE-IMPACTED SEDIMENTS BY WAY OF A GEOTHERMOMETER

**Abstract author(s):** Stefanyshen, Earl (Simon Fraser University)

**Abstract format:** Oral

The temperatures reached in soils and sediments after exposure to fire or other pyrotechnic activities dissipate rapidly once the heat source is removed, making them nearly impossible to measure *ex post facto*. In my research, I was able to create an effective geo-thermometer from a plot of soils and sediments that had sustained a wildfire event. Temperatures were determined several months after the passage of the flame front and subsequent return to ambient outside temperatures within the sediments. These measurements were calculated by identifying and mapping the irreversible mineralogical transformations that had taken place at the time of thermal exposure. In this presentation, I describe the results of a test which utilized soil micromorphology and Fourier transform infrared microspectroscopy to quantify the impact of thermal energy on the subsurface environment and the transformations that occur within the chemistry and mineralogy of common organic soils. An initial application of this protocol was carried out within the perimeter of a wildland fire in British Columbia, Canada which successfully measured on a millimetre-scale the heat diffusion pattern through the soil column. This analytical protocol can now be used in post-burn investigations to assess the effects of wildland fires and pyrotechnic activities on subsurface materials of different regions.

## 7 MICRO-DEBITAGE AND FIRE-STARTING: EXPERIMENTAL TECHNIQUES FOR DETERMINING THE PRESENCE OF STRIKE-A-LIGHT ACTIVITY IN SEDIMENTARY CONTEXTS

**Abstract author(s):** Wiebe, Matthea (Simon Fraser University)

**Abstract format:** Oral

The development of fire-starting techniques is a significant technological advancement in human history and therefore inspires many important archaeological questions, including whether Neanderthals were able to create fire, and whether the introduction of this technology had an impact on human development. The relative ability of species or populations to start fire at will (as opposed to collecting it from landscape fires) could spell the difference between survival and extinction. Despite the importance of this activity, however, we have few methods for identifying fire-starting activities in archaeological context. This contribution describes novel experiments that were conducted using the strike-a-light fire-starting method to produce diagnostic microdebitage to assess the possibility of locating such debitage in the archaeological record. Experiments produced promising qualitative, quantitative, and semi-quantitative data that could become the baseline for identifying fire-starting activity from sedimentary contexts. Using microarchaeological and geochemical lenses, results suggest the possibility of extracting diagnostic artefacts from sediments to assess the presence or absence of strike-a-light fire-starting activity in a wide range of contexts.

## 8 HIDDEN SIGNATURES OF EARLY FIRE AT EVRON QUARRY (1.0 – 0.8 MYA)

**Abstract author(s):** Stepka, Zane (Kimmel Center for Archaeological Science, Weizmann Institute of Science, Rehovot) - Azuri, Ido (Bioinformatics Unit, Department of Life Sciences Core Facilities, Weizmann Institute of Science, Rehovot) - Horwitz, Liora (National Natural History Collections, The Hebrew University, Jerusalem) - Chazan, Michael (Department of Anthropology, University of Toronto) - Natalio, Filipe (Kimmel Center for Archaeological Science, Weizmann Institute of Science, Rehovot; Department of Plant and Environmental Sciences, Weizmann Institute of Science, Rehovot)

**Abstract format:** Oral

Pyrotechnology is a key element of hominin evolution. The identification of fire in Lower Paleolithic (LP) sites relies primarily on an initial visual assessment of artifacts' physical alterations, resulting in an underestimation of its prevalence in the archaeological record. Here, we used a suite of spectroscopic techniques to counter the absence of visual signatures for fire and demonstrate the presence of burnt fauna and lithics at the LP open-air site of Evron Quarry (Israel), dated between 1.0 and 0.8 Mya and roughly contemporaneous to Gesher Benot Ya'akov. We found fragments of burnt tusk using Fourier-Transform Infrared spectroscopy and revealed that Evron Quarry lithics had been exposed to high temperatures by employing UV Raman spectroscopy and a deep learning model. We propose reexamining finds from other LP sites lacking visual clues of pyrotechnology to yield a renewed perspective on the origin, evolution, and spatiotemporal dispersal of the relationship between early hominin behavior and fire use.

## CONTRIBUTIONS OF MICROMORPHOLOGY TO THE UNDERSTANDING OF ARCHAEOLOGICAL RECORDS: ANTA 1 DE VALE DA LAJE, PORTUGAL, AS A CASE STUDY

**Abstract author(s):** Adewumi, Opeyemi (Centro de Geociências da Universidade de Coimbra; Universidade de Coimbra; Instituto Terra e Memória, Mação, Portugal; Instituto Politécnico de Tomar) - Oosterbeek, Luiz (Centro de Geociências da Universidade de Coimbra; Instituto Terra e Memória, Mação; Instituto Politécnico de Tomar) - Vallverdú, Josep (Àrea de Prehistòria, Universitat Rovira i Virgili - URV; IPHES, Institut Català de Paleoeologia Humana i Evolució Social) - Almieda, Nelson (Uniarq, Centro de Arqueologia da Universidade de Lisboa. Faculdade de Letras da Universidade de Lisboa) - Ferreira, Mário Quinta (Centro de Geociências da Universidade de Coimbra, Portugal; Universidade de Coimbra)

**Abstract format:** Oral

In recent years, the use of a micromorphological method has proven to be a veritable tool to assess archaeological records that are beyond the naked eye. This technique allows you to study records and data that can contribute to and improve the archaeological research and investigations. Aside from a wide range of visible artefacts that can be studied within a site, such as the lithic materials, ceramics, bones, etc., and others (studies of soil and sediment) that are not visible "to the eye", can also be studied using various microarchaeological approaches including micromorphology.

The identification of fire evidence with the aid of micromorphology techniques applied to study archaeological records is one of the major advances in the multiproxy microarchaeological approaches. For instance, evidence of vegetation clearance by burning is usually well represented in the form of pedofeatures, recognisable with the aid of petrographic microscope.

Fire is arguably one of the most widely used tools by the early humans, especially during the Neolithic period for various purposes. The technique of micromorphology has increasingly been used in microarchaeological research, especially in the archaeological sites that are associated with human occupations, subsistence economies, agricultural-related practices, habitat construction and settlement.

This paper, therefore, intends to explore the contributions of micromorphology to the understanding of the evidence of fire, burning and other artefacts, recorded at the site of Anta 1 de Vale da Laje, Tomar in Portugal. This paper will also discuss the advances and challenges of integrating micromorphology methods into the study of the site.

## TRACING NEOLITHIC FIRE USE AND PYRO-TECHNOLOGY IN THE MICRO-SCALE THROUGH THE USE OF AN INTEGRATED GEOARCHAEOLOGICAL METHODOLOGY

**Abstract author(s):** Roussos, Dimitrios - Kalogiropoulou, Evita (University of Crete) - Kyparissi-Apostolika, Nina (Ephorate of Paleanthropology and Speleology) - Ziota, Christina (Ephorate of Antiquities of Florina)

**Abstract format:** Oral

The study of ancient fire use and the evolution of pyrotechnology has benefited much from the application of a multidisciplinary micro-archaeological approach. Such nuanced analysis, have provided the means to study ancient combustion remains in substantially greater resolution. Our research, implements such an integrated geoarchaeological methodology into the study of Neolithic firing structures and burnt remains in order to assess the dynamics of daily practices performed in outdoor spaces.

A diverse assemblage of firing structures from two Neolithic settlements, Imvrou Pigadi (Thessaly) and Kleitos 1 (Northern Greece), will be here examined. Their form and spatial allocation suggest variability in their use and function. In order to challenge this hypothesis, we aim to identify their structural properties, and determine maximum temperatures reached and maintenance practices applied. Additionally, the analyses of burnt residues could potentially offer insight into fuel consumption, domestic and/or crafting practices. Our methodology will address these objectives by implementing archaeological soil micromorphology, X-Ray diffraction (XRD) and Fourier Transform Infrared Spectroscopy (FT-IR). Therefore, the functionality of combustion features and their level of pyro-technological sophistication will be attested. Finally, this study means to test our methodological integration and show its strength in providing higher analytical resolution, and therefore a stronger level of interpretation. This research is conducted in the framework of BONDS - 'Beyond Oikos: Outdoor spaces, daily life and sociality in Neolithic Greece' Project (Number: 00229), funded by H.F.R.I.

## NIR SPECTROSCOPY OF ORGANIC MATTER: A NEW METHOD FOR IDENTIFICATION OF ANCIENT AGRICULTURE IN CHERNOZEMIC SOILS

**Abstract author(s):** Dudek, Michal - Krupski, Mateusz - Bednik, Magdalena (Institute of Soil Science, Plant Nutrition and Environmental Protection, Wrocław University of Environmental and Life Sciences) - Kofel, Dominika (Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Sady-Bugajska, Agata (Katowice) - Vrydaghs, Luc (Maritime Cultures Research Institute, Vrije Universiteit Brussel) - Przybył, Agnieszka (Institute of Archaeology, University of Wrocław)

**Abstract format:** Oral

The identification and study of prehistoric agricultural landscapes are one of the subjects where multi-proxy archaeological research has contributed to significant advancements. The widespread use of ALS data allowed to reveal numerous ancient field systems, whereas detailed investigations of the soil record – in macro- and micro-scales – led to the recognition of past farming practices and their impact on the local soil cover.

Near Infrared Spectroscopy (NIRS) conducted on humus horizons of European chernozemic soils (formed from loess), proved capable of distinguishing organic matter derived from forest and meadow vegetation. Recent development of the method permitted to discern a third group of organic matter infrared spectra, characteristic for arable land.

Consequently, we included NIRS in a multi-proxy study of chernozemic paleosols buried beneath Neolithic longbarrows of the Funnel Beaker culture (ca 3500 BC), discovered in the Muszkowice and Głubczyce Forests (SW Poland). The objectives were twofold: 1) to assess whether these soils were used agriculturally prior to the construction of the barrows, and 2) to test the applicability of infrared spectra in such research. Therefore we compared the NIRS results with evidence delivered by micromorphological, physico-chemical and archaeobotanical (seed, fruit, charcoal and phytoliths) analysis.

Our research allows the following conclusions: A) the Funnel Beaker culture longbarrows found in the Muszkowice and Głubczyce Forests were built on previously cultivated terrain, and B) Near Infrared Spectroscopy (NIRS) of soil organic matter can be used as a tool to identify ancient arable land in chernozemic soils and to characterize changes of vegetation cover at the site level.

## MICROSCOPIC, LUMINESCENCE, AND GEOCHEMICAL METHODS FOR UNRAVELING LAND-USE HISTORY OF AGRICULTURAL TERRACES: CASE STUDIES FROM SICILY AND VENETO, ITALY

**Abstract author(s):** Fallu, Daniel (Tromsø University Museum, UiT: The Arctic University of Norway) - Alonso-Eguiluz, Mónica - Albert, Rosa María (ERAAUB Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona; Institut Català de Recerca i Estudis Avançats - ICREA) - Cucchiaro, Sara (Department of Agricultural, Food, Environmental and Animal Sciences, University of Udine; Department of Land, Environment, Agriculture and Forestry, University of Padova) - Tarolli, Paolo (Department of Land, Environment, Agriculture and Forestry, University of Padova) - Lang, Andreas (Department of Environment and Biodiversity, Paris Lodron Universität Salzburg) - Brown, Antony (Tromsø University Museum, UiT The Arctic University of Norway; Geography and Environmental Science, University of Southampton)

**Abstract format:** Oral

Agricultural terraces are one of the most ubiquitous, visible and durable signs of human impact on the landscape. As such, they constitute a considerable untapped archive of environmental and agricultural history. The stratigraphically complex activities of construction, cultivation, and maintenance, however, result in an archaeological record which is difficult, and at times seemingly impossible, to disentangle. The repeated reworking of the soil can result in the movement of dateable material, creating artificially old or young deposits and obscuring contacts between lithostratigraphic layers. Soil horizonation can further obscure what few boundaries remain. As such methods for reconstructing agricultural history must consider the "invisible" aspects of the stratigraphy including microscopic and chemical evidence of sediment input, soil disturbance and soil development. These methods must be integrated with chronological methods which can readily assess soil reworking and which takes into account the difference between dateable inclusions, and events which formed the soil matrix itself.

This study evaluates a combined protocol of Thin Section Micromorphology (TSM), pXRF, FTIR, SEM, portable Optical Stimulated Luminescence (pOSL), and the analysis of biological microremains (phytoliths, ash pseudomorphs, and spherulites) for reconstructing the site development of agricultural terraces. Case studies are taken from two regions in Italy with different agricultural and sociopolitical histories. Samples from the Soave wine region in northern Italy come from terraced fields representing changes in agriculture from the 1st millennium BC through to the modern period. A second case study, from Castronovo in Sicily, demonstrates the efficacy of this combined methodology for reconstructing the complex reworking and maintenance of a single terrace. In both cases, not only were "invisible" strata revealed, but the combined micro-geochemical-luminescence method was able to place the strata into the larger narrative of regional agricultural development.

### MULTI-APPROACH ANALYSIS OF PLANT CONSUMPTION: A CASE-STUDY OF IRON AGE SETTLEMENT AT PADA, NE ESTONIA

**Abstract author(s):** Johanson, Kristiina - Chen, Shidong - Oras, Ester - Sammler, Sandra - Blehner, Marie Anna (University of Tartu)

**Abstract format:** Oral

Plant-based food, especially cereals, plays an essential role in prehistoric human dietary practices and economy. However, in the Eastern Baltic, the investigation of cereal consumption in prehistoric periods faces several obstacles, which are mainly due to the scarcity of macro-botanical evidence.

In our study we took a multi-proxy methodology for tracing cereal consumption in ancient societies, focussing on the informative potential of pottery related food crusts. Twenty five food crust samples from Pada Middle Iron Age (500-800 AD) settlement site in North-Estonia were selected for a multi-approach analysis. We applied conventional microscopic analysis of plant micro-remains (phytoliths and starch grains) and bulk stable isotope analysis in combination with lipid based organic residue analysis (ORA). In our talk we present the results of the combined analysis, indicating the direct cooking of cereals mixed with animal products. Accordingly, we can demonstrate the development of C3 cereal cultivation and animal husbandry at Pada settlement site.

The investigation demonstrates that due to the analytical limitations and biases of each method applied – microfossil studies, ORA and isotopic analysis – the multi-methodological approach is the most reliable and fruitful way to reveal cereal-based food consumption from ancient pottery.

14

### PLOIDY INFLUENCE ON PHYTOLITH PRODUCTION: A POTENTIAL TOOL TO STUDY AGRICULTURAL PRACTICES OF CEREALS

**Abstract author(s):** Andreu Diez, Oriol (ERAAUB-Dep. History and Archeology, Universitat de Barcelona) - Pellicer Moscardó, Jaume (Institut Botànic de Barcelona - CSIC) - Boaretto, Elisabetta (Weizmann Institute of Science) - Albert, Rosa María (Institució Catalana de Recerca i Estudis Avançats - ICREA; Section of Prehistory and Archeology, Universitat de Barcelona)

**Abstract format:** Oral

Phytolith analyses have been shown to be critical to better understand past vegetation landscapes directly related to human activities and the use of plants by past populations. However, there are still some limitations that have directly affected the potential of phytoliths as a tool to study agricultural and domestication processes of cereals. One of the main obstacles is the redundancy problem (similar phytolith morphotypes produced by different plants) that may preclude from precise taxonomic identifications.

Previous studies have shown that there is a relationship between the level of ploidy of certain cereals and variations in phytoliths (Tubb et al., 1993). Based on these results, we hypothesized that the integration of cytogenetic approaches (i.e., flow cytometry) to the study of phytolith morphology should allow us to minimize the problem of redundancy and would improve our ability to identify the presence of cereals at the taxonomic level. Consequently, the identification and tracking of domestication events and past agricultural practices would be facilitated.

To do this, we have designed an experimental study that correlates the phytolith morphology of several previously selected cereal species with their ploidy levels. We present the preliminary results showing the genetic profiles compared to their phytolith production in nine cereal species: six *Triticum* spp. (*T. monococcum*, *T. diccoides*, *T. dicocum*, *T. durum*, *T. spelta* and *T. aestivum*), one *Aegilops* sp. (*A. speltoides*) and two *Hordeum* spp. (*H. spontaneum* and *H. vulgare*). Our objective is to study the genealogy and history of the polyploidization of wheat and the domestication process of barley, which will allow us to improve our understanding of agricultural processes, from production, processing, consumption & trade, as well as social and cultural changes that have occurred over time. Results will be applied to the late Roman period & expansion of Islam in the archaeological site of Pollentia.

15

### A MICROANALYSIS OF ROOFS IN TRADITIONAL AND PREHISTORIC CYCLADIC ARCHITECTURE

**Abstract author(s):** Gkouma, Myrsini (Faculty of History and Archaeology, National and Kapodistrian University of Athens; Science and Technology in Archaeology Research Center, Cyprus Institute; Malcolm H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens) - Tsartsidou, Georgia (Ephoreia of Palaeo-anthropology-Speleology of Southern Greece; Malcolm H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens) - Boyd, Michael (McDonald Institute for Archaeological Research, University of Cambridge) - Margaritis, Evi (Science and Technology in Archaeology Research Center, Cyprus Institute) - Moutafi, Ioanna (Malcolm H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens) - Renfrew, Colin (McDonald Institute for Archaeological Research, University of Cambridge)

**Abstract format:** Oral

Roofs in prehistoric architecture were often made of perishable materials, which have left no visible trace in the archaeological record. The identification of roof structures in the field and the reconstruction of building materials and

practices is therefore a challenging endeavor. It can only be addressed with the application of microscopic methods through which we can detect the macroscopically invisible remains. This ethno-geoarchaeological study applies a combined high-resolution microstratigraphic and phytolith analysis to the roofs of abandoned traditional farmsteads on two islands, Kato Kouphonisi and Naxos in the Cyclades, and compared it with analysis of selected contexts from the Early Bronze Age settlement of Dhaskalio. The ethnographic results were correlated with oral testimonies from elderly residents of Naxos and published data. The main objective of our study was to reconstruct the details of the building materials and practices used on abandoned traditional farmsteads before they become extinct; based on these data we examined to what extent our results can produce far-reaching and valid implications for interpreting archaeological sediments tentatively recognized as roof elements during excavation. A wide range of materials and techniques in the construction of traditional roofs was recorded. Choice of material or technique does not seem to be dependent only on the availability of and access to resources but can also be related to individual family traditions and practices. We here suggest that the results of the ethnographic study can contribute to the interpretation of archaeological contexts and validate the macroscopic recognition of roof sediments. The comparative analysis of traditional and prehistoric architectural elements combined with ethnographic information is a valid methodological approach to trace the lost techniques and missing materials of prehistoric and traditional Cycladic architecture.

## 16 **ASSESSING THE RAW MATERIALS UTILIZED IN LIME PRODUCTION: A CASE STUDY OF PLASTERS AND MORTARS FROM KALAVASOS-AYIOS DHIMITRIOS, CYPRUS**

**Abstract author(s): Herrick, Hannah - Berna, Francesco (Simon Fraser University)**

**Abstract format: Oral**

Multi-method geoarchaeological research conducted in 2015, 2019, and 2022 in association with the Kalavastos and Maroni Built Environments (KAMBE) project focused on identifying the components and production process of lime plasters and mortars at the Late Bronze Age (LBA) regional site of Kalavastos-Ayios Dhimitrios (K-AD), Cyprus. This research aims to identify the natural lithic resources utilized in LBA lime production at K-AD, in order to understand the scale of lime production on-site and to better understand its environmental impact in LBA Cyprus as a whole. This paper discusses results of both petrographic analysis and Fourier transform infrared microscopy (micro-FTIR) as conducted on 1) modern geological outcrops of calcite-rich rock determined to be possible raw materials sources for LBA lime production at K-AD, and 2) archaeological lime plasters and mortars excavated at K-AD from 2015-2020. These results demonstrate that targeted, multi-method analyses of both the archaeological lime products and potential raw materials used in their production can indeed create a more comprehensive picture of both the local LBA lime production process, as well as demonstrate trends in ancient natural resources utilization. Further, the results lay the groundwork for determining the environmental impact of lime production technology in LBA Cyprus.

## 17 **DESTRUCTION PROCESSES IN A LATE IRON AGE PUBLIC BUILDING: A MICROARCHAEOLOGICAL STUDY**

**Abstract author(s): Shalom, Nitsan - Gadot, Yuval (Tel Aviv University) - Shalev, Yiftah (Israel Antiquities Authority) - Lipschits, Oded (Tel Aviv University) - Asscher, Yotam (Israel Antiquities Authority) - Boaretto, Elisabetta (Weizmann Institute of Science)**

**Abstract format: Oral**

Archaeological research has always put an emphasis on the central role and importance of destruction layers for reconstructing past events and material cultures. Nevertheless, traditional archaeology does not always provide sufficient tools for interpreting the specific events that created a destruction context, and often the interpretation depends on preconceptions and external sources. Microarchaeological methods, developed in recent years, enable archaeologists to pose new questions regarding destruction contexts and reconstruct in greater details the depositional processes, making it possible to recognize important nuances. The combination of several methods in the analysis of ruined structures allows to examine, for example, whether they were destroyed by fire, reconstruct the focus and intensity of that fire, and evaluate whether the fire was intentional or accidental. In addition, micromorphology enables us to observe the depositional and post depositional processes in the microscopic scale and identify whether a structure collapsed immediately, or in a long process of decay, indicating whether the destruction layer was quickly sealed or represents a longer time span.

In this paper, I present a microarchaeological study of a late Iron Age public building in Jerusalem, destroyed by fire in the 586 BCE Babylonian destruction of the city. Its rooms were found filled with destruction debris and collapsed stones of the walls. This study uses multiple methods, including FTIR and micromorphology, in order to reconstruct the destruction processes, focusing on the reconstruction of the fire – where was its focus in the building and what intensity did it reach – and the collapse – did the structure collapse in a single event or in a longer, possibly natural, process of decay. These questions may shed light on the life history of the building and through it, refine our understanding of the events of the Babylonian destruction.

## DID THE ROMANS HAD AN URBAN WASTE MANAGEMENT SYSTEM? HOW AN INTEGRATING MICROARCHAEOLOGICAL APPROACH CAN BE USEFUL IN THIS DEBATE

**Abstract author(s):** Gutiérrez-Rodríguez, Mario (Universidad de Jaén) - Bernal Casasola, Darío (Universidad de Cádiz) - Sánchez Vizcaíno, Alberto - Parras Guijarro, David - Tuñón López, José - Montejo Gámez, Manuel (Universidad de Jaén) - Goldberg, Paul (Boston University)

**Abstract format:** Oral

Urban transformation from the Early Empire to Late Antiquity in the Western Mediterranean is a historiographic debate with a long trajectory and development. From the 2nd century onwards, the archaeological record in urban environments gets diversified as a consequence of a new conceptualization of the city. Urban spaces experienced secondary uses and episodes of abandonment, which resulted in the generalization of intramural middens, pits, and reflooring sequences. Most of these urban transformations and new ways of understanding urban life were motivated by changes in habits and dynamics of urban solid and liquid waste management. Although it is not clear from written sources whether in the Early Empire there was a regulated system for the evacuation of urban waste in every city, there is solid archaeological evidence of these evacuation systems through sewer networks and urban and suburban middens. In Late Antiquity, however, middens became widespread inside the inhabited space, obliterating streets, public areas, and private buildings, thus affecting urban mobility and the uses of urban space. In this contribution, we discuss how the changing dynamics of urban waste management decisively contributed to the conceptualization of the city in southern Hispania and North Africa, and how significant information of these human practices, habits, and attitudes towards urban waste is only evident at the microscale. We have applied a multi-analytic microarchaeological approach to the study of several urban middens from Hispania and North Africa, by using micromorphology, physical-chemical analyses, lipid biomarkers, FTIR and  $\mu$ -XRF. Thanks to this integrating approach, we can explore questions like the frequency of discard and nature of the material discarded in urban middens, which are key to understand the evolution of these features. In sum, the understanding of urban waste practices turns essential to unravel urban biographies from the Early Empire to Late Antiquity in the Western Mediterranean.

## APPLYING ISOTOPIC GEOCHEMISTRY TO SOURCE CERAMICS

**Abstract author(s):** Renson, Virginie (University of Missouri Research Reactor)

**Abstract format:** Oral

Isotopic geochemistry has been applied in archaeological sciences to identify circulation of objects as well as human mobility for decades. With the development of multi collector-inductively coupled plasma-mass spectrometers, this approach has become more widespread with lead and strontium representing two of the most commonly applied isotopic systems. For the identification of source and circulation of ceramics, however, the main analytical techniques continue to be elemental chemistry and petrography. Here, we examine how isotopic geochemistry can contribute to our understanding of ancient ceramic provenance and exchange. Examples are drawn from studies of Late Bronze Age and Late Roman-Late Hellenistic ceramics from Eastern Mediterranean contexts and Early Formative ceramics from multiple sites in Mexico. These examples illustrate how lead and strontium isotopes allow determining production centers of material unassigned by elemental chemistry, how isotopic analyses contribute to the identification of local objects and imports, how they allow relating ceramics to their raw materials and identifying mixing patterns, and how to integrate the isotopic approach to elemental chemistry and mineralogy.

## SOCIAL MICROARCHAEOLOGICAL APPROACH TO BURIALS

**Abstract author(s):** Moilanen, Ulla (University of Turku)

**Abstract format:** Oral

In Finland, Early Medieval burials are often divided into dichotomic categories, such as cremations vs inhumations, Pre-Christian burials vs Christian burials, or poor vs rich. This is mostly because of generalisations that simplify mortuary rituals as direct reflections of religious ideologies or social status. When wide generalisations are abandoned and the graves are approached from a social microarchaeological perspective, new details emerge. Small-scale studies will open a rich and multidimensional view of the past. In Finland's case, it may be possible to identify periods of elevated mortality in the Early Medieval period, and possibly even times of social or political instability that could have provoked local power struggles. The microarchaeological approach also helps raise new questions on gender roles and identities, local rituals, commemoration, and the meanings of objects and sites. In general, the small-scale approach widens the possibilities to study and interpret the archaeological material and help integrate it in wider geographical, temporal, and theoretical discussion.

## A COMPLEX JIGSAW. MULTI-PROXY RESEARCH FOR THE DUTCH EARLY NEOLITHIC

**Abstract author(s):** Muller, Axel - Schrijer, Elma (ADC Archeoprojecten)

**Abstract format:** Oral

The central part of the Rhine Meuse Delta in the Netherlands has great archaeological value because of the good preservation of submerged prehistoric landscapes, specifically the fossil river systems in the province of Flevoland. Here numerous late Mesolithic and early Neolithic sites are present and therefore the process of neolithization in the lowlands can be analyzed in great detail.

The construction of a wind turbine complex in the center of Flevoland could potentially destroy a well-preserved prehistoric landscape with a large variation of activity sites, e.g. settlements, burials, hunting and extraction camps and field systems for crop production. After extensive field work new Mesolithic and Neolithic settlement sites and indications for field systems have been documented. Two years of excavating resulted in more than 200 samples of different kinds that were collected to reconstruct paleogeographic dynamics and land use and therefore gain insight in the neolithization processes.

We are planning to perform the following analyses;

- diatoms for the level of marine or fluvial influence on the landscape,
- different botanical proxy's (pollen, macro fossils, parenchyma) for vegetation and environment reconstructions and the study of plant domestication,
- micro-morphology for research on agricultural field systems and different post-depositional processes,
- isotope analysis on Neolithic crops,
- residue analysis on pottery,
- use ware analysis on stone artifacts.

Integration of the results will provide comprehensive data for modeling landscape dynamics, land use and ultimately on the progress of neolithization in the Dutch wetlands.

Although we cannot yet present data, we want to show that there are numerous opportunities to do multi-proxy research within development-led archaeology and that this will substantially increase our knowledge on the early Neolithic in the Rhine Meuse Delta.

## MULTI-PROXY GEOARCHAEOLOGICAL APPROACH REVEALS EARLY ANTHROPOGENIC IMPACTS ON SOILS AND HYDRO-SEDIMENTARY SYSTEMS OF LIMAGNE PLAIN (FR.)

**Abstract author(s):** Mayoral, Alfredo (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - ICAC-GIAP), Tarragona, Spain; Université Clermont Auvergne, CNRS, GEOLAB) - Granai, Salomé (GéoArchÉon & CNRS, Université Paris 1, UPEC. UMR8591. Laboratoire de Géographie Physique: environnements quaternaires et actuels) - Ledger, Paul (Department of Archaeology, Memorial University of Newfoundland & Department of Geography, Memorial University of Newfoundland) - Peiry, Jean-Luc (Université Clermont Auvergne, F-63000 Clermont-Ferrand & CNRS, EDYTEM) - Berger, Jean-François (CNRS, UMR 5600, EVS-IRG & Université Lyon 2) - Develle, Anne-Lise (UMR 5204 EDYTEM, Université Savoie Mont Blanc, CNRS) - Defive, Emmanuelle (Université Clermont Auvergne, CNRS, GEOLAB) - Vautier, Franck (Université Clermont Auvergne, CNRS) - Miras, Yannick (CNRS, UMR7194, Histoire Naturelle de l'Homme Préhistorique, Département de Préhistoire, Muséum National d'Histoire Naturelle, Institut de Paléontologie Humaine)

**Abstract format:** Oral

Interpretation of long-term socio-environmental dynamics in the Limagne plain (central France) has long remained problematic despite a relative abundance of studies and a well-known archaeological record. Poor chronological control and macroscale homogeneity of Limagne dark soils were amongst the major drawbacks avoiding detailed discussion of complex socio-environmental interaction. However since 2014 a novel multi-proxy integrated approach has been developed in order to overcome these recursive difficulties, and better characterize the emergence of anthropogenic impact on this landscape during mid- to late-Holocene. This approach was first applied to the archaeological site of Corent, located in a southern Limagne's volcanic plateau and occupied since the Neolithic. Several sedimentary records were obtained from two complementary contexts in the plateau and surrounding lowlands. They were subject to multi-proxy geoarchaeological analyses (sedimentology, geochemistry and micromorphology) that were further coupled with palynological and malacological datasets. Micromorphological analysis played a crucial role in interpretation of pedo-sedimentary sequences and multi-proxy dataset crosschecking and integration. Main results, supported by robust radiocarbon-based chronology, have contributed to a better understanding and discussion of socio-environmental dynamics in southern Limagne landscapes. Since Neolithic until the Middle Bronze Age, anthropogenic impact on soils and hydro-sedimentary systems appears spatially constrained, and natural hydro-climatic variability is discernible. Impacts start to increase slowly during the Late Bronze Age, but the major threshold occurs in the 7th c. BCE. This implies a much earlier anthropogenic forcing on soils and hydro-sedimentary systems than usually acknowledged in Limagne. Hereafter these impacts gradually increase during La Tène and Roman periods. Similar dynamics have also been detected by recent research in other Limagne areas such as the

Sarliève paleolake and the Gergovie plateau, and contribute to foster the emerging debate around the connection between proto-urban phenomena and precocious landscape-scale forcing of natural systems during Early Iron age in Western Europe.

## 23 FROM MICRO TO MACRO: A MULTI-SCALAR GEOARCHAEOLOGICAL INVESTIGATION OF LONG-TERM HUMAN-ENVIRONMENT INTERACTIONS AT THE HARRISON-CHEHALIS CONFLUENCE SW, BRITISH COLUMBIA

**Abstract author(s):** Ritchie, Patrick (University of British Columbia) - Berna, Francesco (Simon Fraser University)

**Abstract format:** Oral

This paper is a multi-scalar examination of 4,000 year old settlements at the Harrison-Chehalis river confluence, in SW British Columbia, one of the most ecologically rich landscapes and productive salmon habitats in North America. The (trans) formation of this alluvial landform and riverine environment over the last few thousand years has been concurrent with increasing human settlement by the ancestors of the Sts'ailes people who significantly re-contoured their surroundings to create one of the most densely settled landscapes on the Northwest Coast. Our historical study of this important cultural landscape shaped by fluvial changes moves between micro and macro scales of analysis. In particular, we draw on sedimentological and soil micromorphological analyses of natural and anthropogenic contexts from small low-lying islands and over 100 radiocarbon dates from pithouse and plank house features associated with 12 settlements. Our data reveal ways in which human and environmental histories were entangled, sustainable, and resilient.

## 24 TRACK RECORD: A MULTI-SCALAR APPROACH FOR INVESTIGATING MODERN AND ARCHAEOLOGICAL FOOTPATHS UNDER DIFFERENT ENVIRONMENTS

**Abstract author(s):** Nir, Nadav (Freie Universität Berlin) - Stahlschmidt, Mareike (Max Planck Institute for Evolutionary Anthropology) - Davidovich, Uri (The Hebrew University of Jerusalem) - Hardt, Jacob - Busch, Robert - Schütt, Brigitta (Freie Universität Berlin) - Ullman, Micka (The Hebrew University of Jerusalem)

**Abstract format:** Oral

Footpaths are of the most widely occurring types of human influences on the environment both temporally and spatially. We investigate modern and archaeological case studies from Tigray (Ethiopia), Judean Desert (Israel) and East Germany to better understand the formation and effects of footpaths. Here we use Micromorphology, automated porosity analysis, selective Fe extraction, Sedimentary analysis and Satellite and UAV images in a multi-proxy and multi-scalar approach.

We first examine the formation of currently used footpaths through possible patterns and changes in the subsoil in Tigray (semi-arid), the Judean Desert (arid) and East Germany (humid). Second, we attempt to detect micro and macro environmental changes in two presumably historical sunken lanes in proximity to 1st Millennium BCE sites in Tigray and in two footpaths attributed to the Roman period (1st century CE) and Early Bronze age (4-3rd Millenia BCE) in the Judean Desert. Different patterns emerge under the different environments while some common trends are also evident. This work is an initial attempt to bring together the formation and effects of footpaths and treat these human produced surfaces as geomorphological landscape features.

## A. ONE MILLENNIUM OF HUMAN-ENVIRONMENT INTERACTIONS RECORDED IN THE ŚWIĘTE MIRE (WESTERN POLAND, CENTRAL EUROPE)

**Abstract author(s):** Czerwinski, Sambor (Laboratory of Climate Change Ecology, Adam Mickiewicz University; Max Planck Institute for the Science of Human History, Jena) - Lamentowicz, Mariusz (Laboratory of Climate Change Ecology, Adam Mickiewicz University) - Karpińska-Kolaczek, Monika (Climate Change Ecology Research Unit, Adam Mickiewicz University; Centre for the Study of Demographic and Economic Structures in Preindustrial Central and Eastern Europe, University of Białystok) - Guzowski, Piotr (Centre for the Study of Demographic and Economic Structures in Preindustrial Central and Eastern Europe, University of Białystok) - Izdebski, Adam (Max Planck Institute for the Science of Human History, Jena) - Galka, Mariusz (Department of Biogeography, Paleoecology and Nature Conservation, University of Lodz) - Pilloix, Malo (Laboratoire Chrono-Environnement, UMR 6249, Université de Bourgogne Franche-Comté) - Kolaczek, Piotr (Laboratory of Climate Change Ecology, Adam Mickiewicz University)

**Abstract format:** Poster

In this study, we focus on the Święte fen located in western Poland. Our aim is to assess the impact of the progressive local-scale economic activity of the Cistercian Order on forest transformation. We carried out pollen, plant macrofossil, charcoal, testate amoeba, and selected non-pollen palynomorph (NPP) analyses, supplemented by 18 <sup>14</sup>C AMS dates.

Our research showed, that during ca. 1100-1250 cal. CE, pollen data indicate the presence of pine forest with the admixture of deciduous trees, like hornbeam, oak, beech. This phase is followed by probable clearance of the forest, which is indicated by a decrease in PAR (pollen accumulation rate) of deciduous trees, as well as the increase in

anthropogenic indicators. The increased human impact reflects probably the rebuilding of the stronghold in Przemęt, related to the reconstruction of the country after the domestic crisis. It was made by locals under the management of rural official in medieval Poland. In the subsequent period, from ca. 1330 to 1660 cal. CE, there was a gradual increase in human activity around the site. In the early 14th century, an onset of Cistercian activity took place. Its start was linked to further deforestation and possible drainage that is evidenced by a decline in the peatland water table depth inferred from testate amoebae.

Between 1670 and 1730 cal. CE, a significant decrease in pollen indicators of ruderal habitats and cultivated fields was recorded. This decline may be linked to the socio-economic crisis that was a result of the Swedish Deluge (1655-1660 CE). Historical sources indicate that depopulation reached almost 50% in the late 17th century. Shortly before this period, a sharp short-term (ca. 50 years) increase in microcharcoal accumulation rate was recorded, which was probably a result of brick firing for the construction of a Cistercian monastery (1651-1696 CE).

## **CONTROL THE DIVINE: INTEGRATING SACRED SPACES AND RITUALS AT THE 'FRINGES' (ANCIENT CENTRAL AND SOUTH ASIA)**

**Theme: 2. [Re]integration**

**Organisers: Mendoza Sanahuja, Marc (Universitat Autònoma de Barcelona) - Lakshminarayanan, Ashwini (Sapienza Università di Roma)**

**Format: Regular session**

Some lands are bound to become cultural crossroads. Ancient Central and South Asia have been the setting for the meeting of different cultures through the ages and, in consequence, represents a very interesting case of study for diachronically analysing religious integration and re-integration. These locations have often been relegated to fringes in scholar discussions, and this session aims to flip the approach by giving prominence to these lands.

Central and South Asia knew several important nodes of (global) interactions between the East and the West in Antiquity, either as part of the Hellenistic world or wider trade networks of the so-called Early Silk Roads. The interactions between multiple cultural groups were often categorised using simple acculturation models, but nuanced approaches to religious interplay are necessary to fully apprehend the ways in which cultural impact was felt in different communities at varying degrees.

The contact between locals and newcomers -either transient or permanent- always prompted a two-way interaction between their respective belief systems. The situation necessarily entailed challenges and generated answers in both communities. The effects could be perceived at different levels, from purely pragmatic to deep religious transformations: mutual influences ensured that their religious practices no longer remained the same.

Topics suggested within the frame of Ancient Central and South Asia for this session include, but not exclusively:

- Establishment of new sacred spaces in multicultural contexts.
- Religious adaptation at the fringes: challenges and solutions.
- Peripheral religiosity as seen from the centre.
- Comparison of religious rituals between the centre and periphery.
- Introduction of new rituals, ceremonies and convivial practices.
- Religious coexistence: delimitation, interaction, exclusion.
- Archaeological evidence for religious interaction: transference of motifs and iconography, adoption and resignification of ritual objects, etc.
- Archaeological evidence for religious conflicts.
- Religious syncretism: scholar myth or reality?

## **ABSTRACTS**

### **1 TEXTUAL ARCHAEOLOGY: ON SACRED GROVES IN HELLENISED CENTRAL ASIA**

**Abstract author(s): Mendoza Sanahuja, Marc (Universitat Autònoma de Barcelona)**

**Abstract format: Oral**

Texts are also useful tools to reconstruct ancient religious landscapes. Even in regions with very sparse data like Bactria-Sogdiana, textual sources and epigraphy can provide useful clues about the existence of certain religious spaces. Two different documents preserve information about the establishment of sacred groves by Greek settlers in Central Asia. The first one was located in the village of the Branchidae, who were settled in the region during the Achaemenid rule. That grove was likely a reconstruction of the one found in Didyma, the famous oracle near Miletus. The second instance is found in the so-called Kuliab inscription, in which a grove of Zeus is mentioned. The recurrence of this religious space in two different locations and times are interesting. Do they reflect an important aspect of Greek (re)construction of their own religious landscape in that faraway land? Or are they to be understood as the appropriation and the resignification of local religious spaces by the newcomers? These two examples represent

interesting cases of study to analyse and understand the establishment of religious landscapes in colonial contexts, and the interaction within them between locals and newcomers.

## 2 THE HELLENISTIC SANCTUARY IN TORBULOK - A CASE STUDY IN RELIGIOUS INTERACTION?

**Abstract author(s): Lindström, Gunvor (DAI German Archaeological Institute)**

**Abstract format: Oral**

The religious landscape of Hellenistic Bactria still lies in fog, from which only a few sanctuaries emerge that have been excavated since the 1960s. This is because the historical and epigraphic sources allow conclusions to be drawn about Bactria's population in Hellenistic times, which was mainly composed of native Bactrians and relatively few immigrant "westerners", including Greeks, but do not provide any information about the religions.

Among the few sanctuaries that have been explored is the sanctuary of Torbulok in southwestern Tajikistan, excavated in 2013-2019. Its location in a remote valley a day's walk from the nearest Hellenistic settlement group suggests that its visitors were mainly local Bactrians. Some of the archaeological contexts uncovered are unique and indicate that the cult community developed its own religious practices. Other contexts, however, show that the cult community was familiar with apparently Greek cult practices and utensils, such as the symbolic exchange of gifts with the god, as evidenced by the votive offerings, and the perirrhatheria, which provided water for purification rituals. However, it cannot be concluded that Greek immigrants or their descendants were directly involved in cultic activities at Torbulok or that the cult community was even aware of the genealogy of the practices. Rather, the nature of the worship was based on customs known from larger sanctuaries in the country, which were probably perceived as Bactrian, but in any case appropriate for the worship of the deity at Torbulok.

## 3 SHARING THE MORTUARY SPACE: NEW OBSERVATIONS ON THE BURIAL RITUALS IN THE BUKHARA REGION (UZBEKISTAN)

**Abstract author(s): Wang, Shujing (School of Art and Archaeology, Zhejiang University)**

**Abstract format: Oral**

This paper aims to reconstruct the progress of sharing the mortuary space in the Bukhara region in present-day Uzbekistan. Around 200 burials dated to the pre-Islamic period have been excavated in the peripheries of the Bukhara Oasis. These burials are conventionally attributed to pastoral nomads from the steppe. However, the mortuary space of Bukharan burials has been revisited and reused frequently. This paper analyses both archival data and fresh first-hand material from my recent archaeological excavations. It investigates funerary practices related to the production and reconstruction of mortuary space. As a result, four major methods for grave sharing are observed, including the modification of tomb structure, inhumations in burial mounds, the application of ceramic repositories in the burial chamber, and later, in the tumuli. The shared burials not only present the introduction of new burial rituals but also vividly illustrate the roles of ritual transition in establishing connections between later generations and their ancestors, real or imagined.

## 4 THE PRICE OF SALVATION: UNDERSTANDING THE USE OF LATE ANTIQUE COINS ALONG THE SILK ROAD

**Abstract author(s): Ouellet, Jonathan (Leiden University)**

**Abstract format: Oral**

The practice of placing coins on the eyes of the dead is a well-known practice in ancient Greece and Rome. What is often not looked at sufficiently though is their use in areas well outside of the Greco-Roman world. Several researchers have noted the presence of Byzantine gold and Sasanian silver coins in and around the modern Chinese province of Xinjiang, mainly around the modern city of Turpan. Many of these have been found in tombs and seem to be used in a similar fashion to the Greco-Roman ones. Many scholars have noted the reliance on Byzantine gold and Sasanian silver. Beyond being monetary, some scholars have argued that the coins are in fact also a social and ritual item. It is my intent to look at what role Byzantine and Sasanian coins may have played in social and religious traditions of the silk road. I will be looking at examples of coins found in the region and looking at their context as well as economic and social factors which may have played a role in their use in the region. It is the hope that looking at the coins found in Xinjiang, that we can get a better understanding of how monetary items can function in a religious setting.

## 5 MAKING SPACE FOR BUDDHISM: EARLY BUDDHIST PRACTICE IN HELLENISTIC CENTRAL ASIAN RELIGIOUS SPACES

**Abstract author(s): Ross, Edward (University of Reading)**

**Abstract format: Oral**

During the reign of King Aśoka Maurya (c. 304-232 BCE; r. 268-232 BCE), the teachings and practices of Buddhism were brought to the fringes of the Mauryan Empire and its neighbouring kingdoms. This included the regions to the

north-west of Gandhara, the land of Yonas, or as it is known today, Central Asia. Up until this point, the primary evidence for the transmission of Buddhism into Central Asia and the activities that took place during this early period are the Pāli Dīpavaṃsa and Mahāvāṃsa and the inscriptions attributed to Aśoka. The Italian Archaeological Mission in Pakistan has recently unearthed an apsidal temple in Barikot that dates to the time of the Indo-Greeks, and potentially even as far back as Aśoka's time. This early devotional space presents the greatest physical evidence for pre-Kushan Buddhist practice in Central Asia to date. As reports are published from this excavation, new physical evidence of early Buddhist practice will come to light.

With this new information, it is reasonable to consider that Buddhist practice did indeed take place among the Indo-Greeks, and even the Greco-Bactrians further north, before the Kushan Period (c. 30-375 CE). Like much of South Asia, religious activity and architecture were not restricted to single traditions. In fact, religious structures in Central Asia were places for people to engage with different deities and practices, sometimes even right next to each other. In this paper, I will discuss the nature of early Buddhist practice in the context of multi-cultural temples and consider how it would have integrated into the Central Asian temple site in Ai Khanoum. Through this, we can further deepen our understanding of the multi-faceted nature of religious spaces in ancient multi-religious contexts.

## 6 WHAT SORT OF BUDDHISM DID THE GREEKS IN INDIA ENCOUNTER?

**Abstract author(s):** Stoneman, Richard (University of Exeter)

**Abstract format:** Oral

The Greeks who accompanied Alexander to north-west India in 326 BCE, and those who remained there in the succeeding two centuries, came into contact with Buddhists and Buddhist ideas. . But how much of fully developed Buddhist philosophy was current in the fourth century BCE? How far can fundamental tenets such as no-self and dependent arising be attributed to the Buddha himself?

Here archaeology can be brought to bear on the question: the sculptural programme at Sanchi, for example, in which scenes including King Aśoka (a hero of Buddhist legend), and many jataka tales, are depicted, originates in the 3rd century BCE and shows definite signs of Greek influence in ornamentation, representation of the human form, and animal portrayals.

In this paper I propose to develop some of my own earlier discussions of Pyrrho's doctrines in relation to Buddhist ideas. The renegade 'naked philosopher' Calanus, who accompanied Alexander to Babylon, is seen as an identifiable transmitter of ideas. Another of Alexander's Greek companions was the philosopher Anaxarchus, and I make here a first attempt in the scholarship to build a picture of Anaxarchus' ideas as influenced by Buddhism.

Part of the paper will be devoted to The Questions of King Milinda, a Buddhist work dateable to perhaps 150 CE in which the Indo-Greek king Menander (ca 150 BCE) poses some rather penetrating questions to the monk Nāgāsenā. Can this text be taken as evidence for the Buddhism of his period?

Whatever the answer to this question, there emerges from the paper a more nuanced picture of the philosophical interaction of Greeks and Indian Buddhists in the third to first centuries BCE.

## 7 POWER THROUGH RELIGION AND RELIGION THROUGH POWER. ROYAL AGENCY AND LOCAL CULTS IN HELLENISTIC CENTRAL ASIA AND NW INDIA

**Abstract author(s):** Coloru, Omar (University of Bari)

**Abstract format:** Oral

During the Hellenistic period, Central Asia and northwestern India witnessed the emergence of phenomena of religious interaction between local cultures and the Greek world. Although historiographic sources on this period are fragmentary and few in number, archaeological, epigraphic, and numismatic sources are gradually shedding light on the easternmost area of the Hellenistic worlds known to date. If the public image of the Greek rulers who reigned in the region tends to strongly emphasize their belonging to the Graeco-Macedonian cultural sphere, nevertheless in this still little known historical context, remarkable case studies emerge that on the contrary show how local cults were the object of strong interest and participation on the part of the dominant group. Taking into consideration the available evidence on the Iranian cult of the god Oxus, on the Hindu religion, and Buddhism (also in the light of the excavations in Barikot, Swat), this contribution aims to understand how Greek royal authority and its representatives relate to local cults in the geographical areas under examination. In particular, we will try to understand how the sovereigns and their officials publicly promoted these cults, if and to what extent they adhered to them, which forms of representation of the divine element and which rituals were privileged.

## GANDHĀRAN ART AS AN EXPRESSION OF A MULTICULTURAL ENVIRONMENT - TOWARDS UNDERSTANDING THE NATURE OF INTERACTION

**Abstract author(s):** Kubica, Olga (University of Wrocław)

**Abstract format:** Oral

At the beginning of the 20th century Foucher published his famous work "L'art gréco-bouddhique du Gandhāra: étude sur les origines de l'influence classique dans l'art bouddhique de l'Inde et de l'Extrême-Orient" (1905-51), in which he coined the term Greco-Buddhist art. He argued that, since early Buddhist art was aniconic, thus the first sculpted images of the Buddha must have been influenced by Greek artists. Shortly thereafter Coomaraswamy in his article "The Origin of the Buddha Image" (1927) entered into polemics with Foucher's theory. He described the alleged European standpoint, according to which "the creative genius of Greece had provided a model which had later been barbarized and degraded by races devoid of true artistic instincts, to whom nothing deserving the name of fine art could be credited" (Coomaraswamy 1927: 287). These two voices are just an example of how the problem of Gandhāran art was approached in the 20th century. This approach of the scholars "preoccupied with tracing Greco-Roman influences that they believed shaped Gandhāra" was summarized by Behrendt, who argued that it "did serve to identify the many foreign groups that came into contact with the people of Northwest India, but the nature of these interactions remains unclear", because "the people in Gandhāra were actively filtering foreign 'influences' and selectively appropriating forms and ideas coming from abroad." The culture of Gandhāra cannot therefore "be seen as a pastiche of Mediterranean, Parthian, Chinese, and south Asian influences" and interpreted as "polluted – or ennobled – by the Classical tradition" (Behrendt 2004: 50 f.). In this paper I want to take up the topic of whether contemporary researchers have managed to go beyond the described scheme of researching Gandhāran art and if so, to what extent, and moreover, where are we, and what can the interdisciplinary approach change.

## EMBODYING RITUAL PERFORMANCE: DONOR FIGURES IN EARLY GANDHARAN ART

**Abstract author(s):** Elahi, Moizza (University of Toronto)

**Abstract format:** Oral

Traditional scholarship on Gandhāran art has largely been mired in reductive debates on artistic origins and influences. The goal of the present paper, however, is to shed light on locally constructed sculptural representations of donors and devotees from Butkara I in Swat valley—one of the earliest Buddhist sites in the Greater Gandhāra region. The discovery of several sculptures and architectural elements depicting elaborately adorned male and female figures with distinctly individualizing facial features, and bearing varied Buddhist offerings, not only throws into relief the artistic phenomenon of portraiture in early Gandhāran Buddhist art, but also exemplifies the visual enactment of donative ritual and practice. The appropriation of a transcultural and widely legible visual vocabulary for constructing these essentially Buddhist figures, however, underscores the complex cross-cultural interactions and encounters underpinning Gandhāran art and Buddhist practice in the early centuries of the Common Era. Donative inscriptions from Swat and Bajaur attest to the active participation in the Buddhist sphere of local dynasties, governing under imperial structures (Saka, Parthian and early Kushan) during the first century of the Common Era. This paper argues that in addition to relic establishment and donative inscriptions, the ruling dynasts used donor portraits for the material and metaphorical embodiment of their presence and piety within the Buddhist monastic space. Furthermore, these images likely served as public performances for effectively navigating the broader political and socio-cultural currents. Speaking to diverse communities in the multicultural matrix of Gandhāra, these donor portraits, therefore, highlight the participation of visual imagery in constructing new forms of ritual and practice predicated upon the intertwined notions of power, patronage, and religiosity.

## RITUAL MUSIC AND DANCING IN GANDHĀRAN ART

**Abstract author(s):** Lakshminarayanan, Ashwini (Sapienza University of Rome)

**Abstract format:** Oral

Buddhism was introduced in ancient Gandhāra (parts of present-day Pakistan and Afghanistan) around the third BCE and grew to be a popular religious force during the first centuries CE. Large scale Buddhist sacred buildings were funded by local elites and reliefs depicting both biographical and devotional scenes decorated these buildings. A Buddhist artistic tradition, often referred to as Gandhāran art, developed in this cultural and geographic crossroads using motifs (Greek, Roman, Indian, and Central Asian) that were transregionally shared and locally adapted.

Buddhist canonical texts are often used to promote a "pure" version of the religion that rejected musical and dance celebrations. However, Gandhāran relief fragments depict numerous figures dancing and playing music to demonstrate piety towards the Buddha and Buddhist relics. This paper argues that music and dance (may they be Hellenic, Indic or Parthian type performances) were an integral part of Gandhāran Buddhist rituals and reveals that the different types integrated the ideal performances belonging to the socio-cultural groups of the local Buddhist society.

## JAINA - VĪRA-ŚAIVA INTERACTIONS IN SOUTH INDIA: ARCHAEOLOGICAL EVIDENCE FOR RELIGIOUS AND ARTISTIC EXCHANGES DESPITE STRONG FORMS OF DEPENDENCY

**Abstract author(s):** Hegewald, Julia (The University of Bonn)

**Abstract format:** Oral

Archaeological and artistic enquiries into South Asia have tended to focus more intensely on the northern and central regions of the Subcontinent. The South and particularly the modern State of Karnataka, allegedly lying 'at the fringes' have tended to be more neglected in archaeological and art-historical examinations and writings.

This paper focuses on Karnataka in the twelfth and following centuries. It analyses contact between the originally dominant local Jaina community and newcomers in the form of the Vīra-Śaivas, who along with Śrī-Vaiṣṇavas and Muslims, moved into the region from the early twelfth century onwards, took over control and settle permanently in the area.

Although the local Jains found themselves in a situation of disempowerment and extreme dependency, this new condition prompted a two-way interaction between the respective belief systems and artistic practices of the old and the newly dominating group. The situation necessarily entailed challenges and led to the desecration and destruction of Jaina statues and temple edifices. However, it is fascinating to observe that, based on the visual record of preserved sculptural and architectural remains, it generated answers in both communities and did not only influence the art and life of the subdued. The dominating Vīra-Śaivas absorbed Jaina objects and spaces of veneration and integrated them into their own religious practices even though dogmatically and ritually, they made little sense in the religious context of the newly dominant elite. This mutual change ensured that neither of the religious groups or their religious and artistic practices remained the same. In the long run, it also ensured the firm integration of new faiths and traditions into the cultural environment of South Asia.

## CENTER VS PERIPHERY. INTERDISCIPLINARY APPROACHES TO THE STUDY OF MATERIAL CULTURE, ARCHITECTURE, AND LANDSCAPE IN THE CAUCASUS REGION

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Kaliszewska, Agnieszka (Systems Research Institute, Polish Academy of Sciences) - Lorenzon, Marta (University of Helsinki, Centre of Excellence in Ancient Near Eastern Empires) - Hamburg, Jacek (Krukowski Polish-Georgian Interdisciplinary Research Center) - Bieńkowski, Rafał (Systems Research Institute, Polish Academy of Sciences)

**Format:** Regular session

The Caucasus sits at the crossroads between Eastern Europe and Western Asia, and throughout history, the region has been both a peripheral area for dominating Empires and a strategic place for trade, communication and acquisition of natural resources. Its strategic position has made control of the area a key issue for Empires from the Early Bronze Age to the Medieval period. In recent years, the archaeology of the Caucasus has developed at a very fast pace. Everyday discoveries are changing our perception of Caucasus cultures by providing new data on different aspects of material culture, also thanks to the application of new technologies and methods.

This session focuses on bringing together researchers focusing on the study of the Caucasus as a border area between empires, but also as an independent polity. We welcome papers presenting innovative and interdisciplinary approaches to the study of artefacts and ecofacts in relation to the concepts of 'border area', connectivity and skill transfer as presented in the archaeological record. The session's main goal is to bring together specialists from different fields (i.e., pottery, glass, coins, architecture, metallurgy, landscape, archaeobotany, palaeoecology, archaeozoology, geoarchaeology) that focuses on the diachronic study of this region through the analysis of material culture. We believe that the exchange of recent findings and opinions can lead to a deeper understanding of the complexity of the archaeological record as found in the Caucasus.

### ABSTRACTS

#### 1 ON THE TRAIL OF ANCIENT SETTLEMENTS... THE ARCHAEOLOGICAL LANDSCAPE OF KUTAISI IN THE LIGHT OF RECENT POLISH-GEORGIAN EXCAVATION RESEARCH

**Abstract author(s):** Hamburg, Jacek (Krukowski Polish-Georgian Interdisciplinary Research Center) - Isakadze, Roland (Georgian National Museum; National Agency For Cultural Heritage Preservation of Georgia, Kutaisi Historical Architectural Museum - Reserve; Akaki Tsereteli State University) - Badura, Monika (Laboratory of Paleocology and Archaeobotany, University of Gdańsk)

**Abstract format:** Oral

Since 2017 the Kutaisi Archaeological Landscape Project (KALP) conducted surface prospection and regular excavation research at several archaeological sites in the city of Kutaisi and its surrounding area. At these sites were discovered remains associated with the Late Bronze Age / Early Iron Age, Antique and Medieval periods. This speech

focuses on the study of the oldest residues. Archaeological excavations, although difficult due to significant damage caused by modern buildings and growing city, were carried out in the area of the Dateshidze hill and around the Bagrati Cathedral. Results allowed us to obtain the first evidence for the existence of the Late Bronze Age settlement. Archaeologists found sections of the defensive ditch/moat in the 2018 and 2019 seasons, and remnants related to the wooden and wattle-and-daub architecture during the 2019 and 2021 seasons, characteristic for the Colchis Valley region in that period. Its dating is confirmed by the first results of radiocarbon analyses of organic and botanical material found in huge amounts inside the ditch, where anaerobic conditions prevailed. Besides, in the 2019 season, rescue excavations nearby Meskheti hill (unexcavated ancient settlement located ca. 11 km southwest from Kutaisi) were carried out. Antique tomb in pithos was found there. The object was untouched and full of many finds, including gold objects and a single silver coin.

## 2 EARTHEN ARCHITECTURE AND CONSTRUCTION PRACTICES IN THE KUTAISI REGION

**Abstract author(s):** Lorenzon, Marta (University of Helsinki)

**Abstract format:** Oral

The study presents the preliminary results of the analysis of earthen building materials from the excavations of Kutaisi, Georgia. The research aim is to shed light on continuity and change in architectural construction technologies from the beginning of the to the Early Bronze Age to the Medieval period in the central Caucasus Area. The study presents earthen building materials from two distinct sites in Kutaisi: 1. the Dateshidze hill dated to the Bronze Age period (13th -12th B.C.) until the pre-antique period (6th -5th B.C.), and 2. the Bagrati citadel, where the archaeological remains dated to the Bronze Age (2nd Millennium B.C.E.), Byzantine period (5th - 8th century A.D.) and the Turkish period (15th - 17th century A.D.).

This paper focuses on presenting the results of the macroscopic study and preliminary geoarchaeological analysis, which clarify key issues regarding earthen architecture manufacture practices, especially mode of production, selection of raw source materials and construction practices implemented in the Kutaisi areas. This study highlights the presence of three distinctive manufacturing techniques, likely implemented synchronically, and associated to diverse typologies of earthen architecture construction practices.

## 3 A CASE STUDY OF BRONZE AGE POTTERY FROM KUTAISI, GEORGIA

**Abstract author(s):** Kaliszewska, Agnieszka (Systems Research Institute, PAS) - Lorenzon, Marta (University of Helsinki, Centre of Excellence in Ancient Near Eastern Empires) - Badura, Monika (Laboratory of Paleoecology and Archaeobotany, University of Gdańsk)

**Abstract format:** Oral

In this contribution, we present the new pottery finds discovered in the course of the Expedition for Kutaisi Archaeological Landscape(EKAL) project conducted by the Krukowski Interdisciplinary Research Center in the area of Gabashvili Gora and surrounding hills (Kutaisi).

Georgian Bronze Age pottery remains in the periphery of archaeological interest, hence this presentation aims at discussing its variance, usage and the main problems that arise during the study of pottery from the Caucasus area. Considering all of the above, we present the ceramics finds from two consecutive field seasons of the EKAL project, and we compare those with other regional materials first by creating typological comparisons, then by investigating the pottery in correlation with other excavated materials. We also attempt to use pottery, in combination with the results of integrated interdisciplinary studies, as an active indication of the existence, extension and form of the Bronze Age settlement of Gabashvili Gora. Due to dense modern constructions, the evidence we were able to obtain is fragmentary; nevertheless, it is essential to our understanding of the past urban development of the area in question.

## 4 THE ANIMAL STYLE OF THE URARTIAN AND CAUCASUSIAN BELTS

**Abstract author(s):** Castelluccia, Manuel (University of Naples) - Szabó, Geza (Wosinsky Mór Museum)

**Abstract format:** Oral

During the first centuries of the 1st millennium BC Caucasian metalwork exhibited a rich vitality and fantasy in representing animals of the surrounding landscape. Such repertoire is remarkably represented on metalwork, especially on bronze belts. About 400 metal belts are known, most of them coming from documented funerary contexts. A large amount of them exhibits rich geometric and figurative decorations, with complex composition of animals and human as well. The artistic representations were expressed in a typical local style, the result of a local development from a well-established artistic tradition dating back to the Middle Bronze Age. A very similar tendency is observed within the rich corpus of Urartian metalwork, within which metal belts play a remarkable role. However, Urartian metalwork and especially belts showed a different style, with a tendency toward repetition and uniformity. Moreover, only a small number of belts come from well documented archaeological contexts.

The present proposal aims at highlighting the development of animal representations through the 1st millennium BCE, in the interaction of local characteristics and in Urartian art.

## 5 THE SUPPLY OF THE APSAROS FORTRESS (MODERN GONIO, GEORGIA) IN AMPHORA-BORNE COMMODITIES DURING THE ROMAN AND EARLY BYZANTINE PERIOD

**Abstract author(s):** Komar, Paulina (Cardinal Stefan Wyszyński University in Warsaw) - Rogava, Andria (Georgian National Museum)

**Abstract format:** Oral

The aim of this presentation is to offer an overview of transport containers that were discovered by the Gonio–Apsaros Polish–Georgian Expedition at the Roman fort of Apsaros (modern Gonio, Georgia). The analysis of the Roman (1st–3rd c. AD) and Byzantine (6th–7th c. AD) amphora fragments discovered between 2014 and 2021 demonstrate that the most amphora-borne commodities came from the eastern and southern Black Sea region. However Aegean imports appear to be much more popular in the Roman period than during the Byzantine occupation. This should be linked with a preference for a better quality wine and olive oil among the military elite during the 1st–3rd c. AD. Concerning the northern and western Black sea regions, the former seems to have played a minimal role in supplying Apsaros, while the containers from the latter area have not so far been identified. This supply pattern was maintained for the biggest part during the Byzantine period. However we also observe a shift towards regionalization in this period: an increase in the importance of amphora-borne commodities from Pontic region and a significant decrease of imports from outside the Black Sea area.

## 6 BAGRATI CATHEDRAL AND ITS SURROUNDINGS. PRELIMINARY RESULTS OF THE INTERDISCIPLINARY INVESTIGATION OF THE BAGRATI HILL IN KUTAISI, GEORGIA

**Abstract author(s):** Bienkowski, Rafal - Kaliszewska, Agnieszka (Systems Research Institute of the Polish Academy of Sciences) - Badura, Monika (Laboratory of Paleoecology and Archaeobotany, University of Gdańsk) - Lorenzon, Marta (University of Helsinki, Centre of Excellence in Ancient Near Eastern Empires)

**Abstract format:** Oral

The Bagrati Cathedral is a hallmark monument of the town of Kutaisi as well as of the central Caucasus region. With its foundation dated as early as the 9th century, this structure is one of the oldest architectural monuments in Georgia. The architecture of the cathedral has been the subject of multiple studies, which mainly focus on its architecture, not considering the immediate surroundings of the main monument. In the recent field seasons (summer 2019 and 2021), the Polish-Georgian team has focused on understanding and investigating the urban landscape surrounding the cathedral by excavating two trenches on the North-East side. This study aimed at establishing the history of the hill, focusing on the landscape development around the cathedral, and the urban changes this area underwent over time.

Alongside the excavation, the study also included an archaeobotanical analysis of the finds. The preliminary results of this study indicate an intense human activity, especially during the Middle Ages. The archaeobotanical study also aims at describing the role of plants in the daily diet of the inhabitants of the Bagrati hill. This contribution will present the recent findings in combination with previous studies conducted by the Kutaisi Historical Museum. Our final aim is to attempt a reconstruction of the changes from the Early Middle Ages to Modern times that occurred on one of Kutaisi's most prominent historical hills.

---

## 187 THE NETWORK FORMER: TRADE AND EXCHANGE OF GLASS IN ANTIQUITY

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Franjic, Ana (Museum of Ancient Glass, Zadar) - Montanari, Eleonora (Newcastle University)

**Format:** Regular session

By bringing together the archaeological and archaeometric evidence for glass use and trade, this session aims to examine the role of glass in regional and inter-regional social, cultural, and economic networks present in ancient Europe and the Mediterranean (mid–2nd millennium BCE – 7th ct. CE).

Full of colour or nearly devoid of it, opaque or translucent, glass is an artificial material with a unique set of properties regulated by the technological know-how of the craftsmen as well as the aesthetic and functional properties preferred by their societies. Since the beginnings of the industry and throughout antiquity, glass, either as a raw material or as finished objects, was manufactured in primary and secondary production centres and traded further afield, with findings demonstrating the existence of long-distance glass trade since the Late Bronze Age. The resulting cultural interconnections did not only lead to the circulation, appreciation, and different valuations of glass, but also likely acted as a catalyst for technological experimentation and innovation.

The proposed session aims to evaluate the influence of glass on the communal connections at various levels. Was the demand for this prestige material actively forming connections between groups, and establishing new trade cor-

ridors, or was glass supply adapting to the already present nodes of connection? How did the existing connections affect the use of and demand for glass? How were the cross-craft interactions and knowledge transfer organised within different societies and industries, and at different times?

This session will welcome papers exploring the role of glass in wider trade and social networks or in the formation of inter-communal and inter-regional connections through the lens of typology, technology, chaînes opératoires, knowledge transfer, experimental archaeology, and chemical analyses.

## ABSTRACTS

### 1 GLASS EYE-BEADS IN MYCENAEAN GREECE: MANUFACTURE, PROVENANCE AND FUNCTION

**Abstract author(s):** Nikita, Kalliopi (Greek Ministry of Culture - Ephorate of Antiquities of East Attica)

**Abstract format:** Oral

The current paper presents and discusses the occurrence of glass eye-beads in burial contexts of Mycenaean Greece with special emphasis on cemetery sites in the Argolid. In the first place, a definition of this characteristic piece of glass jewellery and an overview of its principle types are given on the basis of its manufacturing techniques. Glass eye-beads are not included amongst the typical jewellery produced by the thriving Mycenaean glass industry, which is also attested to by their rarity and uneven distribution in the Mycenaean World. Taking into consideration that glass eye-beads are characteristic products of alien glass industries their provenance is explored within the external relations network of the Argolid with the Eastern Mediterranean during the Late Bronze Age. Moreover, given that glass eye-beads, as in the case of jewellery in general, principally occur in burial contexts, further examples from contemporary Mycenaean sites outside the Argolid will also be considered to facilitate a more comprehensive discussion. The paper aims to define the function of glass eye-beads in relation to their modes of deposition, age, gender and social status of the dead. Ultimately, the discussion will emphasise on the symbolic attributes of glass eye-beads and the Mycenaean perception of them within the system of Mycenaean religious beliefs and funerary notions.

### 2 EVIDENCE FOR LONG-DISTANCE TRADE ON THE GREAT HUNGARIAN PLAIN: BLUE GLASS BEADS FROM THE TUMULUS CULTURE CEMETERY OF MAKLÁR

**Abstract author(s):** Mengyán, Ákos (Hungarian National Museum) - Sz. Osváth, Zsófia (Department of Archaeology, Doctoral School of History, University of Szeged) - Hrabák, Zita (Hungarian National Museum) - Bajnóczi, Bernadett (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, Eötvös Loránd Research Network - ELKH)

**Abstract format:** Oral

In Central Europe, cross-cultural communication and long-distance trade became consolidated between the 15th and 13th century BC, where the Tumulus Culture emerged and controlled trade routes between Jutland and the Aegean city-states. Among others, the focus of the exchange was on metalwork, amber and glass beads. Glass beads reached also the eastern part of the Carpathian Basin, where multi-layered tell settlements were just abandoned, and this area became the eastern border of the Tumulus Culture.

On the northern edge of the Great Hungarian Plain, in the vicinity of Maklár, two cemeteries are known from this period, namely the sites Nagyrét II. and Koszpérium. In 2021, nearly 180 cremation graves have been excavated at Maklár–Nagyrét II, from which 11 contained blue and turquoise beads, altogether 33 pieces. The scanning electron microscopy analysis (SEM-EDS) verified the early presence of artifacts made of glass/glassy material on the northern territory of the Great Hungarian Plain for the first time. As it was already postulated in the case of other similarly dated glass beads from different parts of Europe, the beads could be the commodity of a long-distance exchange network. The poster presents the results of the chemical analysis of the beads and compares them with beads previously analysed from other Bronze Age sites.

### 3 GLASS CONNECTIONS IN LATE IRON AGE EUROPE: FROM RAW MATERIAL FROM THE NEAR EAST TO ORNAMENTS OF THE NEARBY CITY

**Abstract author(s):** Rolland, Joëlle (UMR 8215 Trajectoires; UMR 7065 Iramat)

**Abstract format:** Oral

This communication aim is to present the different contributions of typological, technological, and analytical approaches to the glass of the late Iron Age Europe, in order to consider this material in the reconstruction of the Iron Age circulation networks. Thanks to the development of analytical methods, the study of La Tène glass has recently reached a new dimension. More than 1400 La Tène glass objects discovered in France and the Czech Republic were recently analyzed using the La- ICP-MS method (laser ablation-inductively coupled plasma-mass spectrometry). Several types of Near Eastern glass used by glassmakers in La Tène Europe were characterized. Based on the typological and analytical data, a diachronic evolution of the compositions used by La Tène glassmakers between

the fifth and the end of the first century BC could be established. These analyzes make it possible to reconstruct the evolution of imports from the Near East during the late Iron Age. This study also sheds new light on the complexity of the commercial and diplomatic relations that the elites of Iron Age Europe developed with the Mediterranean world. Glass, in fact, is one of the only materials linking La Tène societies to the Near East. With this analytical project, it was also possible to approach the distribution of the different groups of glass compositions within the different spaces of Europe of La Tène societies. Once transformed into beads and bracelets, the glass travels through the La Tène networks of people and goods. Through the study of typologies, the inventory of objects, and the technological study of glass beads and bracelets, the study of La Tène glass also allows us to approach the networks of luxury goods as well as the exchange of knowledge between the different secondary production areas.

#### 4 MOSAIC GLASS OBJECTS FROM THE ROMAN LEGIONARY CAMP BURNUM

**Abstract author(s):** Jadric-Kucan, Ivana (University of Zadar) - Sokcevic Purusic, Anamaria (Archaeological collection Burnum National Park "Krka")

**Abstract format:** Oral

Among the first glass objects to appear in the Roman legionary camp Burnum are small luxurious bowls, dishes and bead with head of Medusa made by using the marbling technique dated from the second half of the 1st century BC or the beginning of the 1st century AD. Mosaic glass objects were manufactured using a laborious and time-consuming technique. They reached Burnum via important trade and transit centres Scardona and Iader. A developed road system connected Burnum with these centres, which was necessary for the supply of the military camp with the food provisions and other goods. As a subsidiary civil settlement was probably formed next to the camp for soldiers' families, craftsmen and traders, their importance was even greater. In the end we can say that glass objects were spread also thanks to Roman soldiers, who in that way supported the Romanization process, which is illustrated well by examples from Burnum.

#### 5 ARCHAOMETRIC INVESTIGATION ON THE OPAQUE RED GLASS SECTILIA FROM THE VILLA OF LUCIUS VERUS (2ND CENTURY AD) IN ROME

**Abstract author(s):** Bandiera, Mario (VICARTE, Research unit Vidro e Ceramica para as Artes, FCT/UNL; Dep. de Conservação e Restauro, FCT/UNL) - Verità, Marco (LAMA laboratory, IUAV University) - Vilarigues, Marcia (VICARTE, Research Unit Vidro e Ceramica para as Artes, FCT/UNL; Dep. de Conservação e Restauro, FCT/UNL) - Saguì, Lucia (Sapienza Università di Roma)

**Abstract format:** Oral

This work aims to investigate by a multi-analytical approach the Roman opaque red glass sectilia dated to the 2nd century A.D., to shed light on the Roman glassmaking production of different red shades, from orange to red brown. Due to the lack of glassmaking written source dated to this period the production technology of opaque red glass is still not fully understood. Moreover, there are not clear information where it was manufactured, giving a partial understanding of its production.

The opus sectile decoration from the imperial villa of Lucius Verus (2nd century AD), represents the most important and one of the oldest examples in which glass sectilia began to be employed. The abundance of opaque red glass sectilia, and the presence of different red hues, make this assemblage a rare opportunity to investigate some aspects of the colouring technique during the 2nd century AD.

A set of 40 opaque red glass sectilia from this decoration was collected to be investigated. Each red hue was characterized through: colourimetric measurements, chemical analyses (LA-ICP-MS) to identify the raw materials and the probable provenience, and mineralogical study (Raman Spectroscopy, SEM-EDS and X-ray diffraction) to investigate the main features of the colouring particles of each red hue.

The results highlighted that the five red hues, individuated by colourimetric measurements, were manufactured by well-mastered recipes which include the careful selection of specific raw materials and the application of well-engineered heat treatments. Moreover, compositional differences concerning the silica source and the fluxing agent, distinguish some of the opaque red glass sectilia from the common Roman natron glass. This rises some question about the organization to produce coloured glass during the 2nd century AD, and hypothesizes the existence of specialized production centres devoted to coloured glass, which supplied Rome with high quality coloured glass.

#### 6 THE FALL OF ANTIMONY: SOURCING THE END OF SB-DECOLOURED ROMAN GLASS

**Abstract author(s):** Degryse, Patrick (Earth and Environmental Sciences, KU Leuven; Fac. Archaeology, Leiden University) - Van Ham - Meert, Alicia - Gonzalez, Sofia (Earth and Environmental Sciences, KU Leuven)

**Abstract format:** Oral

Antimony (Sb) is considered a rare metal in the archaeological record, and its ores are not very ubiquitous. Nevertheless, Sb minerals were utilised over several millennia as the prime material to opacify or decolour glass and glazes,

as well as in (natural) copper alloys. In this way, Sb spread throughout the known world from the late Bronze Age onward. In glassmaking, stibnite was the only available mineral raw material that could achieve in a controlled manner the desired opacified nature of the earliest glass, or the necessary effect as a decolourizer or opacifier in later periods. Sb and Pb isotope analysis has allowed Roman colourless glass to be compared to the ore sources possibly known and extracted in the ancient world. Results demonstrated that, although earlier Roman glass was more varied in isotope ratios, variations are not large. Relatively few sources of antimony have the suitable signature matching glass production in antiquity, and are situated in Spain, Romania, Germany and the Caucasus. Conversely, later Sb-decoloured Roman glass is uniform in Sb-Pb isotope ratio, and matches only Dacian stibnite. The isotopic data presented will be used to discuss the inflow of Sb to the glass industry through time, and the transitions in technology to other sources to decolourize or opacify vitreous materials, possibly due to the loss of control over suitable mineral resources.

## 7 TRANSFORMATION IN SICILIAN GLASS ECONOMY BETWEEN THE MID-4TH AND 7TH CENTURIES: MAZARA DEL VALLO AND VILLA DEL CASALE

**Abstract author(s):** Vagni, Elisa - Colangeli, Francesca (Università degli studi di Roma "Tor Vergata", SPFS Department) - Schibille, Nadine (IRAMAT-Centre Ernest Babelon - UMR 5060, CNRS-Université d'Orléans)

**Abstract format:** Oral

Recent research on Sicily has revealed the importance of the island's role within Mediterranean during the Late Roman and the Early medieval periods. In particular, ceramics have often been used for the analysis of manufacturing and commercial aspects. In this proposal, we decide to look at glass as another indicator to investigate questions of production and circulation of goods that affected Sicily during this time.

In context of two ERC research programmes (Sicily in Transition and Glass Routes), we conducted the first systematic study of Sicilian glass assemblages in terms of their chrono-typological and compositional characteristics. The analytic data of the central-eastern rural site of Villa del Casale (Piazza Armerina -EN) and the western city of Mazara del Vallo (TP) will be illustrated, in order to trace a geographical evolution of glass consumption and supply within the island from the mid-4th to 7th century. These sites were selected to point out the differences and similarities between different parts of the island over time.

During this period, the glass-making process is divided into primary and secondary production centres and Egypt and the Levantine coast represent the main export areas for raw glass. As for Sicily, our data illustrate a predominance in glass supply from Egypt up to at least the 6th century. However, at the end of 7th century the income of Levantine glass became prevalent. Similar trends begin to emerge in other areas of the Mediterranean such as the Iberian Peninsula. Moreover, studies on post-Roman ceramic have proved close links between Sicily and North Africa, as well as with the Aegean area. These areas could also have acted as redistribution points for the glass trade.

## 8 GLASS FOR BARBARIANS & GLASS OF BARBARIANS

**Abstract author(s):** Cholakovska, Anastasia (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences) - Petrauskas, Oleg (Institute of Archaeology, The National Academy of Sciences of Ukraine) - Karlsen, Hans-Jörg (Universität Rostock, Heinrich Schliemann-Institut für Altertumswissenschaften) - Hegewisch, Morten (Institut für Prähistorische Archäologie, Freie Universität Berlin) - Kronz, Andreas (Geowissenschaftliches Zentrum, Georg-August-Universität Göttingen)

**Abstract format:** Oral

The site of Komariv at the Dniester River in Western Ukraine was first discovered in 1950, by research fellows of the Institute of Ukrainian Studies (Lviv). Fieldwork campaigns in 1950s, 1960s, and in 1974 at Komariv revealed substantial evidence of local glassworking and vessel production, which defined the site as the only non-itinerant glass craft centre from the late 3rd – early 5th c. AD, attested so far beyond the borders of the Late Roman Empire. Following the first publications in 1960s, Komariv becomes well-known to the specialists of archaeology of the east European Barbaricum. The recent decade saw a revived interest towards the site and its glass, as indicated by some analytical studies performed on finds from the early fieldworks, as well as by an excavation programme for resuming the fieldwork activities. Unfortunately, the glass finds from the 1950 – 1970s excavations mostly lack any archaeological context information, and therefore important questions of chronology and technology of glass working at Komariv cannot be reliably addressed based on their study only.

The present talk aims to outline the latest results of a research project carried out since 2012, which combines geophysical prospection, excavations of new areas of the site, typo-morphological study of the glass finds, and preliminary chemical analyses of selected samples. The data obtained so far confirm the uniqueness of Komariv and contribute to the understanding of the glass vessel repertoire, manufacturing techniques, compositional affiliation of the glass, and the site chronology. Furthermore, crucial questions of the socio-cultural and ethnic identity of the Komariv glassworkers, their routes of raw material supply, glass recycling, and spread of finished production within the context of Chernyakhiv culture and in connection to the broader networks of glass distribution of Late Antiquity will be discussed.

## “WHAT LIGHT THROUGH YONDER WINDOW BREAKS?” FIRST ARCHAEOMETRIC RESULTS FROM THE WINDOWGLASSMED PROJECT

**Abstract author(s):** Bertini, Camilla (Newcastle University; Harvard University)

**Abstract format:** Oral

Chemical and isotopic analysis have often been used as a proxy to answer questions connected with glass production, trade, and provenance during the 1st Millennium AD, but chemical data available for the Early Medieval period are still scarce.

Between the 7th and 10th centuries, glass technologies witness a great transitional period: not only plant ashes replace natron as the “new” source of alkali, but recycling and mixing of different compositions of glass (interpreted by many scholars as a sign of decline in glass circulation from the primary production areas) seems to be the majority of glass circulating at the time.

Moreover, in the past thirty years more and more archaeometric studies focus on a much broader and multidisciplinary approach to ancient glass production: now more than ever we need to reevaluate our “data-driven” vision to move towards a more nuanced and multidisciplinary approach if we want to better understand the Early Medieval glass production in all its complexity.

The WINDOWGLASSMED project (MSCA IF - GF, Newcastle University - UK and Harvard University - USA) aims to open a “new window” on the production, circulation, and recycling processing of glass during the Early Medieval period by using a multidisciplinary approach.

In this session, the first archaeometric results (LA-ICP-MS) will be presented including samples (n=117) from several archaeological contexts (Aquileia, Brescia, Grado, Monselice, Monte Barro, Padova, San Vincenzo al Volturno, and Vicenza) from Central and Northern Italy dated from the 7th to the 10th century CE.

Chemical results will also be discussed within the Northern Italian glass production as well as the broader Mediterranean and Levantine context.

## 10 SAFETY IN NUMBERS: GLASS, COMPOSITIONAL ANALYSIS AND THE MATHEMATICAL NETWORK

**Abstract author(s):** Govantes Edwards, David (University of Córdoba)

**Abstract format:** Oral

Recent decades have witnessed a spectacular increase in our understanding of glass production, distribution and consumption in Antiquity. This has been largely brought about by compositional analysis, which has presented us with a neat way to display our data: glass is organised in well-known compositional groups, the chronology and provenance of which are increasingly well defined. The problem with this is that compositional affinities are elegant, straight and seemingly final, and therefore comforting, when compared with the links that tie glass samples to their archaeological networks, which are ugly, messy and open-ended. Microsoft Excel is rapidly becoming the new context. Apart from other implications, this is leading to a form of scientific reversion of terms when it comes to the analysis of glass trade in Late Antiquity. Glass is being analysed and links created between samples that are sometimes found thousands of kilometres apart, and these links, in turn, used as arguments to establish routes and patterns. The comfort of numbers, however, is making us neglect one fundamental aspect, which is the real role of glass trade in the whole phenomenon of commerce in Late Antiquity. Likely a very minor good, buried under the tons of pottery and archaeologically untraceable goods, such as tin, or wheat, I argue that glass trade can only be understood in its broader commercial context (many more papers concerned with trade mention manganese oxide than, say, the annona supply system), and that compositional analysis should come at the end of the research process, not its beginning: a useful tool, not an oracle. In this presentation, I shall use the example posed by the harbour of Vigo (Spain), in the 6th-7th centuries, as an illustration of the impossibility of understanding glass trade through compositional analysis alone.

## A. CHEMICAL COMPOSITIONS OF SELECTED BRONZE AND IRON AGE GLASS AND GLASSY ARTEFACTS FROM SOUTHEAST HUNGARY

**Abstract author(s):** Sztankovánszkiné Osváth, Zsófia (Department of Archaeology, Doctoral School of History, University of Szeged) - Bajnóczi, Bernadett (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, Eötvös Loránd Research Network - ELKH)

**Abstract format:** Poster

As part of a large-scale archaeological and archaeometric investigation focusing on ancient glassy materials excavated in Southeast Hungary, forty Bronze Age, Middle Iron Age (Scythian Age) and Late Iron Age (La Tène period) glasses and glassy items (e.g., simple or knobby eye beads, fragments of glass bracelets, etc.) deriving from seven sites (in Csongrád-Csanád and Békés counties) have been analysed by handheld X-ray fluorescence spectrometry (hXRF) and scanning electron microscopy (SEM-EDS).

The chemical compositions of the glasses and glassy items indicate that the majority of them were made of soda (mineral natron) glass. However, slight chemical differences were noticed, such as 1 wt% or higher potassium oxide levels approaching the K<sub>2</sub>O concentration of plant ash glass in the beads dated to the Bronze Age and in some glass bracelet fragments. A special glass type rich in potash and iron oxide (16 wt% K<sub>2</sub>O, 4 wt% MgO, 11 wt% Fe<sub>2</sub>O<sub>3</sub>) with high amount of bone ash as well as a glassy faience made of plant ash glass were also identified in the Scythian Age find assemblages. The main colorants are copper or copper together with cobalt, sometimes accompanied by 1 wt% or higher amount of iron oxide, in the blue glass; copper with or without calcium antimonate in the opaque turquoise glass; lead antimonate in the yellow glass; and calcium antimonate in the white glass. These results are partly comparable with the Iron Age finds earlier investigated, however, the larger number of the analysed samples revealed the higher diversity of glassy materials, and enables us to define the changes in the chemical composition of glass in the course of time, within a find complex, especially in the Békésszentandrás cemetery.

## **B. MOVEMENT OF RAW GLASS IN THE ROMAN EMPIRE: HIMT GLASS AT FENÉKPUSZTA, PANNONIA (HUNGARY)**

**Abstract author(s):** Dévai, Kata (MTA - ELTE Research Group for Interdisciplinary Archaeology) - Fórizs, István (Research Centre for Astronomy and Earth Sciences, Institute for Geological and Geochemical Research) - Heinrich-Tamáska, Orsolya (Leibniz-Institute for History and Culture of Eastern Europe - GWZO) - Prien, Roland (Heidelberg Centre for Cultural Heritage, Ruprecht-Karls-Universität Heidelberg)

**Abstract format:** Poster

Invention of the high production rate tank furnace changed the "chaîne opératoire" of glass production in Roman Empire. There was a shift from the system where glass melting from raw materials and forming of the final objects happened in the same glass workshop to the system where glass was melted mainly in centres, in so called primary glass workshops, and raw glass was distributed by trading to so called secondary workshops where the finished product was made. It is hypothesised that glass making centres were situated in Levantine region including Egypt. Because raw glass was made from the same type of raw materials (sand and natron) therefore identification of glasses melted in the different primary workshops are based mostly on the minor and trace components. Several types of glasses have been established on the basis of chemical composition: e.g. Levantine I, Levantine II, Egypt 1, Egypt 2, HIMT. Among these the most characteristic one is the HIMT which is believed to be made in Egypt in the Late Roman and Byzantine Period. When HIMT glass is not coloured it has a characteristic yellowish olive-green colour. Mapping the distribution of HIMT glass finds can help us to understand trading routes within of Roman Empire. According to the literature data HIMT glass has been found at several sites from Great Britain through the Mediterranean to the Caucasus. We can put one more site on this map, Fenékpusztá in Hungary (Pannonia). Yellowish olive-green hue suddenly appears in Pannonia in the second half of 4th century and becomes very common. Its appearance in Pannonia can probably be explained by fact that the previous trade routes have changed, raw material of glass have been obtained from other workshops.

---

## **192 MULTI-PROXY APPROACHES TO KINSHIP IN THE GRECO-ROMAN WORLD**

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Voutsaki, Sofia (University of Groningen) - Nikita, Efthymia (The Cyprus Institute - STARC) - Neveff, Lisa (The University of Michigan)

**Format:** Regular session

The study of kinship in past societies is an imperative, but difficult task. On the one hand, kinship is a key aspect of human life, as it defines people's sense of identities, their social ties and their access to rights and resources. On the other, conceptualizing and defining kinship is challenging because of its complex and fluid character and the variable forms it takes in different societies. Further problems arise when trying to assess the significance of kinship in the archaeological record: Which data should we use, which biocultural aspects should we include, and how should we analyze them? A broad range of methods - such as human osteoarchaeology, ancient DNA or biodistance analysis, contextual analysis of mortuary practices and household archaeology- has been employed. More questions arise if we study historical societies: Which other sources should we try to include? How should we use historical, iconographic, epigraphic or papyrological evidence? What is the potential and the limitations of these different datasets, and how should we integrate them?

In this session, we would like to apply these questions to the Greco-Roman world which offers a wealth of archaeological and textual evidence. The ancient world is characterized by a certain degree of political or cultural unity across current national and continental boundaries, but also by marked diversity. In addition, recent attention to silenced groups - such as women, children, the elderly or enslaved people – shifts the traditional focus on male citizens or the elites, and thereby enable a more holistic discussion of kinship.

We are looking for contributions which either emphasize recent methodological and/or theoretical advances in the study of past kinship, or address the problems arising when integrating archaeological and historical datasets.

**1 THE STUDY OF KINSHIP IN THE ANCIENT GREEK WORLD: SOME REFLECTIONS**

**Abstract author(s):** Voutsaki, Sofia (Groningen Institute of Archaeology; Center for Hellenic Studies, Harvard University)

**Abstract format:** Oral

In this session we are asked to reflect about kinship in the ancient Greek world – how to define and conceptualize this complex concept, how to combine different methods, how to integrate different types of sources. This paper offers some reflections to start off the discussion, by looking at the way scholarship has evolved over the last decades in the many disciplines - ancient history, anthropology and archaeology - which feed the debate about kinship. The aim is to present (briefly) the shifting theoretical and methodological approaches, to raise the main questions arising from the debate and to see how these discussions still impact our own work today. The treatment will inevitably be impressionistic, based on my own interests and readings, inspired by Sahlins' (2013) seminal book on kinship, Humphreys' (2018) magisterial synthesis on kinship in ancient Athens, the burgeoning literature on kinship in archaeology (cf. Ensor 2013, Huebner and Nathan 2017), and the discussions in recent bioarchaeological studies (i.a. Johnson and Paul 2016). Nevertheless, an effort will be made to include the different angles adopted by the speakers in the session, and to exploit the wealth of data and approaches which characterizes the study of the ancient Greek world.

**2 KINSHIP STUDIES THROUGH THE ARCHAEOLOGICAL RECORD: EXPLORING MULTIPLE WAYS OF APPROACHING KIN TIES IN PREHISTORIC SOCIETIES**

**Abstract author(s):** Kyritsi, Maria (National and Kapodistrian University of Athens)

**Abstract format:** Oral

The affiliation created through kinship forms one of the strongest and most fundamental links in human societies. Furthermore, it constitutes a kind of human relationship that can be identified in almost every society, regardless of the time or place. By developing kinship ties, people identify themselves within the wider community, while simultaneously their choices and actions are influenced, even if subconsciously. However, despite the large impact that kinship can have, it remains difficult to recognize in the archaeological record. An extra obstacle is added in the case of the prehistoric era, due to the absence or the illegibility of written documents. As a consequence, studying kinship ties during prehistoric times requires the overall assessment and examination of as many aspects of life as possible. Within this framework, the paper discusses how kinship can be approached, by combining the available data from the fields of domestic organization, architectural modifications, artefact possessions, access to resources, burial customs and the ethnographic record. The contribution focuses upon the Minoan period of the island of Crete and uses specific case-studies in order to establish the methodological keys to unlocking ancient kinship – and draws attention also to the limitations inherent in such study.

**3 HOUSE AND SETTLEMENT DISPOSITION AS A REFLECTION OF KINSHIP RELATIONSHIPS. THE PREPALATIAL HAMLET OF MYRTOS FOURNOU KORIFI AS A CASE-STUDY**

**Abstract author(s):** Vendramin, Daniele (Université Catholique de Louvain)

**Abstract format:** Oral

Most archaeologists perceive kinship as archaeologically invisible and abstain from analysing kinship ties aside from making very general assumptions. However, kinship studies were largely rehabilitated in recent years and previous failures are now attributed to flawed approaches rather than to the actual invisibility of kinship ties in the archaeological record. Besides physical anthropological evidence, the architectural remains of houses and settlements constitute perhaps the most important source for kinship studies in archaeology as ethnological comparisons have shown to what extent house dispositions tend to reflect social relationships. Small, kinship-oriented realities such as villages and hamlets imply that people naturally tend to stay together with their relatives for reasons of mutual assistance and protection and, at the same time, put some distance between them and non-related neighbours. This paper aims at providing an up-to-date discussion on available approaches to recognise kinship ties within a settlement through the analysis of house disposition, working and domestic spaces, settlement layout, and all additional evidence sug-

gesting aggregations or divisions within a settlement. It uses as a case-study the site of Early Minoan IIB (2450-2200 BC) Myrtos Fournou Korifi in South-Eastern Crete and considers domestic and public spaces in the settlement, stressing previously overlooked features of household and supra-household aspects of kinship and community life.

#### 4 MORTUARY STRATEGIES & KINSHIP DYNAMICS IN EARLY GREECE

**Abstract author(s): Alexandridou, Alexandra (University of Ioannina)**

**Abstract format: Oral**

The notion of kinship is of immense importance for the study of early societies, due to its major role in all aspects of life. In Greek antiquity, descent and 'family' could have been variously invented and instrumented by individuals or households for satisfying their power goals and facilitating social differentiation. Kinship in early Greece has been scholarly treated both on a textual and archaeological basis, with different aspects of funerary and domestic evidence taken into account.

Since burials can act as spatial and material dimensions of kinship notions, the present paper would like to discuss kinship on Attica and the Aegean islands during the Early Iron Age based mainly on the mortuary evidence, with the bioarchaeological data considered, where available. The main question that will be tackled is whether indeed descent lied behind early Greek burial groupings and whether it can be archaeologically traced. At the same time, any strategies adopted by the possible kin groups for the funerary representation of their individual members and their connotations will be discussed.

#### 5 ETHNIC ROOTS, FEMALE DESCENT, FAMILY STRATEGIES: VOLTERRA, AN ETRUSCAN COMMUNITY IN THE ROMAN WORLD (CENTURIES 3RD BC-5TH AD)

**Abstract author(s): Limina, Valentina (Université Catholique de Louvain)**

**Abstract format: Oral**

The paper aims to reassess the role of local elites in the broader debate about Integration into the Roman world. One of the crucial issues about kinship in the past is defining the structures generated by genealogical relationships. The words "clan, genos, gens, familia" convey different meanings, excluding or including specific ties between group members. When Rome integrated populations, many possible social structures coexisted between the subjugated groups. For the Etruscans, family identity, female descent, and ethnic roots had a pivotal cultural role. Thus, the Etruscan integration into the Roman world reveals new insights when analyzed through a flexible approach to kinship and integrating archaeological materials, historical sources, epigraphy, toponymy, and prosopography. As the case study of Volterra, one of the oldest Etruscan cities, proves, it is not possible to deeply understand the city integration process into the Roman world without analyzing its local elites. Thanks to extended networks of kinship, friendship, and clientship, the local elites progressively structured and modified their power bases to benefit private interests. Epigraphy proved that a solid local power base was fundamental to support policies and patrimony. Marriages were crucial to strengthen alliances, and the phenomena of bordering estates owned by relatives are attested by toponymy and archaeology. As literary sources confirm, the contemporary adoption of opposite political positions within branches of the same family ensured its survival, whatever the results of political struggles would have been. The period 3rd BC-5th AD is crucial to understand the development of long-term family strategies from the beginning of the integration process until the end of the Western Roman Empire. Thus, reconstructing strategies of power some key groups, the paper provides a new understanding of a community in transition to the Roman world and stresses the pivotal role of women in conducting strategies supporting their families.

#### 6 BIOARCHAEOLOGICAL APPROACHES TO KINSHIP PATTERN ANALYSIS IN THE GRECO-ROMAN WORLD

**Abstract author(s): Nikita, Effhimia (The Cyprus Institute)**

**Abstract format: Oral**

This paper will review existing studies on kinship pattern analysis in the Greco-Roman world drawing examples from published studies, including the speaker's recent involvement in Lebanese and Greek Roman era projects. Emphasis will be placed on methodological approaches that may be used with metric and nonmetric skeletal phenotypic data, which have traditionally been used in biodistance studies as a proxy for the underlying genotype. Such approaches have been employed to explore kinship in different contexts but they are largely still lacking in Greco-Roman studies. The complementarity of these approaches will be discussed as well as the importance of their integration with other lines of evidence, such as funerary and osteobiographic data. In this direction, the recent call to cease focusing exclusively on genetic/biological kinship but instead explore biosocial markers of 'shared lived experiences' (e.g. pathology, stress, diet, occupation), which may be even more representative of past individuals sharing a household, will be discussed to assess its potential and limitations.

## KINSHIP AND SOCIAL CHANGE AT THE ONSET OF THE MYCENEAAN ERA; THE CASE OF AYIOS VASILEIOS

**Abstract author(s):** Tritsaroli, Paraskevi (University of Groningen, Institute of Archaeology) - Moutafi, Ioanna (The Malcolm H. Wiener Laboratory for Archaeological Science Postdoctoral Fellow, American School of Classical Studies at Athens) - Nikita, Efthymia (Science and Technology in Archaeology and Culture Research Centre, The Cyprus Institute) - Voutsaki, Sofia (University of Groningen, Institute of Archaeology)

**Abstract format:** Oral

At the onset of the Mycenaean (or Late Helladic, LH) era, the relatively egalitarian and introvert Middle Helladic (MH) village societies of the southern Greek mainland gave way to expansionist Mycenaean polities. In the mortuary sphere, these changes were expressed with the introduction of new mortuary practices, with multiple burials in elaborate tombs and formal cemeteries replacing single inhumations in simple intramural graves. These new practices, which become the norm in the Mycenaean period, have been interpreted as bringing about new divisions between age, gender and status groups and the emergence of extended kin groups.

The aim of this paper is to investigate the extent to which kinship relationships, anchored in the traditional MH households, were reconfigured during the transitional Early Mycenaean era, and were given material expression by means of new, often experimental, mortuary choices. Our analysis focuses on the Early Mycenaean (ca. 1700-1500 BC) North Cemetery of Ayios Vasileios in Laconia). The cemetery displays the full range of traditional and new practices, i.e. both single burials as well as multiple interments in larger tombs. In this paper, we will examine the biological affinity among individuals buried together in the same tomb, or cluster of tombs, by using dental and cranial phenotypic variation. The results will be integrated with the contextual evidence of funerary practices and specific osteobiographies in order to explore intra-community distinctions based on kinship, but also between age and gender groups. We will also discuss methodological challenges for kinship analysis in prehistoric Aegean material (e.g. sample size, skeletal preservation), as well as the importance of interdisciplinarity in the analysis of prehistoric funerary assemblages.

## BLOOD WILL TELL. FAMILY BURIALS IN ROMAN SAGALASSOS (FIRST-FIFTH CENTURY CE), SOUTHWEST TURKEY

**Abstract author(s):** Beaujean, Bas (Sagalassos Archaeological Research Project; KU Leuven) - Cleymans, Sam (Sagalassos Archaeological Research Project; KU Leuven; Gallo-Romeins Museum Tongeren)

**Abstract format:** Oral

A dead person cannot bury him or herself, but is interred by kin, friends, or other members of society. In the Roman world, there is a lot of evidence for family burials, but also for burials by associations or collegia, and professional undertakers or *libitinarii*. For Roman Imperial to Late Roman Sagalassos (Pisidia, Southwest Turkey; 1st-5th century CE), there is little epigraphic evidence to reconstruct these group-related aspects of funerary and commemorative practices. This paper will therefore turn to the archaeological context – including grave goods and grave architecture – as well as to aDNA-analyses, and the physical anthropological study of the skeletal material, to study the specificities of local group-related and/or kinship practices revolving around burials. Furthermore, it will be examined how this developed throughout the Roman Imperial and Late Roman period. By themselves, none of these datasets are conclusive, but through their synergy it can be demonstrated that most funerary practices at Sagalassos were organised by the family. The same evidence also indicates that the ways of dealing with the death of family members changed throughout these centuries.

## SAFER-SPACES POLICIES IN ARCHAEOLOGICAL PRACTICE [EAA EXB]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Barreiro, David (Institute of Heritage Sciences, Spanish National Research Council) - Pastor-Pérez, Ana (Institute of Archaeology, University of Barcelona) - Simões, Sara (UNIARQ - Centre for Archaeology, University of Lisbon)

**Format:** Workshop

The EAA 2020 Statement on Archaeology and Gender was approved in 2021. It constitutes an important step on the path towards equality and, therefore, towards a fairer, freer and safer archaeological practice for everyone. It is the result of years of work carried out by different people, mostly women, inside and outside the EAA. Those professionals have focused on identifying and preventing the risk of harassment in archaeology and, ultimately, on its future demise.

Moreover, we think that those initiatives are the minimum to adopt a general EAA strategy against harassment, and that it is necessary to expand the field of action including functional diversity, physical appearance, ethnicity or origin, age or beliefs. In our view to transfer the Safe Space policy that is already adopted at EAA meetings to the exercise of the discipline is very relevant, especially in all the archaeological ecosystem: laboratories, classrooms,

offices and archaeological sites-excavations. Safety should be also a priority since risk prevention is often insufficient or even non-existent and its lack constitutes a form of abuse towards the worker.

This session is intended to be a forum for debate how to design and implement Safer Space Policies in the archaeological field and practice. How and how far are we moving forward on preventing risk, bullying, harassment and discrimination together? What are we doing to move towards and safe, egalitarian, inclusive and diverse discipline? How to combine experiences and strategies in order to create supportive frameworks and networks for students and professionals?

Should they be comprehensive policies or should they be designed by experts and applied according to specific criteria? Should they be applied following a principle of co-responsibility or should there be roles of greater responsibility within the workspaces? What can we do from EAA to the broader field of Archaeology?

## **SILK: A CATALYST FOR INTERCONNECTION IN THE SIXTH TO TENTH CENTURIES AD/CE**

**Theme: 4. Polis, Empire, League and Beyond – Living in Interconnected Societies**

**Organisers: Makin, Alexandra - Harris, Susanna (University of Glasgow) - Březinová, Helena (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Klein, Astrid (Leipzig University)**

**Format: Regular session**

Throughout history and across cultures silk has been considered a luxury fibre. It has connected people; been the focus of trade, exchange and espionage. It helped power the building and downfall of empires, and religious expression. It drove the development of technology and ideas, and the movement of people. Silk is a story that connects East and West and spans millennia.

Between the sixth and tenth centuries AD/CE Western Europe considered silk an exotic and expensive material that incorporated many meanings in secular to religious circles. Silk textiles were woven in China from prehistory, with the development of techniques leading to a variety of textile types including, gauze, samite and lampas. As these textiles were traded or exchanged outwards, other cultures developed their own uses and meanings for silk and, eventually, their ability to weave and embroider with it. Throughout, woven and embroidered patterns and motifs evolved, taking on new meanings, forging links between China, the Middle East and silk's newer users.

This session welcomes researchers investigating silk and its role as a catalyst for interconnection in the sixth to tenth centuries AD/CE. Papers may include, but are not restricted to:

- Development and knowledge of silk textiles and embroideries, e.g., weaves, dyes and colours
- Mobility of craft workers and silk across cultures and geographic areas
- Analysis of silk textiles, embroideries and threads; documentary and literary sources
- Role and meaning of silk across cultures and societies, e.g., sedentary and nomadic, secular, religious
- Silk in relation to other material and visual culture
- Woven and embroidered motifs; processes of adaptation and imitation
- Development of silk production in Central Asia, e.g. Tarim Basin
- Silk in the Carpathian basin
- Silk production in Europe

## **ABSTRACTS**

1

### **WHO WAS THE HU? CHINESE SILKS WITH INTERWOVEN "HU WANG" ('BARBARIAN KING') INSCRIPTION AND THEIR CULTURAL CONTEXT**

**Abstract author(s): Zuchowska, Marta (Faculty of Archaeology, University of Warsaw)**

**Abstract format: Oral**

During the period of the Southern and Northern dynasties (420-589) the north and west of China was ruled by the non-Chinese dynasties. This situation created an unprecedented opportunity for the cross-cultural contacts and a lot of western influences were adopted in the Chinese art and craft. In the Chinese weaving art of this period, we can observe as well the new trends, both in technology and in design. Especially interesting evidence of these transformations are two pieces of silk found in two graves in Astana (the area of Turpan, Xinjiang, PRCh), dated respectively to the mid and late VI century AD. Both fabrics are decorated with medallions representing a man leading camel and inscription "hu wang" ('barbarian king'). While the weaving technique is a traditional Chinese jin (warp-faced compound tabby), the decoration is visibly inspired by the cultural contacts with the west. Both, the iconographic representation and the character of inscription are uncommon in the Chinese art of this period. The present paper discusses the cultural context of these two pieces of silk, raising the questions of the meaning and interpretation of their decoration as well as the purpose of such production.

## 2 “KUCHA SILKS” REEXPLORED: HISTORICAL AND BUDDHOLOGICAL ASPECTS OF THE SILK PRODUCTION IN THE TARIM BASIN IN THE 5TH-6TH CENTURIES

**Abstract author(s):** Hiyama, Satomi (Kyoto University; Saxon Academy of Sciences and Humanities in Leipzig)

**Abstract format:** Oral

“Kucha Silks” is a term mentioned for several times in the Turfan manuscripts (dated to the 5th century) as a valuable textile circulated as one of the currencies in the Tarim Basin. While various interpretations of this textile type have been raised in previous studies, in her article in 2018, the author raised the possibility that the textiles represented in the wall paintings of the Buddhist rock monasteries in Kucha, Bamiyan, and the Gansu Province dated from the 5th to the middle of the 6th centuries, as well as excavated artifacts from Northern Xinjiang, should be considered to be the visual and material witnesses of the “Kucha Silks”.

Based on the findings of the present author’s provisional study, this paper reexplores the 1) cultural background behind the donation of the local-made prestige silk textiles from the lay community to the Buddhist monasteries, 2) the historical situation of the circulation of the Kucha Silks as well as its overlap with the Buddhist network, and 3) a possible reflection of the ritual practice of dressing up Buddhist statues with valuable textiles, as hinted by Buddhist art of the Northern Dynasties in Gansu Province and further East.

## 3 BIRD AND CRESCENT INSERTED INTO ROUNDELS: REFERENCE TO TAQUÉTÉ AND EARLY SAMITE SILKS IN KUCHA ON THE NORTHERN SILK ROAD

**Abstract author(s):** Klein, Astrid (Leipzig University)

**Abstract format:** Oral

In Kucha on the Northern Silk Road, many paintings, especially the donor images, but in two cases also the decoration of the cave, show a pattern of pearl roundels. They obviously refer to patterned textiles, possibly silk. Among the mostly unfilled beaded medallions, which cannot easily be assigned to a concrete model of a textile sample, there are only two examples showing a bird inserted into a row or grid of pearl roundels with connecting crescent roundels (Kizil 60, Toghraकेken 11). In addition, three donors wear a caftan with crescent roundels filling the trim or the entire main fabric (Kizil 8). Which textiles could it be? The only comparable and unusual find from Kucha is a samite silk showing birds in a diamond net with connecting crescent roundels (MG 26612). This find is classified as a later development from the mid-8th century. Other examples of the bird roundel, even closer to painting, are also samite silks. They are dated to the early 7th century, the beginning of this new weaving technique, and are productions from Central Asia (including Astana and Dulan). In contrast, the motif of single crescent roundels can best be compared with silks from Astana woven as taqueté.

The painted representation of bird and crescent roundels in Kucha indicates an exceptionally early date around 600 CE, which later spread throughout Eurasia. The talk presents graphic reconstructions of the patterns and examines their compositional and iconographic features in comparison with the characteristics and differences of taqueté and samite silks of the same design. What insights does this provide on the relationship of Kucha to neighbouring regions such as Iran, Sogdiana, Turfan, and China, which were instrumental in the production and exchange of these early silks?

## 4 AN INVESTIGATION OF THE COSTUMES OF FEMALE DONORS IN CAVE 61 OF DUNHUANG

**Abstract author(s):** Zhou, Hongdi (Fu Jen Catholic University,)

**Abstract format:** Oral

Based on the iconographic data of the female donor frescoes in Cave 61 of the Mogao Caves on the Digital Dunhuang Official Website, and its clothing of female donors and the sortord, this thesis attempts to highlight and discuss the differences in the costumes of different ethnic groups that have been noted in the literatures on Cave 61 . This thesis argued that the differences in costume between the different groups in Cave 61 is connects to the alliance and political strategy of Cao's family when I combine the genealogy of the Cao's family donors with various components of the costumes are compared with images from donors of other caves and portable painting on silk about the tenth century.

In addition, an analysis of the costume and sortord of the donors in Cave 61 not only discusses characteristics of costume culture of Dunhuang, Khotan, and Ganzhou Uighur during The Cao's Guiyijun period (914-1036), but also reveals that the sortord of donors was related to the strength of the states in regional politics at the time. The integration of the iconographic data and documentary review of Cave 61 reveals not only the differences in the dress of the donors and the cultural intermingling of the nationalities, but also the utilization of marriage by the Cao family to consolidate their local dominance and maintain regional peace and development. The cultural mixing of donor costumes in Cave 61 , therefore, confirms the multiple religious and cultural intermingling that has been repeatedly mentioned in the literature, and on the other hand, links the details and methods of cultural intermingling from a costume perspective specifically to the pattern of donor family marriages.

## 5 MEDIEVAL SILK AND COTTON ON THE EASTERN EUROPE ALONG THE SILK ROAD ROUTES: RECONSTRUCTION OF THE LOST CONTEXT

**Abstract author(s):** Shishlina, Natalia (-) - Leonova, Nadezhda (-) - Mamonova, Anna (-)

**Abstract format:** Oral

Throughout the 8th–12th centuries many events occurred in the south of the Russian Plain which were related to rise and fall of the Khazar Kaganate. Numerous nomadic peoples left behind their archaeological footprints across the Volga-Don steppes. Such graves contained unique silk and cotton cloths. Because of fragmentary nature of the discovered archaeological assemblages, it was not possible to determine their historical context. Technological and isotopic characteristics of textile items helped reconstruct both the 'biography' of the items and the 'biography' of their owners. Analysis of the funerary offerings suggests that warriors from the Khazar Kaganate or other nomadic people (Petcheneg, Polovtsian or Oghuz) were buried in the graves. They wore clothes made from silk and cotton. It is likely that cotton cloths travelled from the east to the west along the network of Great Silk Road trade routes that also ran across the Eurasian steppes together with silk cloths and other exchange items or as parts of garments or accessories. As early as the end of the 8th century the Khazars started a transit international trade and controlled the trade routes. Military posts, such as the Sarkel fortress, built along rivers maintained order. Adult men buried in the steppe graves could be military post soldiers.

## 6 SILK AS A CATALYST TO DETERMINE TRADE ROUTES BETWEEN EAST AND WEST IN THE 6TH CENTURY AD

**Abstract author(s):** Özsoy, Nusret (Erzurum Technical University; Atatürk University) - Oğuz, Anıl (Erzurum Technical University; Uludağ University)

**Abstract format:** Oral

The concept, which arrived the scientific literature with the Silk Road (Seidenstraße) name, was actually used to describe an East-West centered international trade roads, whose history dates back to ancient times.

In this global network where silk was traded as the main commercial commodity, and besides silk, precious stones and mines, various cultures, religions and Technologies were transported to Mediterranean ports after a long journey, and even dispersed to a significant part of Europe. Silk and silk products, which were mostly preferred by the grandee and elites, occupied a serious place in the economy of the states and became an invariable object of desire for long centuries.

After setting foot in Anatolia in 188 BC, Rome encountered the Parthians, who monopolized the Silk Road in the east. However, this encounter turned into a Roman-Parthian struggle that caused the Roman-Parthian war and spread over long centuries. After the Sassanids replaced the Parths in Iran, this struggle continued between the Eastern Roman (Byzantine) and Sassanid Empires. In this context, both powers did their best to dominate the Silk Road, and did not refrain to use from any military, political, economic or diplomatic ways. Protecting existing trade routes or drawing new ones are some of these alternatives.

Thus, silk as a luxury consumable has turned into a catalyst that enables the establishment of new routes between regions and cultures. Various routes were followed in the journey of silk from east to west and were changed or revised. The main factor of the change was the military and political struggle between the powers that wanted to dominate the silk trade. In this paper, the roads, existing or alternative new routes, passages, ports and resting points which is used between East and West silk trade in the 6th century AD will be mentioned.

## 7 SILK TEXTILES IN GREAT MORAVIAN ELITE GRAVES - EVIDENCE OF LONG DISTANCE TRADE

**Abstract author(s):** Brezinova, Helena (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Krupičková, Šárka (Institute of Archaeology of the Czech Academy of Sciences, Brno)

**Abstract format:** Oral

Although few examples of archaeological evidence of the presence of silk fabrics come from the Great Moravian environment (9th century, Central Europe), the evidence is reliable and significant. As regards the study and processing of textile remains and tools used to make textiles, Mikulčice is the most well researched and documented Great Moravian site in the Czech Republic. This important early medieval European archaeological site – a river stronghold – was the seat of Mijmirid dynasty. It consisted of a fortified acropolis and outer bailey, more unfortified extramural settlements and a wider economic hinterland. The results of 60-year-long archaeological research in Mikulčice include discoveries of 10 church remains with more than 2 500 graves (including elite graves with wealthy grave-goods), a princely palace, groundings of wooden bridges and gates, fortification with stone front wall and tens of thousands artefacts, which are still the subjects of multidisciplinary analytical research. The completely new research of a small yet very well-preserved fragment of silk samite on a small gilded plate unearthed in 1957 during a survey of grave 590 is a fundamental discovery. Its analysis has enabled us to elaborate on the conclusions from past research in greater detail and particularly to confirm the presence of luxury textiles in a lavishly equipped child's grave from the cem-

tery by the Mikulčice basilica. A total of 11 samite-type fabric finds have been recorded from Mikulčice, offering convincing proof that this luxury material was available to the inhabitants of the Mikulčice hillfort, even though it was affordable only by a very small group of the richest or most influential people.

## 8 UNIQUE SILK FINDS FROM THE 10TH CENTURY CARPATHIAN BASIN

**Abstract author(s):** Harangi, Flórián (Pázmány Péter Catholic University, Institute of Archaeological Sciences; Ásatárs Ltd.) - Türk, Attila (Pázmány Péter Catholic University, Institute of Archaeological Sciences) - H. Szabó, Krisztina (Hungarian National Museum, National Archaeological Institute) - Kolozsi, Barbara (Déri Museum) - Langó, Péter (Eötvös Loránd Research Network, Institute of Archaeology)

**Abstract format:** Oral

In 2016, during rescue excavations before the construction of a motorway between Debrecen and Berettyóújfalu, an extensive multiperiod site was recovered at Derecske-Nagymező-dűlő. The site included a graveyard, which we can date to the 10th century.

The Feature 643 was a grave furnished with typical finds of this period, i.e. silver alloy cast earrings with bead row pendants; gilded dress fittings; footwear fittings, square-shaped so-called „belt” fittings, a twisted wire bracelet, which was made of copper alloy, as well as shank buttons. Together with the rich metal finds, a significant amount of textile remains, mostly silk were also recovered from this 10th-century woman's grave. Due to their good preservation and fast and professional conservation, the textile fragments could be separated from the fittings and kept intact.

Among the textile remains, there are examples of both types of weft-faced compound weaves, we could identify weft-faced compound twill (samite) fragments – which are dominant among the textile materials in the Hungarian Conquest period – and weft-faced compound tabby (taqueté) remains too. Besides these remnants, the weft-faced compound tabby silk is very rare in the 10th century in the archaeological heritage of the Carpathian Basin. The parallels of these polychrome silk taqueté finds are known from the Middle East, mainly from the Buyid period Rayy in Iran and various sites from Israel and Egypt. This type of silk was much less common in Europe than the samite. Weft-faced compound tabby silk remains absent from Western Europe treasuries or among the famous Viking finds in Northern Europe. All these facts suggest that Hungarians had access to other sources of silk in the 10th century as the Vikings or people who lived in Western Europe.

In our presentation, we would like to present and compare this unique collection of finds with other previously known finds.

## 9 THE OLDEST SILK TEXTILES FROM THE ARCHAEOLOGICAL CONTEXTS OF PRAGUE CASTLE, CZECH REPUBLIC

**Abstract author(s):** Bravermanova, Milena (Institute of Archaeology of the CAS, Prague)

**Abstract format:** Oral

The oldest silk textiles from the archaeological contexts of Prague Castle date back to the end of the 10th century. The first was picked up from the tomb of Prince Boleslav II. Přemyslid (died 999) and it is a fragment of a samite with an eagle pattern, which was made in Byzantium. Trousers leg were sewn from it, only the lace with a knot that held them below the knee has survived. The second silk fabric is part of the reliquary set of St. Ludmila, also from the Přemyslid dynasty (died 921), served as the cover of the remains of the first Czech saint. It is a protolampas with two patterns - with birds in medallions and a small pattern also with medallions, from which the dalmatic was sewn. The fabric also comes from Byzantium. Both textiles are rare imports and, among other things, document their various uses. In the first case, it is a secular garment, which has become a funeral clothing. In the second case, it is the oldest surviving church robe in the Czech lands, which came here as one of the first bishops in Prague and later became a reliquary cloth.

## 10 SILK TEXTILES IN MEROVINGIAN AND ALEMANNIC GRAVES (6TH-8TH CENTURIES AD)

**Abstract author(s):** Linscheid, Petra (University of Bonn)

**Abstract format:** Oral

In the Early Medieval period, silk is rare. Well known are the silk textiles from the elite graves at St. Denis near Paris. Less well known instead is a small number of silk finds from burials in Merovingian and Allemanic row cemeteries, most of them in southern Germany.

These silk textiles make up several functional and technical groups. In most cases, a smaller amount of silk threads was used in the production of tablet woven bands, as the core of gold threads or as embroidery material. When silk was used in the warp and weft, the weave was mostly a simple tabby. Silk textiles in complex samite weaving are attested in only two cases. Some silk textiles evidently belonged to garments, others made part of the grave furnishing. As far as the kind of silk was investigated, it was reported as cultivated silk.

The paper wants to introduce these silk finds and discuss their possible functions and proveniences.

11

## EARLY MEDIEVAL SILKS IN IBERIA: THE SILK TEXTILES FROM SAN ISIDORO SILVER CASKET (COLEGIATE OF SAN ISIDORO, LEON, SPAIN)

**Abstract author(s):** Cabrera-Lafuente, Ana (research project The Medieval Iberian Treasury in Context: Collections, Connections, and Representations on the Peninsula and Beyond, PI Therese Martin, RTI2018-098615-B-100, financed by the Spanish Ministry of Science and Innovation/AEI /10.13039/)

**Abstract format:** Oral

In the Medieval and Early modern period, Iberian was renowned for its sericulture and silk textiles, among its Medieval heritage the Treasury from the Royal Colegiate of San Isidoro in León is noteworthy, silver and ivory caskets and boxes; reliquaries and silk textiles summarised the riches of this Royal foundation and pantheon by the Leonese dynasty. Leon was the head of the Leonese kingdom, repopulated at the end of the 9th century by the Christian inhabitants from the Northern kingdom of Asturias. The city and dynasty were the most important in Iberia until the end of the 13th century.

The silks preserved in the Royal Colegiate (nowadays museum) are some of the earliest examples of silk textiles from abroad in Iberia. Among them, the silk samite and silk and metal thread embroidery on linen tabby lining the silver casket of San Isidoro are the earliest of this treasury.

These two textiles have been characterized (fibres, dyes, metallic threads and weaves), including radiocarbon dating, due to their uniqueness among the Iberian early medieval textiles preserved. Both have early dates, between the late 9th to early 11th century AD and the embroidery's motifs are foreign to the local tradition.

The possibility to present these two silks from the Royal Colegiate of San Isidoro (León), especially the embroidery on this session, will bring the opportunity to share and exchange ideas about workshops, chronology, textile raw materials and provenance on these textiles, an exceptional assemble on Iberia.

Acknowledgement: The Medieval Iberian Treasury in Context: Collections, Connections, and Representations on the Peninsula and Beyond (PI Therese Martin, RTI2018-098615-B-100, financed by the Spanish Ministry of Science and Innovation/AEI /10.13039/501100011033/ FEDER).

## VIKING BLISS : SILK AND SQUARE KUFIC TEXTILES IN PRE-CHRISTIAN SCANDINAVIA

**Abstract author(s):** Larsson, Annika (Uppsala universitet; The Society for Textile Archaeology & Culture Studies) - Guennoun, Mohamed (The Society for Textile Archaeology & Culture Studies)

**Abstract format:** Oral

In 2017, I presented an exhibition about the importance of silk among Viking Age textiles found in pre-Christian boat- and chamber graves in central Scandinavian areas. It has long been debated whether this silk originated in Islamic Central Asia or in Christian Byzantium. Already in 2007, I suggested that silk in pre-Christian Scandinavia would be traced to Central Asian production, and found way westward on the Russian Silk Roads - until necropolises such as Birka, ceased.

There is also a discussion about the production area for contemporary tablet-woven bands made of silk, with an extra floating layer of weft threads in silver. A predominant view is that they were made in Scandinavia as the patterns are considered to be of "ancient Nordic" character, but made from imported material. During the exhibition work it was discovered that the patterns are Islamic expressions in ancient geometric writing, so-called Square Kufi. However, when an American art historian wrongly claimed in a call "to the entire world" that this writing did not appear until 500 years later and that our reading was also incorrect, the proposal aroused worldwide critical opinion both in media and among academics.

In this lecture, the ancient Square Kufic script, as well as the rich finds of Viking Age textiles with Square Kufic inscriptions found in Scandinavia and Russia, will be detailed presented. The aim is to highlight the importance of silk as well as Kufic expressions in Viking Age burial customs, which allows focus to shift from local traditions concerning interpretations on Viking Age ceremonial costumes, into a much larger interdisciplinary and Eurasian cultural context. Finally, we also shed light on Kufic patterns in textile folk art, which have survived from Viking Age until present day in both Scandinavia and Russia, despite the symbolism has lost its Islamic meaning.

13

## THE REALITY OF VIKING AFTERLIFE: THE PRESENCE OF SILK IN THE VIKING NARRATIVE

**Abstract author(s):** Pallin, Karolina (TexArk – The society for textile archaeology and culture studies; Textile studies, Uppsala University)

**Abstract format:** Oral

This paper presents a study within the larger project "The narrative of Viking legacy", which studies the difference between today's narrative of the Viking Age and the archaeological material. The pilot study was presented at the conference The Viking Age as a Foreign Place, at The Center for Viking Age Studies, Oslo. This second study is presented for the first time here at the EAA annual meeting.

Grave goods can be seen as objects supposed to accompany humans into the afterlife. The Viking afterlife is, according to the Sagas, a mythological place. However, the reality of the Viking afterlife is how we know them. A reality where the archaeological material is of most importance. The Vikings live in the stories we create about them and the effect these stories have on us and our society. They live in the "Viking narrative".

In Scandinavia, silk first appears in the grave goods in the Viking era, marking a change in available luxury goods. As one of a handful of luxury goods that archaeologically defines this era, silk should naturally be a large part of the Viking narrative.

This study explores Viking attributes found in the Viking narrative, with a particular focus on silk as a defining item and a defining luxury concept. The study shows that silk is found in some parts of the narrative and is absent in others. The aim of this paper is to discuss this clash in the narrative and why this is both interesting and problematic.

## 14 SILK, SILVER AND GOLD TEXTILES IN DANISH VIKING AGE GRAVES

**Abstract author(s):** Mannering, Ulla - Rimstad, Charlotte (National Museum of Denmark)

**Abstract format:** Oral

In Danish Viking Age graves, remains of textiles and tablet-woven bands made in silk, silver and gold threads have been recorded. Particularly in the rich male grave from Bjerringhøj in Denmark, dated to AD 971 exquisite silks and tablet-woven bands were found. Similar complicated but more fragmented layers of fur and silk textiles sewn together with silver and gold tablet-woven bands have been recorded in a rich female grave in Hvilehøj dated to the late 10th century AD.

We here present the latest analyses of the silk, silver and gold textiles found in these two graves which are current being studied within the scope of the Danish Fashioning the Viking Age project at the National Museum of Denmark. The silk textiles have been analyzed, tested for dyes and by making reconstructions of the different textile qualities we are able to present a whole new aspect of Viking Age textile appearance. The study further emphasizes the great variation of silk textiles that the Vikings acquired on their travels and produced in their homelands.

## 15 SILK TEXTILES IN A VIKING-AGE HOARD, DEPOSITED 900 CE IN GALLOWAY, SCOTLAND

**Abstract author(s):** Makin, Alexandra (University of Glasgow) - Cartwright, Caroline (British Museum) - Harris, Susanna (University of Glasgow)

**Abstract format:** Oral

The Galloway Hoard was buried around 900 CE in south-west Scotland. As it typical for hoards of the mid 8th to 10th centuries CE, it contained substantial quantities of silver in the form of arm rings, hack silver and ingots. Less typically, it contained a lidded silver gilt vessel filled with exotic and unusual objects. The closed environment of the silver-gilt vessel and its chemical composition, containing copper alloy, has led to the mineral and organic preservation of numerous textiles. The textiles include the homespun, wool and plant fibre, and the exotic, silk. The position of the textiles within the deposit and vessel provides evidence of the way the textiles wrapped individual objects, and formed bundles creating distinct assemblages of textile and objects. This presentation will focus on the silk textiles discovered in the hoard. We will present the fibre and technical analysis of the textiles. The survival of these textiles in a hoard, rather than a human burial or ecclesiastical setting, provide the opportunity to analyse the role of silk textiles in the practice of hoarding in the early medieval British Isles. From these results we will question the role of silk textiles within the hoard alongside objects from diverse areas of the known world.

## 196 "A UNIVERSE WITH AN ADDITIONAL DIMENSION": THE SOCIOENVIRONMENTAL ARCHAEOLOGY OF FISHING [PAM]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Živaljević, Ivana (BioSense Institute, University of Novi Sad) - Mansrud, Anja (Museum of Archaeology, University of Stavanger) - Ritchie, Kenneth (Moesgaard Museum) - Robson, Harry (University of York)

**Format:** Regular session

Numerous archaeozoological studies, as well as the development of biomolecular approaches (stable isotope analysis, organic residue analysis, etc.) have revealed the important contribution of fish to human diets through space and time. In some cases, for example in a number of Mesolithic contexts, fishing constituted the main part of the subsistence economy. However, unlike other modes of subsistence (hunting, gathering, agriculture), fishing required humans to adapt to a whole different medium. As noted by the American anthropologist Gordon Hewes, due to their specific features, aquatic environments are a strange realm from the point of view of land-dwelling beings – "a universe with an additional dimension". Apart from affording particular sensory experiences, fishing also entangled humans in a web of relations with a multitude of aquatic creatures. Landscape socialization, human movement within the landscape, the location of camps and settlements, activities, and beliefs were intimately bound to, and influenced by, natural cycles of various fish species – their migrations, spawning locations, appearance and behaviours.

Such interspecies engagements were also expressed materially – through the structured deposition of fish remains, the usage of fish teeth and vertebrae to adorn human bodies, and in fish-related iconography (sculpture, rock carvings, paintings). With these considerations in mind, we invite a wide range of contributions concerning socioenvironmental aspects of fishing beyond exploitation and diet. We welcome papers approaching this issue from a variety of perspectives – archaeozoological, historical, anthropological, environmental, phenomenological, multispecies, and relational, regardless of chronological, geographical or cultural context.

## ABSTRACTS

### 1 FISHING AS A WAY OF RELATING TO THE WORLD: HUMAN–FISH ENTANGLEMENTS IN THE DANUBE GORGES MESOLITHIC

**Abstract author(s):** Živaljević, Ivana (Biosense Institute, University of Novi Sad)

**Abstract format:** Oral

The amelioration of environmental conditions at the onset of the Holocene brought new kind of interspecies relations to the fore, including those of humans and various aquatic beings. Moreover, unlike other modes of subsistence, fishing required humans to adapt to a whole different medium, and afforded particular bodily and sensory experiences. Fishing, then, can be understood from a socioenvironmental and 'Naturecultural' perspective – not only as a source of nourishment, but also as a new way of being and relating to the world. The Mesolithic archaeological record attests to a variety of ways human–fish engagements were expressed materially, with a number of bodily practices (structured deposition of human and fish remains, personal ornamentation as simulation and/or becoming, 'hybrid' imagery) possibly emerging from blurry ontological boundaries. By using the Danube Gorges Mesolithic as a case study, I explore fishing as a web of enmeshed relationships between different kinds of persons and mediums, and consider the ways humans were 'becoming with' various inhabitants of the deep.

### 2 CATCH AND RELEASE? CULTIVATING TROUT IN MESOLITHIC SOUTH-EASTERN NORWAY

**Abstract author(s):** Mansrud, Anja (Museum of Archaeology at the University of Stavanger) - Mjærum, Axel (Museum of Cultural History, University of Oslo) - Wammer, Elling (Norwegian Maritime Museum, Oslo)

**Abstract format:** Oral

South Norway is one of the few regions in Europe where postglacial coastlines are not submerged, and where maritime subsistence and settlement patterns are documented throughout the Mesolithic period (9300-4000). The importance of fishing is evidenced by numerous coastal settlement sites with fishbones, fishhooks, sinkers, harpoons leisters and other fishing implements. Although fish-imagery occasionally occur on rock art panels, pointing to the symbolic and social importance of fishing, fish is commonly considered just an economic resource and has gained little attention beyond its economic importance as a staple food. This contribution addresses the socio-environmental aspects of freshwater fishing, suggesting that living trout (*Salmo trutta*) or eggs were transferred from creeks to empty glacier lakes in the mountains by humans during the late Mesolithic (c. 6500-4000 cal. BC). Framing human-trout engagement in multispecies and ethological perspectives, we argue that Mesolithic foragers were actively cultivating relations with this colourful and biologically flexible species of fish.

### 3 A NOVEL METHOD FOR THE DETECTION OF AQUATIC BIOMARKERS IN POTTERY APPLIED TO THE HUNGARIAN EARLY NEOLITHIC

**Abstract author(s):** Davis, Izzy (Organic Geochemistry Unit, School of Chemistry, University of Bristol) - Hammann, Simon (Department of Chemistry and Pharmacy, Friedrich–Alexander University Erlangen–Nürnberg) - Whelton, Helen (Organic Geochemistry Unit, School of Chemistry, University of Bristol) - Cramp, Lucy (Department of Anthropology and Archaeology, University of Bristol) - Outram, Alan (Department of Archaeology, University of Exeter) - Evershed, Richard - Roffet-Salque, Mélanie (Organic Geochemistry Unit, School of Chemistry, University of Bristol)

**Abstract format:** Oral

Using biomolecular methods, it is possible to detect aquatic resource processing from lipids preserved in archaeological pottery vessels. Current approaches involve the detection of three classes of lipid biomarker compounds (isoprenoid fatty acids,  $\omega$ -(*o*-alkylphenyl)alkanoic acids, and vicinal dihydroxy fatty acids), which derive from the original fatty acid composition of fish and other aquatic products. Until present, these biomarkers have been detected in lipid extracts using low resolution gas chromatography-mass spectrometry (GC-MS) operated in Selected Ion Monitoring (SIM) mode using multiple analytical runs.

Here we present the development of a new method for aquatic lipid biomarker detection using high-resolution GC-quadrupole-time-of-flight-MS (GC-qTOFMS), offering increased throughput, selectivity and sensitivity, and allowing the simultaneous detection of all biomarkers in complex mixtures using a non-targeted approach. Our novel method is applied to lipids extracted from pottery vessels from early Neolithic settlements in Hungary. The Linear Pottery Cul-

ture marks a significant shift in subsistence away from hunting, foraging, and fishing, and towards cultivated crops and domestic animals. Zooarchaeological assemblages from Hungarian early Neolithic sites are characterised by a low occurrence of fish remains, while domestic animals generally make up >85% NISP. Due to poor preservation, recovery methods and research interests, the low numbers of fish remains may not provide an accurate insight into the prehistoric exploitation of aquatic ecosystems. Trends in aquatic resource exploitation are observed based on environmental setting, and between sites associated with the western Linear Pottery Culture (Linearbandkeramik, LBK) and eastern Alföld Linear Pottery Culture (ALP). The data presented here provide new insights into the relationship between humans and freshwater environments in early farming societies in Hungary.

#### 4 ANCIENT FISHING IN SOUTHERN ITALIAN PENINSULA. AN ETHNOARCHAEOLOGICAL RESEARCH

**Abstract author(s): Giardino, Claudio - Zappatore, Tiziana (University of Salento)**

**Abstract format: Oral**

The techniques, the gestures and the tools for fishing are a relevant aspect of immaterial cultural heritage; they were spread in most of the coastal countries since prehistoric times.

Highly specialized artifacts have been always used for fishing, as it is indicated by the netting-needles, fishing sinkers, hooks, fishing traps, harpoons that were recovered in many archaeological contexts all around the world. These tools require complex gestures and acts, handed down through the generations.

The paper examines the traditional fishing techniques and the connected archaeological objects coming from the coastal areas of southern Italy, taking into account the areas of the Salento peninsula (Apulia); in that area the memory of traditional fishing techniques is still alive. Salento is a territory located between the two seas, the Adriatic and the Ionian. Many evidences were recovered in this territory connected with fishing that date back since the prehistory.

Ethnoarchaeology helps not only to better understand the techniques employed by the societies of the past, but it also provides us with a useful tool for understanding their immaterial culture, such as the methodologies, rituals and beliefs related to catching fish.

#### 5 ARCHAEOLOGY MEETS MARINE CONSERVATION IN THE NEOTROPICS

**Abstract author(s): Fossile, Thiago - Colonese, Andre (Universitat Autònoma de Barcelona)**

**Abstract format: Oral**

Anthropogenic impacts on tropical and subtropical coastal environments are increasing at an alarming rate compromising ecosystem function, structure and services. Understanding the scale of marine population decline and diversity loss requires a long-term perspective that incorporates information from a range of sources, including archaeological remains. The southern coast of Brazil preserves archaeological sites that are unique archives of past socio-ecological systems, as well as of pre-industrial biological diversity. In this study, we reviewed the published data on marine and freshwater fish species recovered from Middle and Late Holocene coastal archaeological sites in the southern Atlantic Forest and Pampa biomes of Brazil. We assessed species composition and relative abundances through space and time and modelled differences in species functional traits between pre-colonial and modern assemblages. We found evidence for generalist as well as specialised fishing practices, with species of Sciaenidae and Ariidae dominating most fisheries. Pre-colonial catches at Babitonga Bay were predominantly composed of high trophic level species, with large body size and body mass, caught regularly by local human populations over hundreds of years. When compared to pre-colonial fish assemblages, a significant decline in these functional traits were observed in modern ecosystems, possibly associated with overfishing in most recent times.

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Borel, Antony (Histoire Naturelle de l'Homme Préhistorique - HNHP, Muséum national d'histoire naturelle, CNRS, UPVD; Institute of Archeological Sciences, Eötvös Loránd University) - Ollé, Andreu (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Marreiros, João (Laboratory for Traceology and Controlled Experiments - TraCEr, MONREPOS – Archaeological Research Centre and Museum for Human Behavioural Evolution, RGZM; ICArEHB – Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, Universidade do Algarve; Institute for Prehistoric and Protohistoric Archeology, Johannes Gutenberg University) - Rots, Veerle (FNRS, TraceoLab, University of Liège; Institute of Early Prehistory and Quaternary Ecology, University of Tübingen) - Ibáñez, Juan José (Archaeology of Social Dynamics - ASD, Institución Milá y Fontanals - IMF, Spanish National Research Council - CSIC)

**Format:** Regular session

Use-wear analysis applied to prehistory aims to characterize the surface alterations of artifacts to determine tool functions and describe past human behaviors. For decades, use-wear have been described mainly qualitatively but recent improvements in microscopy allowed quantitative data to be added to these observations. The number of studies using surface texture measurements to examine and successfully determine surface alterations increases. Indeed, metrological parameters can differentiate traces resulting from different use activities and worked materials. Both qualitative and quantitative approaches are complementary and are essential to provide comprehensive documentation and interpretation of the different types of use-wear. However, the discipline still faces limitations regarding the comparability between different analytical techniques and approaches. It also faces difficulties in terms of repeatability of experimental results and interpretation of the archaeological material. So far, no standard procedure or protocol has been clearly set up for qualitative and quantitative studies and for the integration of both. One of the main reasons is that the needs and possibilities in terms of analytical protocols vary depending on the raw material analyzed. However, with the consolidation of the quantitative approach in the field, the multiplicity of procedures increases once again and time has come to homogenize methods (i.e. screening, cleaning, data acquisition, etc.) in order to improve straightforward comparisons between archaeological series and/or sites.

In this session, we would like to address the difficulties we face in standardizing procedures and to reflect upon possible solutions. Ideally, the session would lead to the proposition of a few recommendations for the discipline. We are thus calling for papers from both qualitative and quantitative perspectives that demonstrate problems caused by the lack of commonly shared standards. The session will focus mainly on stone tools but papers concerning other materials will be also considered.

Session supported by the project K132857, NRDl\_Fund, Hungary.

## ABSTRACTS

### 1 QUANTITATIVE, YES... BUT WITH QUALITATIVELY GOOD DATA!

**Abstract author(s):** Calandra, Ivan (Römisch-Germanisches Zentralmuseum)

**Abstract format:** Oral

Quantification is often portrayed as the next yet complementary step to the traditional, qualitative use-wear analysis. Quantification is also claimed to tackle the issue of subjectivity, comparability, and the lack of reproducibility present in the traditional method. However, quantitative methods are not inherently objective, reproducible or equivalent. Data can be compared only if they were acquired in the same way, or if there are enough metadata available to track the source of the differences. More importantly maybe, quantitative data cannot universally be assumed to be of high quality, or even of higher quality than qualitative data, without considering how the data were acquired in the first place.

Therefore, while standardization surely is crucial to the development of quantitative analysis, data quality is a fundamental aspect if we want to be able to draw robust conclusions from the data. Furthermore, data quality is likely more important for quantitative than qualitative data due to the way they are subsequently analyzed. So how can we define, measure (or at least estimate) and adjust the quality of 3D surface data to fit the requirements of our research questions?

In this presentation, I will show some examples of how the choice of microscope, objective and pixel size influences the quality of the surface data, using the proportion of missing and erroneous points as one proxy for data quality.

From these examples, I will propose some best practices and a workflow for quality control in quantitative use-wear analysis. Hopefully, further refinements of such best practices and workflows will provide the basis for solving some of the issues the use-wear community currently faces and for future developments.

## TRACING NEW CHALLENGES AND LIMITATION IN USE-WEAR STUDIES. PROMOTING NEW PROTOCOLS, GUIDELINES AND METHODOLOGICAL APPROACHES IN THE DISCIPLINE

**Abstract author(s):** Marreiros, Joao - Calandra, Ivan - Carver, Geoff - Gneisinger, Walter - Schunk, Lisa - Paixao, Eduardo (TraCEr, MONREPOS. RGZM) - Robitaille, Jerome (MONREPOS. RGZM) - Thaler, Ulrich (TraCEr, MONREPOS. RGZM)

**Abstract format:** Oral

Use-wear studies are of crucial importance in archaeological investigations that aim to reconstruct past hominin technological behaviour. Functional interpretations of archaeological tools rely heavily on frameworks of comparison, based either on data obtained from experimental replication or from the analysis of artifacts. To facilitate transparency and communication in the discipline, researchers have proposed numerous terminologies and classification criteria for the different traces identified on tool surfaces. During the last decades, mainly due to the development of imaging techniques, a significant new body of evidence has emerged, advocating that the traditional approach be complemented with innovative methods and protocols. The primary aim is thus on generating complementary and detailed data, allowing a more reliable discrimination of the traces of use; at the same time, comparison between studies should be facilitated.

Essentially, this phase corresponded to the development of the quantitative, high-resolution methods in the discipline and, consequently, data. For example, this approach has allowed archaeologists not only to identify diagnostic traces of use (the so-called "families" of wear), but also to differentiate between subtypes (e.g. condition of the worked material or specific actions). Still, even when quantitative methods are applied, current state-of-the-art approaches show that a lack of common procedures or best-practices guidelines in the discipline, such as cleaning methods and acquisition settings, are found to limit the results and further interpretations.

In this talk we aim to discuss the current challenges in the discipline, and at the same time discuss the most recent contributions in the field to tackle these limitations. In sum, illustrated by several case studies, our talk aims to raise awareness among colleagues and promote advances in the discipline.

## CAN WE RELY ON NON-STANDARDIZED EXPERIMENTAL APPROACHES DEALING WITH STONE TOOLS SURFACE ALTERATION? ISSUES CONCERNING EXPERIMENTAL PROTOCOLS SET UP

**Abstract author(s):** Scancarello, Olivier - Lemorini, Cristina (Sapienza Università di Roma)

**Abstract format:** Oral

Tribology is an engineering science concerned with the study of physical systems of interacting surfaces in motion. Lithic artifacts, when in contact with other materials, are subjected to the development of wear caused by friction, that consists in a gradual removal of material. Wears are used by wear analysts firstly to distinguish between use-wear, that is wear behaviorally generated by the active use of tools, and post-depositional wear, generally attributed to a wide array of natural processes. Several studies and experimental approaches have been carried out to determine, describe, quantify, and characterize use-wear and post-depositional surface alterations. Nevertheless, concerning the post-depositional alterations, no given methodology exists in the experimental protocols set up, since an extremely complex variability of natural phenomena have been tested upon an equally vast sample of different raw materials. Here we report on a qualitative experimental approach aimed at evaluating the mechanical effects of water transport on flint artifacts in a low energy system. The experiment shares some methodological aspects with similar experiments reported in the scientific literature while it differs in other since a standardization of procedures is currently still lacking. Although the results of our experiment do not significantly differ from similar ones, we believe that some variables (time, artifacts 'density, flint grain-size, ratio between sediment and water) can lead to different results. Moreover, the lack of a shared standardized procedure and of a clear explication of the chosen parameters can generate difficulties and differences in the replication of similar experiment by other researchers. Finally, although our experiment show that similar protocols can lead to similar results, several variables can alter the outcomes of the experiment and thus have to be taken into account and clearly specify.

## 4 USE-WEAR QUALITATIVE AND QUANTITATIVE VARIABILITY ON STONE RAW MATERIALS FROM THE CARPATHIAN BASIN

**Abstract author(s):** Borel, Antony (Histoire Naturelle de l'Homme Préhistorique - HNHP, Muséum national d'histoire naturelle, CNRS, UPVD; Institute of Archeological Sciences, Eötvös Loránd University) - Marteau, Julie (Laboratoire Roberval, Sorbonne Université, Université de Technologie de Compiègne) - Deltombe, Raphaël - Moreau, Philippe - Bigerelle, Maxence (Laboratoire d'Automatique, de Mécanique et d'Informatique industrielles et Humaines - LAMIH UMR-CNRS 8201, Université Polytechnique des Hauts de France) - Lengyel, György (Department of Prehistory and Archaeology, University of Miskolc) - Mester, Zsolt (Institute of Archeological Sciences, Eötvös Loránd University; Histoire Naturelle de l'Homme Préhistorique - HNHP, Muséum national d'histoire naturelle, CNRS, UPVD)

**Abstract format:** Oral

Current methodological development in use-wear analysis applied to prehistoric stone tools aims at integrating qualitative and quantitative approaches to characterize the surface alterations of the artefacts. Both approaches are essential and complementary as, for example, wear qualitatively clearly visible on a surface can be quantitatively undetectable depending on the configuration of the acquisition system used. We propose here to present an ongoing project which contributes to develop standardized procedures for surface texture analysis of stone tools as well as creating an experimental (quantitative and qualitative) reference collection of traces for stone raw materials from the Carpathian basin. We will first present this collection with examples of traces observed on few different types of stone found in the region. Then, we will focus on a Jurassic flint from Ukraine and quartz-porphry from Hungary, for which we evaluate, with laser scanning confocal microscopy, the variability of surface texture parameters values for wear resulting from different activities of tool use and according to different positioning of the artifact under the microscope. We will describe each step of our procedure to identify the different factors which could have an impact on the results and thus, which could prevent or optimize the detection and characterization of use-wear.

The project is financed from the NRD Fund (K 132857) from Hungary and is realized also within the frame of the GDR SurfTopo (CNRS GDR 2077, France) for topography research.

## 5 THE INTENSITY OF USE IN USEWEAR ANALYSIS: THE CASE OF HARVESTING GLOSS

**Abstract author(s):** Ibáñez, Juan (Spanish National Research Council - CSIC) - Mazzucco, Niccolò (University of Pisa) - Pichon, Fiona (Spanish National Research Council - CSIC)

**Abstract format:** Oral

The dynamic nature of usewear, especially of use polish, has already been acknowledged from the beginning of the functional analysis of Prehistoric tools. However, how use polish shifts through time of use and how these changes affect our capacity to identify the worked material is still poorly known. The variability in harvesting gloss is related to the characteristics of the reaped plants and the environmental conditions in which the task is carried out. In this oral communication, using confocal microscopy and texture analysis, we study how the surface texture of gloss changes through time of use. Sequential experiments of cutting *T. aestivum*, *T. diccicum* and *T. spelta* are used to build dynamic models of polish development. Based on these models, the capacity of the method for the identification of the intensity of use is tested. This analysis is applied to a collection of sickle blades recovered in Early Neolithic sites in the Levant.

## 6 A NEW METHOD TO DISTINGUISH DIFFERENT CONTACT MATERIAL ON QUARTZ TOOLS. FIRST RESULTS FROM ANALYSING USE WEAR STRIATIONS ON QUARTZ

**Abstract author(s):** Lundin, Jon (Independent researcher) - Boström, Sebastian (Independent researcher)

**Abstract format:** Oral

Since its introduction in the second half of the last century, use-wear studies have become a staple of archaeological research. The technique has often been criticized for basing results on subjective observations made by the researcher. The authors present recent studies of how quantitative data can facilitate use-wear analysis of lithic quartz tools, which focus on striations on quartz micro topography. Through a 3D-microtopography, generated from light microscope photographs, striations can be analysed using ISO (International Organization for Standards) standards for length, width, and depth as well as other variables in the software Mountainsmaps (DigitalSurf). The authors follow the idea that striations on quartz surfaces is formed during contact with various materials such as antler, hide, wood and grass etcetera and thus changing the original micro topography. By identifying structures on the surface, it is possible to extract striations and by extension numerical, comparable data. Data that can be used to distinguish between different contact materials on quartz tools. This study uses a database consisting of different experimental quartz tools to test the method and analysing an archaeological material as well.

## ON THE NEED OF QUALITATIVE BACKGROUND FOR A FRUITFUL USE-WEAR QUANTIFICATION

**Abstract author(s):** Ollé Cañellas, Andreu - Arroyo, Adrián (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art) - Asryan, Lena (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art; TraceoLab, University of Liège) - Fernández-Marchena, Juan Luis (Seminari d'Estudis i Recerques Prehistòriques - SERP, Dept.d'Història i Arqueologia, Universitat de Barcelona; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art) - García-Argudo, Gala (Seminari d'Estudis i Recerques Prehistòriques - SERP, Dept.d'Història i Arqueologia, Universitat de Barcelona) - Martín-Viveros, Juan Ignacio - Mateo-Lomba, Paula (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art) - Pedernana, Antonella (University of Zurich) - Tumung, Laxmi (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art)

**Abstract format:** Oral

Recent progress made in the quantification of use-wear on the surface of prehistoric tools undoubtedly fostered the expectations of the traceology as a discipline to obtain objective information on their functions. Some limitations of the traditional methods are expected to be overcome with a precise textural assessment based on 3D surface data, which is basically obtained through confocal microscopy.

However, we argue that such quantitative approaches still need qualitative observations derived from the systematic application of traditional methods. This paper rounds up proposals and results deriving from previous studies and works in progress, including different lithic raw materials, bone, and shell. We use them to show how sequential experiments and systematic recording through a multi-technical and multi-scalar approach can help us get insight into the wear formation processes, the nature of the different wear features, and their variability. Such an approach relies not only on accurate observations but also on rigorous sample preparation and handling protocols, as well as on high-quality imaging. These issues are pivotal to face the quantitative step, guaranteeing the data acquisition through full control of what is being measured.

Finally, the combination of qualitative and quantitative assessments reveals vital to overcome certain terminological discrepancies concerning the identification, description, and interpretation of the wear features such as different types of scars, polished surfaces, and striations. The more the phenomena under study are known, the better we can use technical improvements, protocols, and workflows for their quantification.

The same as standardisation and data quality is critical to make progress in the quantitative analysis, we conclude that its combination with the modern traceological method, conceived from a multi-technical and multi-scalar point of view, is essential to reduce the subjectivity of interpretations, to increase experimental reproductivity, and to assess variability and the effects of equifinality properly.

## HOW TO INTEGRATE QUANTIFICATION INTO QUALITATIVE USE-WEAR ANALYSIS?

**Abstract author(s):** Taipale, Noora - Tomasso, Sonja - Michel, Marine (TraceoLab / Prehistory, University of Liège) - Rots, Veerle (TraceoLab / Prehistory, University of Liège; Maître de Recherches du FNRS)

**Abstract format:** Oral

The field of use-wear quantification has seen significant methodological efforts as well as the first archaeological applications in the recent decades, and progress is currently being made in refining techniques to distinguish quantitatively between worn surfaces resulting from tool use. Yet, as it currently stands, use-wear quantification is embedded in an essentially qualitative analytical framework that requires the analyst to be fully trained in "traditional" use-wear analysis to successfully quantify wear. In this paper, we propose ways in which quantitative analysis could be developed further as a meaningful component of qualitative use-wear approach instead of its competitor. Quantitative approaches have mainly focused on polish, but using experimental and archaeological case studies, we highlight four other key points: 1) we state that different forms of edge damage play a crucial role in determining tool use but have largely escaped quantification efforts, 2) we add further data to discuss differences in wear formation on various lithic raw materials and the challenges of finding a one-for-all protocol that could be also applied quantitatively, 3) we demonstrate the difficulties in interpreting trace causality through quantification, and 4) we discuss ways in which the problem of altered use-wear could be approached by future quantification efforts based on our recent experimentation as well as analysis of archaeological material from varied contexts. By contextualising surface metrological approaches, we propose analytical challenges to which they could respond and identify aspects that have thus far been underdeveloped. In doing so, we hope to present wear quantification as a useful component in a comprehensive, sequential use-wear approach that employs different scales of observation in a stepwise manner and relies on rigorous testing of protocols and analyst competence as well as their transparent reporting.

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Vandeveld, Ségolène (Université Paris 1 - Panthéon-Sorbonne, UMR7041 ArScAn équipe Archéologies environnementales; Laboratoire des Sciences du Climat et de l'Environnement, LSCE/IPSL - CEA-CNRS-UVSQ-Université Paris Saclay) - Ferrier, Catherine (Université de Bordeaux) - Medina-Alcaide, M<sup>a</sup> Ángeles (Fondation Fyssen, Université de Bordeaux; Department of History, University of Córdoba - UCO; International Institute for Prehistoric Research of Cantabria - IIIPC) - Rueff, Bastien (UMR7041 ArScAn, équipe Protohistoire égéenne)

**Format:** Regular session

Fire is a central element for humans with multiple uses (heating, cooking, performing craft activities, or socializing). It is also a source of artificial lighting, a crucial resource for the expansion of social, symbolic and economic behaviour during the nighttime or the daytime within dark spaces such as deep caves.

If anthropologists have shown that the uses of light are eminently cultural, archaeologists have long focused on materials and lighting techniques. Although, in recent years, the field of pyroarchaeology has developed a lot in archaeology, often with the help of new technologies such as virtual reality, for example, certain aspects such as the study of light, an ephemeral object that often leaves diffuse traces, remain little developed. The methodological peculiarities, the specific materials and the interpretative questions that surround this subject push us to consider the development and promotion of a branch within archaeology for the specific study of light in the past.

This session aims to showcase the potential of studying lighting remains in order to obtain archaeological inferences. It also aims to create synergies between specialists who have approached this topic from different scientific fields. We invite proposals on lighting practices, namely on the materials, the techniques and the function of lighting, from prehistory to the present days. Contributions on the definition or evaluation of light proxies (chars, charcoals, soot deposits, rubefaction traces, lamps, etc.), their study through various methodological approaches (archaeometry, ethnography, experiments, etc.) and about works related to physical or virtual simulation in order to advance scientific research or to promote "heritage in the dark" will be warmly welcomed.

## ABSTRACTS

### 1 MOBILE LIGHTING IN MEDIEVAL AND EARLY MODERN SWEDEN

**Abstract author(s):** Qvistrom, Linda (Uppsala University)

**Abstract format:** Oral

The list of prehistoric lighting equipment in Sweden is short. The number of medieval examples is much larger, largely due to the ecclesiastical use of candles and lamps. Stationary light sources were, however, uncommon in homes during the Middle Ages and to a degree even during the early modern era. The main light sources were instead mobile, particularly in the form of wooden tapers and, to some extent, different kinds of torches and lanterns.

The use of mobile lighting, held in the hand or temporarily fixed, is something that has greatly affected the practice of using light, and the experience of it. Different tasks are also variously suitable for stationary and hand-held lighting conditions.

This paper outlines the forms of lighting used in Sweden during the Middle Ages and early modern times. The main point, however, is to address the use of variable and stationary lighting. How and in what situations have these been used? How has this changed over time?

These questions will be addressed based on a study of the changing material culture of lighting. What types of lighting devices are found in which contexts? Contemporary imagery and written sources are also utilized, providing examples of different types of lighting and the situations in which they were used.

### 2 LAMPS AND LIGHTING IN UGARIT, FIRST ELEMENTS FROM THE ARCHIVES

**Abstract author(s):** Blanc, Guillaume (Ecole Pratique des Hautes Etudes - PSL)

**Abstract format:** Oral

This presentation deals with light and lighting in Ras Shamra and Minet el-Beida, ancient city of Ugarit. It aims to showcase the diversity of artefacts which can be supports of light. Although most part of lamps, called Canaanites, has been publicly released, research throughout the archives of the Mission of Ras-Shamra (Schaeffer archives of the Collège de France, Paris), - the legacy of former excavations for this archaeological mission - brings new elements about the way they have been found with an highlight on furniture combinations. In addition, these archives, such as pictures sometimes showing the discoveries in situ, allow us to question the uses and values of light in Ugarit. Finally, it would be the opportunity to draw some parallels with other archaeological sites of the Levantine coast and eastern Mediterranean in order to better consider the material culture of Ugarit at the Late Bronze Age.

### 3 **AEGEAN BRONZE AGE LAMP WICKS. MATERIALS, MANUFACTURING TECHNIQUES AND LIGHT PROPERTIES**

**Abstract author(s):** Rueff, Bastien (ArScAn - UMR 7041-CNRS; University Paris 1 Panthéon-Sorbonne)

**Abstract format:** Oral

Lamp wicks in organic materials are rarely found in the archaeological record. However, environmental data combined to ethnographic and experimental approaches can provide valuable information regarding the materials and the techniques used for their manufacturing. This paper intends to present the current state of knowledge regarding Aegean Bronze Age lamp wicks based on bibliographical researches as well as on the observation of lamps bearing soot deposits. Those use-wear traces, created during the burning processes, can indeed help identifying the kind of wicks used. In addition, the results of experiments will be presented. In the frame of these experiments, a wide range of materials and manufacturing techniques has been tested. Measurements conducted with a photometric cell and a thermocolorimeter also showed that the wicks play a significative role on the flames' illumination, color and heat. The applied methodology has been designed in order to be reproducible on lamps from various periods and areas.

### 4 **THE RED SANDSTONE LAMP OF THE LASCAUX CAVE: AN EXPERIMENTAL APPROACH TO THE USE PROCESSES**

**Abstract author(s):** Ferrier, Catherine (PACEA UMR 5199 – CNRS. Université de Bordeaux) - Medina-Alcaide1, M<sup>a</sup> Ángeles (PACEA UMR 5199 – CNRS. Université de Bordeaux; Dept. of History. University of Cordoba) - Leblanc, Jean Claude (TRACES UMR 5608 – CNRS. Université de Toulouse - Jean Jaurès) - Intxaurbe, Iñaki (Dept. of Geology. Euskal Herriko Unibertsitatea/Universidad del País Vasco) - Ternoy, Marie (-) - Garate, Diego (Instituto Internacional de Investigaciones Prehistóricas de Cantabria - IIPC, Universidad de Cantabria - Gobierno de Cantabria)

**Abstract format:** Oral

The Lascaux cave has yielded numerous stone objects, interpreted as mobile lighting systems. One famous example is a carefully crafted lamp made of red sandstone, decorated on the upper part and including a handle. In his publication, Glory suggests the term "brûloir", indicating that the object could have been used to burn organic material for a purpose other than lighting.

The objective of our research is to check the functionality of the piece as a grease lamp and "brûloir", as well as to verify the usefulness of the handle as a protection against temperature, as mentioned by different authors.

Experiments were carried out, based on faithful replicas, using Permian red sandstone located in the vicinity of Brives (France). For the lamp tests, unprepared beef fat was used as fuel and juniper bark was used for the wick, in accordance as much as possible with the archaeological data. For the "brûloir", juniper wood was burned.

Temperatures were recorded during operation at different points of the lamp in order to understand its thermodynamic functioning and the diffusion of temperature in the material. The intensity of the emitted light was also recorded. The remains resulting from the combustion located in and on the edge of the cup were studied for comparison with the archaeological specimen.

### 5 **ARCHEOLOGY OF THE LIGHT IN ATXURRA CAVE: A MULTIPROXY, MULTIANALYTIC AND EXPERIMENTAL APPROACH**

**Abstract author(s):** Medina-Alcaide, M<sup>a</sup> Ángeles (Université de Bordeaux - PACEA UMR 5199; Dept. of History. University of Cordoba) - Arriolabengoa, Martín (Dept. of Geology. Euskal Herriko Unibertsitatea/Universidad del País Vasco) - Ríos, Joseba (Arkeologi Museoa) - Intxaurbe, Inaki (Dept. of Geology. Euskal Herriko Unibertsitatea/Universidad del País Vasco) - Ferrier, Catherine (PACEA UMR 5199 – CNRS. Université de Bordeaux) - Leblanc, Jean (TRACES UMR 5608 – CNRS. Université de Toulouse - Jean Jaurès) - Mesa, Loli (Dept. of History. University of Cordoba) - Rivero, Olivia (Department of Prehistory, Ancient History and Archaeology Faculty of Geography and History University of Salamanca) - Garate, Diego (Instituto Internacional de Investigaciones Prehistóricas de Cantabria - IIPC, Universidad de Cantabria)

**Abstract format:** Oral

Atxurra cave contains one of the most extensive collections of Palaeolithic Art in the Basque Country (Spain). The walls of some twenty raised shelves located more than 200 metres inside the entrance have several sets of engravings from the Upper Magdalenian period. Traces of various prehistoric visits to the interior of the cave have been discovered on the floor of these decorated spaces. Among them, the combustion remains are varied and heterogeneous. In particular, there is evidence of the three main prehistoric lighting systems: numerous torch residues, a possible mobile lamp and three fixed fires. Besides, in the lower cave level, known as the Armiña site, a flint tool linked to the start of the fire has been reported based on use-wear analysis. All these findings make the Atxurra cave an unprecedented site for the study of the different prehistoric lighting resources, their relationship with parietal palaeolithic art and the use of darkness by prehistoric society. In this oral communication, we will present the results of the holistic and interdisciplinary study carried out on these particular combustion residues, including charcoal analysis,

M-Raman, microsedimentology, C14-AMS, SEM-EDX, among others; and their experimental recreation monitored in a subterranean context based in the preceding archaeometry deductions. On the whole, we have been able to determine what prehistoric firelight looked like, together with various symbolic and economic data on prehistoric subterranean activity.

## 6 MULTIDISCIPLINARY APPROACH TO THE FUNCTION OF FIRE IN THE CHAUVET-PONT-D'ARC CAVE (ARDÈCHE, FRANCE)

**Abstract author(s):** Ferrier, Catherine (PACEA UMR 5199 – CNRS, Université de Bordeaux) - Leblanc, Jean Claude (UMR 5608 TRACES, Université de Toulouse - Jean Jaurès) - Debard, Evelyne (UMR 5273, LGL-TPE, Université Lyon 1) - Fosse, Philippe (UAR 3125 MMSH, Université Aix Marseille) - Gely, Bernard (DRAC Auvergne - Rhône-Alpes, Ministère de la Culture) - Laurent, Antoine (UMR 5505 IRIT, UMR 5608 TRACES, Institut National Polytechnique de Toulouse - INPT) - Sagory, Thomas (Ministère de la Culture, Musée d'Archéologie nationale, domaine national de Saint-Germain-en-Laye) - Salmon, Fabien (UMR 5295 I2M, Université de Bordeaux, INP) - Tosello, Gilles - Fritz, Carole (CREAP, MSHS Toulouse, UMR 5608 TRACES, Université Toulouse Jean Jaurès)

**Abstract format:** Oral

In addition to the paleontological and cave art remains, the Chauvet-Pont-d'Arc cave has revealed numerous traces of the use of fire. From the entrance of the cave to the deepest parts, more than 250m from the porch, we can observe numerous charcoals, rare fireplaces, soot and visible thermo-alterations on the walls and roof (change in the color of the rock and thermal burst).

The information acquired from the study of the floors and walls, as well as from experiments based on archaeological data, allows us to propose a typology of the features, whose functions are multiple and more complex than that of a simple production of light.

The research carried out in the Megaceros Gallery, thanks to experiments and numerical simulation, has made it possible to characterize fires of an unusual intensity for decorated caves (quantity of fuel and method of supply, temperatures and toxicity of gases). However, this intensity has always been within the limits that allow the management of the fires. This raises the question of the multiple functions of these fires and the production of light linked to the symbolic dimension of the site.

## 7 ANTHROPOGEOMORPHOLOGICAL ANALYSIS OF THE ROCHE COTARD WALLS: LOCATION OF THE PALEOLITHIC LIGHTING SYSTEMS

**Abstract author(s):** Vandeveld, Ségolène (Laboratory of Climate and Environment Sciences - LSCE UMR8212) - Marquet, Jean-Claude (Tours University)

**Abstract format:** Oral

The anthropo-geomorphological approach focuses on identifying the part played by anthropic actions in the architecture and evolution of sites (and for example on cave's internal landscapes). In this, it participates in the definition and formalization of the socialization of space as it has been constructed over time. These anthropic actions can leave voluntary and involuntary traces. In this presentation we will focus on the modifications of the walls of La Roche Cotard 1 (Langeais, France), a site in the Loire Valley occupied by Neanderthalian groups. Nowadays, its walls still show marks of reddening (rubefaction), that are evidence of Paleolithic lighting systems. We will detail the methods that we used to identify and characterize these traces, and discuss the additional information that can be deduced from them (wall heating temperature, heating time, location of lightings, etc.) and that inform us about the behavior of past societies to bring light in the dark.

## 8 UNDERSTANDING HEARTH LOCATIONS AND ACTIVITY AREAS IN CAVES BASED ON LIGHT, WARMTH, AND SMOKE DENSITY - CASE STUDY LAZARET CAVE

**Abstract author(s):** Kedar, Yafit - Barkai, Ran (Tel Aviv University)

**Abstract format:** Oral

A hearth is a focal point in archaeological sites, since many group activities such as cooking, tool making, and social interactions took place around it. An air circulation model, coupled by computer simulations, enables the identification of hearth locations and characterization of activity areas by analyzing light, warmth and smoke dispersal emitted from hearths in cave sites. The analysis of light, warmth, and smoke density are affected by various parameters such as: the structure of the cave, the size of the cave mouth, and the location of the hearth. In this talk I will explain the simulation models and present a case study from archaeostratigraphic unit UA25 in Lower Paleolithic Lazaret

Cave, France. Lazaret Cave was chosen for this study because a comprehensive spatial analysis of the finds was performed and only one hearth was active in UA25. In this talk we will present the combination of light, warmth, and smoke density at several different hypothetical locations throughout the cave and analyzed their effect on potential activity areas. Four activity zones were defined, according to the average smoke exposure recommendations from the World Health Organization (WHO). The light and warmth from the hearth are correlated with the distance from it. We will present the parameters for choosing the activity areas based on smoke density and distance from the hearth and compare the results from the simulation with the archaeological finds.

## 9 IDENTIFICATION OF THE SOURCE OF CARBON IN CARBON-BASED SOUTHERN AFRICAN ROCK PAINTINGS

**Abstract author(s):** Dissais, Maud (Ecole Européenne de Chimie, Polymères et Matériaux, Université de Strasbourg; Department of chemistry, Université de Sherbrooke) - Bonneau, Adeline (Department of chemistry, Université de Sherbrooke; Rock Art Research Institute, University of the Witwatersrand)

**Abstract format:** Oral

Many rock art sites have been discovered in southern Africa, most of them attributed to San people. Previous studies [1, 2] discovered that some of their black paintings were made from burnt carbon-based compounds which remained unidentified. The main objective of this paper is to present experimental research conducted to determine the sources of these carbonaceous pigments. We attempt to reproduce the calcination of various animal materials (fat, skin, blood, egg yolk, etc.) as closely as possible to that of used by the San under controlled conditions. We analyzed the carbon blacks formed with elemental, structural and isotopic methods (microscope, SEM-EDS, FTIR, Raman, DART-MS, and IRMS) with the aim to evaluate the influence of the temperature and the calcination time on the final products, indicating the type of fire that was employed. These results would form a database, and by comparing it to actual San black rock paintings, we plan to identify the materials used by the artists in their work and finally solve some of the mysteries associated with the use of fire to create southern African rock art. These methodology and results will also form references for wider investigations on carbonized lighting residues and traces.

## 10 USING DIGITAL AND EXPERIMENTAL APPROACHES TO EVALUATE THE VISUAL EFFECTS OF LIGHTING CONDITIONS FOR MAGDALENIAN PORTABLE AND PARIETAL ART

**Abstract author(s):** Wisher, Isobel (Durham University) - Needham, Andy (University of York)

**Abstract format:** Oral

In this paper, we report the results of experimental and digital (3D modelling, DStretch, virtual reality) analysis of two Magdalenian art case studies: engraved limestone plaquettes from the rock-shelter site of Montastruc (France); and parietal paintings from the Cueva de Las Monedas (Spain). Experimental insights for limestone plaquettes from Montastruc suggest they were intentionally placed in close proximity to hearth structures, and orientated to allow the roving firelight to wash over the engraved surfaces. VR lighting simulations built using 3D models of the Montastruc plaquettes capture how this may have animated forms on the surface, enhanced in some cases by morphological features of the limestone. A similar effect is observed in VR simulations of art drawn onto the limestone walls of the cave at Las Monedas. Here flickering light cast from a torch enhanced topographic features of the cave walls that were integrated into the animal depictions. There are evident differences in many of the specific elements of the sensory experience of art from the two sites, with different lighting sources being used in different types of space. However, the parallels in the visual effects of light on the surfaces of plaquettes from Montastruc and cave art at Las Monedas blur categorical boundaries between different forms of Palaeolithic art. In turn this encourages reflection on the underlying perceptual effects of artificial light in the making and reception of Palaeolithic art that may transcend particular categories of art. Applying VR, 3D modelling, DStretch, and experimental archaeology to further parietal and portable art in future may allow for deeper consideration of the conceptual underpinnings of art creation in the Magdalenian.

## USE OF ARCHAEOLOGICAL EXPERIMENTAL DATA ABOUT PALAEOLITHIC LIGHTING IN COMPUTER SPATIAL ANALYSES RELATED WITH ROCK ART

**Abstract author(s):** Intxaurbe, Iñaki (Dept. of Geology. Euskal Herriko Unibertsitatea/Universidad del País Vasco) - Medina-Alcaide, M<sup>a</sup> (PACEA UMR 5199 – CNRS. Université de Bordeaux) - Garate, Diego (Instituto Internacional de Investigaciones Prehistóricas de Cantabria - IIPC, Universidad de Cantabria - Gobierno de Cantabria) - Arriolabengoa, Martín (Dept. of Geology. Euskal Herriko Unibertsitatea/Universidad del País Vasco)

**Abstract format:** Oral

Formerly, one of the main problems involved in the study of the spatial parameters related with rock art (e.g., visibility, capacity or accessibility) was the subjectivity resulting from the necessary use of qualitative terms, which could make the insights generated by each author very different. In recent years, these problems have been addressed with the emerging use of digital methods that have made spatial analyses more accurate. Geographic Information Systems (GISs) have been widely used in "sensorial" archaeology and interactive documentation, due to their precision and ability to interpret the terrain, with all their strengths and limitations, as previously identified. These techniques are usually employed in open-air studies, but there are some specific precedents in closed and three-dimensionally complex sites, including caves. In these last cases, their total darkness force to determine the physical parameters of the different techniques that were used in prehistory to illuminate them. In this work we want to empathize the importance of the replicability in all experimental programs made to know the features related with the prehistoric lighting, but especially their utility in GIS through the use of interactive scripts. We present some practical examples that show the dynamism of these analysis methods and their strong complementarity with experimental archaeology programs.

12

## A 3D PHYSICALLY-BASED APPROACH FOR THE PROBLEM OF TRANSLUCENT MARBLE TILES AND THE ILLUMINATION OF CLASSICAL GREEK TEMPLES

**Abstract author(s):** de Lara, Juan (UCL)

**Abstract format:** Oral

In recent years the archaeological community has embraced the proposed theory that classical Greek temples were illuminated via thin translucent marble roof tiles. The most famous example are the Parthenon in Athens (438 BCE) and the famous temple of Zeus in Olympia (c. 432 BCE), one of the wonders of the ancient world. However appealing this idea might be, a rigorous digital reconstruction of all architectural elements of the temple evidences the engineering and aesthetic problems associated with this widespread view. This presentation proposes an accurate methodology that accounts for physically-based light settings and appropriate documentation of data to further delve into structural questions related to buildings—and more importantly—how a community may have interacted with them. Indeed, an advantageous aspect of the approach is that in the process of questioning 'how is a building effectively illuminated?' we are able to uncover new and overlooked aspects related to the functionality of buildings.

13

## THE UBIQUITY OF DARK AND LIGHT

**Abstract author(s):** Higginbottom, Gail (El Instituto de Ciencias del Patrimonio - Incipit, CSIC) - Mom, Vincent (Digital Preservation Projects)

**Abstract format:** Oral

This work focuses on the twin ambience of dark and light: how darkness can chase light across the landscape, bringing cold and the unknown, and light chases away that which is darkening the world, thereby bringing warmth and returning the visible world. However, darkness can connect someone to important concepts or experiences of the unknown world, both the unseen and the illusory, with the reality of twinkling skies and wondrous light shows. Thus, darkness has the power to induce and generate these forces of light. Most particularly, similar to Herrstrom's 2017, our presentation focuses upon both the individual's relationship with dark and light as well as shared perceptions, and we do so through the meta-categorization of the notions of Dark and of Light. It reveals how together, dark and light draw individuals into a world of creation and creating; influencing and inspiring them to build megalithic monuments in very specific locations to highlight their own human experience and understanding of these events. Like Pauketat (2017) we try to 'explain the causal relationships between the human body, lived space, cosmic order, habitual practice, and religious experience'. We demonstrate this using the virtual immersion-style, publically available software, Stellarium, to show the interplay between light and darkness during particular astronomical events.

## “FOR THE LOVE” – THE IMPACT AND POTENTIAL OF AMATEUR ENTHUSIASTS ON ARCHAEOLOGICAL SITES AND ACTIVITIES

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Humphrey, Kenneth (Henry M. Jackson Foundation) - Errickson, David (Cranfield University) - Stephen, Jesse (Defense POW/MIA Accounting Agency)

**Format:** Round table

The roundtable discussion would pose the question: What are the opportunities, liabilities, and regulatory challenges to building structured regional or national public programs to enable and promote the involvement of enthusiastic amateurs in archaeology? What are examples of successful programs in the past, what programs serve this need today, and what might they look like in the future? How are archaeologists ensuring ethical practices, leveraging programs in public archaeology, and realizing mutual benefits through their efforts in these areas? What are some notable successes (and challenges, or failures) in this area?

Using the accounting mission as an area of applied practice, roundtable discussants will focus on a subset of archaeological sites and stakeholder groups to further illuminate the topic. Three themes will be used to further guide the discussions: 1) Time: how has the behavior of amateur enthusiasts changed over time, and how has their engagement with the archaeological community shifted?; 2) Impact: what is the current impact of enthusiastic amateurs on sites, in education, and in government?; 3) Direction: what are the biggest opportunities in public archaeology for ethical collaboration with local communities and enthusiastic amateurs, and what is most needed to realize such opportunities?

## ACROSS THE MAELSTROM: SEARCHING FOR NEW DEPARTURES IN THE ARCHAEOLOGY OF THE VIKING AGE

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Sindbaek, Søren (Aarhus University) - Lund, Julie (University of Oslo)

**Format:** Regular session

Whether thinking in terms of exchange and mobility, gender, violence, migration, political evolution, social identities or ontology, the North European Viking Age (c. 750/800-1050 CE) is a pivot of recent debates in archaeology. It is equally highlighted by a range of new conceptual explorations as well as scientific approaches. Yet, the steeply increasing demands for specialization are pulling research communities in different directions, between which gaps are growing. For instance, while research on social identities is creating an increasingly nuanced understanding of the diverse roles in Viking Age society, these perspectives appear to have little impact in the study of social organization or power relations. Similarly, a rise of interest in the exploitation of outland resources provide new understandings of the dynamics of economy and ecology of the Viking Age; but hitherto the social and cultural consequences of these contexts have not been brought to the fore.

This session aims at identifying the predicaments and future directions for a synthetic archaeology of the Viking Age. We call for contributions that explore how different strands of archaeological research may meet and merge to define a more holistic research. How can we develop frameworks with the potential to strengthen the ethical groundings of a contested field of research, and overcome the gap between societal/economic and individual/cultural research cultures? In particular, we are searching for new ways to call in focus the integration and interplay between research and discourses arising from fields as different as genomics, diaspora theory, intersectionality, ecology, environment and climate studies, or studies of landscape, ontology, mobility and political power.

### ABSTRACTS

1

#### LIFE ON THE MARGINS: SOCIAL INEQUALITY AND STRUCTURAL VIOLENCE IN VIKING-AGE SCANDINAVIA

**Abstract author(s):** Raffield, Ben (Uppsala University)

**Abstract format:** Oral

Current archaeological paradigms for the discussion of the Viking-Age (c. 750-1050 CE) are framed almost exclusively by the study of elites. These were martial rulers, their kinship groups and retinues, and the aristocratic landholders who occupied the upper strata of Scandinavian society. The emphasis ascribed to these groups in both scholarly and popular literature reflects cultural historical perspectives dating from the 19th- and early-20th century, when antiquarians and early archaeologists sought to anchor the developmental trajectory of the Scandinavian nations within the prehistoric past. Today, the focus of research on high-status social groups continues to cast a shadow over the lives of the wider population, including members of the lower-status freeborn classes and semi-free, unfree, or enslaved

peoples. To date, there have been few attempts to identify and study the lives of subaltern groups, nor to examine the conditions that allowed hierarchical social structures to be established and upheld across generations.

This paper will introduce a new project that has been designed to address these issues through a critical study of social inequality and marginalisation in the burial record. Focusing on cemeteries located in modern-day Sweden, the project will mobilise a novel framework that combines bioarchaeological, material, and textual analyses in order to examine the ways in which systemic inequality impacted the health and lifeways of different social groups. This will provide a new and crucially overlooked perspective on Viking-Age communities that ascribes primary to those occupying the bottom of the social ladder.

## 2 **“THEN ALL THE POWERS WENT TO THEIR THRONES OF FATE...”. AN ANTHROPOLOGICAL LOOK AT PERFORMANCE AND RITUAL IN VIKING LEADERSHIP**

**Abstract author(s): Maddox, Timmis (University of Wisconsin-Milwaukee)**

**Abstract format: Oral**

In 2014, archaeologists Neil Price and Paul Mortimer (2014) performed an experiment in which a replica of the British Anglo-Saxon Sutton Hoo helmet was worn within a recreated Iron Age hall. What they found was that when worn in the fire-lit interior of the hall, the helmet transformed the appearance of the wearer. Consequently, Price and Mortimer (2014) argued that the wearer of the helmet was meant to become a literal personification of the Scandinavian war god Odin. As a result, increasing interest has been shown in ritual, liminality, drama, and the concept of “play” in Iron Age Scandinavia. Little to no textual evidence exists which could allow us to examine this topic, but modern anthropological theory on play and performance may be able to grant the platform necessary to discuss the role of performance in prehistoric Scandinavia. Utilizing practice and performance theory to discuss the use of the Vendel ceremonial masks, the following paper argues that these helmets reflect the tactics used by the elite to hegemonically shape social perceptions of power—a tactic which the Viking period shows may have been ultimately successful.

## 3 **TRANSFORMATIONS IN VIKING AGE ANIMAL ART – A MULTI-PERSPECTIVE STUDY ON METALWORK AND VISUAL POETICS**

**Abstract author(s): Neiß, Michael (Uppsala University, Department of Archaeology & Ancient History)**

**Abstract format: Oral**

Generations of researchers have been trying to come to grips with Animal Art, with queries that were as multifaceted as their chosen materials. My focal point are Birka type brooches, which are best likened to interactive sculptures that change shape as the viewer changes perspective. Sculptural brooches do not only breathe new life into traditional research questions, but raise new ones that steer us into uncharted waters. Here, we make field observations which fall outside the established paradigms of archaeology. Following the parable of the six blind men who tried to come to terms with the unknown phenomenon ‘elephant’, my study approaches the sculptural brooch phenomenon from different angles, by combining different methods which have been developed within separate research disciplines such as archaeology, art history, cognitive science, sociosemiotics and civil engineering. The methodological framework for my multi-method approach is informed GT, i.e. a variant of grounded theory which uses established theories to identify distinct patterns that previously went unnoticed. Contradictions that arise from the method mix are not seen as a hinderance, but as a generator for progress that gives rise to a new theory. By combining dynamic typology, Panofskyan hermeneutics and multimodal semiotics, my study on sculptural brooches uncovers hitherto unknown parallels between Animal Art and skaldic poetry in regards to context, cognition and imagery. As a result, one is inclined to look for a potential link between those distinct expressions of Viking Age culture. Did objects with Animal Art serve as points of reference for skaldic ekphrasis? Or was Animal Art a material anchor for the same conceptual blends that also transpired through skaldic poetry? The outcome is an empirically grounded theory which links the pictorial language of the smith to the verbal imagery of the skald, more precisely in the context of Old Norse íþrótt ideology.

## 4 **THE PROBLEMATIC DISCONNECTION BETWEEN DECORATIVE STYLE AND OBJECT IN VIKING AGE ART**

**Abstract author(s): Franco Valle, Rebeca (University of Bergen)**

**Abstract format: Oral**

Animal styles have been central in the analysis of Viking Age art and archaeology during the last decades of the 20th century. The schedule of decorative animal styles has proven to be a practical tool for relative dating, to approximate geographical areas of production and to affiliate these culturally with Viking Age society. As it happens with most of the pre-modern art, objects carrying the decorative styles of this period served different practical purposes: brooches for keeping clothes in place, stone commemorative carvings, wooden wall panels, etc. However, when the artistic style represented in these artefacts are analysed, the object material and function are overlooked to become a sort of neutral canvas in which the motifs are represented. This has produced a double-sided effect of

disconnection between the study of these artefacts as either art or archaeology objects: On the one hand, the art style schedule has been kept as a relative dating tool. On the other hand, things and/or representations have formed a crucial role on the study of gender, power, religion, exchange, and other societal aspects. But regardless of how often the style scheme is being used, this has not been in the focus of revision and analysis during the last decades. When we think about how the animal styles have been schematized and scheduled, we see that material properties and techniques employed in the objects themselves has been often overlooked. Thus, the analytic potential of style is limited to descriptive tasks about chronology, chorology and influences, where expressive or semantic interpretations are alternatives. In this paper I argue in favor of a concept of decorative style that depends on technological and operational choices affected by greater scale changes in Viking Age society, those that can be traced through changes in animal art styles in objects.

## 5 POWER, ETHNICITY, AND SETTLEMENT IN THE NORSE-PERIOD LANDSCAPE OF SKYE AND THE WESTERN ISLES

**Abstract author(s):** Ryder, Joseph (University of Bergen)

**Abstract format:** Oral

The Viking (800-1050 AD) and Late Norse (1050-1250 AD) periods of Skye and the Western Isles have long been an enigma within Scandinavian settlement studies. According to archaeological and placename research, the region was settled by Scandinavian-speaking peoples throughout the Norse period (800-1250 AD). Placename evidence suggests that the Norse speakers replaced the native, pre-Norse Celtic-speaking peoples, who could be called Picts. Archaeologically, Pictish culture seems to disappear around the interface of the late 8th/early 9th century AD. Past scholarship has often been dedicated to answering if the transition from Pictish to Norse was peaceful or violent. Yet questions of settlement patterns, power structures, and ethnicity throughout Skye and the Western Isles have not been explored in detail.

My Ph.D project sought to answer questions about power, settlement, and ethnicity in the region. After synthesizing all available archaeological Norse-period data in the region, I utilized a landscape methodology to place the data in context through placenames, topography, and pre-Norse settlements and monuments.

The results show that the Norse imported their settlement system into the islands, and only re-used pre-Norse settlement sites if they fit into a Norse settlement pattern. I developed a centre-periphery model using the Scandinavian concept of the infield/outfield system, which was imported by the Norse. I ultimately argue for a settlement hierarchy within Skye and the Western Isles, with a considerable spread of wealth and elite sites that likely represented individual territories. Maritime routes, harbours, and natural boundaries such as islands likely aided in demarcating territory that led to the establishment of multiple elite centres of varying rank throughout the region. I further argue that this is highly suggestive that the pre-Norse peoples, the Picts, were marginalized during the Norse-period, since there is an overall lack of acculturation or ethnic plurality in the Norse powerscape.

## 6 MAPPING MIDGARD. RECONSTRUCTING MENTAL GEOGRAPHIES OF VIKING AGE SEAFARERS

**Abstract author(s):** Jarrett, Greer (Lund University)

**Abstract format:** Oral

This PhD project aims to reconstruct the mental geographies of Viking Age seafarers and the sailing routes used by these people along the Atlantic façade by combining experimental archaeology and critical cartography. In this session the results of recent fieldwork in Norway will be presented, and the value of integrating different research methods for constructing critical and epistemologically diverse understandings of past peoples and their worldviews will be discussed.

Conventional Western cartography is not a well-suited method for exploring the experiences and worldviews of cultures distinct from our own, and is especially inadequate for studying maritime movement and seafaring experience in the past. However, a range of cartographic alternatives have recently received scholarly attention, arising from developments in digital mapping and from the efforts of subaltern and indigenous communities. Being inspired by this range of creative alternatives, I explore Viking Age worldviews and geographies by creating field-based digital models which emphasise the experiential factors that were important for seafarers in the Viking Age, such as movement, contextuality, time and weather. By focusing on these factors rather than those more commonly used in archaeological cartography, it is hoped that the models will come closer to representing the worldviews and geographies of Viking Age seafarers, and provide a new perspective on sailing, space and experience among maritime communities. This method is intended as an addition to current approaches rather than a universal solution, but it is also hoped that it will encourage others to consider alternative techniques of analysis and representation when engaging with past phenomena, and illustrate the potential of combining field archaeology with digital technologies for promoting intercultural dialogue and research.

## 7 BODY-POLITICS OF THE VIKING AGE

**Abstract author(s):** Eriksen, Marianne Hem (School of Archaeology and Ancient History, University of Leicester)

**Abstract format:** Oral

This paper springs from a sense of puzzlement with some of the ongoing discourse in Iron and Viking Age archaeology. For example, if a major trading good of the Viking Age was enslaved people, as is argued by some scholars — how can we talk about the Viking economy without talking about owning, buying, and selling human beings, and how this relates to personhood? When population DNA studies in Iceland indicate a significant influx of mitochondrial DNA from Ireland and Britain, how can we talk of genomics of the Vikings without thinking about the overarching political consequences of such a genetic map — as well as the consequences for how we understand gender, kinship, and potential sexual and structural violence? These puzzles, among others, highlight gaps where top-down and bottom-up, empirical and conceptual archaeologies fail to meet.

This paper will centre the politics of the body as an approach to bridge perspectives between the 'societal' and 'individual', the natural and social sciences, macro and micro histories. Bodies are malleable nexuses of biology, politics, labour, disease, and many other forces. Bodies explode outwards in relations, ties, obligations, and constraints. Body-related data can tell overarching stories but can also centre embodied experience on the individual scale. Drawing on ongoing research from the 'Body-Politics' ERC project, it will flesh out Viking body concepts and body-worlds, and how these relate to the wider 'Viking phenomenon'.

---

## 206 NO BRAUDEL FOR THE BALKANS? FORGING A NEW, INTERCONNECTED PREHISTORY OF THE BALKAN PENINSULA

**Theme:** 2. [Re]integration

**Organisers:** Galaty, Michael (University of Michigan) - Parkinson, William (Field Museum of Natural History) - Recchia, Giulia (Sapienza University of Rome) - Gori, Maja (Institute of Heritage Science; National Research Council of Italy - ISPC-CNR) - Gyucha, Attila (University of Georgia)

**Format:** Regular session

The Balkan Peninsula (sometimes glossed as "the Balkans" or Southeast Europe) includes the territory south of the Danube and Drava rivers and bordered by the Adriatic, Black, Ionian, and Aegean seas. The cultures within this part of Europe are as diverse as the geography that defines the peninsula. Traditionally, archaeological work in the region has focused on historical periods (e.g., the Classical, Roman, and Medieval periods) and has been motivated by historical questions, especially about the relationship of Balkan peoples to the ancient Greeks and Romans. Increasingly, however, the Balkans are being studied in their own right, with an emphasis on prehistory, and with growing recognition of the interconnections the region had with wider Mediterranean and European societies, beyond Greece and Italy. Nevertheless, this more recent Balkan-focused research stands in stark contrast to the long-standing scholarly traditions that have recognized the Mediterranean and continental Europe as discrete historical entities. There is, simply put, no Braudel for the Balkans.

While there is an extensive record of prehistoric archaeological research in the Balkans, both indigenous and foreign, much of it remains inaccessible to general audiences, published in obscure journals and in many different languages. Recently, however, as the Balkan nations have opened to the outside world, a new, growing interest in their archaeological records has emerged, along with a desire to place them into wider archaeological contexts. This session is designed to accommodate papers by prehistorians working throughout the Balkans. It will provide an opportunity for communication, comparison, and inter-regional model building. Participants will be asked to consider carefully whether the Balkans have always been "balkanized" and the session will demonstrate, we hope, that, more and more frequently today, Balkan archaeologists are working together, across national borders, providing new, innovative understandings of the Balkan past.

## ABSTRACTS

### 1 MOVING PEOPLE, TRADING GOODS, TRANSFORMING CULTURES: EXCHANGE IN THE BALKANS DURING THE NEOLITHIC

**Abstract author(s):** Riebe, Danielle (University of Georgia)

**Abstract format:** Oral

The process of neolithization throughout the Near East and the Balkans is often characterized by the introduction of new practices such as sedentary lifeways, the establishment and growth of permanent villages, the production of new technologies, and the introduction of domestication of animals and plants. However, one of the most critical practices that continues to persist from previous eras into the Neolithic is the system of trade and exchange. This form of engagement between peoples and materials inevitably assisted in spreading the "Neolithic package" through-

out Southeast Europe. Unlike earlier, during the Neolithic the systems of exchange transformed and became more variable in practice. Trade became a way to not just acquire goods and materials, but it also was a means through which socio-cultural information could be relayed, manipulated, and/or implemented. Emerging socio-cultural practices, including social stratification, gender differentiation, and craft specialization, were heavily influenced by both inter- and intra-communal engagements in trade. This paper will discuss the importance of multi-scalar trade and exchange (e.g., short-distance vs. long-distance trade and site vs. regional scale) of various materials (e.g., chipped-stone and ground stone tools, shells, minerals, ceramics, and metals) in relation to the developing socio-cultural complexity that defines the Neolithic in the Balkans.

## 2 CONNECTING THE NEOLITHIC BALKANS: NEW INSIGHTS FROM PRECIOUS STONES AND AMULETS

**Abstract author(s): Horejs, Barbara - Brandl, Michael (Austrian Academy of Sciences OEAI)**

**Abstract format: Oral**

The Neolithisation on the Balkans starting around 6000 calBC shows a regional variability between the Danube and the Aegean, usually associated with well-known key sites representing cultural horizons, such as Starčevo, Karanovo, Anzabegovo et al. While the main trends of the Neolithic dispersal are mostly agreed upon these days, neither the complexity of its socio-cultural dimensions nor the impact of potential regional interconnectivity within the Balkans are yet fully understood.

Our contribution presents data from the newly discovered early to middle Neolithic site of Svinjarička Čuka in south Serbia situated in the South Morava Valley, one of the main communication corridors along the Axios-Vardar-Morava Rivers route connecting the Aegean realm and Central Europe. The new investigations of our Austrian-Serbian collaboration have already demonstrated the potential for unprecedented new insights into this underestimated region for the Neolithisation process of southeast Europe. In addition to an overview of new data and open questions, the paper focuses on the role of distinctive objects, which are interpreted as amulets and were produced from nephrite and other, visually similar green stones. Such objects are known from the Near East, Anatolia and southeast Europe including the Balkan region.

The combination of archaeological contextualisation, typo-technological analyses and geochemical data using pXRF are promising avenues for revealing a potential network for precious objects and/or raw materials (e.g. nephrite) crossing the Neolithic regional borders. Overall, shared aspects of manufacturing techniques, raw materials and potential sources as well as their distinct imagery let us assume the general applicability of Braudel's concept for the 6th millennium BC Balkans, but also raise new questions requiring a re-evaluation and modification of our current Neolithisation models.

## 3 HERDING AND HUNTING IN THE BALKAN NEOLITHIC: A VIEW FROM THE ADRIATIC COAST

**Abstract author(s): McClure, Sarah (University of California, Santa Barbara)**

**Abstract format: Oral**

The Adriatic coast of the Balkan Peninsula provides a unique backdrop for examining Neolithic lifeways. This region serves both as a physical boundary for the Balkan Peninsula and as a gateway to the central and Western Mediterranean. This resource-rich area has a distinctive archaeological record for Neolithic farming communities. The spread of farming and its development along the coasts of modern-day Croatia, Bosnia and Hercegovina, Montenegro, and Albania, along with the off-shore islands, share many material manifestations in lithic and ceramic technologies, as well as subsistence practices. This presentation explores the current evidence for Neolithic herding and hunting in this region, spanning ca. 6000-4500 cal BC. Specifically, it presents faunal data from Dalmatian Neolithic sites in context of broader patterns in this region, highlighting differences in herding and hunting behaviors throughout the Neolithic and in different areas. The results suggest that shifts in the proportions of domestic animal species during the Neolithic signifies a change in management strategies that is also visible in other proxies, and the presence of wild fauna at these sites results from a variety of behavioral responses by farming communities to their changing agropastoral practices and climatic shifts identified in the region.

## 4 DWELLING ALONG THE WETLANDS IN THE NEOLITHIC BALKANS

**Abstract author(s): Naumov, Goce (Center for Prehistoric Research; Museum of Macedonia)**

**Abstract format: Oral**

The Balkan is commonly recognized as the mountainous region, but the valleys, wetlands and lakes are frequent landscape feature as well. Although not considered as significant as dryland areas in the traditional archaeological research, the wetlands and lakes were preferred environmental setting in the Neolithic. Consequently, the wetland societies in the Balkans recently have been studied more intensively by bringing together archaeologists from Southeast Europe. The joined research indicates that the discovered sites in several Balkan countries are far more frequent in the wetlands than on hills, mountains or slopes. The immensity of resources in such areas explains the preference

of marshes, flooded areas, lakes and rivers among the first farming communities in the region. As result to solid access to resources and economic stability these agricultural societies established settlements that could last longer and maintain social and symbolic relationship with the representatives of several generations.

Consequently the wetland societies should be considered as significant contributors in the Neolithic networking, particularly evident since the more comprehensive cooperation between the Balkan archaeologists. Bringing wetland archaeology beyond national borders contributed in more thorough examination of the region and of the relationships that first farmers established 8 000 years ago. Therefore this paper will emphasize the benefits of various international collaborations and the immensity of joined knowledge that can be implied in the Balkan archaeology.

## **5 INVESTIGATING LARGE SETTLEMENTS: THE NEOLITHIC SETTLEMENT COMPLEX OF SZEGHALOM-KOVÁCSHALOM ON THE GREAT HUNGARIAN PLAIN**

**Abstract author(s):** Parkinson, William (Field Museum and University of Illinois at Chicago) - Gyucha, Attila (University of Georgia) - Sarris, Apostolos (University of Cyprus) - Ridge, William (University of Illinois at Chicago) - Riebe, Danielle (University of Georgia) - Yerkes, Richard (The Ohio State University)

**Abstract format:** Oral

This paper discusses efficient, field-based, research techniques for investigating large prehistoric settlements. Due to their size and complex occupational history, the archaeological study of large, multi-component, prehistoric sites is challenging and daunting. Other factors, such as time, funding, and methodological considerations also can hinder the researcher's ability to efficiently model how settlements evolved over time. In this paper, we focus on the Late Neolithic tell-based settlement complex at Szeghalom-Kovácsalom in southeastern Hungary and present a methodological approach that incorporates intensive surface collection, geophysical research, and targeted test excavations to efficiently explore the spatial and temporal evolution of the settlement complex, and also to assess the degree of preservation of different features, especially houses, at the site. The approach we employ: 1) is based on the qualitative and quantitative analyses of magnetic anomalies and excavated structures, 2) is minimally intrusive, 3) facilitates time- and cost-efficient field research to reconstruct temporal developments at large sites, and 4) guides decision making about additional field activities for addressing specific questions.

## **6 TRANSFORMATION OF THE LATE NEOLITHIC VINČA CULTURE: INNOVATIONS AND TRADITIONS IN THE COPPER AGE OF THE CENTRAL BALKANS**

**Abstract author(s):** Milanovic, Dragan (Institute of Archaeology, Belgrade)

**Abstract format:** Oral

During the second half of the 5th millennium BC communities in the Central Balkans experienced fundamental changes. The complex process of transformation of the Vinča culture included a series of internal and external factors, which have led to the gradual abandonment of long-lasting large settlements, micro-regions, and regions, and the formation of the new cultural milieu of the Copper Age. These changes included the establishing of settlements in completely new places and colonization of previously sparsely populated or unpopulated areas. This was accompanied by changes in the overall number, size, internal structure and spatial relationships between settlements, as well as in diet, agriculture, animal husbandry, textile production and copper metallurgy, among other things. The wide range of inhabited altitudinal zones, an increased focus on soils unsuitable for cultivation, complementarity of neighbouring settlements in topography (flat/hill-fort or cave sites), geomorphology (valley/hinterland), and local resources, as well as more frequent settling of naturally fortified positions suggest the utilisation of a wider range of local resources, the existence of economically specialised, cooperative and competitive settlements, cultural diversification, conspicuous territoriality, high level of control over the surrounding area, communications and resources and a greater degree of inter-connections between settlements. On the other hand, the orientation of most Early Copper Age settlements towards a mixed economy and the great importance of agriculture in certain areas indicate a strong Neolithic tradition. All of this indicates an overall decline in population and significant changes in social organization during the second half of the 5th millennium BC. Furthermore, a high level of continuity in the settling of the same places can be noted after a new settlement pattern had been established.

## **7 2000 YEARS OF EARLY STEPPE – BALKANS INTERACTIONS: AN INTERDISCIPLINARY VIEW FROM ARCHAEOLOGY AND GENETICS**

**Abstract author(s):** Preda-Balanica, Bianca (University of Helsinki) - Diekmann, Yoan (Palaeogenetics Group, Johannes Gutenberg University) - Heyd, Volker (University of Helsinki)

**Abstract format:** Oral

We explore the spread of steppe genetic ancestry and early interactions between the Balkans and the steppe landscapes of southeastern Europe, covering a time span of two and a half millennia, approximately between the mid-5th millennium BC and the end of the 3rd millennium BC. Following a long period of stability, continuous population growth, and geographic expansion during the Neolithic, this was a time of dramatic changes, for example: land-

scapes were impacted due to the recurrent influx of newcomers from the wider Pontic-Caspian steppes; lifestyles and economies altered; knowledge of innovative technologies was acquired; new raw materials were used to create objects unseen before; burial rituals and hoarding practices transformed. This culminated in the 3rd millennium BC when thousands of kurgans were built in the steppe landscape of southeastern Europe. For a long time, these were interpreted as belonging to "newcomers", steppe migrants, as opposed to flat burial grounds that were traditionally assigned to "local" communities. Interpretations of interactions between "newcomers" and "locals" ranged from violent invasions and warfare to peaceful cultural diffusion or even organic transformations of societies to account for the same archaeological record. By bringing together genetics and mortuary archaeology, information about the genetic ancestry of individuals and burial practices, we investigate the relationship between descent and identity in the kurgans and flat cemeteries of southeastern Europe, and the impact of steppe ancestry in the Balkans. In this way, we explore new possibilities of interpreting the archaeological data and open a discussion about the intricacies of two and a half millennia of Steppe – Balkans Interactions.

## **8 THE DAWN OF THE BRONZE AGE ALONG THE ADRIATIC COAST OF THE NORTH-WESTERN BALKANS AND THE CETINA PHENOMENON**

**Abstract author(s):** Recchia, Giulia (Sapienza University of Rome)

**Abstract format:** Oral

Approximately 50 years have passed since the Cetina culture was first defined, mostly on the basis of distinct pottery coming from stone tumuli along the Cetina river (central Dalmatia). Yet, data still remains limited, particularly as regards economic strategies and settlement patterns. The Cetina culture is now widely recognized to have spanned from the mid 3rd to the early 2nd millennium BC, but its chronological breakdown remains problematic.

With the discovery of Cetina-type pottery in many Central Mediterranean regions, the expansive character and the superregional dimension of Cetina has attracted much scholarly attention. What it is now called the 'Cetina phenomenon' portrays multiple cross-cultural interactions encompassing a vast area, from the western Balkans to the Peloponnese, peninsular Italy, eastern Sicily, Malta and the Aeolian Islands. Not all the regions yielding Cetina features were directly reached by Cetina groups coming from the western Balkans (via movements or exchange): ceramic models would have spread through a chain of multiple contacts.

This presentation aims at briefly discussing the current picture we have of the Cetina culture, from its origin -rooted in the later Copper Age Adriatic-Ljubljana Culture with external influences, to its development (from the mid- 3rd to the early 2nd millennium BC). The focus will be on the social organization and cultural patterns. The 'core' area of the Cetina culture will be considered closely: present-day Dalmatia, western Bosnia-Herzegovina, Montenegro and northern Albania. Evidence from the neighbouring regions (Istria and the Karst, central-eastern Bosnia-Herzegovina and western Serbia) and across the Adriatic will be analyzed too, with the aim of highlighting patterns of movements and socio-cultural contacts and the impact of the Cetina phenomenon.

## **9 INVESTIGATING SETTLEMENT PATTERNS AND TRACING MOBILITY IN SOUTHERN BALKANS IN THE 3RD MILLENNIUM BC**

**Abstract author(s):** Gori, Maja (National Research Council of Italy)

**Abstract format:** Oral

This contribution will focus on the south-western Balkans in the 4th and especially 3rd millennium BC. Issues concerning relative and absolute will be addressed by discussing new data – where available – against the state of the art, aiming at pinpointing those problems that remain still open. This period can be considered a critical juncture, characterized by discontinuities in settlements and burials. Some of these changes are connected to the creation or dismantling of long-distance networks based on resources procurement, possibly in connections with changes in social structures. These networks and relative patterns in the distribution of archaeological record will be discussed aiming at pinpointing discontinuities and tracing possible large- medium- and small-scale movements. Recently, large-scale movements have been detected with aDNA, which provides a measure of mobility, but does not provide an explanation for it. Specific forms of mobility and migration will be discussed on the basis of the available data, trying to pinpoint possible reasons behind different forms of settlement continuities and discontinuities and human mobility in the Southern Balkans between the 4th and the 3rd millennium BC.

## **10 WHAT ABOUT THE MIDDLE BRONZE AGE IN THE SOUTHERN BALKANS?**

**Abstract author(s):** Krapf, Tobias (Swiss School of Archaeology in Greece)

**Abstract format:** Oral

While the Early and especially the Late Bronze Age have emerged in research as periods of interconnected networks in the Southern Balkans producing a rich archaeological record, the Middle Bronze Age remains – except for a few coastal sites – almost completely unknown. There are probably two reasons: First, there are gaps attested at several

archaeological sites, underlined by absolute dates, and second, often no distinct material culture has been identified that could be clearly attributed to a Middle Bronze Age period in-between the Early and Late Bronze Age.

Part of the problem is our insistence in holding on to the three-period-model of archaeological periodization. Abandoning it would, however, not resolve the question about what happened in the first half of the second millennium BCE in the Southern Balkans. In fact, the issue – if one wants to go beyond the site level – is indicative of recurrent problems in Balkan archaeology: The use of different terminologies, chronologies and approaches and the lack of cross-border comparisons. In the present paper therefore, starting from Sovjan at the corner of Albania, Greece and North Macedonia, the available C14 dates will be compiled and the existing stratigraphies compared, independently of terminologies, in order to identify the material culture of these few centuries that define the period during which the EBA societies evolved into the LBA societies.

## 11 **A MULTI-ISOTOPE INVESTIGATION OF MOBILITY AND DIET IN A LATE BRONZE AGE COMMUNITY IN LIKA, CROATIA**

**Abstract author(s):** Zavodny, Emily (University of Central Florida) - Novak, Mario (Centre for Applied Bioanthropology, Institute for Anthropological Research) - Đukić, Ana (Arheološki muzej u Zagrebu) - Kamenov, George - Krigbaum, John (University of Florida)

**Abstract format:** Oral

Today the Lika region of Croatia is viewed as insular and isolated, but its position in prehistory, situated between the Adriatic coast and interior continental plains, would have been ideal for forging broad inter-regional contacts and relationships across Europe. In this paper we explore these potential inter-regional connections through osteological and mortuary analyses of the burial population at the Late Bronze Age (1200-800 B.C.) necropolis of Smiljan. We also present new results from stable isotope (carbon, oxygen, nitrogen, sulfur, strontium, lead) analyses of bone and teeth from 13 individuals. As one of the most completely excavated necropolises in Lika, Smiljan provides a singular opportunity to reconstruct community-level relationships during this period of rapid social, political, and economic reorganization. Our findings illustrate greater group integration at Smiljan over time and also suggest a growing role for Lika in the expansive inter-regional trade networks of the Late Bronze and Early Iron Ages.

## 12 **LONGUE DUREE IN THE CENTER OF BALKANS – REGIONAL SCALE DIACHRONIC STUDY OF THE GRUŽA RIVER VALLEY IN CENTRAL SERBIA**

**Abstract author(s):** Kocic, Miroslav (Arheološki institut, Beograd; University of Pittsburgh) - Hanks, Bryan (University of Pittsburgh) - Kalicanin Krstić, Marija (Zavod za zaštitu spomenika kulture Kragujevac) - Basar, Petra (University of Pittsburgh)

**Abstract format:** Oral

This paper discusses regional scale comparative project running in Central Serbia, Gruža river valley, with the focus on diachronic social organization change and the emergence of complex societies in prehistory. Prehistory of the Balkan peninsula has been traditionally perceived within the ontology of a study of fragmentary systems, balkanizing past societies, despite the constant search for traces of imports, migration and large culture complexes such as Starcevo Cris Koros and Vinca cultures. One of the many reasons for this also lies in the single site excavation scope of research that was the hallmark of the continental European archaeological tradition, that only started to change recently with regional archaeological approaches with the number of projects in the region done in last 15 years. This paper is a result of two initial projects, NSF funded PhD dissertation work on regional diachronic settlement patterns through systematic survey covering 92 sq km (NSF DDRIG #1741667) and SRGAP (Šumadija Regional Geoarchaeological Project) focusing on development of non invasive methodologies. Combining the use of fluxgate magnetometry, electric conductivity, and magnetic susceptibility, in combination with surface artifact densities, pedological information, and information from previous excavations, allowed for the development of a new multi-scalar approach to prehistoric dynamics in this region of the Balkans. These efforts produced highly significant longue duree patterns and information about emergence of complexity in South East Europe. Results also show that there are strong regional patterns that were previously invisible with a too narrow scope of the research, and also that there are much wider processes at work, underlining that there is a pressing need for creating a nexus of much broader multidisciplinary research reaching across the modern borders and archaeological traditions of the Balkan Peninsula.

## 13 **MAKING SENSE OF THE PAST AND BRINGING SENSE TO THE PRESENT: BURIAL MOUNDS IN BRONZE AND IRON AGE ALBANIA**

**Abstract author(s):** Trinder, Ermelinda (Staffordshire University)

**Abstract format:** Oral

Burial mounds were the exclusive form of burial during Bronze and Iron Age Albania. Throughout the communist period, there was a vivid interest in burial mounds, and they became the symbol of archaeological research in the country. Like the rest of the Balkans, Albanian archaeology was 'caught' in the midst of historical, political and nationalistic

debates around proving the ethnogenesis of Illyrians. Burial mounds were central to this debate. Albanian archaeologists, like many of their Balkan counterparts, adopted a divisive 'ours' against 'yours' approach to the study of burial mounds which resulted in creating scholarly borders, building fences and closing routes of communication. Within Europe, Albanian burial mounds are waiting to be fully discovered, both in terms of their content and meaning.

In this paper, I will explore how death, burial and bereavement influenced Bronze and Iron Age societies through the construction and use of burial mounds. These issues will be considered, analysed and interpreted through the lenses of sensory archaeology, memory and emotions. I will describe how these interpretations have helped shed new light on old data from 130 burial mounds excavated during the communist period. In doing so, this paper shifts the focus from the more divisive issues of ethnogenesis to helping make sense of the past and bring sense to the present. This approach will help scholars both in Albania and the wider region to dismantle borders, knock down fences and build highways of communications.

#### **14 REGIONAL ARCHAEOLOGY IN THE PEJA AND ISTOG DISTRICTS OF KOSOVA (RAPID-K), 2018-2021: INTENSIVE SURVEY RESULTS**

**Abstract author(s): Galaty, Michael (University of Michigan) - Mehmetaj, Haxhi (Archaeological Institute of Kosova) - Deskaj, Sylvia (University of Michigan)**

**Abstract format: Oral**

In this paper we present the results of three summer seasons of intensive archaeological survey in western Kosova, 2018-2019 and 2021. RAPID-K (Regional Archaeology in the Peja and Istog Districts of Kosova) was designed to generate diachronic settlement data for the Dukagjii region, building upon prior extensive surveys. Thus far, we have discovered 50 previously unknown sites, 15 of which are prehistoric, dating from the Neolithic through Iron Age. One of these sites is Pepaj, a very large prehistoric settlement discovered in 2018. Unlike many prehistoric sites in the region, which are hill forts, Pepaj is situated on (relatively) flat land. In 2019, we excavated 30 shovel tests at Pepaj, documenting dense Late Bronze – Iron Age occupation at the site. In 2021, we conducted a magnetometer survey at the site, with interesting results, including several linear anomalies. When combined with broader survey results, data from Pepaj help explain shifts in settlement location from the Bronze Age through Roman conquest. Survey results from western Kosova can be profitably compared to survey results from northern Albania, revealing both similarities and some differences.

#### **15 EXPLORING THE MULTIPLE ROLES OF HILLFORTS IN PREHISTORY: A CASE STUDY FROM WESTERN KOSOVA**

**Abstract author(s): Baci, Erina (University of Michigan)**

**Abstract format: Oral**

Traditional interpretations of hillforts conclude that their role in prehistory was as defensible sites or refuges. While this was surely the case, I aim to further investigate this understanding by exploring the multiple additional roles these strategically located sites may have filled in prehistory. In this paper, I present some of the introductory results of my dissertation research in Western Kosova. For my dissertation, I explore how the prehistoric pastoral inhabitants of western Kosova and northern Albania used their landscape. I focus specifically on hillforts and assess their function(s) in the prehistoric landscape. This work is based on data from surface collections and magnetometry survey collected in July 2021 at three hillforts; Vrellë, Lubozhdë and Syriganë, as well as preliminary test excavation data collected in July of 2022 at Lubozhdë and Syriganë. Also considered is data from three survey seasons from the RAPID-Kosova project, which cover a large swath of the region of Dukagjii, where the above mentioned sites are situated. The sites of Vrellë, Lubozhdë and Syriganë were selected because they share a common characteristic; they are strategically located along the southern slopes of the Albanian Alps, overlooking the region of Dukagjii. This means they have wide views of their surroundings, which encompass key flat settlements below. However, the magnetometry and surface collection results return three different profiles, which I argue are influenced by their variations in their size, elevation, and underlying geology. Together, these physical constraints likely influenced the roles they may have played in prehistory.

#### **16 IRON AGE BETWEEN CENTRAL EUROPE AND BALKANS - CLASH OF THE WORLDS OR FINE EMBROIDERY**

**Abstract author(s): Potrebica, Hrvoje (Dept of archaeology)**

**Abstract format: Oral**

Balkans is more political than geographical term and the nature of it has been highly reflected in history of research in the area. Different approaches, language barriers and lack of knowledge transfer resulted in different narratives that somehow also determined notion of Balkans in prehistory of the southeastern Europe. The best illustration of that is probably the area between the central and southeastern Europe, or Northern Balkans. Even in the area of the Eastern Hallstatt Circle definition of the Iron Age cultural groups proves to be more arbitrary construct based on different theoretical criteria than actual reflection of archaeological data. In the area that we call Balkans this is even

more complicated by identification of cultural groups and ethnicities. This approach is both product of theoretical background of archaeology in this area and actual references in Roman and Greek sources. Solution to this could be switch of scale. Instead of trying to redefine larger cultural units we should probably start on level of individual communities and build knowledge and understanding of larger areas from bottom to the top. We will use example of the border between "Hallstatt", Central European, and Balkan cultures to illustrate all of the above mentioned concepts.

## 17 **BEYOND LIBURNIA: EXPLORING IRON AGE BOUNDARIES AND INTERREGIONAL CONNECTIONS IN NORTHERN DALMATIA**

**Abstract author(s):** Celhar, Martina (University of Zadar) - Zaro, Gregory (University of Maine)

**Abstract format:** Oral

The archaeological site of Nadin-Gradina has long been recognized as one of the largest and most distinctive Liburnian and Roman settlements in Dalmatia. Centrally located in the Ravni Kotari along Croatia's Adriatic coast, this Liburnian settlement was established by at least the 10th century B.C. and was transformed into the Roman municipium Nedinum by the 1st century A.D. The rich artifact assemblage from both settlement and necropolis contexts reflects continuous Iron Age occupation for nearly a millenium and can be used to evaluate the degree to which the Liburnians of northern Dalmatia were engaged politically and socially with cultures and communities around the Adriatic Basin, Balkan Peninsula, the Eastern Mediterranean, and beyond. Analysis of pottery, metal, and other artifact classes point to a complex and shifting array of cultural connections beyond the Liburnian heartland. Although varying in intensity and geography throughout the Iron Age, our results suggest that the Nadin community was strongly oriented toward the Italic world, particularly via cross-Adriatic connections, with additional significant ties to the neighboring Iapodian culture to the immediate northeast. Relationships with more distant societies across the Balkan Peninsula, however, remain much more ephemeral and difficult to characterize.

## 18 **COLONIALISM AND NATIONALISM IN EARLY BALKAN ARCHAEOLOGY**

**Abstract author(s):** Gimatzidis, Stefanos (Austrian Archaeological Institute, Austrian Academy of Sciences)

**Abstract format:** Oral

The Balkans were conceptualized as an archaeological entity within the wider field of European archaeology following previous paradigms such as that of the Mediterranean, the Aegean or even central Europe. The definition of all these notions suffers from a geographical and ecological determinism that often fosters the misrepresentation of the Balkans as cultural and historical entity. The conceptualization of the Balkans as a cultural and historical entity is an invention of Anglo-American scholarship that distanced itself in this way from their subject of their study in a similar way as they did with the Mediterranean. Previous anthropological critique has understood this approach as a disciplinary manifestation of Orientalism.

This paper scrutinizes the motivation, objectives and perception of some of the earliest archaeological explorations in the Balkans. These included the excavation of tumuli and tells, which were the most emblematic monuments encountered by the allied English and French troops in the Macedonian front during the First World War. Their treatment encompasses aspects of colonialism and regional nationalism, both inherent values of archaeology, and presents an opportunity for the examination of the notions of Balkanness, Balkanization and Balkanism.

## 19 **JOVAN CVIJIĆ'S ANTHROPOGEOGRAPHY OF THE BALKANS: LONGUE DUREÉ BEFORE BRAUDEL**

**Abstract author(s):** Novakovic, Predrag (University of Ljubljana)

**Abstract format:** Oral

Though Braudel's idea of observing the history through three temporalities (long-, middle- and short-term histories), presented in his book on the history of the Mediterranean in the Age of Philip II, is rightly considered as an important conceptual novum, several of his ideas are based on works of some earlier scholar, the idea (and content) of *longue dureé* in particular. The notion that historical processes are associated with the effects and changes of the natural environment is very traditional and is associated with anthropogeography, in Braudel's case, particularly with that of Paul Vidal de la Blache (1845 – 1918). While typical, e.g. Ratzelian anthropogeography at the end of the 19th century advocated strong geographic determinism, Vidal de la Blache proposed a softer version – possibilism. Though bound by the natural environment, humans still can choose between the possible alternatives (i.e. ways of life).

At the same time, similar ideas were also developed by Jovan Cijić (1865 – 1927), a Serbian geographer who authored a highly influential monograph on the Balkans (*La Péninsule Balkanique: Géographie Humaine*), published in Paris in 1918, later revised in the Serbian language (1922, 1931). Cvičić's synthesis of the Balkan's human geography soon became 'the book about the Balkans' and was very influential in many fields (geography, history and ethnology in the first place). A closer reading of his works reveals a combination of views of Ratzel, Vidal de la Blache, and his original ideas about the *genres de vie* in the Balkans. In this sense, this paper, to a certain degree, contradicts the title of this session (No Braudel for the Balkans) and aims to demonstrate the closeness of Cvičić's and Vidal de la Blache's concept of geography, and why, despite its great potential, Cvičić had only limited impact on local archaeology.

## A. WHAT TOOK YOU SO LONG? EXPLAINING GAPS BETWEEN THE INITIATION AND THE WIDE SPREAD OF TIN BRONZE IN THE BALKANS

**Abstract author(s):** Nessel, Bianka (Institute for Pre- and Protohistory, Mainz University)

**Abstract format:** Poster

Studies of early tin bronzes usually focusses on the provenance of the raw materials or the occurrence of individual artifacts at certain sites. It is obvious that tin bronze is adapted at different times and with different speed in various regions. Areas or communities, which are slow to embrace bronze metallurgy, are, however, usually investigated less intensively. In some cases, they were treated as "backwater regions" at least for the considered timeframe. Although this is not true for the Balkans, it remains a riddle why communities reject or ignore an innovation for a fairly long time, which has so much potential and such a high impact on everyday life? This poster presentation lays out an interpretation of the reasons behind fast or slow adaptations of tin bronze in the second half of the 3rd and first half of the 2nd millennium BC. It seems that not only the peculiar organization, but especially the longevity and stability of communities are key aspects regarding the participation in supra regional networks necessary to procure copper and tin. This research aims to reveal patterns of the handling of tin bronze during this early period, to get a better understanding of the mechanisms behind large-scale exchange networks for tin and bronze in Europe and their development in time and space.

## B. THE COMPLEX OF TUMULI IN NECROPOLIS OF DOLLC (KOSOVO)

**Abstract author(s):** Baraliu, Sedat (University of Pristina-Faculty of Philosophy; Faculty of Education) - Alaj, Premtim (Archaeological Institute of Kosovo)

**Abstract format:** Poster

The poster presentation, The Complex of Tumuli of Dollc, presents the archaeological data discovered during excavations in 2021, in the tumuli near the village of Dollc, Kosovo. The necropolis of Dollc consisted of 3 tumuli which lay on hilly-mountainous terrain. The tumuli were sized differently; their diameter reached from 12-15 m, with height 0.60-0.85. They lay on a surface of 10-12 gold and the distance between them was close. The maximum distance between each other was 37m meanwhile the minimum was 20m.

The tumuli were hemispherical in shape and were built largely of stones with very little soil. The tumuli were built of ground stones; the peripheral ring of the tumuli was built with larger stones, while the cover of the tumuli and tombs with medium and small stones. Each tumuli was erected over the central tomb and other accompanying tombs.

The three tumuli were bounded by rings built of large stones which surrounded the tumuli. The graves were contoured with stones of medium and large size; most of them were also rich in accompanying material such as: fragments of vessels, ornaments, weapons, etc. The burial rite in all cases is by cremation, with fine remains of the bones of which were very damaged. Based on the pottery discovered during the excavations, these tumuli belong to the last phase of the Iron Age, VI-IV centuries BC."

## C. USAGE OF PREHISTORIC TALI (ASTRAGALI) FROM NADIN, CROATIA

**Abstract author(s):** Kolenc, Magdalena - Korpes, Kim (Faculty of Veterinary Medicine, University of Zagreb) - Čelhar, Martina (Department of Archaeology, University of Zadar) - Trbojević Vukičević, Tajana (Faculty of Veterinary Medicine, University of Zagreb)

**Abstract format:** Poster

Talus (formerly known as astragalus) is one of the tarsal bones with prominent ridges proximally and cylindrical part distally. Due to their unique shape, tali have been used through history for games, divination, offerings to the gods, rituals, talismans, measuring and loom weights. A total of 70 tali were found in Nadin, Croatia. They were excavated from the Tomb 105 dated to 2nd and 1st century BC, where over 220 human skeletons were exhumed. The archaeozoological analysis was conducted in order to determine animal species and the type of modifications made by humans. Even 92,86% of tali belonged to small ruminants (sheep and goat) and the rest of them belonged to cattle, pigs, and dogs. Pigs' tali were artificially flattened distally, whereas 17 small ruminants' tali were flattened laterally and two laterally and distally. Drill holes were recorded on one goat and three sheep tali. The sheep talus with two holes on plantar side also had asterix engraved on its lateral side. Cutmarks were found on the dorsal side of two small ruminant tali. One sheep talus was horizontally cut on its proximal side. A large number of artificially flattend tali indicate their usage as dice or burnisher. Those which were found with holes could have been used as amulets. Unfortunately, it is not possible to establish the original position of the deceased in Tomb 105 due to their secondary movement, except for a few deceased in the crouched position in the lowest layers. So, it is not possible to attribute certain parts of an attire, jewelry or other material, including tali to a particular person, gender or age group. Therefore, without clear context, it is hard to infer the role of tali, however, we can conclude that they had special meaning to the people in Nadin.

**Theme: 2. [Re]integration**

**Organisers: Gomes, Francisco (UNIARQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities of the University of Lisbon) - Machuca Prieto, Francisco (University of Málaga)**

**Format: Regular session**

In the last decades, interest in the topic of cultural memory has been growing in Archaeology. Pioneering studies of "the past in the past", focusing on the analysis of the (re)use(s) of older sites, structures, and objects, have been expanded by new approaches, such as landscape analysis, chronological modelling, mobility analysis, and archaeogenetics, to produce a more nuanced understanding of the ways narratives about the past were constructed and deployed by specific groups and agents.

While prehistoric, medieval, and later contexts deserved particular consideration, growing attention has been paid to the subject of memory-building and to narratives about the past in the European Iron Age, during which the spread of writing gave rise to interactions between non-written and written mnemonic regimes which transformed the ways in which memory was shaped and transmitted. Simultaneously, there has been a growing interest in the role of cultural memory in the Ancient World, as part of studies on the responses to the globalizing processes associated with empire-building and the emergence of local identities.

Cultural memory has been shown to be a critical aspect of the negotiation of sociopolitical structures and the construction of identities during these periods. This session aims to further explore the ways in which narratives about the past were built and deployed as part of broader processes of identity construction, while fostering a theoretical and methodological discussion on the study of cultural memory through archaeological sources.

For this purpose, we invite participants to present case studies from Europe and the Mediterranean which reflect the tools which can be used to trace memory-building processes in the archaeological record, to reconstruct the outline of narratives and discourses about the past built and deployed by ancient communities, and to assess the uses of cultural memory in the negotiation of social, political, and cultural identities.

## ABSTRACTS

### 1 CULTURAL MEMORY IN PROTOHISTORIC AND ANCIENT MEDITERRANEAN SOCIETIES: AN HISTORIOGRAPHICAL INTRODUCTION

**Abstract author(s): Machuca Prieto, Francisco (University of Malaga, Department of Historical Sciences) - B. Gomes, Francisco (UNIARQ - Centre for Archaeology of the University of Lisbon, School of Arts and Humanities of the University of Lisbon)**

**Abstract format: Oral**

Memory and its uses are not neutral. As noted by authors such as M. Halbwachs and J. Assmann, memory, in collective terms, is a powerful tool for identity building, and has been so since the dawn of Humanity. Within each particular society, the performative construction of collective memory consolidates a shared interpretation of what happened or what is worth remembering. This idea has made significant headway in archaeological research in the last three decades, as illustrated by a growing number of works dealing with memory in Prehistory and the Ancient world.

However, the different languages and vocabularies on this topic may confuse those who approach this field, so a necessary first step is to summarize the meanings ascribed to terms like "collective", "social" and "cultural memory". Of these three concepts, the latter, put forward by J. Assmann, has undoubtedly had the greatest impact. In his view, "cultural memory" is nothing other than the remembrance of the past from shifting perspectives in the present.

This phenomenon of production, reproduction, and transformation of narratives about a collective past was already common during the European Iron Age and Antiquity. Studies such as those by E. Bickerman on the Greek world, and, more recently, R. Goloseffi on Pre-Roman Gaul, F. Marco Simón on Pre-Roman Iberia or K. Galinsky and K. Lapatin on the Roman world have made this clear.

From a combination of literary, iconographic, and archaeological sources, the approaches of these authors to "cultural memory" confirm not only that remembering is an act of creation of meaning in the present through the past, but also that the exploration of the ways in which narratives about the past were built and deployed as part of broader processes of identity construction is a field of study which still holds great potential.

## 2 BUILDING MEMORIES: PAST ARCHITECTURES AND THE MATERIALIZATION OF A “SENSE OF PLACE” IN WESTERN SICILY, 9TH – 6TH CENTURIES BC

**Abstract author(s): Ferrer-Martín, Meritxell (Universitat Pompeu Fabra)**

**Abstract format: Oral**

Between the later Bronze Age and the Iron Age, Sicily experienced a deep process of social, political, and economic transformation that, from the mid-8th century, was stressed by the establishment of several Phoenician and Greek communities in its coast and the subsequent establishment of regular relationships among these three communities. Traditionally, this process of transformation has been read from the colonies, considering them as the only motor of change and, consequently, the presence or absence of colonial elements have been established as a perfect measurer of the grade of acculturation that the indigenous communities presented.

Against this discourse that subordinate the local agency to the interests of the colonies, turning them into simple receptors of the colonial innovations, my interest in this communication focuses on the analysis of the architectures of their main communal ritual places, the so-called acropolis, from a local and contextual perspective. Particularly, to examine how these communal architectures -mostly those that reuse ancient architectural models- participated in the creation, negotiation, and legitimation of the social memories that these communities constructed between the 9th and the 6th centuries BC.

## 3 (RE)INVENTING TRADITION: CULTURAL MEMORY AND THE RISE OF RURAL SOCIETIES IN THE EARLY IRON AGE OF SOUTHERN PORTUGAL

**Abstract author(s): Gomes, Francisco (University of Lisbon)**

**Abstract format: Oral**

The first contacts between the local Southern Portuguese communities and the groups of Levantine origin which settled in the Southern Iberia Peninsula at the beginning of the 1st millennium BCE set in motion a historic process which ultimately led to the rise of the regional Iron Age. This process, however, was far from linear or uniform: geographical conditions produced marked asymmetries between the communities in coastal areas, which quickly became embedded in the so-called “Orientalizing” networks and developed into urban social forms, and the communities of the interior.

In the latter area, the Late Bronze Age – Iron Age transition seems to have been a period of crisis, and the sociopolitical structures which arise after said crisis are quite different from those in coastal areas. Here, a dispersed settlement pattern organized in open, heterarchical networks of a markedly rural nature seems to have been the norm, and different groupings with a strong personality can be identified.

Several aspects of the archaeological record of these rural communities of the interior indicate that shared narratives about the past played a key role in the negotiation of their new sociopolitical structures. The highly visible settlements of the previous period were abandoned and almost avoided, while landmarks and practices connected to ancestral communities predating the Late Bronze Age increase in hierarchization, including Prehistoric monuments but especially funerary structures dating to the Middle Bronze Age, were revisited, reinvented, and appropriated as a blueprint for a new model of society.

It can therefore be argued that, in this case, Cultural Memory, built through the trauma of societal collapse and the shared experience of negotiating a new social model, was a key shaping force in the rise of this Early Iron Age rural communities and in the navigating the new geopolitical circumstances in which they became embedded.

## 4 THE SACRED PAST: MEMORY AND THE CONSTRUCTED LANDSCAPE OF THE SORTE MULD SETTLEMENT

**Abstract author(s): Maddox, Timmis (University of Wisconsin-Milwaukee) - Caretta, Nicolas (Bornholms Museum) - Czonstke-Świątkowska, Karolina - Świątkowski, Bartosz (University of Gdansk)**

**Abstract format: Oral**

Over the past five decades, the archaeological community has worked to understand why human communities choose certain points in the landscape to inhabit. Of the potential reasons listed, a popular argument is that certain spots may have possessed significant social value prior to occupation, giving communities extra incentive to gather there. This approach has often been used to investigate the Scandinavian central places, large complex sites which emerged throughout the region during the Iron Age. Representing the earliest examples of urbanism in Scandinavia, sites such as the Danish settlement complex of Sorte Muld were occupied for over a thousand years and housed large populations in comparison to earlier sites. In the summer of 2021, excavations at Sorte Muld uncovered a large Bronze Age mound close to the central site of the agglomeration. While not only giving excavators their first real glance of the earlier Bronze Age landscape of this site, the following paper argues that this structure also provides archaeologists with potential suggestions as to why so many gathered here: particularly the pre-existing social value invested in this landscape due to living collective memory.

## 5 COLLECTIVE MEMORY AND EXTREME EVENTS. SYMBOLIC IMPLICATIONS OF A POSSIBLE EARTHQUAKE IN THE ROMAN LEVELS OF LOS CASTILLEJOS (MÁLAGA, SPAIN)

**Abstract author(s):** Martín Casado, Juan Manuel (Universidad de Málaga)

**Abstract format:** Oral

In the last few years, the study of extreme environmental phenomena has been gaining protagonism in historical research, creating a denominated "history of disasters" (Van Babel et al. 2020). In this new field of research, important efforts have been made to delimit methodological and conceptual boundaries in order to provide it with the necessary framework for understanding and explaining the past. Two aspects that are being particularly focused on are the elaboration of solvent, non-reductionist explanations (Sessa, 2019) and the definition of the chronological frame of reference, an aspect that has already been highlighted as being of particular friction (Izdebski et al, 2016: 14) since the interdisciplinary nature of this research requires collaboration between disciplines with different interests.

In our communication we will approach a study from the temporal perspective of the *longue durée* (Braudel, 1958; Le Roy Ladurie, 2006), a formulation that we adopted in our thesis work as we consider that it offers a solvent interpretative platform to analyse the incidence of phenomena such as earthquakes, tsunamis or climactic changes. We will use a cross-cultural perspective (Bankoff, 2003: 159) to explore how the impact of this type of catastrophe is projected onto the material culture and the symbolic, religious and memory spaces of the affected communities. As a case study, we will expose how a possible seismic event documented at the Ibero-Roman site of the so-called Cerro de Los Castillejos (Martín Casado i.p.) may have contributed not only to cause physical damage with the abandonment of the settlement but also symbolic damage, turning part of the site into a "marked place" from which its inhabitants interpreted that it was important to disassociate from.

## 6 MAKING MEMORIES IN THE MOUNTAINS. THEORIZING CULTURAL MEMORY AT ROMAN IMPERIAL AND LATE ROMAN (25BCE-C.400CE) SAGALASSOS (SW ASIA MINOR)

**Abstract author(s):** Beaujean, Bas (Sagalassos Archaeological Research Project)

**Abstract format:** Oral

Jan Assmann subdivided collective memory into bonding and cultural memory. He considered the former as 'everyday communication' and limited its mnemonic efficacy to only 80-100 years. In contrast, cultural memory revolved around those parameters which are not restricted to the human body (e.g. texts, monuments, institutions), and are vital to the long-term continuation of social groups. While countless archaeological studies have nuanced and/or overcome this modernist dichotomy, the dynamics between the long- and short-term aspects of cultural or social memory processes often remain difficult to conceptualize. For Roman Imperial Asia Minor, this is partially an issue of preservation, as ashlar buildings and honorific monuments preserve better than the many activities which occurred within or around them. To address this disconnect, this paper considers several concepts from Assmann's cultural memory from the perspective of relational theories. Firstly, this paper presents the diachronic changes in the urban archaeological record of Roman Imperial to Late Roman (25 BCE-c. 400 CE) Sagalassos (SW Asia Minor). Secondly, by considering the little evidence of mundane activities at Sagalassos, as well as through contemporary analogies, the local diachronic potential of what Assmann called bonding memory is explored. Last, the considered concepts are used to theoretically explicate the dynamics, by determining if they can explain the diachronic patterns in the archaeological record (25 BCE-c. 400 CE), and do this without resorting to a modernist dichotomy.

## 208 TELLING STORIES ABOUT IMPACTS OF ACADEMIC RESEARCH IN ARCHAEOLOGY ON SOCIETY: WIDER LESSONS FROM THE UK RESEARCH EXCELLENCE FRAMEWORK EXPERIENCE [EAA EXB]

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Foster, Sally (University of Stirling; EAA) - Holtorf, Cornelius (Linnaeus University; UNESCO)

**Format:** Round table

This session asks what we can learn from the UK's recent Research Excellence Framework (REF) experience of university academics having to formally generate, measure and evaluate non-academic impact of their archaeological research.

The REF publishes the results of its 2021 assessment of the quality of research in UK higher education institutions (HEI) in May 2022. The outcomes of this massive enterprise, last undertaken in 2014, affect future HEI funding, with 25% of each score now relating to impact. Over 60 diverse Impact Case Studies for archaeological and related heritage research will be published ([www.ref.ac.uk](http://www.ref.ac.uk)) and offer insights into the character of existing practices.

We aim to explore the following:

- Should archaeological research be evaluated in relation to its public benefits and impact on society, what does that mean, and can it be measured by criteria such as reach and significance?
- What are the trends across Europe in evaluating archaeology's public benefits and impact on society?

- What are the practical challenges and opportunities that arise from any formal requirements of evaluation, and how can we help each other to enhance our performances or change the requirements?
- In the wider context of the drive for Archaeology to demonstrate and improve public benefits and impact, what can we learn going forward?
- We particularly welcome attendance from academics with diverse geographical experience of researching in European Universities. Discussants will include:
  - David Mattingly (University of Leicester, Chair of Archaeology REF Panel) – UK context, processes of measurement and evaluation
  - Sally Foster (University of Stirling) – character of non-academic impacts and pathways to impact in the UK context
  - Peter Hinton (Director, Chartered Institute for Archaeologists) – comparing the agenda for non-academic impact beyond universities
  - Cornelius Holtorf (Linnaeus University) – a non-UK counterpoint based on Sweden.

## 210 DIGGING WOMEN: USE AND MISUSE OF ANCIENT WOMEN AS ROLE MODELS IN ARCHAEOLOGICAL RESEARCH AND DISSEMINATION [AGE]

**Theme:** 4. Polls, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Garcia-Ventura, Agnes (Universitat Autònoma de Barcelona) - Droß-Krüpe, Kerstin (Ruhr-Universität Bochum) - Martins, Ana Cristina (IHC-FCSH NOVA – Pólo Universidade de Évora and Uniarq-UL) - Fulminante, Francesca (University College London; Bristol University; University Roma Tre) - Mouriño Schick, Andrea (Universidade de Vigo)

**Format:** Regular session

By the 1960s and 70s the absence of female protagonists from mainstream historical and archaeological narratives had been acknowledged; and “looking for women” in the past became a goal for women’s studies. Newly rediscovered women from the past were then integrated into courses, lectures, and books about women’s history, which generally caught the attention of a mostly female audience.

However, this scenario did not solely arise in the second half of the 20th century. For example, in her 1889-1890 public lecture tour, through the United States of America, the Egyptologist and writer Amelia B. Edwards (1831-1892) talked about “The Social and Political Position of Women in Ancient Egypt”. In her speeches Edwards used several ancient women to raise and discuss issues relevant to women in her time.

This session aims at highlighting further similar case studies, in the framework of archaeological research and dissemination, from any period or geographical area. We want to analyse and discuss which female role models were promoted or censored in different circumstances. Hence, we particularly encourage contributions that help to highlight how specific women from the past were used (and misused) as models in the education of women in the 19th and 20th centuries. Analyses of lectures, schoolbooks, diaries or correspondence will be especially welcome.

## ABSTRACTS

### 1 INTRODUCTION: ANCIENT WOMEN AS ROLE MODELS IN ARCHAEOLOGICAL RESEARCH AND DISSEMINATION

**Abstract author(s):** Droß-Krüpe, Kerstin (Ruhr-Universität Bochum; Universität Kassel) - Fulminante, Francesca (University College London; Bristol University; University Roma Tre) - Garcia-Ventura, Agnès (Universitat Autònoma de Barcelona) - Martins, Ana Cristina (Pólo Universidade de Évora and Uniarq-U) - Mouriño Schick, Andrea (Universidade de Vigo)

**Abstract format:** Oral

**Introduction:** Ancient women as role models in archaeological research and dissemination

**Abstract:** The analysis of the use of ancient women as exempla for education allows us to reflect about which were the promoted or censored female role models in specific geographies and chronologies. Besides, the activity developed by pioneer women scholars at the end of the 19th century and at the beginning of the 20th century also established feminine role models which, again, were supported or censored. In this introduction we will provide some questions we aim to discuss during the session. These questions include for instance: Which are the sources available to pursue these case studies? How were the female models selected and constructed? Is it possible to identify trends in some countries that differ from those expected in others? How was the influence of pioneer women archaeologists in the framework of archaeological research and dissemination of their time?

## 2 THE “MONA LISA OF NIMRUD” IN THE MUSEO DE REPRODUCCIONES ARTÍSTICAS OF MADRID (SPAIN): BEAUTY AS A FEMININE ROLE MODEL

**Abstract author(s):** Garcia-Ventura, Agnes (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

During the archaeological campaigns directed by Max Mallowan at Nimrud between 1949 and 1956 were found many of the first millennium BCE ivories known as “the ivories from Nimrud”. These consist of a group of ivory plaques and figurines produced mainly in the Levant and in Egypt and then exported to Mesopotamia. Among them there is one that was nicknamed at the time of its finding as the “Mona Lisa of Nimrud”. In this communication I take this piece as a case study to reflect on the use of this image as feminine role model of beauty in archaeological dissemination. To do so, I will develop the communication in two parts. First, I will reflect on the nickname of the piece. It exemplifies the use of the image of a woman of the past – the so-called Mona Lisa (16th century CE) – to interpret in the 20th century CE another feminine image of an older past – the Nimrud ivory (9th-7th centuries BCE). Second, I will concentrate on the plaster cast of this piece in the collection of the extinct Museo de Reproducciones Artísticas of Madrid (Spain). In this museum there were thirteen plaster casts of ancient Near Eastern artifacts. All but this one portray exclusively male characters. This nearly absence of female characters is telling. It shows not only an imbalance in the ancient primary sources, but also a bias in the choices of modern institutions when dealing with archaeological dissemination. To better understand this bias, a brief overview on this collection will be also provided.

## 3 JEZEBEL IN THE CONTEMPORARY VISUAL CULTURE: AN EXAMPLE OF MISUSE OF ANCIENT WOMEN AS A NEGATIVE ROLE MODEL

**Abstract author(s):** López-Bertran, Mireia (Universitat de Valencia)

**Abstract format:** Oral

The Phoenician princess of Jezebel has been a paramount example of the misuse of ancient women in creating a feminine stereotype based on her sexual, sensorial, and sinful features. According to the Ancient Testament (Kings I and II), Jezebel was the daughter of Ithobaal, king of Tyre, who got married with Ahab, king of the Judahite kingdom of Samaria. She was the responsible of introducing the cult of Baal on the Israelite kingdom but was finally killed in accordance with Elijah's prophecy. This historical woman has become even an adjective: following the Merriam Webster dictionary the use of jezebel often as not capitalized defines “an impudent, shameless, or morally unrestrained woman”.

Although some publications have deconstructed this stereotype and empowered the princess (see T. Pippin, 1994; F. Stavrakopoulou 2013, R. Pla Orquín 2019), this communication will explore how the view of Jezebel as seductress have been strengthened through the analysis of some example of contemporary visual culture, mainly films of the second half of the 20th century as, among others, Jezebel by William Wyler or The Sins of Jezebel by Richard H. Landau. These examples participated actively in the promotion of patriarchal ideas of womanhood.

## 4 ROMAN WOMEN IN: COINS TO WAR, COINS TO PROSPER AND COINS TO HONOR

**Abstract author(s):** Pagoto Bélo, Tais (University of São Paulo)

**Abstract format:** Oral

This presentation will aim to explain the iconography of the coins of three important Roman women from the end of the Republic and the beginning of the Empire: Fulvia, Livia and Agrippina the Elder.

Fulvia, who was the wife of Mark Antony, and took control of her husband's affairs while he was away and became involved in the Perusine War against Octavius. Her coins show her as the personification of the goddess Victoria, who in the East was accompanied by Athena on the reverse. However, there are doubts whether this image is really Fulvia, since there is no caption that identifies it. However, such a personified image demonstrates the strength of a woman linked to war and leadership, symbolism that is extolled with Athena on the reverse.

Livia, who was the wife of Augustus, has an extensive monetary iconography, interspersed with personifications linked to goddesses associated with prosperity, fertility, procreation, abundance, such as Ceres/Demeter, Vesta/Hestia, Juno/Hera. Her coins are listed by captions that name her as mater patriae, Diva Augusta and even genetrix orbis, confirming her connection with fertility and sanctioning her characteristics of the ideal Roman matron.

The last Roman to be presented will be Agrippina Major, wife of Germanicus, who was poisoned and then, she was banished to an island at the behest of Tiberius. Her son, Caligula, ended up honoring her in coins during his government, demonstrating the importance of his mother and his ancestry.

The comparison of the iconography of these three Roman women will aim to conclude which were the gender strategies built for these coinages. Consequently, it will be questioned how these women were represented in such objects, since their reproductions should have been designed to send appropriate messages to the public, in view of governmental interests and power struggle.

## 5 **MODEL WOMEN AND WOMEN'S MODELS: ARCHAEOLOGY AND NARRATIVES DURING THE 'ESTADO NOVO'**

**Abstract author(s):** Martins, Ana Cristina (IHC - Polo da Universidade de Évora; Uniarq - Centro de Arqueologia da Universidade de Lisboa; Proyecto 'ArqueologAs' - Universitat de Barcelona)

**Abstract format:** Oral

The period between the 1950s and the 1970s was a period of transition in Portugal, including in scientific terms. Archaeology also bears witness to this, namely with the gradual increase of women contributing to the production of knowledge and archaeological heritage. This situation has resulted in an increase in the number of titles published by women, either as sole authors or as co-authors.

We wonder, however, if this greater involvement of women in archaeology in Portugal urged the search for the female element in primary sources and if there were consequences of this eventual search in (written or iconographic) historical and archaeological narratives published in the country.

Therefore, focusing on ancient period, we will analyse the Portuguese archaeological bibliography published at the end of the totalitarian 'Estado Novo' regime, with a view to identifying possible models of women of the past, as well as how these are presented and what is their expression in different means of their dissemination, for example school textbooks.

## 6 **FEMALE AND MALE ARCHAEOLOGIES IN ITALY FROM THE UNITY TO THE 21ST CENTURY**

**Abstract author(s):** Fulminante, Francesca (University College London; Bristol University; University Roma Tre)

**Abstract format:** Oral

This paper focus on the Archaeology of Italy from the creation of the unitary state (1960s-70s) to the 21st century to highlight the specific contribution of women to this field of research. By analysing the contribution of major female protagonists in Classical Archaeology and Etruscology of Italy, two very traditional and male dominated disciplines, this paper will investigate if the Archaeology made by women has been any different from that made by men. Did women and men have the same opportunities? Did they focused on the same agenda, or did women embrace different topics as their counterpart males? Did Women use figures from the past as exemplar to educate women? While it is undeniable that there have been exceptional protagonists in Italian archaeology who have been women is it sensible to talk about female archaeology in Italy or should we simply talk about great archaeologists who happened to be women?

## 7 **BREAKING THE MOULD WITHIN THE MOULD: GENDER, WOMEN, AND ARCHAEOLOGY DURING THE SPANISH FRANCO DICTATORSHIP**

**Abstract author(s):** Torres Gomariz, Octavio (Universitat d'Alacant; Universitat de Barcelona) - del Reguero González, Jorge (Universitat de Barcelona)

**Abstract format:** Oral

It is nothing new to say that History and Archaeology have been used as a political tool to justify and legitimise, or erase and misrepresent, whatever the ruling classes deem necessary. During the Spanish Franco dictatorship, women had to face a patriarchal regime that condemned them to silence, family, and home. To this end, the ideological apparatus of the regime designed institutions and means of dissemination so that women learned and reproduced what they were destined for. Education was fundamental in providing the ideological basis for the patriarchal regime, and ancient history played an important role in this: the women of the past were vindicated as pious, elegant, and traditional Spanish ancestors. At the same time, the women who dedicated themselves to archaeology, both in universities and museums, tried to make their way in this rigid framework confronting many obstacles and making difficult personal decisions. María Luisa Serra Belabre, María del Pilar Fernández Vega, Encarnación Cabré Herreros and Matilde Font de Tarradell are just some of them. Their trajectories show us their will to escape an imposed destiny for which they nevertheless had to work and collaborate. This work will recompose the model of the Spanish Francoist woman through the dichotomy between the misuse of the women of the past, while at the same time approaching the biographies of women who dedicated themselves to the archaeological exercise, breaking their mould, but still

within their frameworks. This paper is part of the ArqueólogAs project ([www.ub.edu/arqueologas](http://www.ub.edu/arqueologas)), a project aiming at discussing the role of women in Spanish archaeology.

## 8 FEMALE ROLE MODELS IN THE EDUCATION OF PREHISTORY

**Abstract author(s):** Mourriño-Schick, Andrea (University of Vigo)

**Abstract format:** Oral

Within the conceptual framework of Public Archaeology and Gender Studies, we present a case study on the discursive construction of gender in Prehistory's teaching. For this purpose, we analyse textbooks of all educational levels, courses and subjects in which the curriculum presents contents and competencies related to Prehistory between 1980 and 2019. The aim is to identify the prevailing informative patterns and define the historical situations and objects, both in their textual and visual aspects, about the discursive construction of gender, with emphasis on the configuration of the image of women. Similarly, to understand the exposed vision of the prehistoric past and to analyse the stereotypes and sexism installed, their origin and their repercussion on social perception and what role these ideas play in society, and more particularly, what implications they have for women. To this end, a systematic methodology created exprocess is implemented, based on the strategies and tools of analysis of Discourse Theory and Semiotics.

The results reveal how the gender dimension acts as a cultural filter through which a symbolic order originates from which we observe the world and apply it to what we conceive or try to know in which femininity is constructed by otherness. An image of women is projected and transmitted based on their bodies, both in their internal and external anatomical conditions, interpreted from a masculine point of view. Dynamics that we have dragged along overtime, where textbooks and schools play a fundamental role, as they are an almost unavoidable scenario for the majority of society where cultural, current and historical references come into play and contribute to shaping collective and individual identity.

## 9 THE PROBLEMATIC ABSENCE OF WOMEN AS ROLE MODELS FOR FIRST SEMESTER STUDENTS IN GERMANY

**Abstract author(s):** Gutmiedl-Schuemann, Doris - Schuster, Annette (Universität der Bundeswehr München, Department of Social Sciences and Public Affairs, Historical Institute)

**Abstract format:** Oral

In our paper, we will analyse the male dominance in propaedeutic publications, especially books, that were or are used as textbooks in introductory lectures and seminars for first semester students in study programs at Germany universities. For this purpose, we have selected textbooks that were published between the 1950s and 2010s for the use in German-speaking institutions. The books we are

analysing are mainly introductions into pre- and protohistoric

archaeology, and are used in introductory lectures and seminars into pre- and protohistoric archaeology in archaeology study programs. We will show that these publications are on the one hand focussing on methodology, but on the other hand, by introducing the methodology with examples from research history, they are systematically erasing women – both, ancient women as well as female archaeologists. Using narrations of male pioneers and their discoveries and achievements to teach methodology, female and non-binary students won't see humans like themselves represented in archaeology. Role models, however, are important to engage students with research topic and research fields: Therefore, introductory books representing diverse societies are important.

We will show that propaedeutic publications also have their own history, of which lecturers should be aware when using them. After our analysis, we will also discuss possible ways to make introductory lectures and seminars based on these books more inclusive.

This paper emerges from the recently started research project "AktArcha" that focusses on women working in archaeology and their past and present (in)visibility and also reflects the status of them as role models.

---

## 211 RIGHT HERE, LET'S GET IT RIGHT NOW. COLLABORATIVE CREATION OF STANDARDS AND GUIDANCE TO DEFINE GOOD ARCHAEOLOGY IN DIFFERENT JURISDICTIONS

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Hinton, Peter (Chartered Institute for Archaeologists) - Kyle, James (Institute of Archaeologists of Ireland) - Drummer, Clara (CIfA Deutschland) - Hessing, Wilfried (Vestigia Archeologie & Cultuurhistorie)

**Format:** Discussion session

This session is jointly organised by the Chartered Institute for Archaeologists (CIfA) and the Institute of Archaeologists of Ireland (IAI), and builds on CIfA 2020 session on professional standards.

In virtual Kiel we explored how professional standards and their supporting guidance, developed in one jurisdiction, can be adapted for use in others. There, we examined a new model for ClfA guidance, presenting

- the standard that must be met
- high-level guidance on the principles to be applied to different types of archaeological work, that should be applicable to all European jurisdictions and beyond (but needs to be tested and modified)
- detailed guidance on required practice in individual jurisdictions (which can only be prepared by archaeologists who work there – a long project!)

This year, in real Budapest, we will look at consultation versions of ClfA's high-level guidance, and will learn how IAI is reforming its codes and guidance. As an example, we will look at the detailed guidance for Northern Ireland, a product of IAI and ClfA collaboration to support the national heritage body (Historic Environment Division of the Department for Communities), and consider if this way of working translates to other states and regions.

We hope that the national heritage bodies in the UK and Ireland will explain why they are supporting the professional institutes to develop these standards and supporting guidance, what they hope they will achieve, and how – as regulators – they will use them.

But of course we want to hear from beyond that Atlantic archipelago, from those countries where ClfA has a presence and where it doesn't, about whether this approach could specify better outcomes of archaeological work.

## ABSTRACTS

### 1 THE CHALLENGE OF ESTABLISHING A 'LEVEL PLAYING FIELD' – THE ALIGNMENT OF STANDARDS AND GUIDANCE FOR USE IN NORTHERN IRELAND

**Abstract author(s):** Parker Wooding, Jen (Chartered Institute for Archaeologists) - Robinson, Rhonda (Department for Communities, Historic Environment Division)

**Abstract format:** Oral

The Chartered Institute for Archaeologists (ClfA) was commissioned in 2021 by the Department for Communities, Historic Environment Division (HED) to undertake a project focused on reviewing the applicability of Standard and guidance documentation (produced by ClfA and the Institute of Archaeologists of Ireland (IAI)) to archaeological practice in Northern Ireland. The project addresses recommendations in Archaeology 2030: A Strategic Approach for Northern Ireland and aligns with an ongoing ClfA initiative to ensure that their suite of Standards and guidance are up-to-date, accessible, and relevant across all the jurisdictions (where ClfA members practice). Working with consultants from IAC Archaeology this project focused on

- enabling the profession to deliver archaeological activities to consistent and professional standards, to support the delivery of public benefit
- enabling HED, as the regulatory and licencing body for Northern Ireland, to ensure consistent and appropriate standards are applied
- providing a 'level playing field' for all organisations participating in archaeological works or activities in Northern Ireland
- providing clear and consistent information which allow those commissioning archaeological works to understand processes and requirements
- benefiting the conservation of archaeological sites and their associated artefacts, records, and data by providing specific Northern Ireland guidance to help ensure their continued enjoyment by future generations.

This paper will introduce the project, highlighting the challenges involved in aligning Standards and guidance for use across jurisdictions whilst emphasising the potential solutions associated with doing just that.

### 2 STANDARDS AND GUIDANCE IN NORTHERN IRELAND. WHERE ARE WE, HOW DID WE GET HERE, AND WHAT HAVE WE ACHIEVED?

**Abstract author(s):** Robinson, Rhonda (DfC Historic Environment Division)

**Abstract format:** Oral

As the government body regulating archaeological practice in Northern Ireland, Historic Environment Division (HED) commissioned the Chartered Institute for Archaeologists (ClfA) to undertake a review of the application of standards and guidance documentation, produced by ClfA and the Institute of Archaeologists of Ireland (IAI), to archaeological practice in the region. This project emerged as a result of Archaeology 2030: A Strategic Approach for Northern Ireland, in which the archaeological sector identified revised standards and guidance as a key need – in fact it was Recommendation One in the report. What came across clearly in our sectoral engagement was that practitioners wanted easily understood advice on how to implement the standards provided by the Institutes in a specific Northern Ireland context, particularly to meet the requirements of our statutory excavation licensing system in the region. Not

only that, HED staff also strongly articulated the need for specific guidance, both to support them in their role as a regulator, and in undertaking our own range of duties as a government heritage body. This presentation from HED will discuss what we hoped to achieve from the Standards and Guidance project undertaken with the Institutes, and how the results are now being implemented considering:

- How can we achieve the most benefit, and who is the benefit for?
- Reviewing standards and guidance is great – but what about implementing them – both as a regulator and as an archaeologist on the ground?
- Collaboration between the professional institutes and the regulatory body seems obvious – so have we learnt anything new from this project?
- What has the feedback from the sector told us?
- Achieving the end goal - has the Standards and Guidance project got us to where we wanted to be, and have we met the need identified in Archaeology 2030?"

### 3 WHO CAN SET STANDARDS IN AUSTRIA AND GERMANY?

**Abstract author(s): Karl, Raimund (Universität Wien)**

**Abstract format: Oral**

Following a 1999 exemplar by the Verband der Landesarchäologen, all German State Monuments Agencies and also the Austrian Federal Monuments Agency have all adopted 'guidelines for archaeological fieldwork'. These, the heritage authorities pretend to be general quality standards applicable to all fieldwork in their respective jurisdiction, claiming they become legally binding by being attached as conditions to research permits issued for fieldwork. That there is a different one for each German state (and in one state, even more than one) is sometimes explained by 'legislative differences' between the various jurisdictions.

Yet, in this paper, I will argue that this is utter tosh. These 'standards' attached to permits – permits which themselves are sometimes issued illegally for fieldwork falling outside the issuing agency's jurisdiction – mostly are illegal. Neither are they primary nor secondary legislation themselves, nor are they based on any such. They are not even valid administrative rules; leaving aside that even if they were, they could not restrict the fundamental civil rights of archaeologists they interfere with because that would violate the fundamental constitutional principle of the rule of law. And for good measure, some rob archaeologists of their intellectual property rights or completely void their academic freedom, mainly for the benefit of the public officials who wrote them.

So if these are illegal, who can set standards? Certainly not the state, since where academic endeavours like archaeology are concerned, it is constitutionally prohibited from doing so. Ah, if only there were another system for setting standards in Austria and Germany!

Oh, but there is? In Austria, even one regulated by law, the Normengesetz (standards law), which has been around since, what, 1954? So why, then, haven't we been using that system? In this paper, I'll hazard a guess (or two).

### 4 BEWARE OF THE DIFFERENCE! A WARNING TO THE STANDARD-SETTERS

**Abstract author(s): Carman, John (University of Birmingham)**

**Abstract format: Oral**

All professions have their standards of acceptable performance: they would not be professions if they did not. Some such standards can be transferred across territorial and cultural boundaries without problem, but others travel less easily. While archaeology is certainly a global endeavour, in attempting to set professional standards for archaeology that can be applied globally, a number of complex issues have to be addressed which may make the adoption of common standards difficult or even impossible. They are issues that go deep into the history of archaeology as a field of endeavour and are not simply those that arise out of practical difficulties.

There are three areas that need to be taken into account in understanding how archaeology 'works' in any particular context and which need to be accommodated in setting any universal standards:

- Structures of governance and decision-making, which are determined by ideological rather than merely practical considerations and which establish in particular the regulatory framework under which archaeologists work;
- Ideas of what constitutes and can constitute archaeological material; and
- The historical development of archaeological policies and practices which 'act back' on both.

This paper will consider the consequences of these elements for setting a global standard for archaeological work.

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Rose, Thomas (Department of Archaeology, Ben-Gurion University of the Negev; Scienze dell'Antichità, Facoltà di Lettere e Filosofia, Sapienza - Università di Roma; Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum) - Paladugu, Roshan (Universidade de Évora; Sapienza - Università di Roma) - Giaccari, Matteo (Department of Environmental Biology, Sapienza University of Rome)

**Format:** Regular session

The diversity of isotope studies in archaeological research is increasing at a rapid pace. Despite being initially limited to niche roles, applications like dietary reconstruction with stable carbon isotopes, the provenance of raw materials with lead isotopes or radiocarbon dating became popular over time and are now considered standard methods. Advancements in instrumentation, new isotope systems, and novel methods of interpreting data opened up new pathways for reconstructing ancient times. At the same time, standards for working with legacy data and for the publication of high-quality data become more and more critical because both the amount of both, legacy data and new analyses, are rapidly growing.

Unfortunately, discussions about good practices remained somewhat limited in isotope archaeology and are either restricted to a small part of the community and/or are happening in neighboring fields. However, many aspects of isotope archaeology are independent of specializations and materials. Moreover, everyday business, publication pressure, and the precariousness of today's Academia make it hard to find the time for strolling away from one's specialization, systematically exploring new research fields, and getting inspired by unconventional methodological approaches of colleagues.

We, therefore, invite contributions dealing with the application of isotopes to archaeological materials and research questions in the broadest sense possible. This session aims to offer inspiration from and discussion about the work of colleagues you otherwise might only come across by chance and to provide a forum for exchange beyond the borders of specializations and materials.

## ABSTRACTS

### 1 FOODWEB ISOTOPIC VARIABILITY IN THE EARLY NEOLITHIC: DETAILED ANIMAL BASELINE RELEVANCE AND IMPLICATION IN THE AISNE VALLEY (5100-4900 BC)

**Abstract author(s):** Herrscher, Estelle - André, Guy (CNRS, Aix Marseille Univ, LAMPEA) - Hachem, Lamys (Inrap; Trajectoires UMR 8215) - Bedault, Lisandre (Trajectoires UMR 8215) - Thévenet, Corinne (Inrap; Trajectoires UMR 8215) - Hamon, Caroline (Trajectoires UMR 8215) - Balasse, Marie (MNHN, CNRS, AASPE UMR 7209) - Ilett, Michael (Trajectoires UMR 8215)

**Abstract format:** Oral

Based on the great quality and abundance of archaeological data on the LBK in the Aisne Valley (Paris Basin, France), the study of food practices -faunal remains and cereal processing- revealed economic patterning within the settlements. As regards surplus in these first farmers' houses, the larger ones appear more involved in stockbreeding and cereal consumption, whereas the smaller houses show a slightly stronger contribution of hunting and its by-products, suggesting differences in the economic maturity of households. Expansion of the analysis to networks of know-how for pottery manufacture led to the proposal of a model of village organization marked by the integration of new inhabitants through time. Based on this exceptional context, an isotopic study (C, N S) of human dietary practices was designed to characterize the relationship between humans and their surrounding natural and anthropogenic environments and understand how the socio-cultural structure of can be reflected by dietary choices, at the individual and family levels. To ensure reliability of human isotopic ratios interpretation, a detailed analysis of animal isotopic data was firstly conducted to propose a high-resolution isotopic baseline representative of natural environment and herding management over 200 years (5000-4800 BC). This baseline is elaborated from 205 domestic and wild animal samples, corresponding to 11 taxa, sampled from 9 archaeological sites located east-west along the Aisne Valley, over a distance of about 50 km. In agreement with the geographical setting and taxa, isotopic ratios show expected wide ranges. This high-resolution analysis combining chronological, archaeological and biological criteria will make it possible to identify the impact of environmental and socio-cultural factors involved in the isotopic variability of animal proteins in order to propose and discuss the interest and limitations of a standard local food resource model.

This research is funded by the HOMES project directed by Caroline Hamon (ANR-18-CE27-0011-01).

## 2 THE DIET SYSTEM OF THE BRONZE AGE EAST EUROPE POPULATION AND DIETARY RESOURCES: INTERPRETATION OF STABLE ISOTOPE DATA

**Abstract author(s):** Shishlina, Natalia (-)

**Abstract format:** Oral

Reconstruction of Bronze Age food components by traditional archaeological methods has been successfully complemented by stable isotope analysis. Traditional archaeological materials and data of archaeozoological analysis suggest that the forest Volosovo population diet had many food components associated with hunting and fishing. Steppe Yamnaya inhabitants consumed meat and milk of domesticated animals, hunted games; the analysis of vessel residue and interdental teeth space revealed importance of the plant component. Determination of the nitrogen and carbon isotope ratios in the diet system components of the Volosovo populations inhabiting the forest belt and the Yamnaya population living in the steppe areas of eastern Europe in 4000–3000 has provided an opportunity to discuss the relationship between isotopic values of other diet components and specific isotopic composition of humans. Our study has demonstrated that the Volosovo population actively exploited forest resources and consumed mushrooms, probably, nuts and fish in smaller quantities as evidenced by a lack of the reservoir effect in the human bones. Elevated carbon and nitrogen isotope values of the Yamnaya population bone tissue were, probably, also caused by consumption of food products with an elevated nitrogen isotope value, most likely, mushrooms and nuts as well as water components. Differences in the isotopic composition of human bones can help clarify the areas of the exploited natural resources.

## 3 UNDERSTANDING THE PAST THROUGH THE PRESENT: THE IMPORTANCE OF CONTROLLED FEEDING EXPERIMENTS IN ISOTOPE ARCHAEOLOGY

**Abstract author(s):** Gutierrez, Eléa (Department of Archaeology, University of Aberdeen; Department of Biological Sciences, University of Aberdeen) - Mitchell, Sharon - Hambly, Catherine (Department of Biological Sciences, University of Aberdeen) - Speakman, John (Department of Biological Sciences, University of Aberdeen; Shenzhen Key Laboratory of Metabolic Health, Shenzhen Institutes of Advanced Technology; Centre of Excellence in Animal Evolution and Genetics, Chinese Academy of Sciences) - Britton, Kate (Department of Archaeology, University of Aberdeen; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology)

**Abstract format:** Oral

The stable isotope analysis of human and animal remains has become an indispensable tool in palaeodietary reconstruction. Many feeding experiments have been undertaken to estimate the source of variation in trophic isotopic fractionation for carbon, nitrogen and sulphur. Typically these studies are conducted in ecological or biological sciences, and these have permitted archaeologists to estimate trophic isotopic fractionation factors and anticipated diet-tissue offsets for some of the most commonly preserved archaeological tissues e.g. bone, hair. However, beyond the reconstruction of dietary inputs, specific experimental studies under controlled nutritional conditions are needed to examine changes in isotopic fractionation that may be specifically related to the physiology of the individual, but which can also influence the isotope chemistry of preserved tissues. Indeed, there are uncertainties surrounding the effect of food deprivation (e.g., fasting, starvation) on macronutrient metabolism, diet-tissue isotopic offsets and tissue turnover in mammals. Despite numerous studies in other disciplines to understand how the metabolism is working in the context of starvation, very few studies have focused on the specific tissues in archaeology. In this context, the use of controlled feeding experiments is extremely relevant in order to better reconstruct the dietary conditions of past populations. To this matter, we will present various studies carried out on calorically restricted mice and how the alliance between biology and archaeology can enhance the application of multi-isotope methods for the study of the past.

## 4 PRESERVING BARLEY IN PEAT HEARTHES: EXPERIMENTAL ARCHAEOLOGY, STABLE ISOTOPES AND THE IRON AGE SITE OF CLACHTOLL BROCH, SCOTLAND

**Abstract author(s):** Walker-Friedrichs, Fiona - Gröcke, Darren (Durham University) - Heald, Andy - Cavers, Graeme - Robertson, Jackaline (AOC Archaeology Group) - Church, Mike (Durham University)

**Abstract format:** Oral

Little is known about how peat fires influence the preservation and stable isotope values of cereal grains recovered from archaeological hearths. Stable carbon and nitrogen isotope ratios ( $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$ ) can be used to reconstruct agrarian practices from these grains. Therefore, a series of archaeological experiments with peat hearths was conducted, adding a set number of grains of Bere barley, an Atlantic Scottish landrace, to each hearth. The experiments simulated Iron Age (IA) charring conditions in Atlantic Scotland, and the results were applied to archaeological barley grains from Clachtoll broch, Sutherland. Overall, the preservation of the experimental grains was poor except for one perfectly preserved grain. This matches archaeobotanical preservation profiles from IA Atlantic Scottish cereal assemblages. The experiments show a significant increase in  $\delta^{15}\text{N}$  values for the poorly-preserved cereal grains in the experimental hearths. A decrease in grain size and preservation were found to be correlated, as were preservation

and an increase in  $\delta^{15}\text{N}$ . Therefore, it is proposed that only very well-preserved cereal grains (P1-P3 following Hubbard and al Azm 1990) charred by peat fires should be used for stable isotope analysis in reconstructing ancient land management strategies in Atlantic Scotland and the wider North Atlantic region. Our archaeological application of the experimental findings to the barley grains at Clachtoll broch, produced an average  $\delta^{15}\text{N}$  value of  $5.30 \pm 1.70\%$  from 100+ grains, indicating that they were grown in fields with significant anthropogenic amendment.

## 5 STABLE ISOTOPES STUDIES IN SICILIAN PHOENICIAN AND PUNIC SETTLEMENTS

**Abstract author(s):** Meli, Francesca (Dept.Cultural Heritage-University of Palermo; LabHomo- Anthropology Laboratory of Department of Biological, Chemical and Pharmaceutical Sciences and Technologies-University of Palermo) - Tramati, Cecilia (Stable Isotope Ecology Laboratory of the Department of Earth and Marine Sciences-University of Palermo) - Greco, Caterina (Museo Archeologico Regionale "Antonino Salinas") - Griffo, Maria Grazia (Museo Archeologico Regionale Lilibeo di Marsala) - Nero, Carla (Soprintendenza Beni Culturali Palermo) - Fiorentino, Claudia (LabHomo- Anthropology Laboratory of Department of Biological, Chemical and Pharmaceutical Sciences and Technologies-University of Palermo) - Vizzini, Salvatrice (Stable Isotope Ecology Laboratory of the Department of Earth and Marine Sciences-University of Palermo) - Sineo, Luca (LabHomo- Anthropology Laboratory of Department of Biological, Chemical and Pharmaceutical Sciences and Technologies-University of Palermo)

**Abstract format:** Oral

The study of the dynamics and ecology of ancient populations in the central Mediterranean is a current topic in archaeological research. On the basis of several indicators, it is possible to record a significant increase in mobility and human interactions from enterprises beyond the sea of Carthage, around the 8th-7th centuries BCE, or at the latest the 6th century BCE according to traditional literature. When the colonial settlements in the central Mediterranean were established, such as in Sicily, they show an increasing influence of the Carthaginian cultural and urban model. Such phenomena of mixing probably continued even after the middle of the 3rd century BC, until the Roman conquest. This period was characterized by profound changes in the economic, demographic, and social patterns of the city in central-western Sicily, which probably influenced the ecological habits of its inhabitants. In this context, stable isotope studies are a major impetus for discussion.

In this paper, we present a project of the study of C and N stable isotopes in a representative osteoarchaeological sample of human and faunal remains selected from some of the main Phoenician and Punic, and partly Roman, necropolises in western Sicily, namely Solunto, Palermo and Lilybaeum.

This research assesses homologies and differences in ecological and dietary behavior.

## 6 INVESTIGATING HUMAN-ANIMAL INTERACTIONS IN PRECOLONIAL HISPANIOLA: USING BAYESIAN DIETARY MIXING MODELS TO DIFFERENTIATE WILD AND DOMESTICATED PLANT FOOD SOURCE CONTRIBUTIONS

**Abstract author(s):** Shev, Gene - Laffoon, Jason (Leiden University - Faculty of Archaeology)

**Abstract format:** Oral

The Late Ceramic Age (AD 600 – 1500) of the Caribbean is characterized by the emergence of new material cultures, migration and colonization, the widespread use of pottery, and the establishment of sedentary agricultural settlements. On the island of Hispaniola (modern day Dominican Republic and Haiti), new population centers emerged with palaeobotanical evidence suggesting that indigenous peoples were actively altering the landscape, likely due to slash-and-burn farming practices that facilitated the cultivation of a wide variety of domesticated plants. Notably, indigenous peoples did not rely upon domesticated animals as a food source, leading to their designation as hunter-fishers horticulturalists. There is however evidence suggesting that some animal species, in particularly a group of endemic Capromyd rodents known collectively as hutias, may have been managed by indigenous peoples, both based on their ubiquity at archaeological sites and due to evidence of human translocations of hutias from Hispaniola to other islands. This study follows from previous isotopic and zooarchaeological investigation into human-hutia relations, but applies a Bayesian dietary mixing model, Food Reconstruction Using Isotopic Transferred Signals (FRUITS), to differentiate between the dietary contributions of wild and domesticated plant food sources. Our aim is to establish the degree of human involvement in animal dietary behavior by establishing the relative dietary contributions of domesticated plants versus wild plants for several mammal species recovered from four indigenous sites in Hispaniola. Here we discuss: the utility of dietary mixing models to distinguish between 'wild' and 'domestic' plant food sources; our methodology that was specifically catered for herbivorous 'wild' animals compared to isotopic foodwebs curated for human isotope studies; the advantages and limitations of FRUITS and other dietary mixing models for studying human-animal interactions; and finally our results from the trial of three different food source models in FRUITS.

## 7 WEANING AGE FINDER (WEAN): A SIMPLE TOOL FOR ESTIMATING WEANING AGE FROM ISOTOPIC DATA

**Abstract author(s):** Ganiatsou, Elissavet - Souleles, Angelos - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

**Abstract format:** Oral

Nitrogen stable isotope ratios ( $\delta^{15}\text{N}$ ) of incremental dentine collagen have been extensively applied in bioarchaeology for the reconstruction of breastfeeding and weaning practices in ancient populations. The shifts in  $\delta^{15}\text{N}$  values reveal the duration of exclusive breastfeeding, the onset and offset of weaning (weaning age), and potential signals of physiological stress. Contrary to the significant progress in measurement precision, estimating the duration of weaning is performed visually, a task that is time and labor intensive.

We generated a tool for automatically estimating weaning ages based on  $\delta^{15}\text{N}$  measurements of first permanent molars. The tool implements the elbow method, which consists of plots the  $\delta^{15}\text{N}$  values to assigned ages and picks the elbow of the curvature as the individual's weaning age. We applied our approach to published datasets with visually estimated weaning ages and compared the results to evaluate the error between visual assessment and elbow method estimation.

The results show a strong correlation between the two methods underlining that a mathematical framework can be accurately applied in weaning age estimation. The tool estimates the weaning age of a single or many individuals and combines current advances of bioarchaeological research and visually appealing graphics (scatter and line plots, Z-scores). Moreover, it identifies individuals whose  $\delta^{15}\text{N}$  values may indicate physiological stress and assists in the presentation and comparison of isotopic profiles. WEAN is a novel and robust method for weaning age estimation that streamlines the assessment of  $\delta^{15}\text{N}$  values for the exploration of breastfeeding and weaning patterns in antiquity.

Acknowledgment: This research has been co-financed by the European Regional Development Fund of the European Union and Greek national funds through the Operational Program Competitiveness, Entrepreneurship and Innovation, under the call RESEARCH – CREATE – INNOVATE (project title: ECHOES-Development of a methodology for the digital reconstruction of ancient human biographies through the study of archaeo-anthropological material, project code:T2EDK-00152).

## 8 ARCHAEOLOGY OF BRAZILIAN SHELLMOUNDS: OLD QUESTIONS AND NEW MULTI-PROXY APPROACHES

**Abstract author(s):** Cardoso, Jessica (Géosciences Environnement Toulouse, Observatoire Midi Pyrénées, UMR 5563, CNRS, Toulouse; Museum of Archaeology and Ethnology, University of São Paulo) - Guiserix, Danaé (École Normale Supérieure de Lyon ENS) - Jaouen, Klervia (Géosciences Environnement Toulouse, Observatoire Midi Pyrénées, UMR 5563, CNRS; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology, Leipzig) - Strauss, Andre (Museum of Archaeology and Ethnology, University of São Paulo)

**Abstract format:** Oral

The study of shellmounds can shed light in to human occupation and adaptations at coastal environments worldwide. In South America, human groups occupied the territory close to the Atlantic Ocean for millennia (at least 8000 to 1000 ca. years BP), building hundreds of shellmounds, some with impressive dimensions. It is assumed that these populations disappeared when an environmental change occurred and that new ceramicist populations arrived from the inland. We aim here is documenting the mobility of the shellmounds' populations before and after the arrival of ceramic and to study their subsistence strategies in order to test the aforementioned hypothesis. To do so, we conducted a combination of non-traditional and traditional isotope analyses ( $\text{d}^{13}\text{C}$  and  $\text{d}^{15}\text{N}$  of bulk collagen and amino acids,  $\text{d}^{88}\text{Sr}$ ,  $\text{d}^{66}\text{Zn}$  and  $87/86\text{Sr}$  of hydroxyapatite) as well as trace element ratio on fauna and human's bones and teeth of 8 Brazilian archaeological sites. Our preliminary results have shown that non-traditional isotopes can elucidate and improve our understanding on food webs, environment and diet of ancient populations, especially in cases where collagen is not preserved. We demonstrate that shellmound's people had a remarkable adaptation to the coast and weren't replaced by inland populations after the arrival of pottery.

## A COMBINED OSTEOLOGICAL, ISOTOPE AND PROTEOMICS APPROACH TO POORLY PRESERVED HUMAN REMAINS FROM A DUTCH EAST INDIA COMPANY BURIAL GROUND

**Abstract author(s):** Hall, Rachael (Laboratory of Human Osteoarchaeology, Faculty of Archaeology, Leiden University) - Olszewski, Judyta (Division of Clinical Anatomy and Biological Anthropology, Department of Human Biology, University of Cape Town; Laboratory of Human Osteoarchaeology, Faculty of Archaeology, Leiden University) - Kootker, Lisette (Geology & Geochemistry cluster, Department of Earth Sciences, Vrije Universiteit Amsterdam) - Layfield, Robert - Shaw, Barry - Oldham, Neil (The University of Nottingham Medical School, Faculty of Medicine & Health Sciences, University of Nottingham) - Hart, Tim (Archaeology Contracts Office - ACO - Associates, Cape Town) - Derksen, Leon (Independent Researcher) - Manders, Martijn (Cultural Heritage Agency of the Netherlands - RCE; Archaeological Heritage Management, Faculty of Archaeology, Leiden University) - Schrader, Sarah (Laboratory of Human Osteoarchaeology, Faculty of Archaeology, Leiden University)

**Abstract format:** Oral

Skeletal remains discovered in Simon's Town, South Africa were identified as being possibly associated with a formerly standing Dutch East India company hospital. The potential connection to Dutch heritage prompted an international research collaboration between South African archaeologists and the Cultural Heritage Agency of the Netherlands to investigate the poorly preserved remains. The objective of this research was to use a novel combined osteological and biochemical approach to inform the identities of these individuals. Methodologies included osteological observations, and utilising tooth enamel for isotope analysis using strontium (Sr), oxygen (O) and carbon (C) from carbonate, and proteomics. The methods chosen provided information on possible childhood origins, diet, biological sex, and pathological conditions, along with the individuals relation to the site.

Osteological analysis on 22 individuals presented evidence of residual rickets/osteomalacia, various dental pathological conditions, and pipe-notches. Sr-O-C isotope analysis yielded results for 39 individuals. One individual fell within all expected ranges of the Western Cape of South Africa. The remaining 38 individuals, however, did not fall within all expected Western Cape ranges. The majority exhibited ratios which could potentially fit within several relevant European countries. Two individuals likely did not have origins in either the Western Cape nor Europe due to their carbon isotope results. Proteomics analysis on the dental enamel of nine tested individuals confirmed that they were biologically male.

This study suggests that isolated enamel can provide crucial information about individuals pathological conditions, geographical origins, diet and biological sex. These data further demonstrate that a combined approach using multiple osteological and biochemical methods are advantageous for poorly preserved remains. The novel combination of isotope analysis and proteomics in determining biological and geographical profiles proved successful and contextualised the interred individuals with little other direct evidence.

## THE ISOTOPIC RATIO $87\text{Sr}/86\text{Sr}$ AS MOBILITY/PERMANENCE MARKER IN VELIA ARCHEOLOGICAL SITE

**Abstract author(s):** Giaccari, Matteo (Department of Environmental Biology, Sapienza University of Rome)

**Abstract format:** Oral

During roman times the mobility used to be forced by slavery, military reason or self-driven. Assessing the magnitude of this migration is critical to better understand a culture. During the last decades the scientific community agreed on the effectiveness of strontium isotope ratio ( $87\text{Sr}/86\text{Sr}$ ) to study this specific phenomenon.

The aim of this study is to individuate this mobility phenomena using invasive technique in order to characterize the  $87\text{Sr}/86\text{Sr}$  isotopic ratio of different human individua, analyzing the enamel of their teeth.

Strontium (Sr) substitutes calcium (Ca) in biogenic apatite. It is known that only  $87\text{Sr}$  fluctuate during time because of its radiogenic nature so it will varies depending on geological region. It is well known that strontium isn't influenced by isotopic fractionation and passes through the biological cycle unchanged. Due to those characteristics this ratio will result different and diagnostic for specific areas.

It is important to assess a local range therefore, in this case, archeological pigs' values were chosen because they were breed in loco and fed with leftovers. Additionally, values obtained from literature were used and helped to obtain a strong and valid proxy.

In conclusion, it is possible to say with a good margin of error that all the individua are Velian from their birth since the ratio variation from the human samples is negligible and in the range assessed using both literature faunal data and results from this study.

## CONSTRUCTING BIOAVAILABLE STRONTIUM BASELINES FROM THE LOCAL TO THE MULTI-NATIONAL SCALE USING NEW AND LEGACY DATA – CHALLENGES AND LIMITATIONS

**Abstract author(s):** James, Hannah - Cheung, Christina - Gerritzen, Carina - Griffith, Jacob - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel)

**Abstract format:** Oral

As the use of strontium isotope analysis in archaeology to assess mobility and provenance of people, animals and objects expands, the need for robust baseline maps of bioavailable strontium to interpret these data increases. Isoscapes of varying scales, from archaeological site-specific, local, regional to national maps have been published. These isoscapes establish baselines from a variety of different archives; plants, soils, water, and archaeological and modern humans and fauna. The cost and effort to create these datasets is high, so previously published or legacy data is an important source to expand and increase the sampling density of baselines.

This research will present large scale bioavailable strontium datasets from across Europe, using the specific examples of published datasets from Portugal, France, and Ireland. We will discuss how combining datasets of different scales and archives can provide a robust baseline for tracing mobility and provenance in a variety of archaeological disciplines. The extent of other published datasets from Europe will be highlighted and sampling gaps identified. The importance of accessibility, that allows for comprehensive reuse of datasets, will also be discussed.

Reconstructing mobilities and provenances of archaeological materials can address important questions such as landscape use, trade networks or husbandry practices. By combining datasets researchers from across archaeological disciplines can interpret strontium isotope measurements on human, faunal or archaeological materials.

## THE APPLICATION OF SR ISOTOPES TO DECIPHER THE SOURCE OF NABATAEAN BRONZE COINS COLLECTED IN ISRAEL

**Abstract author(s):** Ercoles, Isabella (Department of Earth Sciences, Sapienza University of Rome)

**Abstract format:** Oral

This study presents the analyses of the strontium (Sr) isotope ratio of 40 copper-based coins, belonging to the Nabataean Kingdom and hailing from the Israel Antiquities Authority at the Israel Museum (Jerusalem).

The Nabataean Kingdom was a powerful political entity, that flourished in modern-day Jordan, Israel, and Syria between the 4th century B.C.-106 A.D.

The Nabataeans were a nomadic tribe, expert in trades, and able to control vast trading networks.

The elements concentration in the coin-solutions was analyzed using ICP-AES at the Geological Survey of Israel. Sr isotopic compositions were determined by TIMS and MC-ICP-MS-"Nu Plasma" at IGAG-CNR laboratories at La Sapienza - University of Rome and at the Geological Survey of Israel.

Additional samples, including a prill and an ore material from the Timna area, the most important local source of copper, were employed to detect the provenance of the samples under study.

Lead isotope ratios, commonly used to trace metal provenance sources, are powerful geochemical tracers but could not be sufficient to identify the original ore deposits due to some coinage processes such as mixing and re-melting.

The use of Sr isotope ratio as a geochemical tool (fingerprints) could overcome this obstacle, even if his application is not yet been explored due to the low Sr concentrations in metals. The results show that Sr isotope ratio can effectively trace the metal provenance.

So, the Nabataean copper archaeometallurgy was investigated thanks to the ubiquitous geological database of the Sr isotope ratio, identifying in the Arabah Valley the local source of Nabataean copper coins.

## FROM OXALID TO GLOBALID: A SUBSTANTIAL UPGRADE OF A WELL-KNOWN DATA POOL OF LEAD ISOTOPES FOR METAL PROVENANCING USING R

**Abstract author(s):** Rose, Thomas (Department of Archaeology, Ben-Gurion University of the Negev, Be'er Sheva; Dipartimento di Scienze dell'Antichità, Sapienza – Università di Roma; Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum) - Klein, Sabine (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum; Institut für Archäologische Wissenschaften, Ruhr-Universität Bochum; FIERCE, Frankfurt Isotope & Element Research Centre, Goethe Universität, Frankfurt am Main) - Westner, Katrin (Ecole Normale Supérieure de Lyon, CNRS, Université de Lyon) - Hsu, Yiu-Kang (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum)

**Abstract format:** Oral

Lead (Pb) isotope geochemistry is an approved key method in archaeological sciences to reconstruct the resource provenance of metals and trade networks of the past civilisations. Successful application and interpretation of Pb isotope signatures of metal artefacts rely crucially on the published ore data, which are partly only available from pre- or re-digitalised publications. Most Pb isotope reference data collections were compiled by individual working groups, usually focussing on their projects and regions of interest. A great step towards a large-scale collection of Pb isotope data came with the release of the OXALID database in the early 2000s, which has benefited the scholars in the natural science discipline as well as the more untrained users from the archaeological community. Still up today, OXALID is the most used and cited source for reference data, despite the accumulation of many additional data sets since then. All of them are set up as static data collections, limiting the possibilities to expand, correct, and modify them with the publication of newer results or analyses. Additionally not all of them are easily available for people from across the world and only recently compilations for regions outside of Europe and the Mediterranean became widely available.

Riding the wave of open science and new data infrastructures, the authors are endeavouring to digitalise and construct a global Pb isotope data base using the statistical environment R and Shiny App. The presentation will demonstrate this highly promising application for the modernisation of archaeometry as an applied geoscience discipline.

## FURTHERING OUR UNDERSTANDING OF THE SOURCES OF THE METAL OF ROMAN DENARII – A MULTI-ISOTOPE AND ELEMENTAL ANALYSIS APPROACH

**Abstract author(s):** Greifelt, Tim (Forschungsbereich Archometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum; Institut für Geologie, Mineralogie & Geophysik, Ruhr-Universität Bochum) - Wigg-Wolf, David (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts - RGK) - Klein, Sabine (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum; Institut für Archäologische Wissenschaften, Ruhr-Universität Bochum; FIERCE, Frankfurt Isotope & Element Research Centre, Goethe Universität)

**Abstract format:** Oral

Since coins are generally an officially produced medium, provenance studies of the metal used to produce them can provide important information on the logistical, infrastructural and organizational capacities of central authorities. Thus, it is not surprising that ancient coins have been the subject of a large number of archaeometallurgical studies, in particular involving lead isotopes.

The composition of the silver in the coin metal of Roman Imperial denarii has been intensively investigated in recent years by Kevin Butcher and Matthew Ponting (The Metallurgy of Roman Silver Coinage. Cambridge 2014). However, the work concentrated primarily on the chemical composition, with only a relatively smaller number of isotopic analyses being carried out, and concentrating on specific questions.

To complement the investigations of Butcher and Ponting, more than 200 additional coins from the period 30 BC to AD 240 have been sampled for isotopic analysis in a project based at the German Mining Museum in Bochum. Besides standard lead isotopes, these analyses also included copper and silver isotopes, which were performed in Bochum, at the Frankfurt Isotope and Element Research Center FIERCE, the Laboratoire de Géologie de Lyon, École normale supérieure de Lyon, and in the Institute for Geosciences at the Goethe University Frankfurt.

The combination of isotopic analyses of different elements has provided deeper, sometimes surprising insights, qualifying the information provided by lead isotopes alone. This paper will present the first results and interpretation of our analyses, so indicating how a combination of isotopic methods can advance our understanding of the provenance and the methods used to obtain the raw materials.

## SOCIAL TRAJECTORIES OF MEDITERRANEAN IMPORT IN THE TRANSALPINE WORLD BETWEEN THE 3RD CENTURY BC AND 2ND CENTURY AD

**Abstract author(s):** Bursak, Daniel - Frank-Danielisová, Alžběta (Institution of Archaeology of the CAS, Prague)

**Abstract format:** Oral

In the last years, a significant number of new archaeometric data on metal artefacts from Central European Iron Age and Roman period was collected and analysed. Using methods now considered as "standard" like major and trace element statistics with the lead isotope analysis of bronze and glass artefacts, we often obtained a surprising picture, which in many ways challenged the current view on the function of given items in local societies. We would like to bring into the discussion our experience with an archaeometry analyses from the perspective of archaeologists. Given the complexity of metallurgy, metal distribution and the role of various metal artefacts in the later prehistory, our focus and questions gradually shifted from classical provenance-oriented studies towards more complex questions on the role of artefacts in the society, their relevance as a proxy for mobility, socio-economic studies etc. Since archaeometry seems now to be perceived as an inevitable part of the research approach, our aim is to encourage a discussion on the future role of scientific analyses of artefacts in the complex societies of later prehistory. We would like to develop the process of finding new questions and a deeper and/or more complex involvement of the archaeometric analyses in the future research.

As a medium for our presentation, we selected one of the most conspicuous parts of the archaeological record in the Iron Age and Roman period: the phenomenon of Mediterranean imports. Their distinctiveness has always stood at the forefront of narratives concerning political power, economy and societal networks. Built over the years in the fields of art and cultural history, anthropology and archaeology, the phenomenon of exogenous items in indigenous Iron Age material culture now faces a very significant challenge in its perception due to the rapidly increasing involvement of archaeometric methods.

## DEVELOPMENTS TOWARDS FAIR AND LOUD INSTRUMENTAL DATA REPOSITORIES IN OTHER DISCIPLINES

**Abstract author(s):** Rose, Thomas (Department of Archaeology, Ben-Gurion University of the Negev, Be'er Sheva; Dipartimento di Scienze dell'Antichità, Sapienza – Università di Roma; Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum)

**Abstract format:** Oral

Isotope data, like most other instrumental data, are used in an interdisciplinary setting. Sometimes the analytical methods are borrowed from other disciplines, sometimes the same type of data is also used in multiple disciplines or the data are interpreted using concepts from neighbouring fields. Furthermore, data from other disciplines are used by archaeologists and vice versa other disciplines used data obtained from archaeological material. More often than not a lot of time is still consumed to compile data from the literature and other sources, checking it and enriching it with the necessary metadata. Easy access to high quality data is however key in modern research. Research data should be FAIR and LOUD, i. e. findable, accessible, interoperable, reusable, and they should be linked open usable data. This means that they are easily accessible in the internet (e. g. in repositories) in open format under open licenses with rich metadata, that they are linked to other databases in their metadata (e. g. for geographical information about sampling locations), and that other databases can easily access them.

Great efforts were spent in the last years to develop suitable infrastructures for research data. Because of the extremely interdisciplinary character of the archaeological sciences, these developments and their huge potentials must not be ignored. Moreover, archaeologists should aim to contribute and shape the data infrastructures for instrumental data in neighbouring fields in a way that also meet their needs. There is no reason to build up parallel structures when archaeology-specific parts can be added to existing data pools.

This presentation provides some insights into current developments in other disciplines. Due to the background of the presenter mostly drawn the geosciences, some initiatives and projects that deal with instrumental data will be presented and how archaeologists could and sometimes already are participating in them.

A.

## HOW CAN WE BE SURE THAT OUR (OSSEOUS) FIND IS APPROPRIATE FOR AMS 14C MEASUREMENT?

**Abstract author(s):** Szigeti, Anna (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen; Déri Museum, Debrecen) - Molnár, Mihály - Major, István (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen)

**Abstract format:** Poster

Working in a 14C laboratory, you know several rules and techniques how the samples must be handled to avoid contamination, cross-contamination, etc. and get proper and reliable AMS results. Some studies have already drawn

some attention to these practices, covering the details from sample preparation to the reduction of CO<sub>2</sub> gas to graphite.

However, the age result of a bone sample also depends on what is the sample's condition like when it arrives at the laboratory. This poster aims to outline some tips and tricks to archaeologists, museologist and professionals of other fields about handling samples devoted to radiocarbon dating. This short study focuses on the following topics according our best practice at INTERACT AMS Laboratory:

- How do we select our find on the field for a sample, and what is the next step?
- Risks of pretreatments in the museum.
- How do we select our find for sample from the depths of the museum's store?
- How do we storage, label, etc. our sample before posting it to the laboratory?
- What can we do with the measured result of our sample?

We will try to provide some advice on such and similar issues, focusing primarily on osseous samples.

The research was supported by the European Union and the State of Hungary. Co-financed by the European Regional Development Fund in the project of GINOP-2.3.4-15-2020-00007 "INTERACT".

## **B. ROMAN CONNECTIONS IN VALKENBURG: A TRIPLE SR-O-C ISOTOPE APPROACH TO THE HUMAN REMAINS OF THE PEOPLE IN A MILITARISED BORDERSCAPE**

**Abstract author(s):** De Coster, Maura (Geology & Geochemistry, Department of Earth Sciences, Vrije Universiteit Amsterdam) - Vos, Wouter (Vos Archeo; Saxion University of Applied Sciences Deventer) - Stevens, Saskia (Ancient History and Classical Civilization, department of History and Art History, Utrecht University) - Davies, Gareth (Geology & Geochemistry, Department of Earth Sciences, Vrije Universiteit Amsterdam) - Kootker, Lisette (Geology & Geochemistry, Department of Earth Sciences, Vrije Universiteit Amsterdam)

**Abstract format:** Poster

The lower German limes, recently recognized as a World Heritage site by UNESCO, attracted people from across the Roman Empire. Not only did the limes have forts, watchtowers, linked infrastructure, and civilian centres, but its key settlements operated as trade hubs that made them unique meeting points between the Roman Empire and northern populations. Therefore, remains of the Lower German borderscape illustrate the important impacts of the Roman military presence on the landscape and society of the periphery of the Empire.

A few kilometres from where the Lower German limes ends in the North Sea, the unique Roman cemetery of Valkenburg Marktveld has been excavated. Located circa 500 m. south of the auxiliary fort, the archaeological site plays a key role in understanding the population dynamics in a Roman borderscape and coastal landscape. This cemetery was used between 50 – 300 CE for the entire military community that consisted of men, women and children, who lived in the vicinity of the auxiliary fort. Over 650 individuals were recovered, 145 of which are inhumations (41 adults, 104 children and infants); an extraordinary number as cremation dominates the Roman burial record in the Netherlands. A triple Sr-O-C isotope approach was adopted to infer more information about the geographical origin of the inhumed and cremated individuals. In this poster, the first results are presented that give a rare insight into the population dynamics within a militarised borderscape.

## **C. THE DIETARY IMPACT OF THE YAMNAYA HORIZON ON CONTEMPORARY AGRICULTURALIST POPULATIONS IN THE BALKANS**

**Abstract author(s):** Sandoval, Elena (University of Bristol; YMPACT project)

**Abstract format:** Poster

The migration of Yamnaya people in the Early Bronze Age, ca. 3,300 BCE–2,800 BCE, into the Pontic-Caspian steppe changed the genetic fabric of Europe. However, how much of the existing societal fabric, if any, was influenced by this migration and subsequent genetic mixing has not been thoroughly explored. Determining the extent of the Yamnaya influence on prehistoric Europe requires an interdisciplinary approach that combines multiple lines of evidence.

This poster presents how this potential cultural flow is being investigated through the lens of diet, via both organic residue and stable isotopic analysis. As Yamnaya are represented exclusively by burial mounds, faunal bones and pottery are rare. Heavily pastoralist subsistence patterns of Yamnaya are generally assumed, based on the lack of settlement evidence. Here, dietary practices within the Yamnaya are directly reconstructed using bulk and compound-specific stable isotope analysis of human skeletal remains. Faunal baseline carbon isotope values will be modelled based upon lipids extracted from pots from local contemporary non-Yamnaya settlements, and Yamnaya faunal bones where available. The analysis of pottery sherds from a diachronic perspective also allows for an investigation of potential cultural exchange between migrating Yamnaya and Balkan societies. Samples of 166 skeletal remains and 238 pottery sherds were chosen to reflect this angle of inquiry creating a sample group that is comprised of Eneolithic, Early Bronze Age, and Middle Bronze Age pots and skeletal remains from across modern day Bulgaria and Romania, creating an in-depth study of both spatial and temporal dietary trends.

This study will provide the first detailed picture of the subsistence patterns and change throughout the Yamnaya migration and subsequent contact with Eneolithic Balkan societies.

#### **D. COMPARISON OF REMOVAL METHODS OF CONSERVATION SUBSTANCES LAID ON ARCHAEOLOGICAL BONE SAMPLES DEDICATED TO CARBON ISOTOPIC ANALYSES**

**Abstract author(s):** Major, Istvan (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen) - Szigeti, Anna (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen; Déri Museum, Debrecen) - Fogarasi, Eszter (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen; Department of Physical Chemistry, University of Debrecen) - Futó, István (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen) - Lengyel, György (Department of Prehistory and Archaeology, University of Miskolc) - Jull, AJ - Molnár, Mihály (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen)

**Abstract format:** Poster

Human- or animal-derived bone, teeth, ivory and antler archaeological finds have always been frequent samples submitted to radiocarbon laboratories. Nowadays, in excavation campaigns, increasing attention is devoted to the selection and handling of the most promising samples, also considering subsequent scientific analyses. However, in the past, this care was not in focus thus a lot of objects stored in museums had been chemically treated to preserve them for the future. For this purpose, a wide range of natural and artificially produced substances has been applied in archaeology so the analyses and dating of these objects are still laborious. At the Hertelendi Laboratory of Environmental Studies, we aimed to try to estimate the effect of some conservation substances to the actual age of a reference bone sample. A larger long bone was selected and split into fragments, which were then treated artificially by preservatives such as epoxy resin, superglue or paraffin. After drying, the surface of the samples was polished and the fragments were crushed. Regarding chemical pretreatment, a simple acid-base-acid (ABA) wash, a post-ABA ultrafiltration step and a complete Soxhlet-extraction, ABA and ultrafiltration protocol were selected for comparison. After gelatinization, the produced samples were measured by accelerator mass spectrometry and stable isotope ratio mass spectrometry and the results were evaluated and compared from a carbon isotopic aspect.

The research was supported by the European Union and the State of Hungary, co-financed by the European Regional Development Fund in the project of GINOP-2.3.4-15-2020-00007 "INTERACT".

#### **E. SAMPLING METHODOLOGY FOR THE RADIOCARBON DATING OF HISTORICAL MORTAR: EXAMPLES OF SAMPLES FROM THE OLDEST STRUCTURES AT PRAGUE CASTLE (CZ)**

**Abstract author(s):** Tomanova, Pavla (Institute of Archaeology of the CAS) - Válek, Jan (Institute of Theoretical and Applied Mechanics of the CAS) - Světlík, Ivo (Nuclear Physics Institute of the CAS) - Maříková-Kubková, Jana - Herichová, Iva (Institute of Archaeology of the CAS)

**Abstract format:** Poster

So far, nobody has systematically studied the radiocarbon dating of lime mortar binding agents in the Czech Republic. However, recent times have brought significant changes to the field of isotope analysis. Since 2005, the Institute of Archaeology of the Czech Academy of Sciences has been collaborating with the radiocarbon laboratory of the Nuclear Physics Institute of the CAS. This laboratory was later granted an international CRL code. In 2021 and 2022, the laboratory has acquired its own AMS system with a tandem accelerator capable of accurately measuring ultra-low radionuclide activities, which allows us to conduct routine measurements of  $^{14}\text{C}$  activity for the purposes of radiocarbon dating.

This poster presents the current results of the ongoing research project focused on the sampling methodology for historical mortar and aiming to improve the quality and credibility of carbonate binding agent dating results. We primarily work with mortar samples from the relics of the oldest Prague Castle masonry structures (9-12 century) uncovered by archaeological excavations starting in the 1920s. Some of the relics are still accessible at the archaeological site, while some of the samplings took place during the excavations, and the samples have been archived. The sample selection is connected to a previous study of the authenticity of historical mortars, a review of their find context, and an analysis of the used materials and lime technologies.

The ongoing research project aims to combine the knowledge from the field of historical material analysis (mortar) and archaeological data analysis to optimise the sampling process and the processing of samples for AMS dating. Another aim is to identify cases where radiocarbon dating may be helpful and define the reasons why relevant results have not been found in the case of some binding systems.

**F. STABLE ISOTOPE ANALYSIS IN HUMAN BONE COLLAGEN FOR THE RECONSTRUCTION OF DIETARY PATTERNS IN THE ANCIENT COLONY OF ABDERA (GREECE).**

**Abstract author(s):** Georgiadou, Angeliki - Zisis, Anastasios - Ganiatsou, Elissavet (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Kallintzi, Constantina (Ephorate of Antiquities of Xanthi, Ministry of Culture and Sports) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

**Abstract format:** Poster

During the second Greek colonization (8th – 5th c. BC) numerous of colonies were founded across the region of Aegean Thrace. Abdera is a renowned and prosperous colony located in the littoral of Aegean Thrace. The geostrategic location in addition to fertile land and mineral resources turned Abdera into a notable commercial and political international hub. The colony shows a unique case of two-wave colonization. The city was firstly founded by Ionians from Clazomenae (c. 654 BC), but their endeavor did not succeed. Harsh environmental conditions and denoted aggression from local tribes, led the first colonists in demise within the first couple of generations. About a century later (545 BC), Abdera was re-founded by new settlers, from Teos, another Ionian city involved in colonial activity. Within these circumstances, previous anthropological research shows a high frequency of malnutrition expressed with the prevalence of infections and metabolic diseases in the population of Abdera, during its initial occupation phase. In this study, we present a diachronic dietary reconstruction from the ancient city of Abdera. We apply the established method of stable isotope analysis ( $\delta^{15}\text{N}$ ,  $\delta^{13}\text{C}$ ) in bone collagen of human skeletons from the cemetery of ancient Abdera. The sample has a vast chronological range beginning with the two phases of the city's foundation and re-foundation (archaic period) and extends to the Roman era. Our dataset consists of 94 human skeletons (26 males, 31 females, 30 subadults and 7 indet. indiv.). Our preliminary results show a diachronic preference in terrestrial animals during both periods with lesser contribution of C3, C4 plants. Our pilot observations depict a diachronic trend of the dietary habits in Abdera and offer a window to the dietary differentiation during historically diverse periods.

**G. DIET RECONSTRUCTION IN ANCIENT AMBRACIA: STABLE ISOTOPE ANALYSIS ( $\Delta^{15}\text{N}$ ,  $\Delta^{13}\text{C}$ ) FROM HUMAN BONE COLLAGEN, DURING THE ARCHAIC AND CLASSICAL YEARS**

**Abstract author(s):** Georgiadou, Angeliki - Ganiatsou, Elissavet - Xanthopoulos, Kyriakos - Zisis, Anastasios (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Papadopoulou, Varvara (Ephorate of Antiquities of Arta, Ministry of Culture and Sports) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

**Abstract format:** Poster

The Greek colonial expansion of the early 1st millennium BC spread people, goods, art, ideas and lifestyles across the Mediterranean and the Black Sea. The relationships between the mother-cities and colonies were multidirectional, profitable for both entities, and in some cases the colonies preceded the motherland in terms of cultural and political developments. Within this context the reconstruction of dietary habits can shed significant light on these interactions, as food in ancient Greek societies was regarded as a marker of ethnic and cultural differentiation. To address pending questions about subsistence in ancient colonies, we apply the established method of stable isotope analysis in human bone collagen to present the diet in the colony of Ambracia, from its occupation phase (archaic era) up to its destruction (Hellenistic era). Ambracia was founded by the city of Corinth in 625 B.C. on the banks of the river Arachthos in western Greece. The geostrategic location, at the crossroad of southern and northern Greece, made the colony a melting pot of cultural and commercial exchange particularly during the classical period (480-323 BC). Our dataset consists values of stable isotope ratios of carbon and nitrogen ( $\delta^{15}\text{N}$ ,  $\delta^{13}\text{C}$ ) from bone collagen of 158 human skeletons from the western cemetery of ancient Ambracia. Preliminary results show that terrestrial animal protein played a pivotal role in the dietary habits of the population with a lesser contribution of C3 plants and marine resources. Our findings will be correlated with literary evidence and other dietary studies in total period datasets from ancient Greek colonies. Our observations aim to delineate the dietary shifts during the colonization process and shed light on the intensely debated subject of daily life during the second Greek colonization in mainland ancient Greece.

**215 FACING WATER RESOURCES AND VARIATIONS IN CENTRAL ASIA FROM PREHISTORY TO TIMURID PERIOD: DISASTER(S), ADAPTATION, ANTICIPATION**

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Rhoné-Quer, Camille (Aix-Marseille University; CNRS/IREMAM) - Brisset, Elodie (CNRS/IMBE; Aix-Marseille University) - Kholov, Vohid (Institute of History of the Academy of Sciences of Uzbekistan)

**Format:** Regular session

Context and challenges: The hydrological networks of Central Asia includes some of the major rivers of the world (Syr Darya and Amu Darya) and their mountainous watershed, as well as vast low-land oases and continental seas (Aral,

Caspian). Did perception and adaptation to hydrological risks influenced landscape construction as well as social organizations from Prehistory to Timurid periods?

This session aims to address this question and analyse these challenges in a multidisciplinary approach, including all disciplines related to archaeology, paleoenvironment, history, sociology or anthropology. What are the evidences and testimonies of climatic hazards (flood, drought, rivers' bed displacement, sea-level change), and disasters (people injuries, infrastructure losses and damages)? Can we distinguish the effects of abrupt, short-term events of the ones evolving over the *longue-durée* on the political, social, economic or cultural processes? Papers will investigate the ways to face water variations, as for example:

- shaping urban networks, and innovative architecture according to risk consciousness and accessibility to water resources (distance from rivers, irrigation canals, cisterns...);
- mobility (desired or unplanned/compulsory), either of nomadic or sedentary people, on a small or large scale (including military disorders and invasions);
- adaptations in agricultural practices (animal selection, floristic evolution);
- reflexion about role of political leaders in these adaptations (planned or unplanned attitudes/evolutions).

## ABSTRACTS

### 1 STUDYING RELATIONSHIP BETWEEN PREMODERN SOCIETIES AND WATER RESOURCES OR VARIATIONS IN CENTRAL ASIA: A STATE OF THE ART

**Abstract author(s):** Rhoné-Quer, Camille (Aix-Marseille University; CNRS/IREMAM) - Elodie, Brisset (CNRS/IMBE)

**Abstract format:** Oral

While environmental studies are increasingly popular and give rise to a multitude of publications, there are disparities in the way the various scientific disciplines deal with the issue of the relationship between pre-modern Central Asian societies and water resources. Of course, the climate changes underway in the 21st century are pushing researchers to analyse the resilience of populations. However, studies on the reaction of Central Asian societies to variations in water resources between prehistoric times and the Timurid period are far from being limited to this question alone, and are not necessarily part of an environmental studies approach. This contribution aims to identify the main areas of interest of researchers working on hydrology in premodern Central Asia as well as the methodological tools used for their analyses, and the specificities of the various disciplines in the field. This contribution will focus on the themes of the triptych "disasters, adaptation, anticipation". Are these three points of the panel's subtitle studied in equal measure or are there epistemic imbalances in this area? Some reflections will be proposed to explain the specificities of the various approaches as well as the persistence of grey areas. Furthermore, the role of interdisciplinarity in the treatment of this vast hydrological subject will be assessed, as well as the perspectives offered by the development of multidisciplinary research teams.

### 2 THE VALUE OF WATER IN THE STRATEGY OF CENTRAL ASIA

**Abstract author(s):** Kholov, Vohid (Institute of History of the Academy of Sciences of Uzbekistan)

**Abstract format:** Oral

The territory of Central Asia, mainly Mewara al-Nahr has always felt the deficiency of water. Because its economy is directly connected with water coming by rivers, rainfalls and snowfall shortage is the reason of vast deserts throughout the area. Water deficiency led to settled agricultural development based on artificial irrigation. According to Y. Gulyamov, artificial irrigation in Central Asia was first developed in Khwarazm that is the successor of Keltaminor culture where economy mainly based on fishing and hunting. Due to an increase in population number and their needs, water reservoirs started to become main strategic destinations in the area and the institution of Mirab was developed. Damming the source of canals was the best way of influencing the enemy, states Bayoniy.

There are numerous factors that impacted the development of medieval urban settlements of Central Asia. First was the change of water reservoirs' direction whose consequence can be seen in Varakhsha, Gonurtepa, Keltaminor and Cherekrobod that were deserted by their population because of water shortage.

Being strategic points as to be a gate and shield of the area, the Syrdarya and the Amudarya were main challenges for enemies to enter the area from the north and south and west which was defended by high mountains in the east. As Thomas Welsford stated, the Amudarya was main problem for armies to enter Mewara al-Nahr. In most cases, crossing the Amudarya safely without any loss was the key of victory. It is seen in the experience of Acheamanids, Macedonians, Hephthalites, Arabs, Amir Temur and etc.

To sum up, water in the area was not only the key of life, but the strategic factor in the area.

### 3 **THAT THIN RED LINE. WATER RESOURCES VARIABILITY AND AGRICULTURAL ADAPTATION IN SOUTHERN TURKMENISTAN DURING THE BRONZE AGE**

**Abstract author(s):** Arciero, Roberto (Leiden University)

**Abstract format:** Oral

Southern Turkmenistan in Central Asia is one of the main areas that witnessed the development of the Bactria and Margiana Archaeological Complex (BMAC) during the 3rd and 2nd millennium BCE. Over the last sixty years, archaeological teams working in the region have uncovered magnificent citadels and impressive material culture which showed cultural connections with Iran, Indus Valley, and Mesopotamia. Critical to the region was the Murghab inner delta and scholars have long argued for the importance of the water resource in the rise and development of the BMAC. However, crucial aspects such as the adaptation of agricultural practice and water management by local communities remain poorly investigated. Likewise, macro-scale investigation on the ancient Murghab hydrological system often failed to deliver a comprehensive overview of the possible differences in the water accessibility and settlement pattern between urban and peripheral areas. In this respect, I argue that a detailed micro-scale investigation on selected areas of the Murghab can help to disentangle many open research questions.

This paper aims to present selected results of my Ph.D. In my research, I investigated how the local hydrological variability may have (differently) impacted the agricultural strategies, water management, and landscape occupation of the Bronze Age areas of Togolok and Ojakly in the Murghab. These local areas were investigated with a multi-disciplinary approach through remote sensing analysis, walking survey, and geoarchaeological investigation of the paleochannels system. In short, the project aims to investigate how the ancient hydrological network and its variability shaped the local economic, agricultural, and settlements patterns during the 3rd and 2nd millennium BCE in the Murghab.

### 4 **THE CITY OF TERMEZ IN THE MIDDLE AGES AND ITS IMPORTANCE IN THE FLOODING OF THE AMOU DARYA**

**Abstract author(s):** Makhmasobirova, Feruza (Aix-Marseille university)

**Abstract format:** Oral

The first civilization of the Central Asian region appeared and developed in the Amou Darya and its surroundings. Many colonies, fortresses, and towns have sprung up over the centuries along the banks of the river. Termez is well known as one of the most important cities of the Amu Darya waterway in ancient and medieval times. The article discusses the development of the city of Termez in the Middle Ages and the role of the Amou Darya in this process. It is important to study the role of Termez, which has its own port, in the development of regional navigation, as well as its role in economic and cultural relations along the river. For this study, it is important to determine whether there are archaeological finds that confirm the information of historical written sources, and what aspects of these finds mainly serve to clarify the history of Termez. The article also analyzes the development of waterways and shipping professions in the Middle Ages in the city. Research is based on medieval Arabic, Persian, and ancient Turkic sources, as well as the results of archaeological excavations in Termez.

### 5 **BRINGING ENVIRONMENTAL AND HISTORICAL ARCHIVES TOGETHER TO ANALYZE ADAPTATION STRATEGIES OF AGROPASTORAL SYSTEMS VIS-À-VIS WATER STRESS IN CENTRAL ASIA**

**Abstract author(s):** Brisset, Elodie (IMBE, Aix Marseille Univ, Univ Avignon, CNRS, IRD) - Rhoné-Quer, Camille (IREMAM, Aix Marseille Univ, CNRS, MMSH) - Djamali, Morteza - Guiter, Frédéric - Gandouin, Emmanuel - Brousset, Lenka (IMBE, Aix Marseille Univ, Univ Avignon, CNRS, IRD)

**Abstract format:** Oral

While some works have suggested that large-scale mobilities and conflicts in Central Asia and Western Asia (e.g. Mongol invasions) have been linked to climatic events, in this contribution we choose to move the focus to local human-climate interactions. We will specifically investigate what were the adaptation strategies of agropastoral systems vis-à-vis water stress, in the frame of various political constructions, over the last 1500 years. Based on paleohydrological and paleoecological investigations carried out on selected lake sedimentary archives of Iran and Uzbekistan, we will reconstruct the long-term variability of lake evaporation and runoff processes (sedimentology, geochemistry), together with indicators on the nature and relative intensity of the agropastoral practices (palynology). Those results will be put into a Human perspective through comparisons with historical sources. In particular, we will propose a special focus on the Medieval Islamic Period to discuss the hypotheses that regional climate changes, by modifying water resource availability locally, might have impacted crops and pastoral livestock productions, triggering economic losses and social contestations unevenly addressed by the succeeding political powers.

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Ribeiro, Artur (University of Kiel) - Stutz, Liv Nilsson (Linnaeus University) - Kienlin, Tobias (University of Cologne)

**Format:** Discussion session

The prevalence of science in archaeology becomes more marked every passing year. By "science", we mean the hard sciences - methods, techniques, and approaches that derive from the natural sciences, computer sciences, and mathematics. This also includes scientific epistemologies, such as the hypothetico-deductive and quantitative approaches to the archaeological past. This science revolution has also been accompanied by an increase in research funding for archaeology, making our discipline appear more socially relevant to the wider public. In the process archaeology is now a staple form of research in high-ranking journals. Archaeology is no longer the handmaiden of history or anthropology, much on the contrary, archaeology has become a dominant discipline when it comes to research and popularity.

However, this development in archaeology re-establishes ideas and approaches that were popular 50 years ago, when processual archaeology became the most dominant way of conducting archaeology in the west. But processual archaeology did not last long; it underwent a radical critique that demonstrated the limitations of very strict scientific epistemologies, that there is no such thing as absolute objectivity, and that the ideas and approaches of the humanities can and should still play a role in archaeology.

Is archaeological science the new status quo or is there the possibility to harken back towards the humanities? The sciences are of crucial importance to archaeology, but we can certainly make a case that archaeology operates better when combining both science and humanities. The aim of this session is to discuss the current state of the art with regards to the practice of archaeology, what role the humanities can play, the current critique of the sciences in archaeology, the role of theory in current science research, and ultimately, whether we are happy with where the discipline is going.

## ABSTRACTS

### 1 ARCHAEOLOGY AS A FACTORY – THE ALLURE OF MASS PRODUCTION, STANDARDIZATION, AND STREAMLINING RESEARCH IN ARCHAEOLOGY

**Abstract author(s):** Ribeiro, Artur (Christian-Albrechts-Universität)

**Abstract format:** Oral

The main reference points when it comes to the history of archaeology are usually processual and postprocessual archaeology. Albeit having had considerable influence on how archaeology is practiced, processual and post-processual archaeology were theoretical movements that had lesser impact than most archaeologists assume. Additionally, many archaeologists also assume that processual and postprocessual archaeology form part of natural pendulum in how archaeology develops, with processual archaeology representing a pendular movement towards more scientific research and postprocessual archaeology representing a pendular movement towards more humanistic research.

While there might be some truth to this, what seems to be developing in archaeology today is much more than a return to processual archaeology and a strengthening of scientific research; the scientific revolution archaeology we are witnessing today represents an economic streamlining and corporatization of archaeological discourse. Rather than an intellectual exercise, a slow process of knowledge attainment and of discovery, archaeology seems to be favouring a fast-paced model of establishing scientific facts. To achieve this, research has gradually become more standardized, with archaeologists fulfilling pre-established roles in an assembly line.

More than embracing science, what archaeology is truly embracing is the short-term logic of late-stage capitalist economics. If this continues, it will not be long before we see the disappearance of our capacity to tell stories, to empathize, and to truly discover the archaeological past.

### 2 TRUE COLOURS? EGYPTOLOGY AND RACIALISM BETWEEN SCIENCE AND HUMANITIES

**Abstract author(s):** Matic, Uros (Österreichisches Archäologisches Institut)

**Abstract format:** Oral

Egyptology, a discipline encompassing philology, art history and archaeology of ancient Egypt is not really known in archaeological circles as a theoretically aware discipline. The consequences of the lack of interest for theoretical and methodological foundations of research in Egyptology are manifold, leading some Egyptologists to label it as a "cursed discipline". This paper will explore the consequences of the lack of serious interest in theory in Egyptology using racialism as a case study. It will be argued that the introduction of novel scientific methods such as isotope

analyses and ancient DNA in Egyptology did not really provide solutions to complex questions of identity in ancient Egypt and beyond. Instead, old concepts ("proto-ideas" sensu L. Fleck) prevail and they can be traced back to late 19th and early 20th century racial science and culture-historical archaeology. Now they are only enriched with results coming from laboratories instead of reports of physical anthropologists. The paper will propose different ways of using the same data to pose questions rooted in humanities.

### 3 WHITHER ARCHAEOLOGY: HOW TO ASSESS A DIVERSE AND VARIED DISCIPLINE

**Abstract author(s):** D'Aprix, Michael (University College London)

**Abstract format:** Oral

Archaeology is a diverse and varied discipline that draws method, theory, and philosophy from a range of social scientific and natural scientific fields. Some believe archaeology is parasitical in its adoption of ideas while others view archaeology to be pragmatically omnivorous. Regardless of these views, the way archaeology has developed has resulted in countless, varied forms of archaeology. Each tradition of archaeology has developed to address unique goals, various hurdles, or to address specific issues, whether those be methodological, theoretical, philosophical, or external to archaeology, political, cultural, societal, and so on.

The question 'whither archaeology' cannot be answered nor can the state of such a varied discipline be assumed without first understanding how diverse archaeology is and its context. We regularly make discipline-wide assumptions like that of a science revolution or that archaeology is 'no longer the handmaiden of history or anthropology' yet there is no grounding for such arguments in a discipline where the basic definition of archaeology can differ from nation to nation, region to region, institution to institution, and site to site.

This paper argues the need to better understand the context of archaeology, what do archaeologists do, not through philosophical or theoretical questioning but through actual surveys, systematic reviews, and international conventionality.

We cannot begin to question how science and humanities operate together without first asking how they are used by archaeologists. Are scientific tools like carbon dating, pollen or isotope analysis, or even GIS used systematically across the discipline or are they used sporadically, and if so, how does that impact our understanding of archaeology as a science?

We must take the time to better understand what it is that archaeologists actually do and how they do it before addressing and generalizing the state of a varied and diverse discipline.

### 4 THE GROWTH AND IMPACT OF SCIENCE UPON THE DISCIPLINE OF ARCHAEOLOGY 1960-2021: A VISUALISATION AND EXPLORATION THROUGH BIBLIOMETRIC DATA MAPPING

**Abstract author(s):** Sinclair, Anthony (University of Liverpool)

**Abstract format:** Oral

As a discipline, archaeology is consistently classified as either a social science or more often a humanity. Yet we also believe that archaeology has become 'scientific', with evidence for this change visible in the incorporation of new techniques of analysis, the 'discovery' of new forms of evidence and the adoption of a scientific approach to investigation and interpretation. Archaeological science dominates the most highly publicised archaeological findings to the exclusion of a more humanistic understanding of the past. However, to what extent is this a genuine transformation or our perception of change? With more than 110,000 documents related to archaeology indexed since 1960, an historical analysis of this process through a reading of the literature is no longer possible.

A visual 'mapping' of bibliometric data - the metadata concerning documents (including sources, authors, dates of publication, terms, etc.) - provides a different vantage point from which to explore how archaeology has developed. This paper will explore the developing shape of archaeology since 1960, exploring its language and terminology, its geography of specialists, its sources and venues of publication through a series of interactive science maps charting the discipline's direction of transformation across time.

### 5 IS ASKING THE CORRECT QUESTIONS A KEY TO THE BALANCE? A CASE OF TRANSDISCIPLINARY STUDY OF PORTABLE ROCK ART COLLECTION

**Abstract author(s):** Radchenko, Simon (University of Turin) - Kiosak, Dmytro (Ca' Foscari University of Venice)

**Abstract format:** Oral

The relations between science and humanities could never be described as a perfect balance. A history of science is rather a history of research trends consequent movement from one pole to another. Archaeology is not an exclusion — the oscillation between processual and post-processual worldview corresponds to the change of interpretative fashion from empiric and science-based to an artistic and humanities-oriented one. However, science and humanities will never be the pair of opposites, as they do not contradict each other. Both rather introduce a set of practices

that are applicable to different disciplines. Moreover, they present quite different questions. In one word, we apply to the science when trying to understand a phenomenon; furthermore, we use humanities when endeavor to explain it. This difference appears to be clear when it is not enough to do only one, ignoring the other. For instance, a portable rock art collection from Kamyana Mohyla in North Azov Sea region used to be interpreted from the prospects of humanities and the humanistic view on the engraved stones. However, technological study performed through image based 3D-modeling reveals an asset of wrong interpretations. Therefore, a new attempt that would take into account the new data is needed. A technological research was required to provide the understanding of the objects. Onward, a new approach based on the contemporary philosophy and new ontology was presented to propose the explanation to the studied phenomenon.

This case study introduces a model of science and humanities interaction that seems to be most promising nowadays: using both for the needs of the discipline instead of choosing between them. Such approach is not just fruitful; it corresponds both with the current total desire for transdisciplinarity and a contemporary cultural and social agenda of post-postmodern word.

## 6 **ARCHAEOLOGY OF PROBABILITIES: BRIDGING SCIENCE AND HUMANITIES**

**Abstract author(s): Santos, Joel (NOVA University of Lisbon, Portugal) - Carvalho, Daniel (UNIARQ; FCT; LAQU)**

**Abstract format: Oral**

Investigating the complex nature of the human past is of paramount importance to archaeology. Throughout the years, several theoretical proposals on how to perceive the past have been constructed. From formulating law-like statements to symbolic and contextual approaches, passing to symmetrical and ontological critiques, archaeological theory has experienced change and shifts in relative interest in the last several decades. However, a fundamental question arises: how are archaeologists able to face the near infinite possibilities that constitute the past? On top of this already difficult conundrum, the basis of our work is nothing but fragmented material remains, mere shadows of things that once were. Is this an impossible task?

Can archaeology go further than currently possible in its quest to unveil the past? In this communication, a framework that joins theory and method, sciences and humanities is proposed that intends to enable archaeologists to build, test and debate more complex epistemological issues. We argue that it can be achieved through the conjunction of three factors: uncertainty, relations and materiality, and a fundamental element that connects them all: probability. Thus, an "Archaeology of Probabilities" considers which hypotheses are more probable to explain past phenomena, utilizing mathematical and statistical models to achieve its goals. For the purpose of demonstrating how it can be relevant for archaeological research, two case studies are analyzed using this framework.

## 7 **WHERE IS THE VALUE OF HUMANITIES? PROVIDING PERSPECTIVES FOR INTERDISCIPLINARY RESEARCH**

**Abstract author(s): Paasikivi, Sofia - Moilanen, Ulla (University of Turku)**

**Abstract format: Oral**

The Third Science Revolution in archaeology has encouraged the use of big data and scientific methods. The fast development of methodologies has also led to scientific archaeology getting more publicity than purely humanistic archaeological research. To some extent, the issue lies in a hierarchy in which sciences are valued higher than humanities. This, on the other hand, results from fundamental differences in how we see the disciplines. Both researchers and the general public may be intrigued by the idea of sciences offering exact knowledge on the past, while traditional archaeological interpretations seem to include countless possibilities. However, this is misleading since scientific results are also based on interpretations of data, and they are not free from uncertainties either. For archaeologists, it is also clear that only humanities can provide the context for interpretations, and scientific data has very little meaning without it. How can we (and should we) raise the value of humanities in the eyes of scientists and scientific publications, and how can we tackle the imbalance between valuing journals and certain merits in different fields while working together in interdisciplinary projects?

## 8 **DEATH AND THE HUMAN BODY: FINDING A COMMON GROUND FOR ARCHAEOLOGY AND ANTHROPOLOGY**

**Abstract author(s): Gramsch, Alexander (RGK - Romano-Germanic Commission DAI)**

**Abstract format: Oral**

The late 20th and early 21st century saw an ever-increasing specialisation and various fractures between archaeology, bio-archaeology and physical anthropology. The so-called "Third Science Revolution" of recent decades has revealed both the possibilities of an intensified interdisciplinary exchange and the need to re-learn each other's disciplinary languages and modes of thinking. Starting from considerations on a focus on the historicity and sociality of the human body and on body 'itineraries' as a new field of research, this presentation aims to explain why and how such

a field can bridge the epistemologies, bringing together the social and bio-archaeologies and anthropologies, but also psychology, neuroscience, and philosophy. I will suggest approaching both the thanatology of bodily remains encountered in archaeological contexts and body-related practices combining both science and humanities. From an archaeologist's point of view, I will discuss the study of human remains and the practices associated with them as a starting point enabling us to find a new common ground for science and humanities in the archaeologies.

## 9 SCIENCE IS DEAD. LONG LIVE SCIENCE

**Abstract author(s): Griffiths, Seren (Manchester Metropolitan University)**

**Abstract format: Oral**

Discussions about the nature of archaeology as a discipline do more to serve the progression of individual scholars than to move the discipline forward. Recent developments in the application of science techniques in archaeology - especially Bayesian chronological modelling, isotope studies, aDNA and pottery residue studies - have allowed us to recover a range of data that were unimaginable 50 years ago. With these data come challenges of interpretation and dissemination, both within the archaeology community and with members of the public which require consideration of the nature of our knowledge claims and the structures within which we work, as well as the ethics of our practice. To attempt to define our discipline within terms of 'either science' 'or humanities' is mistaken. Archaeology is a unique approach to engaging with the world and we need to use this unique status as a major strength. Archaeology is archaeology or it is nothing.

## 10 TO ASK A SILLY QUESTION: NEED FUTURE ARCHAEOLOGICAL QUESTIONS ENTAIL SCIENTIFIC METHODS IN ORDER TO BE PROPOSED?

**Abstract author(s): Pantmann, Pernille (Museum North Zealand)**

**Abstract format: Oral**

Being an archaeologist of the 21st century, science is an integral part of my archaeological work. I welcome the perspectives that the results can offer, and I acknowledge that the various scientific disciplines are invaluable tools when unleashing new archaeological questions. But I have also realized that I cannot expect answers of 100% certainty. The outcomes and success of the scientific results depend entirely on the potential and quality of the archaeological samples. And even more important, the results are dependent on the scientific interpretation and understanding of data. From humanities we are familiar with data, which are based on estimates rather than certainties, but we do not necessarily expect such degree of uncertainty from science. We are used to have scientific results presented as solid, objective facts in various tables and graphs. Because of the often very convincing presentation of scientific facts, the critical archaeological approach towards science is perhaps not as confident as it should be. There is no such thing as exact science, therefore we should take pride in our own academic discipline and consider it to be equally important. Because there are questions to which science cannot give the answers. Topics such as personhood, ethnicity, social structures, identity, beliefs, ethics, and rituals cannot be proven scientifically. Yet, the question stands, if all future archaeological questions need to be based upon scientific results to be accepted as science with subsequent funding and publishing possibilities? Although interdisciplinary research has huge potentials and will increase our knowledge, archaeology is still an independent and relevant discipline with numerous perspectives. If we do not believe so, the entire basis of interdisciplinary research is at stake.

## 11 ANCIENT DNA AND KINSHIP ANALYSES IN BRONZE AGE EUROPE

**Abstract author(s): Wilson, Kathleen (SUNY University at Buffalo)**

**Abstract format: Oral**

Advancements in science and technology throughout the last several decades have created opportunities for new archaeological methods of analysis. These methodologies allow archaeologists to analyse and interpret aspects of past societies that may have been difficult to study using prior methods and technologies. By the 1990s, the use of ancient DNA (aDNA) analysis became widely utilized within the archaeological community as it enables more in-depth archaeological interpretations of past societies, such as migration patterns, kinship, and social structures. Although a valuable tool for archaeologists, aDNA has been the subject of much debate in recent years due to assumptions that have been made in the interpretation of data. This paper aims to provide a critical overview of how aDNA has been used to analyse kinship and familial relationships in studies of Bronze Age Europe, discuss the challenges of aDNA analysis, review assumptions that are often made regarding social structures based on aDNA evidence, and provide suggestions for future aDNA-kinship studies.

## POTENTIAL, LIMITATIONS, AND PERSPECTIVES ON THE COMBINATION OF HUMANITIES AND NATURAL SCIENCES: THE CASE OF THE TRANSCULTURAL PROJECT

**Abstract author(s):** Maurer, Anne-France (Universidade de Evora) - Oliveira, Luis Filipe (Universidade do Algarve / I.E.M-FCSH-Nova) - Vilar, Herminia (Universidade de Évora – Escola de Ciências Sociais – CIDEHUS, Evora) - Tété Garcia, Cristina (Research Center in Archaeology, Arts and Cultural Heritage, DRC Algarve, Faro) - Valente, Maria João (Centro de Estudos de Arqueologia, Artes e Ciências do Património, Universidade do Algarve – FCHS ; CEAACP) - Fernandes, Teresa (Research Centre for Anthropology and Health - CIAS, University of Coimbra; Departamento de Biologia. Escola de Ciências e Tecnologia. Universidade de Évora) - Barrocas Dias, Cristina (Laboratorio HERCULES, Universidade de Evora; Departamento de Química, Escola de Ciência e Tecnologia, Universidade de Évora) - Mac-Roberts, Rebecca - Lopez-Aceves, Judith - Ortega-Gonzalez, Alvaro (Laboratorio HERCULES, Universidade de Evora)

**Abstract format:** Oral

In 2018, the TRANSCULTURAL project was initiated to investigate cultural identity and inter-cultural contact which occurred at the dawn of the Portuguese Kingdom (10th-14th cent. AD) between Muslims and Christians. Diet and mobility are at the heart of this project as their pattern can help to enlighten the socio-economic organisation of Muslim and Christian individuals (identified according to their funerary habits) during this period of economic and political transition. Skeletal remains constitute a privileged archive of diet and mobility. Indeed, in addition to anthropological data, which allow estimation of sex, age at death and pathologies, the geochemical composition (isotopes) of bones and teeth is directly related to the nature (type of resource) and location (geographic and geological) of the food that has been consumed, therefore allowing for the reconstruction of dietary habits and population movements.

During this presentation, the results from the investigation of four necropolises dated from the 12th to 14th cent. AD and yielding individuals who have lived and witnessed this transition period will be presented. The individuals were Muslims, Christians and a military order.

As this project is using a multi-faceted approach combining history, archaeology and anthropo-biogeochemistry, the focus here will be on the necessary dialogue between Humanities and Natural Sciences accompanying the four case studies. What are the limits of this dialogue and how can this be improved? Have the Natural Sciences provided new evidence to the already existing archaeological and historical knowledge? What are the limitations of the Natural Sciences and how the Humanities can help to overcome these limitations? These are some of the general questions that arise within the attempt of using a transdisciplinary approach to answer archaeological and historical questions, and that we want to illustrate with this particular research project.

## BEYOND THE DIVIDE: THE UNCONSCIOUS, THE DIGITAL, AND THE POLITICAL IN ARCHAEOLOGY

**Abstract author(s):** Barruezo-Vaquero, Pablo (Independent) - Laguna Palma, David (Universidad de Granada) - López-López, Víctor (Spanish National Research Council - CSIC-INCIPIT)

**Abstract format:** Oral

Archaeological sciences seem to be the dominant topos in archaeology, at least in recent decades. These variegated 'sciences' (digital, biomolecular, genetic, etc.) has favoured new studies, accelerated data analyses, shed complex results, and attracted funding as well as media attention. So far, so good...so what!

We share a preoccupation for what this panorama means for archaeology—especially when it seems to be far from humanities' theoretical discourses. Our aim is not to argue against the new 'sciences' that have made their way into archaeology; they arguably bring positive outcomes. Instead, this paper aims at warning against some issues that come along with an all-too-scientific Archaeology, which must be defied. To make this "tour de force", we turn towards three interlinked topics, which also help in blurring the distinction between sciences and humanities: the unconscious of this research agenda, the status of digital data, and the political matters that should be part of our research.

- The concept of the Unconscious serves for questioning why the search for objectivity still endures: what archaeologists seek (in the Other)?
- Data, and more concretely, digital data sometimes generate much and quite heated debates. From utter suspicion against data's objectivity to over-trustiness, there seems to be no real consensus. J. Huggett argues in favour of the data in so far as we embrace a humanistic approach towards the debate. In this paper, we align with the latter idea whilst aiming at enhancing it still further. We thus argue that digital data should be contemplated from a humanistic point of view but within a posthuman understanding.
- Bringing politics to archaeological discourses is necessary for Archaeology not to be vanquished by Late Capitalism. This means embracing socio-political explanations (about the past and for the present) in our research (human-environment relationships, crisis-and-change, etc.) despite its undeniable scientific approach.

## INTERDISCIPLINARY PRACTICES, SCIENTISM AND SCIENTIFIC ATTITUDES

**Abstract author(s):** Niculescu, Gheorghe Alexandru (Vasile Pârvan Institute of Archaeology)

**Abstract format:** Oral

The widespread enthusiasm for incorporating results of scientific research, especially those generated by molecular biologists and physicists, is not necessarily accompanied by attitude changes towards science or by a shift from interpretation and induction to ways of thinking constructed around theory testing. This situation can be explained in part by the presence of scientism in what archaeologists think, something that does not seem to bother many of the scientists who work with them. Despite the hopes put forward by Kristian Kristiansen, frequently no new ways of thinking are borrowed from the hard sciences or generated as a reaction to the contact with them. The knowledge objects remain pre-constructed, shaped by unexamined assumptions and customary perception. The persistence of the dominant role of history in what aspires to become a scientific archaeology is visible in ontologies of the social world that make the old group making expectations suitable for the scientific data that has become recently available. However, the critical capacities of the historians do not seem useful for assessing interdisciplinary practices and their outcomes. For that we have to turn to the philosophy and sociology of scientific knowledge.

## ARCHAEOLOGY AND ARCHITECTURE AS COMPLEMENTARY AND COLLABORATING FIELDS

**Abstract author(s):** Benjamin, David (David N. Benjamin, Sivilarkitekt MNAL)

**Abstract format:** Oral

Many recent publications concern the interdisciplinary work of archaeological perspectives on architectural relics from prehistory and architectural perspectives on archaeological phenomena, mainly by archaeologists. Further, three new training programs in Europe, which bring post-graduates and professionals from archaeology and architecture to study together, show a sincere and deep interest in both camps to advance common understanding.

These methods used by each field for conceptualizing phenomena are similar and complementary, enabling co-learning. This includes methods of direct observation and analog tools for recording sensible evidence and projecting the characteristics of phenomena not immediately available to the senses (hand drawings, etc.). These methods help to maintain and enhance the person's facility for observation and understanding sites and artefacts, confirmed by recent work in brain myelination and cognitive science.

Architects bring to this collaboration skills at both direct observation and drawing records of complex sites and artefacts with analog methods, directing the work of autonomous digital devices and software, and observation, gaining understanding and mastery through continuous practice and extended cognition. Learning capability is further enhanced through motivation and the beneficial results are often evident with those archaeologists who are passionate about using and continually practicing these skills.

Architecture as a field contributes to this collaboration, methods for (1) conceptualizing buildings and sites as whole spatio-temporal forms, (2) recording extant sites and artefacts with a multiplicity of methods to create a musée imaginaire of modifiable forms that are ordered in the mind according to categories, use types and function in a form of bricolage, and (3) conceptualizing built and landscape forms in space and time as both diagram and a conceptually 'finished' form, thus allowing for a mental back and forth on-site, between immediate, thought experiments, multi-sensory site observations and reflecting at drawn records.

## APPRENTICESHIP AS RESEARCH METHOD

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** van Gijn, Annelou (Leiden University) - Wendrich, Willeke (Cotsen Institute of Archaeology, UCLA)

**Format:** Discussion session

Archaeology has a long and varied history, and one of the aspects that is in flux is the identity of the archaeologist. From 17th- and 18th-century European amateurs, through the professionalisation of archaeology, we are now in a period where decolonisation and diversification are at the centre. Engaging local communities, providing opportunities to members of society who do not have easy access to academia but are traditional caretakers of cultural heritage, listening rather than explaining, are just some of the activities that the present day archaeologist increasingly partakes in. Broadening participation in scientific or scholarly endeavors can be undertaken in several ways, for instance through citizen science, experimental archaeology and ethnoarchaeology. For archaeologists, embarking on experiments together with volunteers is an excellent way of cementing a community in which both academics and local specialists or community members can thrive. Creating a teaching-learning continuum enables archaeologists to learn as much as teach, and local communities to be initiators and contributors, thereby increasing the connection to their past and providing a sense of place. The same pertains to ethnoarchaeology: learning about traditional crafts, and the use of long-forgotten plants and their uses, are of great benefit to the interpretive models of archaeologists. At the same time, studying, appreciating and even reviving such traditions, be it in Africa, the Ameri-

cas, Asia or Europe, is a way to address issues of sustainability. By highlighting indigenous knowledge, local crafts and subsistence strategies, project participants can provide and exchange location specific knowledge where everybody both teaches and learns.

We invite papers dealing with the teaching-learning continuum: community initiatives and archaeology, indigenous knowledge and the benefits for archaeology, community and the future of our planet.

## ABSTRACTS

### 1 COMMUNAL ARCHAEOLOGY: INDIGENOUS KNOWLEDGE, SCIENTIFIC RESULTS AND LEARNING BY DOING

**Abstract author(s):** Wendrich, Willeke (UCLA Cotsen Institute of Archaeology)

**Abstract format:** Oral

As an archaeologist trained in western academia, but working in different countries and communities around the world, I have become increasingly aware of the importance of listening and learning, sharing and growing. Knowledge and knowledge transfer have many different forms ranging from scientific analyses to oral traditions and similarly, the form in which knowledge is held and remembered differs widely from databases to narratives, from imagery to ingrained body knowledge. Community archaeology or public archaeology have become increasingly important in archaeological projects, not necessarily as part of the research, but often as an activity that provides information, rather than being embedded in both the research and surrounding community. By taking indigenous knowledge seriously, while providing full insight in the archaeological process, we can create an atmosphere of mutual respect and shared interests, allowing all participants to bring questions and answers to the table, or to learn together. At the center of communal archaeology is curiosity, potentially leading to a number of different research questions, methods and results. This is a process that will require archaeologists (and funders) to be less rigid in our research design, because the interests of the archaeologist may not fit those of other participants.

### 2 BRINGING A STONE AGE DWELLING CONSTRUCTION TO LIFE: A JOINT VENTURE OF LOCAL VOLUNTEERS AND ARCHAEOLOGICAL SCIENTISTS

**Abstract author(s):** van Gijn, Annelou (Faculty of Archaeology, Leiden University) - ter Brugge, Jeroen (Masamuda Educational Archaeological Centre; Rijksmuseum Amsterdam)

**Abstract format:** Oral

Public participation in archaeological projects is becoming ever more essential and experimental archaeology is an excellent way of reaching out and creating a scientific community in which both the general public and archaeological scientists can learn from each other. In the town of Vlaardingen, near Rotterdam, local volunteers have set up an archaeological educational centre about the archaeology of the Rhine/Meuse delta, called Masamuda, where school children learn about the past of their region. Here volunteers and professional archaeologists together have built a late Neolithic dwelling, using Stone Age tools only, and documenting the entire chaîne opératoire. In a new collaborative project we attempt to fill in the details of daily life around this house: what kind of crafts were carried out, how did people process their food, and how did they move about in this water-rich landscape? Despite extensive archaeological excavations in the area, we actually know surprisingly little about the material culture and the technological organization. A combination of microwear and organic residue analysis, petrography and experimental archaeology will be used to get an understanding of technological processes. Workshops are organized in which experienced craftspeople teach both archaeological scientists and local volunteers about their craft. Discussions and practical interaction with such a varied group of people, each with their own knowledge and experience, have raised new questions not previously posed by archaeological scientists. These, in turn, have opened up new research avenues and alternative interpretations, to be explored by means of scientific analysis and further experiments. Last, the scientific knowledge and practical expertise obtained by the volunteers through interaction with traditional craftspeople and archaeological scientists is transferred to the school children, ensuring a teaching-learning continuum outlasting the current research project. In this paper I will discuss the results obtained so far in this exciting joint venture.

### TO DO OR...TO DO! FROM THE CHALCOLITHIC TO THE CARMO ARCHAEOLOGICAL MUSEUM: EXPERIMENTAL AND PUBLIC ARCHAEOLOGY

**Abstract author(s):** Martins, Andrea (UNIARQ - FLUL; Associação dos Arqueólogos Portugueses) - Cura, Pedro (PrehistoricSkills) - Neves, César (Associação dos Arqueólogos Portugueses; UNIARQ - FLUL) - Carrondo, Joana (PrehistoricSkills) - Diniz, Mariana (UNIARQ - FLUL; Associação dos Arqueólogos Portugueses) - Arnaud, José (Associação dos Arqueólogos Portugueses)

**Abstract format:** Oral

During 2019 and 2020, several Experimental Archeology workshops were held at the Carmo Archaeological Museum in Lisbon, under the VNSP3000 project. These workshops, aimed at a very diverse audience, were empirically based on the materials and structures identified in Vila Nova de São Pedro (Azambuja, Portugal). Thus, the holding of the Workshops entitled "How did you live 5000 years ago? A journey to Prehistory" and "Prehistory in Carmo", each with several thematic sessions, were one of the ways to combine two themes of the project, involving scientific research and experimental archaeology with the dissemination and sharing of knowledge to a wider audience. broad and not strictly scientific/archaeological.

In the field of Experimental Archaeology, the main focus is always on identifying the operative chains of production of artifacts, seeking to apprehend and replicate methods and gestures that may have been practiced by agents of prehistory, through the formulation of hypotheses and trial and error. In the workshops, this execution, carried out in a first phase by the team members, allows the demonstration and transfer of knowledge to a non-specialized audience. This practical and sensorial activity, in which the participants interact and are part of the experience, leads to the transmission not only of empirical and theoretical knowledge, but also of execution methods. Active participation, in contrast to the usual passivity where the audience just listens and observes, also makes it possible to achieve a feeling of personal fulfillment achieved with the execution of the proposed artifact or action. The experience becomes inclusive leading to, in a didactic way, the apprehension of the importance of archeology and the study of the past is achieved.

We intend to present this knowledge transmission project – starting from an experimental archeology program, to the creation and development of didactic workshops.

### REVISITING HUSBANDRY AND SUBSISTENCE IN SOUTHWESTERN ASIA USING INTEGRATED APPROACHES AND THE LATEST DEVELOPMENT IN BIOARCHAEOLOGY

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Casanova, Emmanuelle - Vuillien, Manon (UMR7209 Archaeozoology and Archaeobotany: Societies Practices and Environments, National Museum of Natural History, CNRS) - Davoudi, Hossein (Archaeozoological section, Bioarchaeological laboratory, University of Tehran)

**Format:** Regular session

Animal husbandry is a fundamental component of the economy of agropastoral societies since the beginning of the domestication of ungulates. It can be defined, in zootechny, as a technical sub-system of resource exploitation articulated around the breeders, the herds and the environment. Domestication also revolutionised means of food procurements and introduced new commodities in human diet such as dairy products. For nearly ten millennia, in Southwest Asia, animal husbandry and pastoralism, especially of caprine, have played a major role in the development of societies.

Animal husbandry studies in archaeology allows a better understanding of the economic and socio-cultural systems of past societies by investigating the available resources, as well as the needs, practices and traditions associated with the exploitation of these resources. However, a comprehensive understanding of animal husbandry and exploitation remain difficult to attain due to the relative scarcity of archaeological remains compared to the abundance and diversity of past activities. Over the last decades, pluridisciplinary studies on bioarchaeological remains are becoming more common and allow a better understanding of animal husbandry and their exploitation for food procurement.

This session seeks to bring together papers presenting cross-disciplinary studies on bioarchaeological remains from the beginnings of domestication to explore husbandry and subsistence in Southwestern Asia. We particularly focus on recent bioarchaeological tools which allow to go beyond and complement the traditional methods. We welcome pluridisciplinary contributions such as - but not limited to - geometrics morphometric, seasonality, cementochronology, organic residues analyses, isotopic, proteomic and genetic methods applied to husbandry and subsistence in this region.

**1 HUMAN DIETARY DYNAMICS AND EARLY CAPRINE HUSBANDRY: ISOTOPIC AND PROTEOMIC ANALYSES OF SKELETAL TISSUES AND DENTAL CALCULUS FROM 'AIN GHAZAL**

**Abstract author(s):** Makarewicz, Cheryl (University of Kiel) - Kendall, Iain (University of Bristol) - Palmer, Karren (University of Manchester) - Winter-Schuh, Christine (University of Kiel) - Buckley, Mike (University of Manchester) - Evershed, Richard (University of Bristol) - Rollefson, Gary (Whitman College)

**Abstract format:** Oral

The emergence of caprine husbandry in the southern Levant by approximately 8300 cal BCE is thought to have substantially increased the accessibility of animal resources available for human subsistence. Indeed, the zooarchaeological record indicates pronounced shifts in animal exploitation during the Pre-Pottery Neolithic, from strategies focused on intensive gazelle hunting to practices engaging both ungulate hunting and animal management and, later, dedicated husbandry of domesticated caprines. We investigate how the initial exploitation of managed goats and, later, domesticated sheep and goats may have altered human diets, in particular protein intake, through bulk and compound-specific isotopic analyses of faunal and human skeletal remains recovered from the key Pre-Pottery Neolithic settlement of 'Ain Ghazal, Jordan. We also investigate the potential role of dairying at 'Ain Ghazal through proteomic analyses of human dental calculus, and explore how human dietary dynamics articulated with spatial shifts in landscape use and the emergence of mobile pastoralism.

**2 HUMAN SUBSISTENCE IN IRANIAN PREHISTORY REVEALED THROUGH LIPID RESIDUE ANALYSIS IN POTTERY VESSELS**

**Abstract author(s):** Casanova, Emmanuelle (Muséum national d'Histoire naturelle) - Davoudi, Hossein (University of Teheran) - Zazzo, Antoine - Boco, Audrey (Muséum national d'Histoire naturelle) - Bernbeck, Reinhard - Pollock, Susan (Free University of Berlin) - Tsuneki, Akira (University of Tsukuba) - Ghafoori, Om ol Banin - Nokandeh, Jebreil (National museum of Iran) - Mashkour, Marjan (Muséum national d'Histoire naturelle)

**Abstract format:** Oral

The Fertile Crescent in SW Asia is a key region for the early domestication of ruminant animals. The domestication of caprine in the SW Asia started about 10000 years ago and took an important place in the development of a farming economy. With the introduction of caprine domestication come the question for which products they were exploited : their primary products (meat), their secondary products (milk, wool) or both.

The development of pottery technology in the early Neolithic also influenced food processing and pottery vessels have been extensively used for culinary preparations. The organic residues preserved in archaeological pottery vessels serve therefore as archives for ancient diet through prehistoric times. Using molecular and isotopic analyses on lipid residues recovered in the ceramic vessels, the source of the food residues can be discriminated, including carcass from the dairy products of ruminants.

We report here the study of lipid residues preserved in prehistoric iranian pottery assemblages dating between the late 7th and 5th millenium BC which provide insights into prehistoric human subsistence in Iran.

**3 ANIMAL EXPLOITATION DURING THE EARLY HARAPPAN PERIOD: A CASE STUDY FROM BHANDO QUBO (SINDH, PAKISTAN)**

**Abstract author(s):** Parque, Óscar - Jiménez-Arteaga, Carolina (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra) - Lancelotti, Carla (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra; ICREA – Institució Catalana de Recerca i Estudis Avançats) - Veesar, Ghulam Mohiuddin - Abro, Tasleem - Chandio, Ameen (Department of Archaeology, Shah Abdul Latif University) - Madella, Marco (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d'Humanitats, Universitat Pompeu Fabra; ICREA – Institució Catalana de Recerca i Estudis Avançats)

**Abstract format:** Oral

The Indus Valley Civilisation was one of the first urban societies of the Old World, leaving an archaeological record in what is today Pakistan, NW India and Afghanistan and Iran. The Pre-Urban or Early Harappan phase covers a chronology from 3300 to 2600 BCE. Afterwards, an unprecedented urban process took place along with the integration of local cultural traditions into a major Harappan "vener", which is known as the Mature Harappan period (2600-1900 BCE).

To date, there are only few archaeological sites in Pakistan with a long stratigraphic and absolute chronology dated sequence illustrating how small settlements became urban centres. Moreover, most zooarchaeological research in Pakistan has been carried out and published during the 90's while on the Indian side more data is available.

The aim of this paper is to present the preliminary results of the analysis of faunal remains from Bhandu Qubo (Sindh, Pakistan). The settlement lies in the core area of the Indus Valley Civilisation, the alluvial plain of the lower course of the Indus River. The site is found at around 60 km from Mohenjo-Dhara and about 20 km from the current course of the Indus River, while an old branch of the Indus has been identified nearby the site. Stratigraphically, the site comprises a long chrono-cultural sequence, spanning both Early Harappan (pre-Urban) and Mature Harappan (Urban) occupations.

In this presentation, we will illustrate the importance of analyzing very fragmented assemblages considering mortality profiles, bone surface modifications, and anatomical profiles. That information allows us to evaluate the subsistence strategies carried out during the Early Harappan occupation as well as livestock management practices in the period before the flourishing of the urban settlement.

#### 4 FEEDING PRACTICES AND MULTI-SEASON REPRODUCTION AMONG SHEEP AND GOATS IN EARLY AENEOLITHIC MONJUKLI DEPE, TURKMENISTAN

**Abstract author(s):** Eger, Jana (Freie Universität Berlin)

**Abstract format:** Oral

Sheep/goat predominate the Neolithic and Aeneolithic faunal assemblages in southern Central Asia, yet their husbandry is still incompletely understood. Some aspects of sheep/goat herding practices, such as the annual timing/seasons of birth and feeding in consideration of local conditions, have received little attention so far.

This paper focuses on these aspects by using an integrated approach, combining a multi-isotope analysis mainly on caprine teeth/bones with archaeozoological results and archaeobotanical data from Monjukli Depe. The small settlement in southern Turkmenistan was inhabited in the late Neolithic (ca. 6200-5650 BCE) and again in the early Aeneolithic (ca. 4800-4350 BCE). Excavations at this site have yielded a large, well-preserved animal bone assemblage.

The analysis reveals that sheep and goat were born across multiple seasons within the annual cycle, contrasting results such as from Neolithic sites in Europe with currently two main seasonal lambing patterns. Furthermore, a greater proportion of individuals received a more diverse vegetation than others with possible contribution of C4 plants in diet - both on a seasonal and long-term basis. Herding practices in the Monjukli case seemed to focus on landscape microvariability, where there might have been ecologically different grazing locations. Overall, the information gained from the investigation helps to draw a more detailed picture of sheep and goat husbandry, including a better understanding of breeding practices and controlled herd security by the people who tended the animals. The results demonstrate a wide zootechnical knowledge in this early village society.

#### 5 UNDERSTANDING HUMAN OCCUPATION IN GEORGIA'S MOUNTAINS DURING THE CHALCOLITHIC AND EARLY BRONZE AGE: CONTRIBUTIONS FROM ARCHAEOZOOLOGY, CEMENTOCHRONOLOGY AND ISOTOPE GEOCHEMISTRY

**Abstract author(s):** Vautrin, Adeline - Berthon, Rémi - Balasse, Marie (Muséum national d'Histoire naturelle, UMR 7209 AASPE, CNRS, Paris) - Bedianashvili, Giorgi (Georgian National Museum, Tbilisi) - Fiorillo, Denis (Muséum national d'Histoire naturelle, UMR 7209 AASPE, CNRS, Paris) - Gambashidze, Irina - Gogochuri, Giorgi (Georgian National Museum, Tbilisi) - Gourichon, Lionel (Université Côte d'Azur, UMR 7264 CEPAM, CNRS, Nice) - Stöllner, Thomas (Ruhr-Universität, Bochum; Deutsches Bergbau-Museum, Bochum) - Mashkour, Marjan (Muséum national d'Histoire naturelle, UMR 7209 AASPE, CNRS, Paris)

**Abstract format:** Oral

The exploitation of mountain ecosystems by agro-pastoral communities has played an important role in the development of these societies in the Caucasus. Providing access to raw materials such as obsidian and copper ores needed for tools, the mountains also offer herders ample pasture for their flocks. Nevertheless, in winter, these high-altitude areas seem less favourable to the permanent installation of agro-pastoral societies, notably because of the snow which prevents access to these pastures and restricts the parking of the animals.

As the archaeological occupations of the mountains in Georgia are still little studied, the archaeozoological approach that we use allows us to test the hypothesis according to which zootechnical innovations allowed a more perennial settlement of societies in the mountain ecosystems during the Chalcolithic and the Early Bronze Age periods.

To try to answer this hypothesis, the first phase of the study was devoted to recording archaeozoological remains to verify that the sites were indeed occupied by herders. The measurements of isotope ratios recorded in carbonates (dental enamel) and collagen (bone) have been carried out to account for breeding practices (mobility, feeding, seasonality of births). Finally, the season of site's occupation will be tested by cementochronology analyses.

## DRAW ME A SHEEP: A MORPHOLOGICAL INVESTIGATION ON APPENDICULAR BONES OF MODERN AND ANCIENT POPULATIONS FROM SOUTHWEST ASIA (EVOSHEEP PROJECT)

**Abstract author(s):** Vuillien, Manon (AASPE, Muséum national d'Histoire naturelle, CNRS, Paris) - Vila, Emmanuelle (Archéorient, CNRS, University of Lyon 2) - Chahoud, Jwana (Archéorient, CNRS, University of Lyon 2, France; Department of Archaeology, Lebanese University) - Davoudi, Hossein (Archaeozoological section, Bioarchaeological laboratory, University of Tehran) - De Cupere, Bea (Directorate Earth and History of Life, Royal Belgian Institute of Natural Sciences) - Helmer, Daniel (Archéorient, CNRS, University of Lyon 2) - Gourichon, Lionel (University Côte d'Azur, CNRS, CEPAM, Nice) - Mashkour, Marjan (AASPE, Muséum national d'Histoire naturelle, CNRS, Paris; Archaeozoological section, Bioarchaeological laboratory, University of Tehran) - Cucchi, Thomas (AASPE, Muséum national d'Histoire naturelle, CNRS, Paris)

**Abstract format:** Oral

Further co-authors: Manon Vuillien, Emmanuelle Vila, Jwana Chahoud, Hossein Davoudi, Bea de Cupere, Daniel Helmer, Moussab Albesso, Agraw Amane, Rémi Berthon, Sofiane Bouzid, Homa Fathi, Joséphine Lesur, Azadeh Mohaseb, Lionel Gourichon, Marjan Mashkour, Thomas Cucchi.

Sheep husbandry has played a major role in the economy of human societies in Southwest Asia over the last 10 millennia. However, if archaeological and archaeozoological "clues" provide insight into husbandry practices developed by early human societies, it is still difficult to assess the diversity of first breeds these societies relied on, such as, anthropogenic selective pressure and ecological conditions. To tackle this issue, EVOSHEEP project focuses on the complex history of early sheep husbandry in Southwest Asia between the Late Neolithic and the Bronze Age using an integrated approach including archaeozoology, morphometrics, genetics, iconography, philology. The objective is to identify the biological and anthropological components underlying the emergence and development of early sheep breeds. In this paper we present our first results based on modern breeds from Southwest Asia and East Africa using 3D geometric morphometrics on isolated elements from forelimb (distal humerus) and hindlimb (calcaneum and astragalus) as a proof of concept to explore the morphological diversity of sheep. These bones have proven to be powerful tools to understand both herding strategies and environmental conditions. The next step is to test the morphological patterns on ancient populations belonging to forty archaeological sites and covering five millennia of economic and cultural transformations, between the 6th and the 1st millennium BC.

## AD SALUBRITATEM CIVITATUM. THE ARCHAEOLOGY OF WATER EVACUATION INFRASTRUCTURES IN ROMAN URBAN SETTLEMENTS

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Acero Pérez, Jesús (Department of Prehistory and Archaeology, University of Seville) - Lebre, Jean-Baptiste (Casa de Velázquez) - Felício, Catarina (CHAM – Centre for Humanities, FCSH, Universidade NOVA de Lisboa)

**Format:** Regular session

The famous passage by Ulpianus in the Digest (43.23.1.2), referring to the need of repairing and cleaning the city's sewers to safeguard public health, highlights the interest of the ancient Romans in the construction and maintenance of water evacuation infrastructures. However, although Roman cities shared the same urban and hydraulic engineering principles, their execution was adapted to very different realities, from provincial capitals to secondary towns and other small urban settlements.

This session focuses on the archaeological evidence of structures related to urban sanitation in the Roman period, namely sewers, drains, latrines, and cesspits. Papers can present regional or local studies, but also more specific analyses on a particular site or building. The main objective is to discuss rain and wastewater disposal systems and to determine if there were differences based on the following variables: degree of urban development, legal status, geographical and climatic conditions, availability of water resources, and influence of pre-Roman traditions.

Papers addressing methodological aspects focused on the research and archaeological record of these structures are also welcome. In this sense, the results of both archaeometric analysis (geomorphology and bioarchaeology, including paleoparasitology) and new graphic documentation techniques (photogrammetry, laser scanner, 3D reconstructions, etc.) are considered of great interest. The combination of cultural and bioarchaeological data will allow to to deepen the understanding of the construction, operation, maintenance, and hygienic conditions of sanitation structures in Roman urban centres.

**1 THE BOUNDARIES OF THE UNWANTED: REFLECTIONS ON DRAINAGE NETWORKS IN THE ROMAN WORLD**

**Abstract author(s):** Lebreť, Jean-Baptiste (Casa de Velázquez)

**Abstract format:** Oral

Urban hydraulic networks within individual properties are nowadays compartmentalized between water drainage networks and water supply networks. The boundary between these two entities is marked by a water-consuming structure such as a sink, shower or toilet. Thus, one network supplies the facility (the supply network) and the other drains the water that has been altered as a result of its use in this structure (the drainage network).

This watertightness between the two networks reflects the hygienic theories of the 19th century. But what about hydraulic systems founded by societies where microbial theory was not yet known? It is through the archaeological analysis of Roman drainage systems that the question of the boundary between these two hydraulic systems will be addressed.

This questioning has a double interest. Firstly, historical, because the study of these networks allows us to question the perception of water in the Roman period, along their course, in the different structures that they cross. Secondly, methodologically, because archaeologists, like modern hydraulic networks, tend to separate the two entities: supplies on the one hand (aqueducts, fistulae, impluvia, cisterns...) and evacuations (drains, sewers, cesspools, sanitation) on the other. The question is whether this distinction should be maintained or eliminated.

**2 WHERE DOES THE WASTEWATER GO? DRAINAGE CHALLENGES AND SOLUTIONS ON THE AGORA IN NEA PAPHOS, CYPRUS**

**Abstract author(s):** Michalik, Michal (Doctoral School in the Humanities, Jagiellonian University) - Misk, Łukasz (Institute of Archaeology Jagiellonian University)

**Abstract format:** Oral

The Agora in Nea Paphos excavated by the expedition of the Jagiellonian University is the largest of its kind, known from Cyprus. From the 2nd century BCE to the first half of the 2nd century CE served as the main public space for the Hellenistic-Roman capital of the Island. Although its original design was in accordance with the Hellenistic-Alexandrian fashion, unearthed remains of the Agora comprise mainly superseding Roman Period habitation levels. This complex stratigraphical alignment is an imprint of major construction work prompted by the donation made by the emperor Augustus following the severe destruction of the city after the earthquake in the year 17/15 BCE. The reorganization of the Agora included the reconstruction of tetrastoon shaped porticos and the erection of the Odeon, but what is more, a new approach towards the design of the water evacuation infrastructure on the plaza.

In this paper, we would like to address the problems associated with precipitation disposal on Paphian Agora, which will be discussed in accordance with the site topography and character of attested monumental architecture. This will be confronted with the remains of wastewater infrastructure unearthed on the site during excavations and pinpointed in the course of non-invasive prospection. Additionally, the context of other sewage discoveries within the city will be taken into account.

This will permit the introduction of the challenges determining the wastewater treatment, and their solutions implemented into the hydraulic infrastructure of the monumental municipal plaza. Moreover, the diachronic perspective will allow presenting the transitions in the design of plaza drainage and outline of new ideas brought by the Roman engineers to the Island.

**3 THE HIDDEN FACE OF THE HYDRAULIC NETWORK OF A PROVINCIAL CAPITAL: THE WATER EVACUATION SYSTEM OF TARRACO**

**Abstract author(s):** Lebreť, Jean-Baptiste - Lasheras, Ada (Casa de Velázquez - EHEHI)

**Abstract format:** Oral

Between the 1980s and 1990s, numerous archaeological operations have allowed us to better understand the organization of the Roman city of Tarragona (Tarraco). The urban layout, the different monumental buildings of the town and its water supply network were all discovered. However, only part of the hydraulic network was analyzed. Indeed, if the water resources and the aqueducts of the capital of Hispania Citerior are globally known, the water evacuation system has not yet been the subject of a systematic study.

Thus, I propose to present the "hidden face" of the hydraulic network of the provincial capital. The drainage networks in the ancient period collected both run-off and wastewater (combined network) and functioned solely by gravity (gravity network). They are therefore dependent on topographical and more broadly environmental elements that we will analyze first.

Then, I will present the Tarraco drainage system through two levels of study. Firstly, at the neighborhood level, in order to understand the interactions that can exist between the individual drainage networks that are organized at the scale of a building, and the public/collective drainage network of the agglomeration. Secondly, I will focus on the collective drainage network, at the city level, in order to establish the articulations of Tarragona's management system of its undesirable water. The different drainage installations in the city will be described in the light of the structures found in other Roman towns, particularly in Gallia Narbonensis, and in other provincial capitals such as Merida and Lyon.

#### **4 URBAN SEWERAGE SYSTEMS IN THE ROMAN PROVINCE OF LUSITANIA: CONSTRUCTION AND OPERATION.**

**Abstract author(s): Acero Pérez, Jesús (Department of Prehistory and Archaeology, University of Seville)**

**Abstract format: Oral**

This work aims to present, through a selection of case studies, an overview of sewage networks in the cities of Lusitania, one of the three provinces in which the territory of Hispania was divided during the High Empire. The provincial capital, Augusta Emerita (Mérida, Spain), was an ex novo settlement founded by Augustus and it became one of the most important cities of Roman Hispania. In recent years, this city has been the subject of a specific study on urban waste management, including sewage disposal systems. This research has gathered detailed information about the implementation of the sewer network, already conceived in the founding urban project, its subsequent evolution and its main construction features.

In other cities of Lusitania, the knowledge of the wastewater collection systems is much more fragmentary. However, the preserved remains reveal the existence of sewage networks installed in the main streets and public buildings, as observed in cities such as Aeminium (Coimbra), Conimbriga (Condeixa-a-Velha), Olisipo (Lisbon) or Pax Iulia (Beja), all of them located in current Portuguese territory.

This global approach shows that among the Lusitanian cities there were differences in the sanitation networks based on the degree of urban development achieved in each of them, its geographical conditions and the local building materials and techniques.

#### **5 RAIN AND WASTEWATER MANAGEMENT IN ROMAN MIROBRIGA (SANTIAGO DO CACÉM, PORTUGAL). AN OVERVIEW OF THE EVACUATION SYSTEM**

**Abstract author(s): Felício, Catarina (CHAM - Centre for the Humanities, Universidade NOVA de Lisboa)**

**Abstract format: Oral**

From the turn of the Era onwards, the administrative reforms lead to the creation of numerous urban centres throughout Hispania. Some of which coincident with previous settlements whose importance or strategic geographic implantation were deemed as optimal for the creation of the new municipia.

Such was the case for the small urban centre identified with Mirobriga, an oppidum stipendiarium mentioned by Pliny (Nat. IV. 35. 118) and Ptolemy (Geo. II. V), located near what is now Santiago do Cacém, in Portugal. The site has its origins in the Iron Age and was subject to an extensive construction program in the second half of the 1st century CE, where most of the public buildings were built.

Unlike most of the cities created ex nihil or largely transformed in this period, Mirobriga never received an underground sewage network, leaving all the rain and wastewater to run freely throughout its streets.

In this presentation we analyse the town's topographical environ, characterized by a series of small to medium sized hills, and the way the different buildings were placed in the terrain, resulting in different strategies to evacuate and control the flow of water throughout the streets and to displace it outside the urban perimeter.

#### **6 ROMAN WATER EVACUATION STRUCTURES. ASSESSMENT OF FUNCTIONALITIES AND BUILDING TECHNIQUES PRESENT AT MIROBRIGA (SANTIAGO DO CACÉM, PORTUGAL)**

**Abstract author(s): Felício, Catarina (CHAM - Centre for the Humanities, Universidade NOVA de Lisboa) - Sousa, Filipe (CHAM - Universidade NOVA de Lisboa)**

**Abstract format: Oral**

While analysing two of Ulpianus' passages in the edict De Cloacis, namely (Dig. 42.23.1.4) and (Dig. 43.23.1.6), we can infer that in Antiquity all evacuation structures would have been encompassed under a single term, «cloaca». However, given the diversity in size, construction, and function of the existing remains, it becomes impractical for modern investigation to refer to all using the same designation.

In this presentation, we analyse the different evacuation structures related to the evacuation of rain and wastewater that have been identified in the town of Mirobriga (Santiago do Cacém, Portugal) and the role each of them played in the town's evacuation system. Comparing the construction of main conducts, secondary branches, and pipes,

and confronting the results with the type of residue that was evacuated and the sort of building they were located, we make a tentative effort to determine the degree of specialization, or multifunctionality of each type of structure.

## 7 TRANSFORMATIONS IN THE URBAN DRAINAGE SYSTEMS IN LATE ANTIQUE HISPANIA (3RD – 6TH CENTURIES CE)

**Abstract author(s):** Acero Pérez, Jesús (Department of Prehistory and Archaeology, University of Seville) - Romani Sala, Núria (Autonomous University of Barcelona)

**Abstract format:** Oral

Between the end of the 1st century BCE and the beginning of the 2nd century CE most of the Roman towns of Hispania were equipped with an extensive network of sewers, coinciding with a period of great urban development. In some cases, mainly in ex novo settlements, the sanitation network was unitarily planned from the outset of the urban project; in others it was gradually implemented during the various periods of urban renewal. These sewerage networks were very often related to the introduction of complex supply systems, mainly aqueducts. Regular cleaning and repair tasks were essential to ensure the correct operation of both sewers and aqueducts.

From the 3rd century CE onwards a process of transformation of the Classical city began, with important consequences for the urban organization in force until then. This was also clearly reflected in the water supply and sewerage systems, many of them becoming abandoned and clogged up.

This paper addresses the transformation of urban drainage networks from the 3rd to the 6th centuries CE, an issue which, along with several changes that occurred in Late Antique towns, has been largely overlooked. In this period, the ancient sewerage systems were no longer properly maintained due to the local government neglecting its erstwhile duties. However, certain devices were employed to keep the urban sanitation network operational, such as repairing and reusing former abandoned sewers or by rebuilding them using salvaged construction materials and previously unused construction techniques. By focusing on some examples from Hispania we will outline the final maintenance processes developed and the subsequent abandonment of the sanitation systems in the towns of that specific Roman region.

---

## 223 WINDS OF CHANGE? POST-MEDIEVAL AND HISTORICAL ARCHAEOLOGY IN SOUTHERN EUROPE AND THE MEDITERRANEAN

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Panetta, Alessandro (Università degli Studi di Genova) - Casimiro, Tânia (Universidade Nova de Lisboa)

**Format:** Regular session

Historical Archaeology and Post-Medieval Archaeology, sometimes divided into Early Modern and Contemporary Archaeology, seem to be well developed concepts in some parts of the world. The subject has been approached with several publications which summarize and address the key points in the debates that this concept generates in terms of material culture, mobility, inequality, globalization, social structures... among many other subjects. However, such discussions do not seem to be equally distributed. While in northern Europe this debate is decades long, even originating several written syntheses and frequent conferences, for the Mediterranean area the subject is seldom discussed, and southern European countries are under-represented in historical archaeology conferences. Although some exceptions exist, and historical and contemporary archaeology projects are being developed in countries such as Italy, Spain and Portugal, the general panorama is still fragmented in national traditions and lacks a large-scale discussion. Why weren't these ideas discussed and books written? Is it a problem of linguistic or cultural barriers? Lack of exchange of information? Maybe related to the paucity of theoretical debate in a type of archaeology that insists on providing more empirical data? Is it a problem linked to a still dominant classical archaeology perspective? Ceramology and other artefacts studies still seem the most flourishing field although lacking supra-local or -regional studies and rarely overcoming the firmly rooted typological studies.

In this session we invite people to think about what the specificities and themes for Historical/Post-Medieval Archaeology of the Mediterranean countries are. We encourage papers focusing on critical reviews of national and regional traditions, comparative studies between different nations, regions or border areas, relations and exchanges between east-west and north-south, not only from the European Mediterranean countries but engaging or in relation with a broader Mediterranean cultural perspective, but also single case studies that highlight themes of general interest.

**1 TO SHARE OR TO DIVIDE? DEFINING SPACES AT THE UPLAND SETTLEMENT OF COLANESI (GENOVA, ITALY) BETWEEN 19TH AND 20TH CENTURIES**

**Abstract author(s):** Bizzarri, Giulia (Laboratorio di Archeologia e Storia Ambientale - Università di Genova)

**Abstract format:** Oral

The contribution draws on ongoing studies carried out at the settlement of Colanesi, on the hillsides of Monte Fasce, to the east of Genova (Liguria, Italy). Throughout the Modern Age, the area was characterised by the presence of common lands, shared by social groups belonging to downstream villages. Between the 19th and the early 20th century, these lands were privatised. 19th century documents highlight how complex the privatisation process was. Social groups belonging to municipalities, local and state authorities were all involved into the discussion regarding the common lands on Monte Fasce. Access rights to these lands were negotiated and contested by different social groups and individuals, often through practical acts of possession. Here, archaeological, building archaeological and historical-ecological surveys have identified traces of past environmental resource management practices, recording signs of a diversified and extensive management of these hillsides for the post-Medieval period, such as settlements, terraced fields, chestnut tree groves and pastures. The settlement of Colanesi shows a specific complexity in how architectural structures were modified over time. Especially within buildings, walls were added and altered, entrances were moved, creating and dividing spaces. Within architectural complexes structures were built, showing different alignments or shifting spatial properties. Furthermore, 20th century cadastre data shows a high fragmentation of property within the settlement and speaks for a profound shift in spatial organisation, at least on paper. Building and use phases will be contextualised within the shifting nature of these lands during the 19th century, investigating how the privatisation and the discussion on common lands influenced how people redefined space within and around the settlement. The shift from common to private will be analysed, assessing whether this brought to changes in how spaces and resources were shared or divided, keeping a focus on architectural space as embodying social interactions, conflicts, and cooperation.

**2 WATER MANAGEMENT AND RESILIENCE IN SOUTHERN ITALY: THE CASE OF ARENA**

**Abstract author(s):** Mascarello, Chiara - Felicioni, Camilla - Patacchini, Andrea - Citter, Carlo (University of Siena)

**Abstract format:** Oral

The Arena Project derives its name from a small village within the Serre Calabre mountain, in southern Italy. It is focused on the resilience of local communities to landscape as well as political changes over time. In this paper we focus on water management. It is one of the key features that shaped this landscape, both from environmental and juridical point of view. A network of artificial channels runs all along the mountains around Arena, in order to irrigate a large number of artificial terraces. This system is nowadays still partially in use. However, we do not know exactly when it was established. We can find several comparisons throughout the Mediterranean. The nearest and more similar traditional irrigation system is located in the mountains of Trapani, in Sicily. It derives its origin from the Islamic domination (IX – XI centuries). The Calabrian network is composed of channels excavated in the ground, locally named "prise", and tanks named "gebbie". This last term is also used in the Sicilian system and derives from the Arabic word "jabh" (water tank for irrigation). All these elements could suggest an Islamic origin also for our set of water management. The objective of this research is to reconstruct the structure of this network and its different uses. We used historical sources, GIS elaborations and fieldwork. We propose a preliminary chronology and its development over time. Finally, we will underline the impact of this management's system on the local community and its juridical organization.

**3 A HIDDEN TRADING HUB OF THE OTTOMAN EMPIRE: SZOLNOK AND LONG-DISTANCE TRADE IN THE OTTOMAN PERIOD BASED ON ORIENTAL CERAMICS**

**Abstract author(s):** Komori, Tünde (Medieval Studies Department, Central European University, Vienna and Budapest) - Kertész, Róbert (János Damjanich Museum, Szolnok, Hungary)

**Abstract format:** Oral

Szolnok, situated Southeast from Budapest in Hungary, was occupied by the Ottomans between the mid-sixteenth and the late-seventeenth centuries. Based on recent excavations at the territory of the former castle, the sancak seat, located on the Tisza River, has been a vibrant trading hub of the period. The finds and the Ottoman-period buildings of the castle indicate high-ranking dwellers who probably took good use of the opportunities the river provided for trading.

Chinese porcelain and Central Asian faience started appearing in the material culture in Hungary along with the Ottoman occupation. To date, it has not been studied in detail how these objects moved around the Empire and who traded with them under what conditions. Finds from well- interpretable archaeological contexts are rare, as most of the Ottoman-period oriental ceramics are unearthed in Hungary from upper layers mixed with modern debris. The case of Szolnok provides an opportunity for a more complex analysis of the finds including the consumers who used

the pieces, as well as the trading connections and the routes through which they arrived in Szolnok, along with a clearer picture of the sancak seat's widespread connections in the early modern period.

The proposed paper summarizes the results of this analysis, with a special focus on revealing possible routes and connections through which Chinese porcelain reached the Ottoman Empire, an aspect of Ottoman trading connections that to date has not been studied in detail. These possible routes, based on different sources of trade, include an overland route through the Balkans; a partly maritime and partly overland route through the Black Sea and Wallachia and Transylvania; and for the Chinese objects possibly one from Egypt through the Eastern Mediterranean to Izmir, and from there to Istanbul.

#### **4 POTTERY CONSUMPTION IN MODERN BRAGA: FROM NATIONAL RESEARCHES TO REGIONAL TRADITIONS**

**Abstract author(s):** Fernandes, Lara (Laboratório de Paisagens, Património e Território - Lab2PT; Unidade de Arqueologia da Universidade do Minho - UAUM) - Machado, Diego (Fundação para a Ciência e Tecnologia - FCT; Laboratório de Paisagens, Património e Território - Lab2PT; Unidade de Arqueologia da Universidade do Minho - UAUM) - Martins, Manuela - Magalhães, Fernanda - Bofica, Natália (Unidade de Arqueologia da Universidade do Minho - UAUM; Laboratório de Paisagens, Património e Território - Lab2PT)

**Abstract format:** Oral

The studies conducted on the economic dynamics of Portugal in the modern period, and especially those dealing with ceramic materials, are still somewhat lacking. In fact, most of the work carried out in recent decades has been devoted to the systematization of pottery production, or to the consumption of these objects, whether in political or religious institutions, or from fragmentary interventions in urban centers. However, in general, there is a lack of studies on economic and social processes in the modern period that provide a synthesis of the consumption patterns of ceramic materials in the effervescent post-medieval Portuguese cities.

In Braga, the principles of Renaissance urbanism were inaugurated with the archbishopric of D. Diogo de Sousa in the early 16th century, which contributed to change the medieval profile of the city, whose morphological evolution is reasonably well studied. However, the state of the art is quite different regarding the pottery from the modern contexts, whose study or systematization is lacking, having been the target of occasional analyses within the scope of excavation reports. In this sense, we propose to develop a systematization of modern period ceramic production (16th-18th centuries) from several archaeological interventions under the responsibility of UAUM, in order to understand the economic dynamics of the city associated with the production and consumption of ceramic ware. In fact, the variety in its consumption can be understood as a reflection of the diversity of status of the inhabitants of Braga, since the urban population was made up of different social groups, whose acquisitions varied according to purchasing power and taste, as well as reflecting the impact of trade routes on the city's supply.

#### **5 ARCHAEOLOGY OF VENETIAN-MADE CERAMICS IN THE MODERN ERA. A CASE STUDY**

**Abstract author(s):** Ferri, Margherita (Ca' Foscari University of Venice)

**Abstract format:** Oral

In the past, the study of Venetian ceramics of the modern period has been approached from an art-historical perspective (the book *Ceramica nel Veneto*, the works of Nadir Stringa on Antinobon, the works of Angelica Alverà Bortolotto on the venetian majolica), highlighting above all the history of production starting from the data obtained from the abundant written sources on people who made that pottery.

From the point of view of archaeological research, however, Venetian ceramics of the 1600-1700s has played an absolutely marginal role, without ever entering into the great general themes of Italian post-medieval archaeology.

This tradition of studies has undoubtedly played a decisive role in strengthening the current local craft economy (i.e. the productive district of Nove and Bassano). This type of outcome is common in some ways to what has happened in other Italian ceramic cities.

The case study of the Venetian Terraferma will be compared to other ceramic historical cities and their museums (Faenza, Montelupo) with the intention of testing the unexplored potential of the theme.

#### **6 MATERIALIZING DEATH. AN INTERACTION OF PEOPLE AND THINGS AT THEIR FINAL HOUR IN EARLY MODERN PORTUGAL**

**Abstract author(s):** Casimiro, Tania (CFE HTC - Nova University of Lisbon) - Costa, Inês (Independent Archaeologist) - Iglesias, Jessica (Independent Archaeologist)

**Abstract format:** Oral

Material culture associated to graves is widely studied in southern Europe since pre-historic times, although not that much has been made in Portugal relating to a time between the 15th and the 19th centuries. During this period the ritualization of death was occasionally related to some objects, made from different raw materials. Most of them

correspond to religious and superstitious items, although others materialize identity, gender, age, ethnicity, and cultural backgrounds. While some structural social and cultural constructions such as religion makes some of them quite similar in wide regional areas, others reflect a more individual and personal choice allowing to discuss different stages of engagement between the deceased and the object.

Based on the evidence provided by several necropolis from every part of Portugal this paper aims to discuss what type of relations did people and objects shared at the time of death and how certain objects reflect religious, superstitious, economic and symbolic aspects in the reaction people had with their final moments. We hope to discuss with other colleagues if similar relational behaviours occur in other parts of the Mediterranean.

## 7 THE FUNERARY EPIGRAPHY OF THE NW IBERIA (1850-1940) OR HOW ARCHAEOLOGY CAN HANDLE THE SUBTLE NUANCES OF POWER

**Abstract author(s):** Álvarez, Samuel (Incipit, CSIC; Universidade de Santiago de Compostela)

**Abstract format:** Oral

The following proposal addresses an unusual topic in contemporary archaeology, especially in the Iberian Peninsula: the memorials and the funerary epigraphy. In this work, a social and epigraphic analysis is proposed which, using a very simple approach methodology, aims to highlight some of the main historical and sociolinguistic dynamics of the autonomous community of Galicia (NW Spain). The aims of this are twofold: on the one hand, it is intended to show how the epigraphic and memorial study materialises certain social and linguistic dynamics, providing a brief review of the historical and linguistic context and drawing a correlation with the data of the suggested analysis. On the other hand, and based on these results, it is intended to reflect about the extent to which some archaeological records may not be as "transparent" as they could be identified from an exclusively archaeological perspective. Furthermore, the need to analyse social contexts imbricated in strong power dynamics from broader perspectives is raised, along with some supporting tools for the identification of discordant records and hidden discourses from archaeological perspectives.

## 8 COFFEE CUPS FROM THE EAST: TRADING CONNECTIONS OF OTTOMAN SOFIA BASED ON ORIENTAL CERAMIC FINDS FROM THE POST-MEDIEVAL PERIOD

**Abstract author(s):** Komori, Tünde (Medieval Studies Department, Central European University, Vienna and Budapest) - Goryanova, Snezhana (National Archaeological Institute with Museum, Bulgarian Academy of Sciences, Sofia) - Dafova, Lyuba (Regional History Museum – Sofia)

**Abstract format:** Oral

The proposed paper discusses the faience and porcelain finds unearthed in Sofia, Bulgaria from the post-medieval period of the Ottoman rule, with a special focus on the sixteenth and seventeenth centuries. Sofia was a significant administrative and military center of the Western section of the Ottoman Empire, conquered by the Ottomans for about half a millennium. Oriental decorative ceramics started to be in use in this part of the Empire in the sixteenth century and have become more and more popular with the spread of coffee culture. Their use and distribution on the everyday level however is an under-studied topic in both Ottoman historical studies and archaeological research in all the concerned countries.

Although the trade of these objects is difficult to study based on written sources, since they rarely appear in them, their archaeological distribution may indicate the routes through which they travelled from the place of production to the place of use and disposal. Such a study involves several methodological approaches, such as object biography, economic history, and the historical archaeological examination of post-medieval overland and maritime trading routes. The latter aspect also concerns underwater archaeology, in connection with the Chinese porcelain sherds, and the study of shipwrecks along the possible trading routes.

From a broader perspective, this study touches upon the trading connections of the Ottoman-occupied Balkans and Eastern Europe from the aspect of these oriental ceramics that were part of the everyday material culture in these territories. The examination of such a material may lead to a broader picture of how Chinese porcelain first arrived in the Ottoman Empire, which so far is not clear, and how it affected the production of Iznik faience ware that has become widely popular throughout the Empire.

## 9 WHERE THE MIDDLE AGES DID NOT END

**Abstract author(s):** Citter, Carlo (University of Siena)

**Abstract format:** Oral

Archaeologists are still much inclined to please timelines provided by historians that are not suitable for the material record. To force data within prefabricated boxes prevents exploring the full potential of a changing scale factor analysis. On the contrary, to focus on the continuities allows to emphasize those features that persists notwithstanding changing sociopolitical assets. This paper provides two case studies in western Mediterranean (Mount Amiata-Tusca-

ny and Vibo Valentia-Calabria both in Italy), where the traditional breaks do not mark real changes in the archaeological record. However, there are dates that point out a change. In Calabria after the 1783 earthquake the feudal castles were abandoned and no longer reoccupied. In both areas there was no industrial turn and the great change came after WW2. In Amiata the Black Death (AD 1348) was a turning point. Both areas proved to be connected with other niches at a regional scale, though they developed local and peculiar structures.

## 10 TEAR ALONG THE ... BORDERS

**Abstract author(s):** Gattiglia, Gabriele - Anichini, Francesca - Di Pasquale, Caterina - Trabucco, Nicola (University of Pisa - Dipartimento di Civiltà e forme del sapere)

**Abstract format:** Oral

This presentation aims at reflecting on possible causes on why contemporary archaeology is a neglected research field in Italy, starting from the experience of the educational project "Archaeology of Border", developed by the MAPPA Lab of the University of Pisa. The project, carried out in 2021, promoted a trans-disciplinary archaeological and anthropological path and involved the students in an educational experience dedicated to contemporary borders: the stiff border on the mountains of Versilia, northern Tuscany (Italy), along the Gothic Line during the Second World War on one side and the "fluid" and changeable border of the contemporary migrations' traces on the Lampedusa Island (Sicily, Italy) on the other side. In both cases, approaching contemporary archaeology means adopting a holistic approach that merges archaeology and anthropology to investigate tangible and intangible traces as a unique palimpsest. It stems from a method of analysis for interpreting materiality, which combines documents analysis, field survey, excavations, spatial and statistical analysis, anthropological fieldwork and ethnographic data collection, interviews, ethnography of ritual moments and commemorations, and censuses of objects, monuments, memorial plaques, graves, other spatial landscape markers, etc. This approach implies a lively and up-to-date theoretical debate, which is missing in Italy, both inside and outside the academia and must start from educational activities for training students in approaching the archaeology of the contemporary era.

## 11 GUERRILLA WARFARE AND THE POLITICS OF MEMORY: A TRANS-NATIONAL COMPARATIVE PERSPECTIVE

**Abstract author(s):** Tejerizo, Carlos (Università degli Studi di Genova) - Santeramo, Riccardo - Bizzarri, Giulia - Piu, Caterina (Laboratorio di Archeologia e Storia Ambientale - Università degli Studi di Genova)

**Abstract format:** Oral

Conflict archaeology is one of the main pillars on which European Post-Medieval and Contemporary Archaeology have traditionally stood, expanding the chronology of Archaeological inquiry. Moreover, recent proposals from the so-called Modern Conflict Archaeology have furthered the scope of the discipline, introducing new topics and methodologies such as GIS, the material impact of conflicts on local societies or the phenomenology of war. However, Guerrilla warfare and its material memory has not been as deeply archaeologically addressed as open war conflicts, although some recent projects throughout Europe have opened the door to this topic. In this paper, we will assess them from a comparative perspective delving into the differences of the politics of memory on the guerrilla warfare in contemporary times. Taking as case studies the processes of memorialization of the guerrilla warfare in Spain, Italy, Greece and Lithuania—based on recent archaeological projects developed in these countries, we will reflect on the different factors that have configured the current memory of this traumatic past and consider how they have affected the way archaeology has been introduced as a methodology to study this phenomenon. By doing this, we will consider the role that Post-Medieval and Contemporary Archaeology could play in Western Europe with regards to the current political situation.

## 12 COMMON-LANDS, PRACTICES AND LOCAL KNOWLEDGE: AN ARCHAEOLOGICAL PERSPECTIVE TO THE INNER SOCIAL DIMENSION OF LANDSCAPE. CASE STUDIES FROM SOUTHERN EUROPE

**Abstract author(s):** Stagno, Anna Maria (University of Genova - Laboratory of Environmental Archaeology and History) - Panetta, Alessandro - Attolini, Davide - Bizzarri, Giulia - Cristina, Giovanni (Università di Genova) - Menéndez Blanco, Andrés (University of Oviedo) - Menozzi, Bruna - Piu, Caterina - Santeramo, Riccardo - Molinari, Chiara (Università di Genova)

**Abstract format:** Oral

During the last three centuries, numerous reforms addressed European mountain areas' social, economic, and environmental organisation to "rationalise" and, then, to "modernise" their uses. The impact of those reforms on the environmental resources management system was indeed profound. At European level, the 19th century has been defined as the century of collective property attacks (and sale). Even if several reforms were aimed at erasing the jurisdictional value of agro-sylvo-pastoral practices, conflicts over access rights to commons still preserved in 19th and 20th century central and local archives show that it never fully occurred. The vitality of commons and the many

national and transnational organisations related to their acknowledgement do not fit with the "generalised" idea of marginality associated with shared uses and collective ownerships.

These elements suggest that the complexity of these "recent" phases in the transformation of European landscapes and societies still has to be fully acknowledged.

The paper will focus on the first results of a series of research projects, carried out by the Laboratory of Environmental Archaeology and History, which are addressing – from various points of view – the process of the so-called marginalisation of mountain areas during the last centuries.

The aim is to reflect on archaeology's contribution to an historiographical debate on this process, which has mainly involved historians. Reflecting on the way through which archaeology brings to light temporal and spatial continuities and discontinuities in the use of spaces, our goal is to discuss how it could contribute to decipher the changes in access rights, the transmission of local knowledge (and its interruption) and finally changes in the relationships between local actors and local social groups, who managed, claimed and appropriated spaces.

### 13 EXPLORING CONNECTIONS BETWEEN ARCHAEOLOGIES OF EARLY MODERN SPAIN AND COLONIAL IBERO-AMERICA

**Abstract author(s):** Senatore, Maria - Gutierrez Lloret, Sonia (Instituto de Investigación en Arqueología y Patrimonio Histórico - INAPH, Dep. Prehistoria, Arqueología, Hª Antigua, Fil. Latina, Fil. Griega Universidad de Alicante)

**Abstract format:** Oral

This paper presents a review of the lines of research conducted on postmedieval contexts in Spain that could contribute to building an integrated approach to colonial and early modern worlds. In recent decades, archaeologists focused on modern Spanish colonialism in America have highlighted the relevance of understanding persistence, changes and continuities in the long term. These perspectives have shown significant insights extending comparative lessons beyond one area and time period in Ibero-America but have been limited to indigenous histories. We consider that these approaches could be enhanced by a broader perspective that includes studies of material and social changes taking place through centuries in diverse time periods and regions not only in Ibero-America but also in the Iberian Peninsula. Therefore, here, we explore to what extent the archaeologies developed in a variety of modern contexts in Spain could contribute to contextualizing and understanding changes and continuities in different temporal and spatial scales connecting colonial and modern contexts.

### 14 POST-MEDIEVAL ARCHAEOLOGY, ARCHAEOLOGY OF MODERN AGE OR ARCHAEOLOGY OF MODERNIZATION? REFLECTIONS ON LATER HISTORICAL ARCHAEOLOGY IN THE MEDITERRANEAN

**Abstract author(s):** Panetta, Alessandro - Cristina, Giovanni - Stagno, Anna Maria (Università degli Studi di Genova; LASA - Laboratorio di Archeologia e Storia Ambientale - Università degli Studi di Genova)

**Abstract format:** Oral

The archaeological study of the post-medieval age is now widely diffused in the Mediterranean area, to the point of including also the most recent centuries including the contemporary age. Although individual national traditions may proceed in an uncoordinated manner, this is a well-established practice in both research and conservation. Nevertheless, there are still few opportunities to reflect on the historiographical specificities of an archaeology of the modern age, i.e. how material traces found during excavations and surveys can be used as sources within specific historiographical themes of the modern and recent centuries.

Historical archaeology generally seems to identify the main significance of modernity with the process of globalisation that began as a result of European geographical explorations. At the same time, the archaeological study of industrialisation, although recently approached also from a social perspective, is often practised as a formal study of industrial architecture.

But the themes underlying the idea of Modernity, such as the emergence of large urban centres, central states or industry/enterprise seem to remain in the background, as do reflections on the ideologies underlying these transformations, such as improvements and rationalisations.

If these problems are tangible for archaeological research in general, they seem to become more acute with regard to the Mediterranean area, which seems to live 'in reflex' the consequences of geographical exploration and industrialisation.

This paper, based on a review of the general trend for post-medieval archaeology and a comparison with the research themes of historians, as well as on some specific case studies, aims to reflect on the contrary on what could be the specificities for an archaeology of the modern age of the Western Mediterranean.

## HUNTER-GATHERERS RESILIENCE: ADAPTATION PATTERNS TO CLIMATIC SHIFTS AT DIFFERENT LATITUDES FROM MIS3 TO MIS 1 [PAM]

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Mutri, Giuseppina (The Cyprus Institute - STARC) - Sari, Latifa (Centre National de Recherches Préhistoriques, Anthropologiques et Historiques)

**Format:** Regular session

The ability of Homo sapiens to adapt to the most diverse environments has been the key of the success of our species. Scholars have often paid attention to the adaptation models, assuming that the capability of coping with different environments was a response to the external stressful situations. But how exactly this happens? How humans react to sudden climates changes and which solutions they find when environmental conditions became extreme? Exceptionally dry climates, extremely cold environments, particularly humid ecological niches, represented and still represents nowadays, a major challenge for human societies. Hunter-gatherers have always found creative adaptive solutions, modelling their lifestyles, economy, settlement system, seasonality and social structure according to the environmental conditions to create a sustainable relationship with it.

The effect of this adaptation models may be reflected in their material culture and, in some cases, also their physical and biological features. From MIS 3 to MIS 1 major climatic shifts have occurred and different technological and behavioural traits have been developed by Modern Humans in Eurasia, Africa and Oceania. What role has the climate played in shaping global hunter-gatherer adaptability and cultural traits? This session aims to collect outstanding examples of Homo Sapiens hunter-gatherers adaptations in different parts of the world.

### ABSTRACTS

#### 1 NEW ELEMENTS ON THE GRAVETTIAN TO SOLUTREAN TRANSITION: THE OPEN-AIR SITE OF PORTELA 2 (LEIRIA, CENTRAL PORTUGAL)

**Abstract author(s):** Gameiro, Cristina (UNIARQ - Lisbon University) - Aubry, Thierry (Fundação Côa Parque / UNIARQ - Lisbon University) - Zambaldi, Maurizio (UNIARQ - Lisbon University) - Dimuccio, Luca (GEGOT - Coimbra University)

**Abstract format:** Oral

Severe cooling and the expansion of ice sheets during the Last Glacial Maximum (LGM), 27–19 ky ago, had a dramatic impact on plant, animal and human populations. In Southwest Europe, a pan-European technocomplex, using bone or wood projectile points armed with lithic barbs (Gravettian), was replaced by a regional technocomplex using stone points as hunting weaponry: the Solutrean. The origin of the Solutrean has been a central issue in the study of European Upper Palaeolithic. Nevertheless, in the mid-1990s a transition phase, characterized by the presence of Vale Comprido points, was identified in the littoral of Central Portugal.

In early 2009, the opening of a ditch related to the Maceira (Leiria, Central Portugal) sanitation network led to the discovery of the Portela 2 archaeological site. The recovery of Vale Comprido points suggests a Proto-Solutrean occupation. The fact that this is a transitional phase between the Gravettian and the Solutrean, poorly known in south-western Europe, prompted a new archaeological excavation, conducted in 2021 in the scope of the PALE-ORESCUE project. Field observations allowed considering the archaeological site within the surrounding landscape, recovering a larger artefacts assemblage, and laying the groundwork for investigating the site formation processes by means of petrographic, sedimentological and geochronological analyses. We will present the results of the lithic technology study and some conclusions concerning site formation process.

## WAS THE PROTO-SOLUTREAN OF SOUTHWEST EUROPE TRIGGERED BY HEINRICH STADIAL 2? NEW INSIGHTS ON THE PEÑA CAPÓN SEQUENCE (CENTRAL SPAIN)

**Abstract author(s):** Alcaraz-Castaño, Manuel (University of Alcalá) - Alcolea-González, José-Javier - Luque, Luis - Castillo-Jiménez, Samuel - Jiménez-Gisbert, Guillermo - Triguero, Ignacio (Area of Prehistory, Department of History and Philosophy, University of Alcalá) - Albert, Rosa-María (Department of History and Archeology, University of Barcelona) - de Andrés-Herrero, María (Department of Prehistory, Ancient History & Archaeology, Complutense University of Madrid) - Cuartero, Felipe (Spanish National Research Center for Human Evolution - CENIEH) - Cuenca-Bescós, Gloria (Aragosaurus-IUCA, Department of Geosciences, University of Zaragoza) - Kehl, Martin (Institute of Geography, University of Cologne) - López-Sáez, José-Antonio (Environmental Archeology Research Group, Institute of History, CCHS CSIC) - Mangado, Xavier (Department of History and Archeology, University of Barcelona) - Rodríguez-Antón, David (Department of Prehistory, Autonomous University of Barcelona), Ruiz-Alonso, Mónica (Environmental Archeology Research Group, Institute of History, CCHS CSIC) - Sánchez de la Torre, Marta (Department of History and Archeology, University of Barcelona) - Yravedra, José (Department of Prehistory, Ancient History & Archaeology, Complutense University of Madrid)

**Abstract format:** Oral

The relations between climate variability and cultural behaviors of Paleolithic hunter-gatherers, including population dynamics, techno-economic adaptations and settlement patterns, have been the object of intense debate for decades. In recent years, the Upper Paleolithic of Western Europe has become one of the main areas of study on this topic. In this context, research has recently focused on defining and understanding the Proto-Solutrean as a human adaptation potentially triggered by abrupt climate and environmental change caused by Heinrich stadial 2 around 26,000 years ago. Chrono-stratigraphically located immediately after the Gravettian and before the Solutrean, there are, however, relevant questions concerning the meaning of the Proto-Solutrean, both in terms of human adaptations and cultural change.

We present new data on Proto-Solutrean archaeological assemblages recently excavated in the Peña Capón rock shelter (Guadalajara province, central Spain). This site is located in the Iberian interior plateau, a large area that, until recently, was thought to be devoid of human settlement during the Last Glacial Maximum due to its harsh climatic and environmental conditions. The new geoarcheological, paleoecological and chronometric data obtained at this site demonstrate that hunter-gatherers with Proto-Solutrean technology occupied this area during Heinrich Stadial 2, in a period dominated by scarce vegetation cover and low forest and faunal diversity. Considered in the context of the Upper Paleolithic sequence of western Europe, we provide new elements to further current discussions on the apparent association between periods of significant decrease in vegetation cover and biodiversity with the appearance of large projectile stone points, as opposed to periods of increasing vegetation cover and forest density, which were potentially related to hunting technologies based on bladelet armatures and a stronger presence of bone and antler points. Although data obtained at Peña Capón broadly support this trend, some relevant questions are still open.

This research has been mainly funded by a European Research Council Grant (ERC-2018-STG-805478) within the Horizon 2020 Program, under the project "Population dynamics and cultural adaptations of the last Neandertals and first Modern humans in inland Iberia: a multi-proxy investigation" (MULTIPALEOIBERIA).

## "NOTHING HAPPENS UNTIL SOMETHING MOVES": SETTLEMENT PATTERNS IN THE BALKAN PENINSULA DURING MIS 3-1

**Abstract author(s):** Plavšić, Senka - Dragosavac, Sofija (University of Belgrade, Faculty of Philosophy) - Radović, Predrag (University of Belgrade, Faculty of Philosophy; National Museum Kraljevo) - Mihailović, Bojana (National Museum in Belgrade) - Mihailović, Dušan (University of Belgrade, Faculty of Philosophy) - Dogandžić, Tamara (MONREPOS Archaeological Research Centre and Museum for Human Behavioural Evolution)

**Abstract format:** Oral

As repeatedly demonstrated by archaeological and ethnoarchaeological data, hunter-gatherers' settlement patterns are known to differ between different groups and periods. How groups organized their movements and settlements in the landscape was to a large extent influenced by the important events in climate history and more intermediate environmental conditions. The goal of this study is to examine if and how hominin groups changed their settlement patterns as a response to fluctuating climatic and environmental conditions during the rather unstable Marine Isotope stages 3-1 on the Balkan peninsula. Based on the published data two analyses have been conducted: bivariate WABI (Whole assemblage behavior index) and multivariate PCA (Principal component analysis) analyses for the following variables: lithic density, retouched frequency, core, blanks and chips frequency as well as tool diversity, which are frequently used to access settlement patterns of prehistoric human populations. Both Middle and Upper Paleolithic sites are included in the study, which allowed us to detect changes in settlement in different time periods, different hominin populations and in different microregions of the Balkan Peninsula.

#### 4 **MESTEC/OSTROV, AN EARLY MESOLITHIC SITE IN BOHEMIA – SUBMISSION TO THE ISSUE OF HUMAN ADAPTATIONS TO THE PLEISTOCENE/HOLOCENE CLIMATIC SHIFT**

**Abstract author(s):** Mlejnek, Ondrej (Archaeological Centre in Olomouc) - Petr, Libor - Přichystal, Antonín (Faculty of Science, Masaryk University, Brno) - Záhorský, Vít (Archaeological Centre in Olomouc)

**Abstract format:** Oral

In this contribution the results of an excavation of an early Mesolithic site in Eastern Bohemia will be presented. The site was excavated in 2018 as a rescue archaeological project. A total of 4986 lithics were found in a circa 30 cm thick plough horizon. Another 141 lithics were collected nearby during surface surveys. An area of 343 m<sup>2</sup> was unearthed in a grid and all the sediment was wet-sieved. Ústí nad Orlicí type semi-local Cretaceous chert dominates in the raw material spectrum, however quartz, erratic flint and other imported raw materials are present as well. Most common technological categories include small cores, tiny fragments, flakes, blades, bladelets and microblades. Tools are represented by small end-scrapers, burins, backed bladelets, tiny points, splintered pieces, microlithic triangles and retouched flakes. Tanged tool with a retouched tip used for cutting and drilling is a unique find. The assemblage can be essentially dated back to the Early Mesolithic. A Late Palaeolithic admixture can be assumed due to the presence of a tanged tool and other slightly patinated bladelets made of erratic flint. The collection of lithic artefacts excavated at this site is one of the largest Mesolithic assemblages from eastern Bohemia. It provides a new dataset for comparisons with other sites. Nearby, we managed to obtain two sedimental drill cores, which provided us with the palynological environmental records dated to the Pleistocene/Holocene boundary. Together with the archaeological finds from the campsite, it can improve our understanding of the hunter-gatherers' adaptation patterns to the Pleistocene/Holocene climatic shift in this region. Finally, at the end of the presentation, our data will be compared to other Bohemian localities dated to this period and several concluding remarks concerning the issue of human adaptations to the MIS 2/MIS 1 climatic change in this region will be suggested.

#### 5 **PLEISTOCENE–HOLOCENE TRANSITION AND HUNTER–GATHERER ARCHAEOLOGY IN THE CARPATHIAN BASIN**

**Abstract author(s):** Szegedi, Kristóf (Hungarian National Museum; Mikoviny Sámuel Doctoral School of Earth Sciences, University of Miskolc) - Major, István (Institute for Nuclear Research, Eötvös Loránd Research Network) - Újvári, Gábor (Institute for Geological and Geochemical Research Research Centre for Astronomy and Earth Sciences Eötvös Loránd Research Network) - Lengyel, György (Department of Prehistory and Archaeology, University of Miskolc)

**Abstract format:** Oral

The Carpathian Basin faced a severe climatic amelioration during the Late Glacial period that culminated into the Holocene environment. Both the Late Glacial (14.7–11.7 ka cal BP) and the Early Holocene pre-Neolithic (11.7–8.2 ka cal BP) archaeological records of the Carpathian Basin are weak. There are a few sites dated to between 14.7 and 10.4 ka cal BP, for instance Lovas, Szekszárd-Palánk and Erk 1. and sporadic finds, such as the osseous harpoon of Mezőlak and Nádasladány, and no absolute nor relative chronological evidence for human occupation from 10.4 ka cal BP until the 9.4 ka cal BP NGRIP event that is approximately coeval with the earliest occurrence of the Mesolithic in Hungary. Thus, a reliable absolute and relative chronology for the Pleistocene–Holocene transition in the sense of human occupations is missing. The lack of integrity of archaeological evidences, on the one hand, emerged from the fact that the sites were excavated decades ago with the application of outdated excavation and sampling methods of the 1950's and 1960's, thus the spectrum of currently available dating methods were not available. On the other hand, such archaeological data after a critical evaluation suggested that the Carpathian basin was only sporadically visited by hunter-gatherers after the Late Epigravettian that left for the northern territories of Eastern Central Europe about 14.7 ka cal BP until the emergence of the Mesolithic type archaeological record at 10.4 ka/9.4 cal BP. Our research on the domain of the archaeological chronology of the Pleistocene–Holocene transition obtained new radiocarbon dates for yet undated archaeological sites, revised the cultural affiliation of archaeological assemblages, to reveal the ecological aspects of the hunter-gatherer population of Eastern Central Europe visiting the Carpathian Basin and reconsider the origin of the Mesolithic population that has long been linked with the local Epigravettian.

## 6 THE ECOLOGY OF AURIGNACIAN HUNTER-GATHERERS IN THE WESTERN CARPATHIANS, EASTERN CENTRAL EUROPE

**Abstract author(s):** Lengyel, Gyorgy (University of Miskolc, Miskolc, Hungary; Institute of Systematics and Evolution of Animals, Polish Academy of Sciences, Kraków) - Dobos, Endre (University of Miskolc) - Krajcarz, Maciej (Institute of Geological Sciences, Polish Academy of Sciences, Warszawa) - Magyar, Enikő (Eötvös Loránd University, Budapest) - Major, István (Isotope Climatology and Environmental Research Centre - ICER, Institute for Nuclear Research, Debrecen) - Moskal-del Hoyo, Magdalena (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) - Palcsu, László (Isotope Climatology and Environmental Research Centre - ICER, Institute for Nuclear Research, Debrecen) - Szegedi, Kristóf (Hungarian National Museum, Budapest) - Újvári, Gábor (Research Center for Astronomy and Earth Sciences, Eötvös Loránd Research Network, Budapest) - Wilczyński, Jarosław (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences, Kraków)

**Abstract format:** Oral

Aurignacian sites of the Western Carpathians are found in both caves and open-air locations. Caves often offer superior conditions for faunal and botanical remains preservation compared to open-air sites, but meanwhile, caves are more often subjected to admixtures between archaeological periods. Therefore, the preservation of the Aurignacian archaeological record divided between caves and open-air sites in the Western Carpathians is uneven, which makes the archaeological dialogues difficult. A striking feature of the Aurignacian cave sites in the Western Carpathians is a rarity or lack of typical Aurignacian lithic tools and an abundance of bone tools and faunal remains. Open-air sites did not preserve fauna nor osseous tools but plentiful specimens of Aurignacian-type lithics. Our analyses of the Aurignacian in the Western Carpathians involved new data from Istállóskő Cave and a newly discovered open-air site Alsódobsza Kerek Domb (ADKD) of northeast Hungary. Up to date, ADKD is the sole known open-air site of the Western Carpathians that preserved abundant faunal material comparable to cave sites. This gives a possibility to clarify whether the archaeological difference between caves and open-air sites is due to ecological or taphonomic reasons. The results of our research within the review of iconic Aurignacian archaeological assemblages from Poland, Hungary, Slovakia, Czechia, and Austria can contribute to the insight of the ecology and the subsistence strategies of the human population carrying Aurignacian artifacts in the territory of Eastern Central Europe.

## 7 THE HUMAN NICHE SPACE OF LATE UPPER PALEOLITHIC EUROPE AND THE EFFECTS OF CLIMATE AND POPULATION

**Abstract author(s):** Yaworsky, Peter - Hussain, Shumon (Aarhus University)

**Abstract format:** Oral

Between ca. 20 and 9kya, during the post-LGM (Late Glacial Maximum) Pleistocene and the transition to the Holocene, the volatility of Europe's climate resulted in environments and landscapes vastly different from any encountered today. Throughout this period, human populations of mobile hunter-gatherers, differentiated by their stone tool assemblages, occupied and abandoned various habitats across the landscape. Here, using radiocarbon-dated archaeological sites and downscaled TraCE21k paleoclimate data, we bracket the human climate niche of Late Upper Paleolithic Europe. Next, using general classifications of the stone tool macro-complexes, we test whether the different complexes represent adaptations to spatiotemporally defined climate niches. We find that the human climate niche during this timeframe is relatively narrow and that many of the tool complexes have overlapping climate niches. Additionally, we find that as populations grow, the niche envelope expands. We interpret this process of niche expansion in the light of the ideal free distribution model and as evidence of pan-European population pressure in the Late Glacial, particularly in regard to mounting resource competition and the gradual depression of higher-ranked, larger-bodied animal prey items as the Ice Age draws to its end.

## 8 LIMITING FACTOR MODELLING REVEALS CHANGING ADAPTIVE PRESSURES AND POPULATION DYNAMICS OF EUROPEAN HUNTER-GATHERERS FROM LATE MIS2 AND INTO MIS1

**Abstract author(s):** Riede, Felix (Department of Archaeology and Heritage Studies, Aarhus University; Center for Biodiversity Dynamics in a Changing World, Aarhus University) - Ordonez, Alejandro (Center for Biodiversity Dynamics in a Changing World, Aarhus University)

**Abstract format:** Oral

Population dynamics set the framework for understanding human genetic and cultural adaptations. For foragers, demographic and environmental changes correlate strongly, and much attention has focused on single explanatory values such as net primary productivity or insolation. Yet, the causal relations between different environmental variables and human responses through time and space likely varied. Building on the notion of limiting factors, namely that the scarcest resource regulates population size, and drawing on Binford's global sample of ethnographically documented hunter-gatherers, we present a statistical approach to identify the dominant climatic constraints for hunter-gatherer population densities and then hindcast their changing dynamics in Europe for the period between 20kyBP to 8kyBP (late MIS2 to early MIS1) when climatic regimes flipped from Pleistocene to Holocene mode. Limiting

factors shifted from ubiquitously temperature-related variables during the Pleistocene to a regional mosaic of limiting factors in the Holocene. This spatiotemporal variation suggests that hunter-gatherers needed to overcome very different adaptive challenges in different parts of Europe, and that these challenges varied over time. Knowledge of these changing limiting factors facilitates heightened attention to the specific biocultural adaptations necessary for contemporaneous hunter-gatherers to maintain viable populations in different regions. The signatures of some of these changing adaptations are visible archaeologically, and include specific technological innovations as well as the changes in mobility, land-use and social network structures observed across the Pleistocene-Holocene boundary.

## 9 **LATE EPIPALAEOLITHIC SETTLEMENT IN THE QA' SHUBAYQA: A CASE STUDY IN RESILIENCE IN THE ARID MARGIN OF THE SOUTHERN LEVANT**

**Abstract author(s): Richter, Tobias (University of Copenhagen)**

**Abstract format: Oral**

The Levant of Southwest Asia is characterised as a mosaic of habitats ranging from coastal, woodland and mountain zones with high rainfall, to semi-arid and arid steppe and desert regions. Expansion and contraction of these zones during the Late Glacial and Post-Glacial posed both opportunities and challenges to Epipalaeolithic hunter-gatherers. While the coastal and woodland zones of the Levant were more environmentally stable, the semi-arid and arid regions saw significant changes. Since 2012 the Shubayqa Archaeological Project has investigated human settlement in the Qa' Shubayqa area in northeast Jordan. A nowadays semi-arid region, this area was predicted to have been severely impacted during the Younger Dryas as cooler and drier conditions set in. Surveys and excavations at a number of Late Epipalaeolithic and early Neolithic (PPNA) sites around the edges of the Shubayqa mudflat indicate not only intensive and prolonged settlement in this area before, during and after the Younger Dryas, but also show how Late Epipalaeolithic hunter-gatherers adjusted settlement patterns and resource exploitation in subtle ways. The Qa' Shubayqa therefore provides a useful benchmark against which to evaluate the severence and impact of Late Glacial and post-glacial climatic changes on humans in the Levant. This research indicates that human groups appear to have been far better at adapting to adverse climate change than previously thought and only adjusted their activities in minimal ways.

## 10 **A PLACE CALLED HOME. LAND MANAGEMENT BETWEEN THE LIBYAN COAST AND THE EGYPTIAN WESTERN DESERT DURING MIS 2-1**

**Abstract author(s): Mutri, Giuseppina (The Cyprus Institute)**

**Abstract format: Oral**

The millennia that elapse between the MIS2 and MIS1 were strongly challenging for humans, mainly because of significant and sometimes abrupt climatic changes. The pic of the cold and dry conditions of the last glaciation (LGM) determined the abandon of the areas currently corresponding to the Egyptian Western Desert, whose reoccupation only took place, very slowly, at the end of MIS1. On the opposite, places which could offer a greater variety of resources, together with milder climatic conditions, experienced a demographic decline without being completely abandoned. This is the case of the Libyan sub-coastal strip (up to 100 km south from the Mediterranean shoreline), where two different areas, the Jebel Gharbi on the West and the Jebel Akhdar on the East, were interested by a continuity in the human occupation, despite the climatic shift at general and local scale. The two regions, which are separated by about 600 km (East to West), and present a few key environmental and geomorphological differences, are characterized by a series of similar choices, which may reflect the adoption of a wide-spectrum economy on a seasonal base, but, at the same time, may be an indicator of a commonly-shared cultural background. In this paper we will offer a complete framework of the human subsistence strategies adopted between the MIS2 and MIS1 in the Egyptian Western Desert and in the Libyan sub-coastal strip.

## 11 **HUMAN ADAPTATIONS TO CLIMATE CHANGE IN NORTHWESTERN AFRICA DURING MIS 2**

**Abstract author(s): Sari, Latifa (Centre national de recherches préhistoriques, anthropologiques et historiques)**

**Abstract format: Oral**

The LSA Iberomausian is subdivided into Early and Late phases, based on strictly defined typological and technological criteria in correlation with specific chronostratigraphic units in well stratified sites in Northwestern Africa. The emergence of early Iberomausian seems to have taken place during the Late Pleistocene (MIS 2) in a relatively warm and moist conditions indicated for the Late Glacial Maximum in these latitudes, while Late Iberomausian appears to be related to wetter climatic conditions. The transition between these two phases would have occurred around 16-15 ka cal BP during Greenland interstadial 1. This coincides with a change in core reduction strategies and the adoption of a broad subsistence spectrum, as well as the emergence of new forms of social and residential adaptations.

If the geographical and chronological limits of early and late Iberomausian are currently widely accepted, no specific morphotype of lithic armatures characterizing each of the two phases has been further defined in the literature.

In addition, geographical and chronological distribution of specific shaped lithic armatures within and out of Africa has not yet been crossed. Yet, seen as a vector of cultural identity, lithic armatures attest to the territoriality and participate efficiently as chrono-cultural entities in the definition of chronological phases. Furthermore, several questions remain unanswered: to what extent the paleoenvironmental changes have impacted the core reduction strategies and microlith production adopted by the hunter-gatherers during early and late Iberomaurusian? Can we consider microlith production variability as resulting from a diversified subsistence pattern in different ecological niches varying from early to late Iberomaurusian?

In this communication, we plan to discuss the relevance of the existing chrono-cultural sets in the Iberomaurusian of Northwestern Africa largely inspired by the Anglo-Saxon framework and the role of abrupt climate change in shaping distinct territories and techno-economic identities of the Late Pleistocene hunter-gatherers.

## 12 HUMAN ADAPTATION DURING THE MIS3 IN EASTERN AFRICA: GOTERA 10, A NEW MIDDLE STONE AGE SITE IN SOUTHERN ETHIOPIA

**Abstract author(s):** Fusco, Marianna (University of Rome La Sapienza; Universitat Rovira i Virgili) - Spinapolice, Enza (University of Rome La Sapienza)

**Abstract format:** Oral

This research reports new data on the GOT10 site, located within the Gotera area, southern Ethiopia. The site is characterised by robust evidence of high-density human exploitation during the MIS3, where the presence of past human groups is scattered in an area of more than two km<sup>2</sup>.

The Marine Isotopic Stage (MIS) 3 in East Africa is a period of critical technological changes within the Homo sapiens groups, probably linked to environmental conditions and climate fluctuations. From the archaeological point of view, this period is significant for the presence of a transitional phase, reflected in the progressive decrease of MSA technological traits and the increase of elements characterising the Later Stone Age (LSA).

The discovery of the GOT10 site, an open-air stratified sequence with the evidence of lithic artefacts and faunal remains in situ discovered in 2018, shed new lights on an almost unknown area, away from the Rift border, where most of the archaeological evidence is located.

The presence of lithic artefacts, faunal remains in situ with evidence of combustion features in association with the archaeological record reflects the frequent occupation of the area, suggesting the hypothesis of the Gotera area as even a refugee area. This hypothesis, further to be tested, may reveal new evidence of Homo sapiens adaptation to the local environment during climatic events leading to an additional model of the resilience of our species.

## A. ULUZZIAN AND AURIGNACIAN TECHNO-COMPLEXES OF GROTTA SERRA CICORA A (NARDÒ – LECCE, SOUTHERN ITALY)

**Abstract author(s):** Ranaldo, Filomena (Museo della Preistoria di Nardò; U.R. Università di Siena, Dipartimento di Scienze Fisiche) - Massafra, Dario (Museo della Preistoria di Nardò) - Eramo, Giacomo - Monno, Alessandro (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari Aldo Moro) - Kitagawa, Keiko (Institute of Prehistory, Early History and Medieval Archaeology, University of Tübingen; Museo della Preistoria di Nardò) - Bona, Fabio (Dipartimento di Scienze della Terra "Ardito Desio", Università degli Studi di Milano; Museo della Preistoria di Nardò) - Strafella, Silvia (Museo della Preistoria di Nardò)

**Abstract format:** Poster

Grotta Serra Cicora A opens in the Mesozoic limestone of the Park of Porto Selvaggio (Nardò, LE), roughly 35 m asl. It is part of a cave system in which archaeological research about Palaeolithic has been conducted since 1960s. The "Museo della Preistoria di Nardò" has lately started a review of the collections as part of a wider project aimed at the reconstruction of the evolution of coastal landscape in relation to the population dynamics of the area.

The stratigraphic sequence of this cave testifies the frequentations of Homo neanderthalensis and the ancient diffusion of Homo sapiens in Italy. New research, held in collaboration between the "Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente" of the University of Siena and the municipality of Nardò, increases the available data about the transition phases from Middle Palaeolithic to Upper Palaeolithic, considering that in this site it is possible to understand the relation existing between the Uluzzian and the following Aurignacian. For this purpose, a new study of the techno-complexes found in the layers that mark the transition Uluzzian/Aurignacian (Layer B) has been activated.

The study of the technical system of production allows to frame the typological differences of the tools inside the techno-cultural and organisational changes of the groups. The modifications observed in the technical characters of the tools couple with a different selection of the used raw materials and they will be correlated with the resources management strategies on the territory.

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Moshenska, Gabriel (UCL Institute of Archaeology) - Politopoulos, Aris - Arciero, Roberto (Leiden University) - Lerma Guijarro, Alma (Backset Archaeology) - Kiddey, Rachael (Oxford University)

**Format:** Regular session

This session aims to explore the implications of anarchist archaeology in both research, and contemporary political and social issues. In recent years, there have been various developments at the intersection between anarchism and archaeology. In the last decade there have been a growing number of studies, including collaborative research with indigenous groups, that reveal how both ancient and contemporary societies have functioned without, or actively rejected hierarchical forms of organization. Likewise, research on gender and queerness have created new, inclusive histories and archaeologies that look beyond binaries to focus on oppression and resistance.

In this session we want to explore anarchy as both archaeological theory and as praxis in our daily and professional lives. What can anarchist theories contribute to the interpretation of archaeological evidence? And how might anarchist practices transform our (often hierarchical) archaeological working environments?

We welcome contributions from speakers and collectives that explore (but are not limited to):

- Anarchist theories in archaeology,
- Archaeological evidence of non-hierarchical societies or rejection of power relations,
- Re-interpretation of data in the light of new anarchic perspective,
- Explorations of how and why societies rejected and opposed state level of organization,
- Theoretical and practical anti- or decolonial practice in archaeology.

Likewise, in times of pandemic and financial crisis, we encourage papers that present alternative/anarchist ways to fight against hierarchical structures, mental oppression, and gender discrimination by adopting egalitarian, bottom-up, and mutual-aid practices.

The main aim of the session is to broaden our knowledge of anarchy in practical and theoretical archaeology, and to have an opportunity to discuss and explore new forms of resistance.

## ABSTRACTS

### 1 MUTUAL AID IN ARCHAEOLOGY: THE BLACK TROWEL COLLECTIVE MICROGRANTS

**Abstract author(s):** Politopoulos, Aris (Leiden University)

**Abstract format:** Oral

The Black Trowel Collective Microgrants (BTCM) is a collective of archaeologists committed to the active support of archaeology students from working-class and historically looted communities who are both regularly excluded by traditional scholarship and academic programs, or who require more economic support than those resources cover.

We recognize that academia in its current form is ethnicity, class, ability, and gender-biased and discourages or even effectively forbids minorities and people from working classes from attending programs by enforcing prohibitively high tuition fees, expensive mandatory field schools and ignoring the often harsh reality of these students' lives outside of the academic bubble. All too often, we and our students have to work double shifts to get the extra money needed to buy a book, attend an excavation project, pay rent or internet bills to have access to online university materials from home, or even just buy a proper meal so that they do not have to attend the next class on an empty stomach! It is our goal to erode these barriers to make them more permeable for the next generation of archaeologists.

In this presentation we will be discussing the practice of caring and mutual aid in archaeology, as well as the first two years of the BTCM's actions.

### 2 THE PRACTICAL ANARCHIST, WORKING FOR BETTER ARCHAEOLOGICAL FUTURES

**Abstract author(s):** Morgan, Colleen (University of York) - Borck, Lewis (New Mexico Highlands University) - Herrmann, Corey (Yale University)

**Abstract format:** Oral

With this paper we will discuss how methods drawn from anarchist practice and tactics can foment more egalitarian approaches in archaeology. These methods include consensus-based decision making in the development and implementation of research and training projects, using the progressive stack for teaching and outreach, and anarchist approaches to ethics, including those that draw from immanent metaphysics and include advocacy for the dead. By discussing these practical approaches we hope to show the value of the anarchist toolbox. This toolbox has been added to and critically engaged with by thousands of practitioners for over a century. Our goal is to make anarchist methods more accessible for broad adoption within archaeology. Each of the authors works in a different

region of the world, time period, and with a variety of stakeholders, and will bring insights both specific to the local context and of broader relevance to the profession. We have found considerable power, creativity and benefits to wellbeing within these approaches, and have used them to enact significant change. As such, we seek to challenge archaeology's emphasis on authoritarian power structures in authorship and collaboration and to crack open the tightly bound circles of knowledge production that academia has woven. We encourage individuals to re-centre the local and to build networks and community, following the anarchist view of the social self. It is within and between these localised and relational practises that equitable changes accrue and prefigure better archaeological futures.

### 3 “CÍRCULA XONDA” OR THE MUTUAL AID AMONG PREDOCTORAL RESEARCHERS IN ARCHAEOLOGY

**Abstract author(s):** **Á. Granell, Carmen - Carbajo Usano, Matilde - Ramírez Corredor, Yvonne - Villena Rodríguez, Noelía - Moral de Eusebio, Enrique - Muriente Pastrana, Aurora (Universitat Pompeu Fabra)**

**Abstract format:** Oral

“Círcula Xonda” was born from the need and will of the PhD students and candidates of the ABERIGUA Research Project (Colonialism, Gender and Materialities - CGM research group, Pompeu Fabra University, Barcelona) to share and support each other in the day-to-day struggles and challenges that we face during our predoctoral journey. It is a space to verbalize archaeological concerns, celebrate strengths, and to help and be helped. It grew out of our personal and shared interest in producing engaged historical knowledge through a transformative process which eschews the unhealthy normative competition and individualism of academia.

The two main purposes of Círcula Xonda are: (1) to introduce a space where the interweaving of our personal and academic lives is acknowledged and (2) to collectively produce valuable historical knowledge. Our aim is to set up a space for common reflection that will benefit from and contribute to our individual predoctoral lives. We intend to build a deep and cohesive epistemological background that guides our archaeological praxis, and a net for personal support. To do so we established short, medium and long-term goals together with fortnightly meetings to keep track of each other's and mutual projects. We plan to publish our personal and professional experiences and theoretical reflections through a blog or zine to reach out to the broader community of which we are part and archive the process.

Círcula Xonda stands for the “Buen Vivir” tenets produced by decolonial thinkers from the Global South. Believing that solidarity and deep knowledge of the past are crucial to reshaping our present, we pursue a “Buen Vivir” that guides our predoctoral studies, archaeological practices and, ultimately, our attitudes beyond professional and academic life.

### 4 “UNPROOF IS THE GROUND OF ACTION” – AN ARCHAEOLOGY OF POSSIBILITIES

**Abstract author(s):** **Frieman, Catherine (Australian National University)**

**Abstract format:** Oral

My Life Is In Ruins” reads the slogan on a tee-shirt sold by US archaeology jobs hub Shovelbums. It's a joke many archaeologists have heard (and more have been told), and an acknowledgement that one of the field's preoccupations is piecing together a fragmented and incomplete past. The fragmentation of the archaeological record presents methodological challenges: as we analyse and construct models, we do not (and in most cases cannot and will not) know what's missing. Philosophers of science have cautioned that archaeological data is underdetermined—that is, that the evidence available to us is not sufficient to answer unequivocally many of the questions we pose. Empirical modellers address this dilemma in various ways, from inventing ever more complex quantitative methods to calls to eschew the small-scale and the individual in our stories of the past in favour of dehumanised big(gish) data to despair. The rest of us carry on MacGyvering our methods to suit our research questions and tacking back and forth across scales and data sources, not to fill the inevitable holes, but to define and work with them. In this paper, I will argue that these holes are not an impediment to good archaeology, but one of the field's greatest strengths. They not only force us to be reflective and complex in our understanding of and approach to studying the material traces of past people's lives, they create possibilities for interpretation, inventiveness, and inspiration that make space for social conformations, relations of power, and entanglements with the non-human world that are marginal to unthinkable in our present reality. The uncertainty of a past in ruins empowers us to imagine and work towards a better future.

### 5 HERITAGE AS A COMMONS: THE OCCUPATION OF HISTORIC BUILDINGS IN GREECE AND THE CASE OF ROSA NERA AT CHANIA, CRETE

**Abstract author(s):** **Lekakis, Stelios (McCord Centre, Newcastle University)**

**Abstract format:** Oral

In the current state of economic recess and the repurposing of social and political agendas in Greece and Europe, there has been a growing demand for economically efficient cultural products and various proposals for their sustainability in monetary terms. Hidden behind them is the omnipresent rhetoric of the “inability of the public bodies to

manage" and the "need to support competitiveness and entrepreneurship to leverage the cultural capital" for the benefit of the national economies. These discussions can be easily associated with various attempts to further enclose other goods of the public/common sphere, as natural resources, Internet and information. On the other hand, various movements for the re-appropriation of public/common goods have been springing around Europe associated with anti-austerity, anti-fascism and ecology, demanding the return of the resources to their rightful owners, the people.

Within this context, in this paper we will be discussing the potential and dynamics of placing heritage in the realm of the commons in Greece, examining it as a Common Pool Resource and progressively as a Common. We will be focusing on the historic building of the 5th Army Division/Rosa Nera squat (since 2004) in Chania, Crete that is currently being claimed by a shady company to be developed in a *hôtel de charme*.

## 6 **MAPPING THE DIFFERENCE BETWEEN UNEQUAL AND AGAINST-THE-STATE SOCIETIES. AN APPROACH FROM NW IBERIA (4TH-1ST BC)**

**Abstract author(s):** Álvarez, Samuel (Incipit, CSIC; Universidade de Santiago de Compostela)

**Abstract format:** Oral

The following proposal suggests a review of the social dynamics of the Iron Age societies in the NW of the Iberian Peninsula. A multidisciplinary approach is presented, purposing "built space" as a main thread. The aim is to synthesise the remarkable divergences between the forms of social organisation in different regions, which are particularly evident between the coastal and inland communities. However, the focus of the paper is not the archaeological characterisation of these divergences, although it is deemed necessary to understand the validity of the study. However, the focus of the paper is not the archaeological characterisation of these divergences, although it is deemed necessary to understand the validity of the study. Its aim is to explore the emergence of two apparently opposing social dynamics as a reflection of certain choices and decisions. Within this context, the usual relationship between "progress" and "development of social complexity", which assumes a teleological perception of history and suggests an inevitable linear evolutionism towards "more advanced forms", is rejected. Instead, we suggest a perspective of analysis that accepts indivision and resistance to change not as a "failure" in the development of these communities, but as a "success" that materialises both the effectiveness of these strategies and their lack of interest in transform their social ethos.

## 7 **INEQUALITIES, ENCLOSED SPACE, AND SOCIAL RESISTANCE: BUILDING FORTIFICATIONS AND NEW SOCIAL REALITIES IN SIBERIAN HUNTER-GATHERER PASTS**

**Abstract author(s):** Schreiber, Tanja (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

In Archaeology, the deep-rooted equation of hunter-gatherers with egalitarianism prevails in narratives of peaceful, non-stratified hunter-gatherer societies, that are viewed as having limited impacts on their environment. On the basis of these notions, hunter-gatherers have rarely been linked with monumental constructions. However, new research on fortified hunter-gatherer settlements in Western Siberia, presented here, proves the opposite: here, forager communities constructed distinct forms of fortification systems around their settlements, encompassing palisades, ramparts and ditches, from the 6th millennium BC to the Russian conquest of Siberia. The reasons for the appearance and endurance of fortified sites in this region are still poorly understood, however, their construction is often linked with territorial conflicts, surplus economies and wealth imbalance. In a pilot study, the levels of social inequality within the hunter-gatherer communities in focus were measured diachronically, by applying a common statistical method of wealth measurement: the Gini-Index. Additionally, a spatial analysis was conducted for over 100 fortified sites, in order to examine the amount of social and private space within the settlements as well as to record the size of their fortification systems. The results not only reveal a correlation between phases of higher social inequality and fortification construction activities, but also show architectural adjustments to societal changes in the form of denser cohabitation and thus the transformation of social space, in order to enhance new social solidarities. These architectural changes possibly occurred in response to rising social inequalities and suggest highly fluid social arrangements within the societies in study. The results obtained thus provide evidence, that the forager groups of West Siberia were self-consciously experimenting with different social possibilities to counteract social imbalances. Shedding new light on these practices of past social resistance may help to challenge the ways in which we respond to social and economic realities today.

## 8 **AN UNHEALTHY FASCINATION WITH INEQUALITY, OR ALTERNATIVE STORY LINES FOR EUROPEAN PREHISTORY**

**Abstract author(s):** Robb, John (University of Cambridge)

**Abstract format:** Oral

European prehistorians have long had an unhealthy fascination with inequality, seizing upon any evidence for inequality and using it to proclaim that prehistoric society was unequal. This has provided the major story line for

prehistory between farming and urbanism: social evolution and the inevitable rise of inequality. This approach has numerous conceptual and empirical flaws. Anthropologists have shown that inequality is present in all human societies, and that all societies have multiple forms of leadership; what matters is how overall social process is organised. We assume that collective action is difficult or impossible, rather than the norm in most societies; that people only use skill or exchange to further political ambitions; and that people are passively unconscious of their own social order rather than participating in it and managing it attentively. Empirically, like magpies, we are fascinated by shiny objects; a few objects of display in a burial outweigh a lack of distinction or accumulated capital in the all the rest of the archaeological evidence. This paper begins by asking why there is actually so little unambiguous evidence for entrenched social inequality in most of European prehistory. I argue that prehistoric Europeans used a wide range of tactics and social engineering – mobility, heterarchical organisation, forced redistribution and dispersing wealth, kinship relatedness, and many others – to prevent the growth of inequality and to safeguard their autonomy. They were largely successful. The result is a new storyline for European prehistory: the achievement of equality, of millennia of a stable, self-governing world.

## 9 ANARCHY IN ARCHAEOLOGY: HISTORIOGRAPHY AND PERSPECTIVES

**Abstract author(s):** Demoule, Jean Paul (University of Paris I - Panthéon-Sorbonne)

**Abstract format:** Oral

Recent archaeological studies bearing the anarchist label can be seen as belonging to a wider current termed Anarchist Anthropology. Since the 1970s, this movement has focused on phenomena of resistance to power (archê in Ancient Greek). In particular we can cite the names of Pierre Clastres in France (author of *Society against the State*), who died following an accident in 1979, and Marshall Sahlins (author of *Stone Age Economics*). Belonging to the same generation are James C. Scott (author of *Against the Grain*, for which I wrote the preface to the French edition) and Christian Sigrist in Germany. As regards the generation that followed, David Graeber, David Wengrow (archaeologist) and Alfredo Gonzalez Ruibal deserve mention. Central to these works, which deal with concrete cases, is the very topical and serious issue of power and inequality, or more accurately the question of their control and rejection by a certain number of societies in the past and present. While it is possible to observe such mechanisms through ethnographic studies, archaeologists are faced with the problem of identifying them in the archaeological record, especially when textual evidence is lacking. This paper provides a number of examples, particularly concerning the Neolithic and Iron Age in Europe and, following on from the work of David Graeber, questions the forms of current political engagement that such research might lead to.

## 10 A NORMIE HISTORY OF MAINSTREAM ANARCHIST ARCHAEOLOGIES

**Abstract author(s):** Flexner, James (University of Sydney) - Frieman, Catherine (Australian National University) - Birmingham, James (Institute for Anarchist Studies/Black Trowel Collective)

**Abstract format:** Oral

Anarchy and anarchists are often associated with society's margins in theory and in practice. While there have been anarchists in the field for at least several decades, it is only recently that anarchist thought and praxis has risen to prominence in archaeological literature. In the past decade there has been a substantive increase in academic publications focusing on 'anarchist archaeologies' of various stripes. This paper outlines a brief and incomplete history of anarchist archaeologies, primarily from an anglophone perspective, laying out common themes and approaches. These include identifying resistance to hierarchies as an intentional and active process rather than a 'lack' of complexity; work that emphasises solidarity with the lives of marginalised and oppressed people past and present; and generally egalitarian approaches to fieldwork and scholarship. The paper also examines what has been gained as well as lost in making anarchism part of the 'mainstream' literature within archaeology. On the one hand, having more people explicitly reading and talking about anarchist thought and praxis is an important step in proliferating anarchisms in the field, laboratory, classroom, and beyond. On the other, there is a risk that in doing so the approach loses its critical edge, becomes an empty label, or produces 'only' academic rhetoric. Knowing the past is key to understanding present and futures, as most archaeologists will acknowledge, but what futures can the history of anarchist archaeology prefigure?

## 11 ANARCHIST ARCHAEOLOGY: REVIEW FROM THE BEGINNING TO NOWADAYS

**Abstract author(s):** Lerma Gujjarro, Alma (Backset Archaeology)

**Abstract format:** Oral

Since anarchist archeology began to be suggested in 2004 by the anthropologist David Graeber and shortly after by Roca Martinez in 2008, without forgetting that its bases are in the anti-neo-Darwinian theories of Kropotkin and the father of anarchist anthropology Pierre Clastres (1960-1970), until nowadays, going through the impulses of projects such as Palimpsests proposed by the Argentine Leonardo Faryluk in 2015, we have been able to observe how

archaeologists and anarchists from all over the globe have been contributing their forces in pursuit of an anarchist archeology that beyond of theory focuses on practice through mutual aid and activism.

This paper try to carry out a review throughout the short history of anarchist archeology projects and put a state of the art of the present of the same discipline in order to continue with the work towards the future of anarchoarchaeology. Relying on the examples that the colleagues of the different projects have been giving for some years.

Likewise, examples will be mentioned in different areas where a methodology that starts from this discipline has been put into practice. In the Laboral scene; in the company and union spheres; in the social sphere; in the academic and proposals of different types of economic support or barter, but always from mutual aid; in the activist for archeology as anarchists and for anarchy as archaeologists; and so on.

Knowing our past to strengthen the load-bearing walls that drive our future. Stone by stone in pursuit of anarchoarchaeology.

## FOREIGN VS LOCAL IN MEDIEVAL AND MODERN AGE FOODWAYS IN THE BALTIC SEA REGION

**Theme: 5. Climate Change and Socioenvironmental Perspectives**

**Organisers: Rannamäe, Eve (Department of Archaeology, Institute of History and Archaeology, University of Tartu) - Bartosiewicz, László (Osteoarchaeological Research Laboratory, Department of Archaeology and Classical Studies, Stockholm University)**

**Format: Regular session**

The Medieval Period in the Baltic Sea region witnessed new power structures, growth of human population, urbanisation, and variability in cultures that brought along a growing and changing need for food resources – processes that continued into the post-medieval era as well. In addition, these socio-environmental transformations were most probably influenced by the oscillations in the natural environment and climate (e.g. Little Ice Age, modifications in land use, etc.). Trade, marine fishing, and animal husbandry expanded in order to provide both local and foreign goods. In order to explore the foodways of people living in the 13th–19th century around the Baltic Sea and understand the extent and importance of imported food vs that of local origin, we invite presentations discussing small- and large-scale developments in animal husbandry at that time and the exploitation of food resources visible in both zooarchaeological and human osteological material. Applications of zooarchaeological (food remains, animal husbandry), biomolecular (ancient DNA, stable isotopes), anthropological (human pathologies, population studies), archaeological (artefacts related to food processing and trade), and written sources (recipes, visual data, account books) are the core of this session. In addition to regional insights based on local materials and research questions, parallels and patterns between the areas around the Baltic Sea and beyond would be of most interest.

### ABSTRACTS

#### 1 BY THE BOOK? MEDIEVAL AND EARLY MODERN AGE HIGH STATUS MEAT CONSUMPTION IN THEORY AND PRACTICE

**Abstract author(s): Bartosiewicz, Laszlo (Department of Archaeology and Classical Studies, Stockholm University) - Gál, Erika (Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network, Budapest)**

**Abstract format: Oral**

By the time of the High Middle Ages courtly life had consolidated in Europe and people of high social status could afford the luxury of consuming curious creatures. Tracing exotic animals, however, is difficult in archaeozoological assemblages as such species were by definition rare to begin with. Chances of actually recovering their odd remains are thus even more limited. Although the bones of non-native species sporadically occur in the Medieval and Early Modern Age Central European archaeological record, many are not related to meat consumption but were circulated as luxury items in other realms of high-status self-representation. Such artifacts indicate imports from Northern Europe and Southwest Asia. The paucity of exotic animals among food remains is in sharp contrast with the likely idealistic picture presented in the cookbook written for the Mainz Elector in 1581 and its Hungarian adaptation translated a century later. The integrated quantitative analysis of fish, birds and wild mammals in this work helps interpreting the meaning of its rich inventory of species in light of the environmental/zoogeographical realities of the time. A comparison with late Medieval animal bone assemblages from Hungary shows that patterns of meat consumption are consonant with those in the cookbook as far as ordinary, local species are concerned. However, the recovery of more exotic remains from the food refuse can probably be expected only when the analysis of large assemblages will make their occurrence increasingly more probable. Until then, exotica listed in the cookbook will look like wishful thinking rather than material reality.

## 2 WHAT ABOUT EXOTIC SPECIES?

**Abstract author(s):** Schmölcke, Ulrich (Centre for Baltic and Scandinavian Archaeology - ZBSA)

**Abstract format:** Oral

Regularly, in the large bone assemblages of medieval settlements, we find remains of animals that must have been exotic to the people of that time. Animal exotics are species or single individuals of special species that did not exist at all or only very sporadically in the area in question at a certain time. The reasons for their "rarity" can be manifold, among others:

1. "Last Chance to See". The reasons for their disappearance are diverse.
2. They are the "first of their kind" in the area, because of natural range expansion or following human landscape change.
3. Animals entered an area as individuals or smaller groups by humans (movement could have been for a variety of reasons). If the species is subsequently not noticeable for everybody, it will remain in exotic status.
4. Animals existed only in the imagination of people, but their existence was generally assumed (example: unicorn).

With a focus on the southwestern Baltic Sea region, this presentation will discuss examples from all four categories. In particular, the question of how people judged and reacted to "foreign animals" will be explored.

## 3 TASTY AND EXPENSIVE: FOREIGN ANIMALS AND PLANTS ON THE KINGS' TABLE. DATA FROM THE 13TH-17TH C. VILNIUS LOWER CASTLE, LITHUANIA

**Abstract author(s):** Piliciauskiene, Giedre (Vilnius University, Faculty of History) - Blaževičius, Povilas (National Museum of Lithuania) - Minkevičius, Karolis (Vilnius University, Faculty of History)

**Abstract format:** Oral

Vilnius Lower Castle and the Palace of the Grand Dukes of Lithuania (13th-17th c.) are objects of special significance for the history of the Lithuanian state. From the beginning of the 14th century to the middle of the 17th century, it was the main castle of the Grand Duke and the capital of the Grand Duchy of Lithuania. From the mid-16th century onwards, the Grand Duke of Lithuania was also the King of Poland, so he spent half the year in Vilnius. Various historical sources, zooarchaeological and archaeobotanical data provide an insight into the non-local species of animals and plants on the table of the ruler of two countries. Peacocks, pheasants, carp, grapes, dates, walnuts, etc. have been found in Vilnius Lower Castle since the end of the 14th and the beginning of the 15th century. However, the Lower Castle's account books, menus and zooarchaeological material do not contain some of the products that are very common in neighbouring countries. This suggests the specific and at the same time unique dietary habits of Lithuanian rulers.

## 4 STABLE ISOTOPE EVIDENCE FOR IMPORTED VS LOCAL FOOD CONSUMPTION IN HISTORIC PERIOD ESTONIA

**Abstract author(s):** Agurajua-Lätti, Ülle (Archaeological Research Collection, Tallinn University)

**Abstract format:** Oral

As part of a multidisciplinary project on the foodways of Medieval Estonia (Estonian Research Council grant no PRG29), stable carbon, nitrogen and sulphur isotope analysis has been conducted on a large dataset of faunal and human remains from the historic period (ca 1000-1800 AD). According to written accounts, fish was an important trade article and an affordable and widely available dietary resource in Medieval Estonia. Yet the current stable isotope evidence from the wider Baltic Sea region has failed to demonstrate a significant marine component in the diets of local people. By combining extensive new faunal isotope data from the local foodweb, including freshwater and marine fish, a better understanding of the local isoscape has been achieved. In particular, the stable isotope ranges for local marine and freshwater species show considerable overlap, most likely due to the brackish conditions prevalent in the Baltic Sea. This in turn has allowed for a more nuanced discussion on access and consumption of imported vs local (marine) foods among different social classes and geographical regions in Estonia.

## 5 DIET AND SOCIAL STATUS IN MEDIEVAL AND EARLY MODERN TARTU (DORPAT), ESTONIA

**Abstract author(s):** Malve, Martin (University of Tartu) - Agurajua-Lätti, Ülle (Tallinn University)

**Abstract format:** Oral

During the Medieval period, the Hanseatic town of Tartu (Dorpat) was an important trading center in the eastern Baltic, situated on the crossroads of regional transport networks. It was also the seat of the Bishopric of Dorpat and boasted an imposing Gothic cathedral situated on a hill overlooking the lower town. Most of the noblemen, clergy, and merchants living in medieval Tartu were ethnically foreign, whereas the poorest members of the society often lived outside the city walls and were commonly made up by ethnic Estonians. Here we present first stable carbon and nitrogen isotope evidence from various burial contexts in and around Tartu, spanning from the 13-18th century

AD, providing a broad picture of dietary preferences among different social classes (nobility and clergy from the Cathedral, foreign merchants, common townfolk, and rural peasants) and throughout the Medieval and Early Modern periods. Medieval Cathedral burials are very clearly distinct from all other analyzed groups, characterized by very high nitrogen isotope values. There is however very little variation between urban and rural commoners. We also detected a slight change between the dietary composition of medieval and Early Modern commoners, suggesting an increased reliance on foods enriched in  $^{13}\text{C}$ , most likely marine resources.

---

## 229 DEVELOPMENT AND USE OF GARDEN ARCHAEOLOGY IN DIFFERENT PARTS OF EUROPE, COMPARING INDIVIDUAL APPROACHES, INTERACTIONS, COOPERATION TO ASSES THEIR EFFECTIVENESS

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Vynckier, Geert (Flemish Heritage Agency) - Dix, Brian (Independent consultant) - Golembnik, Andrzej (INCEDO3D)

**Format:** Regular session

Archaeological methods of investigation, recording, and analysis are a standard requirement for studying past landscapes. But it is only recently that such techniques have begun to be used as part of a cross-disciplinary approach to trace the evolution and significant features of historic parks and gardens from early modern period (16th century) to the 19th century. The increased understanding that such archaeological investigation brings has enabled the accurate reconstruction of several historical gardens and related parkland, which enhanced their attraction to visitors as well as deepening the understanding of individual sites. The scope of work ranges from background studies using aerial photographs, historical maps and other records, through analytical fieldwork and non-intrusive geophysical surveys to detailed excavation. The results can be used as the basis for accurate restoration, repair, and reliable reconstruction in addition to informing conservation management plans and policies.

The creation of projects involving a cross-disciplinary team with specialists from separate areas of study is a helpful means of assessing the relative degrees of importance and value of the different sorts of evidence. Not all sources may point to the same conclusions and their divergence produces a healthy dialogue, in which the testing of one source against another can lead to a better understanding of the reliance that can be placed upon the evidence. Likewise, the significance of surviving groups of features and the individual physical remains which comprise the historic site can also be assessed.

The proposed session will review the development and use of Garden Archaeology in different parts of Europe, comparing individual approaches, interactions, and cooperation to assess their effectiveness in protection and revitalizing specific parks and gardens.

### ABSTRACTS

#### 1 THE DEVELOPMENT OF GARDEN ARCHAEOLOGY, WITH PARTICULAR REFERENCE TO THE UK

**Abstract author(s):** Dix, Brian (Independent consultant)

**Abstract format:** Oral

In Europe during the later twentieth century Britain was in the vanguard of using archaeological methods to study and, in some instances, to restore the remains of historic gardens. In a long tradition of archaeological fieldwork, the techniques of earthworks recognition together with advances in other forms of non-intrusive survey were applied to the analysis and interpretation of old gardens still being used in addition to abandoned sites. At the same time, conservation concerns impacted upon the desire to improve the presentation of some historic sites. Archaeological investigation, with concomitant excavation and recording, became as much an integral part of future repair and plans for restoration as other specialist work like archive research and botanical studies. The scope and relative values of the individual types of approach to studying these sites are well indicated by how the sub-discipline has developed. A full range of studies involves cooperation between experts in different disciplines, with research results fully integrated to provide a strategic and cost-effective programme.

#### 2 GARDEN ARCHAEOLOGY IN FLANDERS: A DIFFICULT AND CONTINUING PROCESS IN INTRODUCING THIS ARCHAEOLOGICAL DISCIPLINE IN THE NORTHERN PART OF BELGIUM

**Abstract author(s):** Vynckier, Geert (Flanders Heritage Agency)

**Abstract format:** Oral

Although garden archaeology has been used successfully throughout Europe for more than three decades, its entry into Flanders has been fairly recent. The first project was in 2007 as part of a conservation plan investigating the nature of 18th-century garden paths in the Neue Garten (1786) at the landcommandery 'Alden Biesen' in Limburg province.

In 2008, there was a search for traces of an early 17th-century garden in the courtyard of the Museum Plantin-Moretus in Antwerp as a part of the study for a museological evocation. Subsequent projects have been interdisciplinary investigations at the garden of the Norbertine Abbey at the Parc at Heverlee (2019) and of the Benedictine Abbey of Vlierbeek (2021), both near Leuven. First archival research and then geophysical examination took place in order to dig trenches to search for clues for a reconstruction of the gardens. The latest research (2021) took place in the garden of the castle of Gaasbeek (near Brussels) in order to better understanding of the original 19th -layout. This garden has always been open to the public and its redesign and renovation will provide the visitor with a good impression of its original form.

### 3 RECONSTRUCTION OF EARLY PHASE OF ROYAL BATHS PARK (WARSAW, POLAND) ON THE BASIS OF CARTOGRAPHIC, ICONOGRAPHIC AND ARCHAEOLOGICAL SOURCES

**Abstract author(s):** Solecki, Rafal (Cardinal Stefan Wyszyński University in Warsaw)

**Abstract format:** Oral

The Royal Baths Park is one of the largest park in Warsaw (Poland), occupying currently 76 hectares of the city centre. The setting of this park was initiated by Stanisław Herakliusz Lubomirski in late 17th century and its designer was Tylman van Gameren. Later, in late 18th century, it was bought and rearranged by King of Poland, Stanisław II August. There are sources – one cartographic and one iconographic – that show, that at the 1760-70s there was a different conception of the park, with channels which allowed to sail around it. For a long time it was not clear, are these sources were only a project of the park, that was not realized or they were scetched from nature? Now, on the basis of archaeological excavation, it was proven that these channels did existed and with help of DEM (Digital Terrain Model) of the park area imported into GIS environment it is possible to perform a virtual reconstruction of this little known phase of the Royal Baths Park.

### 4 INVESTIGATING THE ANCIENT GARDENS (16TH C.-18TH. C.) OF MARIEMONT (BELGIUM) : THE CONTRIBUTION OF ARCHAEOLOGICAL PROSPECTION

**Abstract author(s):** Demelenne, Marie (Musée royal de Mariemont) - De Smedt, Philippe (Department of Environment, Faculty of Bioscience Engineering, Ghent University; Department of Archaeology, Faculty of Arts and Philosophy, Ghent University)

**Abstract format:** Oral

Royal and imperial residences have been established in the Domain of Mariemont (B., Prov. Hainaut, Morlanwelz) between 16th c. and 18th c. Between the 16th and 18th century, royal and imperial residences were established in the Domain of Mariemont (Morlanwelz, Hainaut Province, Belgium). Following the French Revolution, at the end of the 18th century these residences were abandoned and the site was transformed in an industrial and bourgeois complex.

Now a public domain, a major restoration project is underway at Mariemont, for which sensitive archaeological areas (approximately 45 ha) have been identified to allow optimal curation. Among these areas is the 'Abundance terrace', named after a group of sculptures installed there in the 20th century. To evaluate the archaeological potential and characterise subsurface remains of the terrace, an integrated prospection approach – combining historical accounts with non-invasive prospection approaches – was deployed. On site, a multi-method geophysical survey was conducted. Both electromagnetic induction (EM) and electrical resistivity (ER) instruments were used to map the electrical and magnetic variations of different soil volumes down to a maximum depth of 3 m below the surface. This allowed targeting magnetic structures such as brick foundations and heated structures, as well as non-magnetic building elements (e.g. sandstone) and earthen banks, zones of increased soil compaction, and ditches.

The results of this field prospection were linked with iconographic and historical evidence, providing a first view on the nature and preservation of the archaeology of the site. In this presentation we will discuss the results of this campaign, along with a methodological blueprint for investigating the wider area of Mariemont.

### 5 THE MEDIEVAL MONASTIC GARDENS OF ØM ABBEY, DENMARK

**Abstract author(s):** Møllerup, Lene (Museum Skanderborg)

**Abstract format:** Oral

The monastic gardens is often identified as a symbol of monastic medical knowledge. However, gardens around monasteries are more than that. Medieval monasteries functioned as self-sufficient units and had a wide variety of gardens close by. In the monastic garden crops were grown for consumption, for making beverages, to use as insecticide, spices, textiles and rope as well as medicine and from the gardens came flowers to decorate the church during the liturgical calendar.

None monastic gardens from the Middle Ages have survived in northern Europe. It is necessary to gain information's elsewhere from and with the help of archaeology, historical sources, plant macrofossils and pollen analysis's it is possible to identify types of gardens and the landscape surrounding the monasteries.

This paper demonstrates how it is possible, through an interdisciplinary approach to get information's of the gardens and surrounding landscape of the medieval Cistercian Abbey Øm in Denmark, AD 1172-150.

## 6 USING GARDEN ARCHAEOLOGY -A CASE-STUDY FROM HAMPTON COURT, ENGLAND

**Abstract author(s):** Dix, Brian (Independent consultant)

**Abstract format:** Oral

The reconstruction of King William III's Privy Garden of 1701-02 at Hampton Court Palace represents a landmark of achievement in Garden Archaeology. The various features of its layout have been accurately and faithfully restored, each following precisely the details of the original design as revealed by archaeological excavation.

The arrangement of flowerbeds and paths, location of statues and steps, and the character of the flanking terrasses have been restored.

Working in close association with specialists historians, botanists and engineers, the garden has been authentically recreated. The way in which the work was carried out demonstrates the value of a staged programme and shows how accumulative evidence can be used to inform management decisions. Other work within the Palace's grounds and wider estate, whilst employing a variety of techniques according to the individual situation, similarly indicates how such projects should be integrated into the processes of overall planning and design execution as part of a cross-disciplinary approach.

## 7 THE HISTORY OF THE CONSTRUCTION OF THE ROYAL RESIDENCE IN WILANÓW - A ROMANTIC VERSION

**Abstract author(s):** Golembnik, Andrzej (INCEDO3D)

**Abstract format:** Oral

The archaeological research conducted in the years 2003-2011 at the residence of King Jan III Sobieski in Wilanów was probably one of the largest excavation projects in the post-war history of Poland. Almost four hundred different sized excavations and kilometers of supervised installation trenches, explored during renovation and conservation works, have become a testing ground for many new methodological solutions. They were based on measurements and recordings made with a laser scanner and spatial digital photogrammetry. These studies, apart from new methodological experiences, also provided a lot of interesting information, becoming the basis for intriguing conclusions.

Research results have weakened the value of the conclusions so far. New archaeological materials, artifacts and information collected during the analysis of the stratification processes of the earth embankments forming the space of the royal gardens have become the reason to verify the existing knowledge. They also constitute a solid basis for a discussion about the history of the residence, introducing new threads into it. They concern not only the obvious issues related to dating, the sequence of events and their consequences, but also touch on new, non-material aspects of the history of the construction process. They reveal the emotions of the king, apparently having a direct impact on the course of the work. According to archaeologists, they caused many ups and downs accompanying this royal investment. They are an unquestionable proof of the inconsistency of decisions resulting, on the one hand, from the king's engineering knowledge, and on the other, from impatience and haste. And these were undoubtedly a consequence of the expectations and dreams arising from the ardent love that the warrior monarch had for his French wife, Marie Casimire d'Arquien. This love thread, embedded in a sequence of layers and constructions, seems to be an interesting topic for more detailed research.

## 8 THE RUINS IN THE GARDENS OF MARIEMONT (B.): BETWEEN DISCOVERY AND DISPLAY

**Abstract author(s):** Demelenne, Marie (Musée royal de Mariemont) - Dosogne, Michele (Agence wallonne du Patrimoine)

**Abstract format:** Oral

In 1893, Raoul Warocqué, a wealthy industrialist and philanthropist, takes the lead of the family domain in Mariemont (Belgium, Hainaut province, Morlanwelz). This domain consists of a vast landscaped park surrounding the family castle. He leads large works in the park, including a display of an ancient castle and its gardens (16th c. -18th c.), an important archaeological site. This castle was built in 16th c., transformed in the second half of the 18th c. and abandoned after the French Revolution. At the turn of 19th and 20th c., Raoul Warocqué transformed some monuments from the 18th c. (the castle's main building, the orangery, and monumental stairs – the so-called "fer à cheval").

Since 2010, historical and archaeological research has been carried out to understand the evolution of the site and involve to the restoration of the gardens. We shall show how the chronology of the site as well as the owner's goals, intention and personality can be enlightened by garden archaeology.

To conclude, we will present how our research can involve the restoration project of the gardens and some prospects.

## 9 HISTORIC RENOVATION OF THE PERNŠTEJN GARDEN GROUNDS

**Abstract author(s):** Vágner, Michal (Department of Archaeology and Museology, Faculty of Arts, Masaryk University) - Dejmal, Miroslav - Šimík, Jakub - Těsnohlídek, Jakub (Archaia Brno z.ú.)

**Abstract format:** Oral

The garden grounds, founded in the baroque style in the 18th century and extended under the vogue of Anglo-Chinese (or "sentimental") style at the beginning of the 19th century below medieval Pernštejn Castle, was until recently in a state of disrepair. Therefore, their overall restoration was undertaken. During this process, it was necessary to subject the area to comprehensive archaeological research that comprised two approaches – a non-destructive geophysical survey combined with classical archaeological excavations. The first stage, which took place in 2016, was aimed to gather maximum information on the appearance and layout of the garden, including detailed data on extant structures. In this stage geophysical survey by ground-penetrating radar was conducted and small excavations verified the gathered results. The second stage, completed in 2019, consisted of standard protective archaeological excavations. Its purpose was to document the sites disturbed or exposed during construction works and, possibly, identify their value as cultural heritage so that they could be either integrated into the restoration plan or re-covered and conserved underground. The research was exceptional in terms of its contribution to the restoration of the castle grounds and it played an active part in the whole restoration effort. The survey partly helped to discern the original layout of the flat areas of the garden, and its findings had a substantial impact on the intended appearance of the grounds as projected in the initial stages of restoration. The preliminary test-pits provided answers to several questions concerning the construction and current condition of various structures historically located on the premises. The archaeological research proper, carried out simultaneously with the construction works, confirmed the validity of the initial conjectures about the layout of the gardens and delivered additional detailed information about their past appearance and chronological development.

## 10 BRONZE AGE AEGEAN RITUAL MEADOWSCAPES AS PREHISTORIC GARDENS

**Abstract author(s):** Daróczy, Tibor (Romanian Academy, Cluj chapter)

**Abstract format:** Oral

Ritual meadowscapes of the Aegean are recognised in sacred 'gardens' of the elites, information about which is conveyed to us mostly through visual (frescoes, glyptic, pottery) and written (Linear B) media that is exemplified through well-known finds. Evidence in the archaeological record for these is sought in archaeobotany, especially for flowers and trees, while palaeobotany is employed to understand how and when the human-nature relation represented by 'gardens' is born, that is to say is glocalised in the Aegean.

The paper argues for the Bronze Age glocalisations of human-nature relations, which are recognisable through landscape archaeology approaches and a phenomenological mind set. It proposes a methodology rooted in classical archaeology and only partially in natural sciences. Ultimately, this illustrates how Bronze Age people relate through all of their senses and perceptions to their environment and nature, but also how these are major factors in the choice of place, time and people for performative utterances and enactments of social memory. Lastly, the study demonstrates that similar ideas are in circulation in the same time over larger areas and their local adaptations give birth to the nuanced facets of what we call the Bronze Age world.

---

## 230 SEDIMENT AND SOIL ARCHIVES TO DECIPHER HUMAN-ENVIRONMENT INTERACTIONS IN WETLAND LANDSCAPES FROM THE NEOLITHIC TO THE XXTH CENTURY

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Mayoral, Alfredo (ICAC - Catalan Institute of Classical Archaeology) - Dendievel, André-Marie (Univ Lyon, Université Claude Bernard Lyon 1, ENTPE, CNRS, UMR 5023 LEHNA)

**Format:** Session with keynote presentation and discussion

This session focusses on the use of soils and sediments to decipher the interactions between climate, paleoenvironments and past societies in wetland landscapes. This approach relies on the collection and processing of geoarchaeological or paleoecological data to reconstruct socio-environmental changes in diverse cultural and chronological contexts. We propose to challenge the intercomparison of multidisciplinary data by discussing how multi-proxy analyses of soil and sediment archives from wetlands can be combined with archaeological data in order to reconstruct long-term trajectories of socio-ecosystems –and the resulting cultural landscapes– from the Neolithic to the XXth century.

The contributions will combine archaeological studies (excavation, surveys, historical data) with a broad analytical panel of sedimentary archives (from field geomorphology and paleopedology to physico-chemical characterization

and microscopic approaches). The geographical framework will include mainly (but not exclusively) European and circum-Mediterranean contexts. Communications should deal with one or more of the following reference topics:

- Wetlands and hydrosystems as a result of socio-environmental interactions: natural dynamics, resources, anthropogenic impacts and legacies
- Waterscapes: paleogeography and environmental changes in fluvial, lacustrine and coastal landscapes as a limiting factor/opportunity for human activities, adaptation and co-evolution
- Anthropocene records: impact of hydraulic infrastructures (drainage/irrigation networks, bridges, harbours...) and risk management (flooding, droughts, water level fluctuations) deciphered from wetland archives
- Soil formation/erosion under climatic and/or anthropogenic forcing and consequences for hydrosystems and wetlands evolution
- Cities and wetlands: environmental impacts of urban settlements in or around wetlands
- Paleo-pollutions in wetlands as a marker of human activities (mining, crafting, industry)
- Methods: intercomparison of data from soils/sediments archives and archaeological record; dating approaches and issues

Beyond discussing socio-environmental interaction, this session will also be the place to debate broader issues such as implications for cultural heritage, wetlands reclamation, and lessons for the future management and sustainability of cultural landscapes.

## ABSTRACTS

### 1 FROM THE PALEOANTHROPOCENE TO THE ANTHROPOCENE: TOWARDS A HIGH RESOLUTION OF THE LONG-TERM ANTHROPOGENIC IMPACT ON WETLANDS IN NORTHWESTERN FRANCE

**Abstract author(s):** Lespez, Laurent (Lab. Géographie Physique - LGP - CNRS; Univ. Paris Est Creteil) - Beauchamp, Axel (Nantes Métropole · Direction du patrimoine et de l'archéologie; CREAAH - CNRS) - De Milleville, Lucile (Lab. Géographie Physique - LGP - CNRS; Univ. Paris Est Creteil) - Lemer, Laurence (Lab. Géographie Physique - LGP - CNRS; Univ. Paris 1 Panthéon Sorbonne) - Gauthier, Agnès (Lab. Géographie Physique - LGP CNRS; Univ. Paris 1 Panthéon Sorbonne & Univ. Paris Est Creteil)

**Abstract format:** Oral

Numerous geomorphic and palaeoenvironmental studies have revealed the longstanding influence of anthropogenic processes on the wetland dynamics of northwest Europe. The impact of the agricultural exploitation of the catchments and the subsequent implementation of hydraulic installations is now better known in the long term. New geoarchaeological research conducted in the area surrounding archaeological sites has the objective of better identifying the initial impacts of agropastoral practices from the Early Neolithic period onwards, and of clarifying the effects of various types of hydraulic works (weir, dams, construction of ponds, etc.) on the wetlands.

The multiplication of the fluvial and wetland records and radiocarbon dating allows nowadays to clarify the timing of anthropogenic transformations in areas with no lake or peat bog environments. In this Moreover, in the plains of Northwest France, the combination of sediment (high resolution geochemical analysis) and biological (Pollen, Non-pollen Palynomorphs, fire signal, eDNA) proxies provides new data to improve the understanding of the environmental changes. In this paper, we propose, from a review of radiocarbon dating of Holocene sedimentation in the central and western Paris Basin and case studies in Normandy and Ile-de-France, to disentangle the punctual consequences of human activities from more generalized impacts of landscape transformation. We propose a spatial analysis of the impacts of anthropization, paving the way for a more precise definition of the Anthropocene of wetlands and highlighting the challenges to be overcome in the future.

This knowledge is also crucial to understand the extent of anthropogenic transformations, to place the present state of the wetlands in an ecological trajectory, and to define restoration pathways that consider the legacies.

### 2 ENVIRONMENTAL CHANGE DOCUMENTED IN A FLUVIAL LANDSCAPE: CASE STUDY ON THE LATE NEOLITHIC BRŠADIN-PAŠNJAK POD SELOM SITE (NE CROATIA)

**Abstract author(s):** Botić, Katarina (Institute of Archaeology, Zagreb) - Marks, Leszek (Polish Geological Institute – National Research Institute, Warsaw) - Welc, Fabian (Cardinal Stefan Wyszyński University, Institute of Archaeology, Warsaw) - Nitychoruk, Jerzy - Rogóż-Matyszczyk, Anna (Pope John Paul 2nd State Higher School, Faculty of Technical Sciences, Białá Podlaska) - Szymanek, Marcin - Czajkowska, Monika - Cabała, Izabela (University of Warsaw, Faculty of Geology)

**Abstract format:** Oral

The Late Neolithic site Bršadin – Pašnjak pod selom is located on the former bank of the Vuka River, one of the Danube's tributaries in north-eastern Croatia (southern Carpathian Basin). At present, the site consists of several oval elevations, probably a result of past major landscape modifications. Archaeological excavations were carried out in

two test trenches in which stratified remains of the Late Neolithic settlement were explored. The formation of a Late Neolithic settlement on the very edge of the river bank just after 5000 BC, and not earlier, raised questions about environmental conditions in that period.

In 2016 two geological cores were drilled, the first (Br 1) through the cultural layers of the north-eastern part of the site, and the second (Br 2) through natural layers in a shallow marshy depression between two elevations. Freshwater molluscs and ostracods and geochemical composition of these cores were analysed and record a substantial change in the immediate environment of the Neolithic settlement after it was established. They also provide insight into the environmental conditions just before formation of the Neolithic settlement.

### 3 HUMAN ACTIVITIES AND WETLAND ENVIRONMENT DECIPHERED BY USING MACROFOSSILS IN URBAN AND PERI-URBAN CONTEXTS FROM THE ROMAN PERIOD TO NOWADAYS

**Abstract author(s):** Dendievel, André-Marie (Univ Lyon, Université Claude Bernard Lyon 1, ENTPE, CNRS, UMR 5023 LEHNA) - Gaillot, Stéphane (Service Archéologique de la Ville de Lyon) - Pruvost, Jean (Univ Lyon, Université Claude Bernard Lyon 1, ENTPE, CNRS, UMR 5023 LEHNA) - Dessaint, Philippe - Monin, Michèle (Service Archéologique de la Ville de Lyon) - Mourier, Brice - Winiarski, Thierry (Univ Lyon, Université Claude Bernard Lyon 1, ENTPE, CNRS, UMR 5023 LEHNA)

**Abstract format:** Oral

Preserved in various depositional environments, the study of sediment deposits and their macrofossil content can be considered as an effective tool revealing local socio-environmental changes at different temporal scales. This communication presents a palaeoecological-based approach to decipher changes in urban and peri-urban freshwater ecosystems at two different periods: (1) on pond deposits dated back to the beginning of the Roman Era at Fourvière's hill (Lyon, France), and (2) on a recent (XXth century) semi-aquatic environment located along the Rhône River, downstream of Lyon (France). Achieved on well-characterised and dated sediments, we outline the benefits of studying plant macrofossils (seeds, wood remains, buds, leaves), as well as animal macrofossils (small crustaceans, fish vertebrae) and inorganic particles (sands, slags) in silty-clayey deposits to provide key elements to understand the local evolution of wetland landscape closely related to human activities. Macrofossil evidence of flora and fauna highlighted the ecosystem response to land-use changes and to the establishment of pathways and dams by the presence of typical macrofossil assemblages (plant tolerant to trampling, nitrophilous and silicicolous plants, new semi-aquatic communities, etc.). This analysis also provided information on consumption and production releases at the two periods: grape seeds, olives or fig achenes during the Roman period, nettle seeds, iron slags and microplastics in the recent times. This work demonstrates the potential of macrofossil analysis in understanding changes in the local environment close to urban contexts over different time periods.

### 4 3D-MODELLING OF HOLOCENE LANDSCAPE CHANGE IN THE AREA OF THE LATE NEOLITHIC WETLAND SETTLEMENT SITE OF PESTENACKER, SOUTHERN GERMANY(PART1)

**Abstract author(s):** Wanger-O'Neill, Anneli (Bavarian State Department for Cultural Heritage - BfLd) - Köhler, Anne - Schneider, Birgit (Leipzig University, Institute for Geography) - Rabiger-Völlmer, Johannes (Leipzig University, Institute for Geography) - Werban, Ulrike (Helmholtz Centre for Environmental Research - UFZ, Department Monitoring and Exploration Technologies) - Werther, Lukas (University of Tuebingen, Institute for Prehistoric and Medieval Archaeology) - Dietrich, Peter (Helmholtz Centre for Environmental Research - UFZ, Department Monitoring and Exploration Technologies) - Berg, Stefanie (Bavarian State Department for Cultural Heritage - BfLd) - Zielhofer, Christoph (Leipzig University, Institute for Geography)

**Abstract format:** Oral

Wetland settlement sites are valuable geoarchaeological archives. A high groundwater table provides excellent preservation conditions for palaeoecological and geomorphological proxies as well as for archaeological features and artefacts.

The Late Neolithic settlement site of Pestenacker near Landsberg am Lech in the Upper Bavarian Alpine foothills represents such an exceptionally well-preserved wetland settlement of the Altheim Culture. It is located in the valley of the Verlorener Bach and was extensively excavated between 1988 and 2004. Its founding can be dated dendrochronologically to the year 3,496 BC. Due to its great archaeological and supra-regional importance, it has been part of the UNESCO World Heritage Site "Prehistoric Pile Dwellings around the Alps" since 2011.

The extraordinarily high amount of analogue excavation documentation is being digitally processed in the course of ongoing scientific evaluation. This enables us to handle the high information density of the excavation site, covering 900 m<sup>2</sup>, and to understand the highly complex stratigraphy of up to 200 overlapping archaeological layers. GIS-based vectorisation and 3D-visualisation allow three-dimensional mapping of archaeological finds and findings as well as 3D-modelling not only of archaeological structures, but also of the surrounding landscape.

By combining these 3D-modellings with two direct-push colour-log transects, percussion drillings and numerous 14C-datings, a high-resolution chronostratigraphy of the floodplain with several former stream courses can be recon-

structed. The first fluvial activity began in the Middle Holocene. The incision of the stream enabled drainage of the surrounding sediments resulting in a lowering of the groundwater level. This condition probably led to the occupation of the floodplain by the Late Neolithic settlers.

## 5 3D-MODELLING OF HOLOCENE LANDSCAPE CHANGE IN THE AREA OF THE LATE NEOLITHIC WETLAND SETTLEMENT SITE OF PESTENACKER, SOUTHERN GERMANY (PART2)

**Abstract author(s):** Köhler, Anne (Leipzig University, Institute for Geography) - Wanger-O'Neill, Anneli (Bavarian State Department for Cultural Heritage - BLfD) - Schneider, Birgit - Rabiger-Völlmer, Johannes (Leipzig University, Institute for Geography) - Werban, Ulrike (Helmholtz Centre for Environmental Research - UFZ, Department Monitoring and Exploration Technologies) - Werther, Lukas (University of Tuebingen, Institute for Prehistoric and Medieval Archaeology) - Dietrich, Peter (Helmholtz Centre for Environmental Research - UFZ, Department Monitoring and Exploration Technologies) - Berg, Stefanie (Bavarian State Department for Cultural Heritage - BLfD) - Zielhofer, Christoph (Leipzig University, Institute for Geography)

**Abstract format:** Oral

Wetland settlement sites are valuable geoarchaeological archives. A high groundwater table provides excellent preservation conditions for palaeoecological and geomorphological proxies as well as for archaeological features and artefacts.

The Late Neolithic settlement site of Pestenacker near Landsberg am Lech in the Upper Bavarian Alpine foothills represents such an exceptionally well-preserved wetland settlement of the Altheim Culture. It is located in the valley of the Verlorener Bach and was extensively excavated between 1988 and 2004. Its founding can be dated dendrochronologically to the year 3,496 BC. Due to its great archaeological and supra-regional importance, it has been part of the UNESCO World Heritage Site "Prehistoric Pile Dwellings around the Alps" since 2011.

The extraordinarily high amount of analogue excavation documentation is being digitally processed in the course of ongoing scientific evaluation. The resulting new evaluation possibilities allow 3D-modelling not only of archaeological structures, but also of the surrounding landscape.

By combining these 3D-modellings with two direct-push colour- and electrical conductivity-log transects, selected percussion drillings, geochemical analysis and numerous <sup>14</sup>C-datings, a high-resolution chronostratigraphy of the floodplain with several former stream courses can be reconstructed (Köhler et al. 2022). The first fluvial activity began in the Middle Holocene. The incision of the stream enabled drainage of the surrounding sediments resulting in a lowering of the groundwater level. This condition probably led to the occupation of the floodplain by the Late Neolithic settlers.

(2022): A hydrological tipping point and onset of Neolithic wetland occupation in Pestenacker (Lech catchment, S Germany), *Quaternary Science Reviews* 278, 107370, <https://doi.org/10.1016/j.quascirev.2022.107370>.

## 6 HUMAN FOOTPRINT IN CHANGING ENVIRONMENT REVEALED THROUGH MULTI-PROXY RECONSTRUCTION: THE STUDY OF BRUSZCZEWO MICROREGION IN WESTERN POLAND

**Abstract author(s):** Niebieszczanski, Jakub (Adam Mickiewicz University in Poznań) - Gałka, Mariusz (University of Łódź) - Hildebrandt-Radke, Iwona - Karpińska-Kołaczek, Monika - Kołaczek, Piotr - Rzodkiewicz, Monika (Adam Mickiewicz University in Poznań) - Spsychalski, Waldemar (Poznań University of Life Sciences)

**Abstract format:** Oral

Numerous lakes and wetlands has formed since the retreat of the Vistulian ice sheet (~22 000 BC) in the territory of Poland and Northern Central Europe. These environments were occupied due to the water- and aquaculture-dependent subsistence strategies already by Neolithic farmers and even earlier. In some instances, waterscapes have been inhabited throughout the ages, while some lakes and wetlands ceased to exist due to climatic or anthropogenic factors. The changing environmental conditions and thus the changes in settlement patterns can be traced through the multi-proxy reconstruction on the one hand, and the detailed archaeological survey on the other. The combination of settlement archaeology and palaeoecological investigations provides an opportunity to discover the human-environment relations in temporal scale.

The following presentation concerns the archaeological and palaeoenvironmental reconstruction of the Bruszczevo microregion in Western Poland. This relatively small area has witnessed human occupation since Neolithic, but its most widely known settlement stage is connected to the Early Bronze Age and the Unétice culture fortified settlement. There are also several later stages of occupation (e.g. Late Bronze Age, Early Iron Age and Roman Times), the last of which is being dated to Medieval. Bruszczevo microregion spans the middle section of Samica River, which has adopted the glacial tunnel valley. In the following research we present the evolution of the valley, starting from the Late Pleistocene glacial meltwater lake, through Holocene ribbon lake and wetland/peatland, which has finally demised in result of the river drainage around 1300 AD. The multi-proxy reconstruction (palynology, macrobotanical

remains, diatom, sedimentology and geochemistry) was compared to the extensive archaeological knowledge (excavations and survey) on the sedentary practices and subsistence strategies related to the changing environment. This study was funded by the National Science Center, Poland, grant no. 2019/33/N/HS3/00193.

## 7 **LARGE-SCALE GEO-ARCHAEOLOGICAL PROSPECTION OF MID- TO LATE HOLOCENE WETLAND LANDSCAPES IN THE CENTRAL NETHERLANDS USING A MULTI-DISCIPLINARY APPROACH**

**Abstract author(s):** De Moor, Jos - Van Zijverden, Wilko (EARTH Integrated Archaeology) - Troelstra, Simon (VU University Amsterdam) - Verweij, Geurt (Bureau Waardenburg Ecology & Landscape)

**Abstract format:** Oral

The city of Almere (central Netherlands) is one of the fastest growing cities in the Netherlands. Planning and development of a large new residential area (4300 hectares with 15000 houses, including infrastructure) is currently taking place and according to Dutch legislation, archaeological research had to be carried out prior to construction activities.

The region contains a well preserved buried late Pleistocene aeolian landscape, covered by several meters of Holocene sediments. The archaeological value of the late Pleistocene landscape is rather well known and tens of Mesolithic hunter-gatherer sites have been discovered here during the last 20 years.

However, the prehistoric to historic archaeological value of the Holocene deposits in the area is still largely unknown. Therefore, as part of the compulsory archaeological research, a large scale geo-archaeological assessment of the Holocene sediments has been carried out. This assessment consisted of an integrated multi-disciplinary approach aimed at landscape and palaeogeographic reconstructions of mid- to late Holocene wetland environments. Using a combination of lithological descriptions of sediments, soil-micromorphology, radiocarbon dating, botanical analyses, diatom analyses and micropalaeontological analyses, we were able to reconstruct Holocene sedimentary environments and landscapes and - in combination with existing archaeological data - to assess their archaeological value.

The research has not only resulted in new insights in the archaeological value, usability and habitability of Holocene wetland environments in this part of the Netherlands, but it has also revealed new and valuable information on mid- to late Holocene landscape development of the region. The research has shown that the applied multi-disciplinary geo-archaeological approach is not only highly effective for this type of large-scale (regional) compulsory archaeological investigations, but it also generates new research themes, scientific information and datasets regarding the regional Holocene stratigraphy.

## 8 **RECONSTRUCTING THE LANDSCAPE OF THE SOUTHERN DANUBE DELTA IN ANTIQUITY: A SOCIO-ENVIRONMENTAL APPROACH**

**Abstract author(s):** Bivolaru, Alexandra (Aix Marseille Université, CNRS, IRD, INRA) - Morhange, Christophe (Aix Marseille Université, CNRS, IRD, INRA; EPHE, Section des Sciences Historiques et Philologiques, UMR 8546, Archéologie et philologie d'Orient et d'Occident - AOrOc) - Baralis, Alexandre (Musée du Louvre, Department of Greek, Roman and Etruscan Antiquities)

**Abstract format:** Oral

In this paper, we investigate the natural constraints and potentialities in terms of resources, communication, accessibility and navigability from the Archaic (7th c BC) to the Late Roman period (7th c AD) in the southern lagoons of the Danube Delta (Razelm-Sinoe lagoon system, Romania). The study is focused on two complementary directions: firstly, we reconstruct the palaeo-environmental evolution of the southern Danube Delta using a multi-proxy approach and secondly, we characterise the natural constraints and potentialities in the determined environment, with an in-depth comparative analysis of navigation conditions, accessibility and harbour and economic activities for three Graeco-Roman settlements: Orgame, Caraburun, Istros. The selected study-cases are key archaeological multi-layered sites, that testify for long-term human occupation and interaction with the environment.

The palaeo-environmental reconstruction is based on the sedimentological, biological and chrono-stratigraphic study of sedimentary cores extracted from each of the three sites. Through an integrative comparative approach (historical, archaeological and bio-sedimentological data), we propose an in-depth socio-environmental analysis of the historical evolution of the settlements and their entanglement with their milieu, from micro-ecologies to regional scale.

## A GEOARCHAEOLOGICAL TALE OF TWO CITIES: PALAEOGEOGRAPHY, SOCIO-ENVIRONMENTAL INTERACTION AND COASTAL LANDSCAPE EVOLUTION AROUND ANCIENT ABDERA (THRACE, GR.)

**Abstract author(s):** Mayoral, Alfredo (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - ICAC-GIAP; Université Clermont Auvergne, CNRS, GEOLAB) - Ejarque, Ana (ISEM, Univ Montpellier, CNRS, IRD) - García-Molsosa, Arnau - Georgiadis, Mercourios - Apostolou, Giannis (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - ICAC-GIAP) - Gaertner, Vincent (CNRS, UMR 5600, EVS-IRG & University of Lyon) - Kallintzi, Constantina (Director of the Eforia of Antiquities at Xanthi, Archaeological Museum of Avdira) - Kefalidou, Eurydice (National and Kapodistrian University of Athens, School of Philosophy, Department of History and Archaeology) - Palet, Josep María - Orengo, Hèctor A. (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - ICAC-GIAP)

**Abstract format:** Oral

Long-term socio-environmental interaction is the main factor in the development of Mediterranean landscapes. Within the TransLands project, focused on the landscapes of Greek colonization, we undertook the geoarchaeological study of Abdera, a phocaeon colony founded in VIIIth c. BC in coastal Thrace. We implemented an integrated approach including remote sensing, geomorphological mapping, borehole drilling, radiocarbon dating and archaeological data. The main objective was to reconstruct Holocene coastal dynamics, and landscape changes related to the colony. Detailed litho-stratigraphic and sedimentological data from 19 coring points distributed in five transects, together with 32 <sup>14</sup>C dates, allowed to outline the palaeogeographical evolution from the Neolithic to the Antiquity. Small coastal valleys were submerged by marine transgression since c. 5000 cal BC, and beach-barrier systems with lagoons developed quickly and remained stable during several millennia. The Klazomenians settled at c. 650 cal BC in a rocky promontory dominating a large bay, which was gradually silted as a result of accelerated coastal progradation from IVth c. BC, perhaps due to anthropogenic forcing. The harbour area itself was likely silted by sediments coming directly from the colony. The relocation of the city slightly southwards in this period, although coastal advance was only incipient and the bay was probably still navigable, suggests that the causes of this displacement were rather historical events. By the late Roman period the coastline was very close to its present-day position. Lagoons were almost totally silted and had become shallow marshes. Abdera's decay since the IVth c. AD was certainly reinforced by a high energy marine event, likely a tsunami, which devastated the coastal lowlands in the Vth c. AD. Forthcoming multiproxy palaeoenvironmental and geoarchaeological analyses will certainly provide a more comprehensive perspective of socio-environmental interaction and landscape change in the area around the colony.

## HUMAN-ENVIRONMENTAL INTERACTIONS AT HAIMENKOU- A LATE NEOLITHIC AND EARLY BRONZE AGE WETLAND SITE IN SOUTHWEST CHINA

**Abstract author(s):** Su, Kai - Kidder, Tristram (Washington University in St. Louis)

**Abstract format:** Oral

Haimenkou is a wetland site with exceptional preservation and represents one of the earliest Neolithic occupations in Southwest China at ca. 3600 cal. BP. The site is located on the margin of the alpine Jianhu Lake (ca. 2200 m a.s.l.). A coring survey along the lakeshore reveals nearly 10 m fluctuation of the water level and complex intercalations of occupational layers, lacustrine deposits, and alluvial fans developed from the surrounding mountains. During the prolonged settlement (over 1,000 years) at Haimenkou, people changed the land- and waterscape significantly through deforestation and cultivation. Using the sediments and buried soils around the site, we reconstruct the environmental context and diachronic changes during the occupational period (ca. 3600-2300 cal. BP) at Haimenkou. Field survey has identified exposed profiles that preserve evidence of lake level changes, drainage shifts, and alluvial fan developments. Multi-proxy methods allow us to detect the major environmental changes during the flourish of the settlement and to explore the reason behind site abandonment, and to investigate the complex relationships between climate-driven and anthropogenic changes in this fragile environment.

## RISK ASSESSMENT OF GLOBAL CHANGE IMPACTS ON MEDITERRANEAN LAKE SITES

**Abstract author(s):** Piqué, Raquel (Universitat Autònoma de Barcelona, Departament de Prehistòria) - Romagnoli, Manuela (Dept. for Innovation in Biological, Agro-food and Forest systems - DIBAF, University of Tuscia) - Barbaro, Barbara (Soprintendenza for Archaeology, Arts and landscape, Rome) - Galotta, Giulia (Institute for Cultural Heritage Conservation and Restoration) - Chaumat, Gilles - Martínez-Carballal, Xavier (ARC-Nucléart) - Palomo, Antoni (Museu d'Arqueologia de Catalunya) - Terradas, Xavier (Consejo Superior de Investigaciones Científicas) - García, Irene (Universitat Autònoma de Barcelona) - Moscatelli, Cristina (Department for Innovation in Biological, Agro-food and Forest systems - DIBAF - University of Tuscia)

**Abstract format:** Oral

Assessing the impact of climate change poses one of the main challenges for implementing better practices for the study and conservation of wetland cultural heritage. The greatest risks come from certain exacerbating factors, namely the rise in minimum temperatures, extreme climate events, global warming, intense rainfall, and prolonged droughts, besides human activity. The main goal of the current project "Archaeological Wooden Pile-Dwelling in Mediterranean European lakes: strategies for their exploitation, monitoring, and conservation" is to assess the impact of climate change and extreme climate events on the conservation and safeguard of pile dwellings in Mediterranean lakes. The project has selected three case studies: the Neolithic site of La Draga (Spain) and the Bronze Age sites of Bolsena and Mezzano (Central Italy) with the aim to assess the concrete impact of climate changes and global warming on waterlogged wood, providing also the correlation with the lake ecosystems in the Mediterranean. We present the first results of the analysis of some parameters that could influence the state of conservation of wood, such as the provenance environment, like water characteristics and lying conditions (e.g. sediments), climate and landscape reconstructions on a wide-ranging time scale as well as environmental data acquired by different organisms (municipalities, deputy environmental agencies, researchers, etc.).

## A MULTI-PROXY APPROACH TO ANALYSIS OF IRON AGE SETTLEMENT ON THE WETLAND MARGINS: CASE STUDIES FROM TWO SITES IN SCOTLAND

**Abstract author(s):** Roy, Lynne - Robertson, Jackaline (AOC Archaeology Group)

**Abstract format:** Oral

Throughout Scotland there is evidence that Iron Age communities were able to successfully settle in and around wetland margins. This research studied the sediment deposits from two sites; a wetland village and a terrestrial broch, which produced evidence of damp or wet conditions to varying degrees throughout their occupation. The main objectives of this paper are to demonstrate how using a multi-proxy geoarchaeological and palaeoenvironmental approach better informs us about the strategies used to manage living conditions in saturated environments.

The study of well preserved deeply stratified organic rich floor layers from the wetland site of Black Loch of Myrton, Dumfries and Galloway revealed evidence for the importation of large quantities of vegetation to create floors which were continually augmented with plant litter to raise the surfaces above the rising water levels and soak up the inevitable damp. Multi-proxy analyses of these deposits allowed us to better understand and appreciate the role of organic matter in the formation of floors as a means of managing settlement in wetland environments.

The multi-proxy approach applied at Black Loch provided an opportunity to consider how evidence for use of organic material in floors is often overlooked on terrestrial sites where organics are preserved largely through carbonisation. This was true at Clach toll Broch, Assynt which was destroyed by a catastrophic fire leaving behind a large and well preserved ecofact assemblage. Stratified organic rich saturated deposits were identified within the terrestrial broch. By analysing these deposits using the same methodology applied to Black Loch it was possible to identify similarities in the approaches used by both communities to manage settlement in challenging damp conditions.

## USING SEDADNA TO IDENTIFY PAST ECOSYSTEM ENGINEERING SPECIES

**Abstract author(s):** Vernot, Benjamin (Ancient Environmental Genomics, Max Planck Institute for Evolutionary Anthropology) - Sperisen, Christoph (Swiss Federal Institute for Forest Snow and Landscape Research WSL) - Robin, Vincent (Laboratoire Interdisciplinaire des Environnements Continentaux, UMR 7360 CNRS - Université de Lorraine) - Larsen, Annegret (Environmental Sciences, Wageningen University & Research)

**Abstract format:** Poster

Before humans assumed the dominant role in engineering streams and floodplains, native taxa controlled ecosystem engineering and surface change within river-floodplain systems. However, little is known about this pre-human, natural condition of European rivers and their floodplains. Furthermore, for periods where human activity was a major driver of river floodplain evolution, it can be challenging to distinguish between sites affected by human vs faunal behavior in the absence of physical evidence. In this pilot study, we aim to reconstruct the pre-human environmental condition of central European, low order streams and their floodplains. Further, we develop a methodology to identify the major drivers of ecosystem engineering at specific riparian sites. We selected two research sites in central

Europe, and reconstruct the pre-human palaeo-environmental conditions at these sites. We then use ancient DNA from sediments (sedaDNA) to test for the presence and absence of specific wetland vegetation, and compare with an analysis of botanical macroremains from the same sediments. We also test for animal ecosystem engineers, such as the beaver, water vole and aurochs – which are globally or locally extinct, but instrumental to healthy, sustainable riparian ecosystems. Locating where and when these species were present will not only give us an understanding of the natural and most sustainable environmental conditions of riparian areas, but will also create a baseline for a better understanding of subsequent human-environment interaction.

## **B. HUMAN-ENVIRONMENT INTERACTIONS IN AND AROUND VENICE LAGOON: MICRO-ECOLOGIES AND GEOARCHAEOLOGICAL NARRATIVES FROM ROMAN PERIOD TO MIDDLE AGES**

**Abstract author(s):** Bivolaru, Alexandra (Aix-Marseille Université, CNRS, IRD, INRA, Coll. France, CEREGE, EPHE-PSL, Chaire d'archéosciences) - Morhange, Christophe (Aix-Marseille Université, CNRS, IRD, INRA, Coll. France, CEREGE, EPHE-PSL, Chaire d'archéosciences; EPHE, Section des Sciences Historiques et Philologiques, UMR 8546, Archéologie et philologie d'Orient et d'Occident - AOrOc) - Cottica, Daniela (Dipartimento di Studi Umanistici Università Ca' Foscari Venezia Palazzo Malcanton - Marcorà)

**Abstract format:** Poster

This paper addresses the question of social aggregations and environmental transformation in and around Venice Lagoon from Roman times to Medieval period (2nd c. BC to 9th c. AD). Our aim is to bring completely novel perspectives to the interpretation of archaeological dataset in an environment with plentiful of potentialities (communication hub, dense forests, salt pans, fishy waters, calm estuaries, wild game, and animals), but also constrained by paleo-hazards (coastal and fluvial mobility, hyper-sedimentation at base systems, storms, inundations etc.). The human-ecological relationships that underpinned social transformations on the longue durée in and around Venice Lagoon form the core of this paper. The area is evaluated in an historic and anthro-ecological perspective, providing unique insights into the study of vulnerability, resilience and adaptation of human societies to challenging environments. Using a new set of sedimentary cores and a novel multi-proxy analysis (archaeological, sedimentological, biological, geochemical and radiocarbon), we examine the socio-ecological relationships that underpinned social transformations on the longue durée from Venice Lagoon to Aquileia and Grado. The selected key sites (Venice, Altinum, Lio Piccolo, Torcello, Aquileia and Grado), reflect pivotal moments in human-environment interaction, technical advancement and societal differentiation, inside peculiar and challenging environments. Hence, their study through an eco-anthropological and geoarchaeological approach will describe how people became entangled in the maintenance of a very particular eco-anthropological system.

## **C. INSIGHTS INTO THE IMPACTS OF NEOLITHIC LAND USE AND CLIMATE CHANGE ON THE VEGETATION OF NORTHERN GREECE**

**Abstract author(s):** van Vugt, Lieveke - Morales-Molino, César - Gobet, Erika - Lotter, André (Institute of Plant Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Vogel, Hendrik (Institute of Geological Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Hafner, Albert (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Tinner, Willy (Institute of Plant Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern)

**Abstract format:** Poster

More than 8000 years ago agriculture was introduced to Greece, starting the European neolithisation process. This cultural shift led to the arrival of new crops and livestock and changed the natural environments of Europe forever. Early farming societies developed new land use practices, which had an impact on vegetation and fire regimes. At the same time, early farmers were influenced by changes in climate and their environment. This relationship between Neolithisation, vegetation and climate is complex and not well understood.

Here, we present a continuous and high-resolution multi-proxy time series of past vegetation dynamics and fire history from Limni Zazari, spanning the Late Mesolithic and the Neolithic. We analysed pollen, spores and microscopic charcoal from lake sediments, to study the long-term relationships between Neolithic people and their environment. Limni Zazari is a small lake in Northern Greece and multiple Neolithic settlements were excavated nearby.

During the Mesolithic, the area around Limni Zazari was covered by mixed deciduous oak forests interspersed with open grasslands. The first decline in forest vegetation occurred around 6600 cal. BC, but it is unclear whether land use alone or also climate played a role. In the region first Neolithic settlements are dated to c. 6500 cal. BC, however, after the establishment of several local settlements around 5500 cal. BC, regular disturbances of the forest vegetation occurred. These disturbances likely led to changes in the forest composition. The presence of *Hordeum*-type and *Triticum*-type pollen suggest that people grew crops like barley, einkorn and emmer close to Zazari.

Our study describes vegetation dynamics in response to climate change and Neolithic farming disturbances of primeval forests. The results will lead to a better understanding of the complex interactions between climate, vegetation and human societies and may help our society to prepare for a future under global change conditions.

#### **D. RECONSTRUCTING ROMAN AGE LAND COVER CHANGES IN TRANSDANUBIA (HUNGARY) USING POLLEN, ANTHRACOLOGICAL AND GIS STUDIES**

**Abstract author(s):** Merkl, Máté (Department of Environmental and Landscape Geography, Eötvös Loránd University; Tata Kuny Domokos Múzeum) - Csüllög, Gábor - Hajdúné Darabos, Gabriella (Department of Environmental and Landscape Geography, Eötvös Loránd University) - Magyarai, Enikő (Department of Environmental and Landscape Geography, Eötvös Loránd University; MTA-MTM-ELTE Research Group for Palaeontology)

**Abstract format:** Poster

We present the results of a pollen analytical study of Lake Balaton (Cores 34 and 35) for the Late Holocene together with the results of anthracological investigations on archaeological sites dating to the Roman period from the surrounding of Lake Balaton in Hungary. The Romans conquered Transdanubia between 13 and 8 BC. By the 2nd century, the area around Lake Balaton had been Romanized through settlements. In the 4th century, in addition to smaller settlements and farmsteads, we also find military forts near Lake Balaton. To reconstruct how the Roman occupation altered the land cover and vegetation of the area, we use two 60 cm sediment cores from the Szemes Basin of Lake Balaton. For the pollen-based land cover reconstruction we use the LRA-Reveals (LRA-Landscape Reconstruction Algorithm) model, which estimates the true vegetation distribution from pollen distribution, taking into account the pollen dispersal and production capabilities of the species.

Pollen productivity estimates (PPE) differ significantly in different geographical areas, which can be connected to the climate of the area, soil characteristics, land use and other factors. In this study we apply the recent PPE European compilation of Githumbi et al. (2022) and the more proximal PPE dataset of Kunes et al. (2019) from Southern Moravia (Czech Republic). Two REVEALS based land cover reconstructions are performed with these two PPE datasets.

Pollen analyses are supplemented with the macro botanical results of the archaeological sites of Balatonlelle, Balatonfőkajka, Szabadbattyán and Tác. The archaeobotanical records come from various archaeological objects, such as storage pits, post holes, fireplaces and dwelling pits. Among the carpological findings cereals (*Triticum* sp.) dominate. Based on our observations so far, oak-wood (*Quercus* sp.) dominated the charcoal assemblages, which may show the effect of human selection.

With our macro botanical study we determine the nature of the environment and land use of the sites, we also deal with similarities and differences in the land use in Roman times. The examination of the macro remains also makes it possible to identify the location of different vegetation types around the settlements and its transformation by Roman age agriculture. We process, evaluate and present the data with the ArcGIS software, generalized to different coverage categories.

#### **E. HOLOCENE VEGETATION CHANGES IN SOUTHERN UKRAINE UNDER CHANGING LAND USE AND CLIMATE**

**Abstract author(s):** Ganz, Kathrin - Morales-Molino, César (Institute of Plant Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Kiosak, Dmytro (Dipartimento di Studi sull'Asia e sull'Africa Mediterranea, Università Ca' Foscari) - van Leeuwen, Jacqueline - Gobet, Erika - Tinner, Willy (Institute of Plant Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern)

**Abstract format:** Poster

Humans drastically increased their impact on vegetation when they changed from nomadic hunter and gatherers to sedentary farmers at the Mesolithic–Neolithic transition. In Europe, this so-called “Neolithisation” started more than 8000 years ago and had a big impact on the environment and the biosphere, e.g. through the introduction, propagation, reduction or extirpation of species as well as through increased erosion, fire, and eutrophication. Disentangling the ecological legacy of prehistoric land use from the natural climate-driven trajectories is important for correct assessments of future European ecosystem dynamics.

Holocene vegetation history of most of Europe's vegetation types has been studied for decades. However, there is little information available of Holocene vegetation changes related to climate and human impact in Eastern Europe, and even less concerning the Pontic steppe region. As a matter of fact, the complete lack of high-resolution studies and the usually poorly constrained chronologies so far prevented assigning vegetation shifts to specific climatic events detected in independent reconstructions or to archaeological findings.

Here, we present a novel palaeoecological record (pollen and charcoal), from the Kardashinski swamp in southern Ukraine, including two high-resolution sections (contiguous sampling), to contribute to filling the knowledge gaps in the vegetation history of this region. Our results show that throughout the past 8200 years, the steppe was always the dominant vegetation. However, pollen data also suggest the presence of broad-leaved tree stands in the floodplain of the Dnieper from c. 6050 cal BC until c. 4150 cal BC, when they declined massively. Earliest palynological evidence

of agricultural activities was already found during the Neolithic at c. 5950 cal BC, which considering the dating uncertainties is in agreement with the earliest pottery evidence from southern Ukraine. Land use then intensified during the Bronze Age and the past centuries.

## F. BURIED IN THE GROUND? LOOKING FOR ENVIRONMENTAL CHANGES FOR SERBIAN BANAT LATE BRONZE AGE SETTLEMENTS ABANDONMENT

**Abstract author(s):** Estanqueiro, Marta (University College Dublin; CEAACP-Universidade de Coimbra) - Lewis, Helen (University College Dublin) - Penezić, Kristina (Biosense institute, University of Novi Sad) - Molloy, Barry (University College Dublin) - Salamon, Aleksandar (Narodni muzej Zrenjanin)

**Abstract format:** Poster

The abandonment of LBA Serbian Banat settlements between 1250 and 1150 BC raises important questions regarding the factors that may have contributed to that process.

New LBA settlements continue to be discovered through satellite images and surveys, which seem to indicate that they were connected in a dense network.

These settlements emerged around 1500 BC, in a period that coincides with the abandonment of MBA tells. Varying in size and layout, some of them achieved considerable size, with several being surrounded by ditches and ramparts. Yet, something changed around 1200 BC, leading to the settlements' abandonment for more than 200 years. Were the environmental conditions, that allowed these communities to settle and prosper in this area, no longer favourable?

Following what seems to be a similar path to the Terramare culture of the Southern Po Valley (Italy), with the flourishing and decline occurring at similar periods, we look for evidence of environmental changes through sediment deposition analyses that can shed some light into this question.

---

## 231 BIOANTHROPOLOGY IN WESTERN ASIA: MOVING FORWARD (A SESSION IN HONOUR OF PROF HOLGER SCHUTKOWSKI)

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Kharobi, Arwa (University of Bordeaux; Bournemouth University) - Maaranen, Nina (Bournemouth University)

**Format:** Regular session

Recent years have witnessed many important contributions to the investigation of past populations in Western Asia. The number of projects integrating bioarchaeology has increased, leading to a better understanding of the diachronic interplay between ecological, socio-cultural and politico-economic changes in the region. This development, however, has often occurred within highly challenging contexts and surroundings, concerning not only limited accessibility and preservation but also the lack of efficient communication within and beyond the academic community. Such demanding contexts require us to work side-by-side with local communities and develop broader research questions to promote better collaborative tools.

In addition to presenting bioanthropological research projects, this session aims to spotlight the great efforts done by the scientific community today to promote diversity, accessibility, and inclusion. Therefore, we welcome submissions of quality and originality from all bioanthropological perspectives regarding Western Asia that offer examples of:

- Bioanthropological studies investigating ancient populations and their environments in both individual, site and regional scales from all time periods
- Challenges and solutions for working in the field and laboratory
- Bioanthropological Initiatives (open-access database, websites)

This session is held in honour of our mentor Holger Schutkowski who lost his fight to MND in 2020. Schutkowski was a Professor of Bioarchaeology at Bournemouth University who carried out bioarchaeological research across multiple sites in Western Asia. His work was always marked by the importance of a holistic approach to the study of the past, integrating osteoarchaeology with interpretive archaeology.

## 1 DENTAL PATHOLOGIES AT THE DAWN OF NEOLITHIZATION IN THE NEAR-EAST: NEW METHODS APPLIED TO ANCIENT COLLECTIONS

**Abstract author(s):** chamel, Berenice (Archéorient Laboratory, Lyon, CNRS)

**Abstract format:** Oral

The Neolithization of the Near-East is considered as one of the key period in the history of mankind, a change of economic model, moving from a predatory economy - based on hunting, fishing and gathering - to a production economy, where we rely more and more on agriculture and animal husbandry. This long process, which lasted almost 6,000 years, can be seen in numerous sites in Syria, Jordan, Israel, Lebanon, Iraq and in the island of Cyprus. However, due to the antiquity of some of the excavations, as well as the tense political situation, the archaeological and anthropological collections of these sites are frequently hardly accessible, or have been dispersed, lost or destroyed.

The aim of this study is to return to ancient collections of human remains from several sites and studying them with the new methods of biological anthropology, to see if the upheavals experienced by neolithic populations can be observed in the oral health status. Dental pathologies (dental caries, abscesses, ante-mortem tooth loss and periodontal disease) are indeed linked to diet and reflect the changes in the subsistence economy. Human remains from 7 Syrian sites, covering the entire Neolithic period from 9820 to 6000 cal BC (from the PPNA to the Pottery Neolithic), were studied in a diachronic perspective, with 312 individuals grouped into 4 major periods.

Results reveal that changes in oral health are far from linear, and that pathologies do not all progress at the same rate. Agriculture plays a very important role in the peak of severity of dental lesions observed in the Middle and Late PPNB, but the new way of preparing food in the Pottery Neolithic also contributes to a significant increase in the frequency of pathologies during this last period of the Neolithization process.

## 2 SOCIAL VIOLENCE AT NEOLITHIC ÇATALHÖYÜK

**Abstract author(s):** Knusel, Christopher (Université de Bordeaux) - Milella, Marco (University of Bern)

**Abstract format:** Oral

In the 1960s Lawrence Angel identified traumatic injuries at Neolithic Çatalhöyük that were interpreted to be the result of low frequency accidental injuries, and thus as inconsequential evidence for inter-personal violence. As a result, the large Neolithic village/town at Çatalhöyük was considered to represent a peaceful early farming community. This interpretation remained dominant in the absence of further study of human remains for evidence of violence-related trauma from the site. Renewed excavation and further consideration of the context of human remains provide the opportunity to re-visit this interpretation.

More recent excavation has also revealed further evidence for ritual elaboration in addition to that unearthed in James Mellaart's 1960s excavations. This ritualistic behaviour is considered to have provided a release to dissipate the increased social tensions generated in this large, densely populated community. Another insight into the nature of these social control mechanisms comes in the form of individuals excluded from the more commonly found platform burials within structures. As attested by the location of a young male bearing peri-mortem facial injuries on a floor surface, these mechanisms extended to social penalties that included denial of more commonplace funerary treatment as well as violent assault.

This contribution presents intriguing insights into possible mechanisms of social control in this Neolithic society. This evidence suggests new facets of Çatalhöyük communal living, and prompts research questions about the link between population density, social complexity, and social control in past societies.

## 3 CONTINUITY DURING TIMES OF CHANGE – EVIDENCE FROM MIDDLE BRONZE AGE SIDON (LEBANON)

**Abstract author(s):** Maaranen, Nina (Bournemouth University) - Stantis, Chris (Bournemouth University; National Museum of Natural History) - Kharobi, Arwa (University of Bordeaux; Bournemouth University) - Serhal, Claude (Sidon Excavation)

**Abstract format:** Oral

The Middle Bronze Age (MBA, circa 2000-1500 BCE) in the Levant has been called the 'dawn of internationalism'; it was a time of expanding trade networks and technological developments, urbanisation, and social stratification. Numerous excavations across the region have provided a wealth of information about this time period, and along them publications of skeletal assemblages have also increased steadily. Available data from Lebanon, however, has remained limited, particularly from larger skeletal assemblages, and more information is required to understand how the development of MBA harbour towns shaped populations at the time.

The ancient town of Sidon, Lebanon, was formed at a natural harbour circa 40 kilometres south of Beirut. Excavations at the heart of the city, at the Sidon College site, have uncovered one of the largest coastal cemeteries. This site offers

a unique opportunity to explore population changes during a time of burgeoning network growth and associated social changes by engaging with both skeletal human remains and the rich archaeological record. The investigation combined isotopes, biological distance and palaeopathological analyses. Despite the changes taking place, Sidon shows a remarkable level of continuity, providing new insight of the impact of inter-site relations to local populations.

#### 4 BETWEEN THE MOUNTAINS AND THE DESERT: ISOTOPIC EVIDENCE OF ALLUVIAL FAN SUBSISTENCE AT TEPE CHALOW IN NE IRAN

**Abstract author(s):** Soltysiak, Arkadiusz - Fetner, Rafal (Department of Bioarchaeology, Faculty of Archaeology University of Warsaw) - Vahdati, Ali A. (Northern Khorasan branch of Iranian Cultural Heritage, Handicrafts, and Tourism Organization, Bojnord) - Biscione, Raffaele (Institute for Technologies Applied to Cultural Heritage, Consiglio Nazionale delle Ricerche, Rome)

**Abstract format:** Oral

Changes in land use patterns accompanying the formation of the Bactria-Margiana Archaeological Complex (BMAC) are poorly understood. To fill this gap, this study aims to look at carbon and nitrogen isotopic values ( $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ) in collagen extracted from human and animal bones excavated at Tepe Chalow, an archaeological site in NE Iran. Bone samples taken from human skeletal remains represent two phases of occupation of the site: Late Chalcolithic and Early Bronze Age (proto-urban, LC/EBA, c. 3400–2400 BCE) and BMAC (urban, c. 2300–1700 BCE). Animal bone samples were available only for the BMAC period. Bone collagen was extracted using a modified Longin protocol and isotopic values were obtained with standard isotopic ratio mass spectrometer. In most human and animal samples, average  $\delta^{15}\text{N}$  values are very high (15.8‰ LC/EBA humans, 14.7‰ BMAC humans, 12.7‰ BMAC ovicaprids, outliers excluded), higher than the values of a local wild carnivore, the golden jackal (11.0‰).  $\delta^{13}\text{C}$  values differ significantly between LC/EBA and BMAC (both human and animal) subsets. High  $\delta^{15}\text{N}$  values are likely the result of combined aridity and intensive manuring in the relatively small area of land suitable for irrigation agriculture. The shift in  $\delta^{13}\text{C}$  between proto-urban and urban phases may be related to the transition from household animal husbandry to wider exploitation of saline steppes. Isotopic data supports the model of a regional shift from small-scale farming (Late Chalcolithic) through various forms of agropastoralism (Bronze Age) to nomadic or transhumant pastoralism (Iron Age).

#### 5 NEW GENOMIC EVIDENCE OF A BRONZE AGE LEVANTINE-EGYPTIAN NEXUS

**Abstract author(s):** Saupe, Tina (Estonian Biocentre, Institute of Genomics, University of Tartu) - Stantis, Chris (Faculty of Science and Technology, Department of Archaeology and Anthropology, Bournemouth University; Department of Anthropology, National Museum of Natural History, Washington) - Pagani, Luca (Estonian Biocentre, Institute of Genomics, University of Tartu; Department of Biology, University of Padua) - Guellil, Meriam (Estonian Biocentre, Institute of Genomics, University of Tartu) - Scheib, Christiana (Estonian Biocentre, Institute of Genomics, University of Tartu; St John's College, Cambridge)

**Abstract format:** Oral

West Asia, especially the Eastern Mediterranean coast (also known as the Levant), has played its role in the migration history of humans as the bridge between Europe, Asia, and Africa. During the Bronze Age (~3500-1150 BCE), groups from the Levant started to move towards Northern Africa and with the beginning of the 2nd Intermediate Period (~1640-1530 BCE), one particular group, known as the Hyksos, ruled the northeastern region of the Nile Delta sharing their cultural artefacts such as ceramics and burial practices with locals in Ancient Egypt and leaving their marks on the Egyptian culture. While previous studies have pointed to a "Levantine" origin of the Hyksos, the actual geographical and genetic origin remains debated.

To investigate the presence of the "Levantine" ancestral component and the connectedness between genetic data and shared burial practices, we extracted DNA of human skeletal elements at the dedicated ancient DNA laboratory at the Institute of Genomics, Tartu (Estonia) of ancient individuals dated to the Late Middle Bronze Age from six archaeological sites geographically located in the Levant ((Pella (Jordan), Jericho (Palestine), Tell Mozan and Umm el-Marra (Syria)) and Egypt (Tell el-Dabca). We generated genome-wide data of 16 ancient individuals from the Levant with an average genomic coverage between 0.004x and 0.048x (more than 6,000 single nucleotide polymorphisms (SNPs)) and were able to obtain partial and fully covered mitogenomes of 25 ancient individuals using mitochondrial DNA target enrichment via hybridisation capture.

We compared the first preliminary genetic results of the newly generated dataset with published available data and found a genetic overlap in the Levant with present-day individuals indicating a stable ancestral composition. We further plan to investigate the genetic impact of the "Levantine" component in the ancient and present-day individuals from Egypt and find a presence of the legacy of the Hyksos.

## 6 IDENTITY AND DISABILITY IN EGYPTIAN BIOARCHAEOLOGY

**Abstract author(s):** Zakrzewski, Sonia (University of Southampton)

**Abstract format:** Oral

What is disability and how do we identify it in a bioarchaeological context? Within paleopathology, disability has often been viewed from a modern medicalist model standpoint, but the field of bioarchaeology is intrinsically social in nature. People experience physical impairments, but are not necessarily disabled by those impairments. In ancient Egyptian contexts, the medical papyri provide a view of the emic understanding and treatment of bodily difference in the Egyptian past, but this concept of difference does not map directly on to etic modern understandings of physical bodily difference, and may not map to skeletal impairment identifiable from bioarchaeology. Even when considering disAbility as enabling a focus on the ability to undertake actions, there is still a fluid boundary between disabled and able-bodied, with shading and gradations along the continuum of disAbility depending on the actions and activities of the individuals involved. Using case study examples of disease and disability from the Nile Valley, this paper aims to add nuance to understanding of the interaction between identity and disAbility so that changes in disAbility may be viewed through the lens of the lifecycle.

## 7 REPURPOSING OPEN ACCESS ISOTOPIC DATA IN ANCIENT EGYPT AND WESTERN ASIA

**Abstract author(s):** Stantis, Christina (Bournemouth University; Department of Anthropology, National Museum of Natural History) - Huffer, Damien (Department of History, Carleton University; School of Social Sciences, University of Queensland) - Cheung, Christina (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Department of Art Sciences & Archaeology, Vrije Universiteit Brussel) - Salesse, Kévin (Department of Anthropology, Faculty of Science, Masaryk University)

**Abstract format:** Oral

Isotopic analyses of human remains and other materials from archaeological contexts provide opportunities to investigate broad themes of diet, migration, and climate. When combined with other archaeological information, stable isotope data can provide further insights into a wide array of anthropological and environmental issues such as weaning practices, disease processes and physiological stress, social stratification, animal husbandry practices, and climatic conditions. There are, however, current limitations of this method in the broad study region of Egypt and the Near East, most especially limitations surrounding a dearth of comparative and baseline data.

By utilizing the IsoArch database (<https://isoarch.eu/>; Salesse et al. 2018), part of an initiative to advocate data sharing for bioarchaeological isotope researchers, we investigate the current isotope data available within the online repository. In addition, this compilation effort will benefit the entire archaeological community working in Ancient Egypt and the Near East by making isotopic data easily accessible online, available to anyone free of charge and available for re-use without restriction, except that attribution be given to the source.

With 83 previous research outputs (totaling 2880 human samples and 1485 animal and plant samples) we find a wide range of isotopic data, from 6000 BCE to modern baseline samples. Although the long durée and broad region smooths out local information and creates interpretation issues regarding differences in physical and social environments, we show where past research has focused and highlight data gaps that can be addressed by future research.

## 8 WHAT TO DO WITH ALL THIS DATA: NEW INITIATIVES FOR LARGE-SCALE BIOARCHAEOLOGICAL RESEARCH IN THE MEDITERRANEAN AND MIDDLE-EAST

**Abstract author(s):** Mardini, Mahmoud (The Cyprus Institute)

**Abstract format:** Oral

Bioarchaeological data can provide long-term perspectives on humans' complex biosocial nature and interactions with their environment; this includes, among others, issues of animal exploitation, landscape transformation, and human responses to socio-political and environmental change. Despite the progress in the last decade across disciplines in bioarchaeology, to date, less emphasis has been placed on large-scale comparative studies and meta-analyses. To facilitate bioarchaeological studies and promote large-scale meta-analyses, a team of bioarchaeologists at the Science and Technology in Archaeology and Culture Research Centre of the Cyprus Institute is currently developing multiple open-access databases for bioarchaeological studies. These include open-access bibliographic databases for human bioarchaeology and zooarchaeology in the Eastern Mediterranean and Middle East (EMME) (Bi(bli)oArch - <https://www.biblioarch.com/>; Zoobi(bli)oArch - in progress), as well as an interactive database of published strontium isotopes values across the Mediterranean (SrIsoMed - in progress). Bi(bli)oArch is an open-access database containing titles and abstracts of human bioarchaeological studies from the EMME region, including over 3,521 titles. SrIsoMed will be an open-access database that contains over 11,000 87Sr/86Sr measurements from organic and inorganic remains originating from countries across the Mediterranean basin. Zoobi(bli)oArch will serve the same purpose as Bi(bli)oArch but for zooarchaeological studies. These projects will be highlighted in this presentation to encourage wide-ranging data syntheses and promote the development of other databases for archaeological research.

## FOLLOWING THE TRACES OF PARTHIANS AT THE VASTMIN ARCHAEOLOGICAL SITE IN IRAN

**Abstract author(s):** Amjadi, Motahareh (Eötvös Loránd University, ELTE, Doctoral School of Biology, Department of Genetics) - Ramezani, Maryam (University of Tehran, Department of Archeology) - Szécsényi-Nagy, Anna - G. Mende, Balázs (Institute of Archaeogenomics, Research Centre for the Humanities, Eötvös Loránd Research Centre) - Egyed, Balázs (Department of Genetics, ELTE Eötvös Loránd University) - Tavallaie, Mahmood (Noor Human Genetic Research Center, Tehran) - Sharifi, Abdol Motaleb (Center of Research, Office of Cultural Heritage, Handicrafts and Tourism Organization of Mazandaran, Sari) - Forouzanfar, Farzad (Iranian Cultural Heritage, Handicraft and Tourism Organization, Tehran)

**Abstract format:** Oral

The Parthian Empire, also known as the Arsacid Empire, was a significant political and cultural power in ancient Iran from 247 BC to 224 AD. The Parthians maintained one of the great imperial states in ancient world history. They stretched from the northern reaches of the Euphrates, in what is now central-eastern Turkey, to eastern Iran.

Parthian wealth obtained through lucrative trade networks resulted in substantial patronage of the arts, particularly relief sculpture, statuary (large and small scale), architectural sculpture, metalwork, jewelry, and ceramics. Various burial customs prevailed because of the empire's long-endurance, vast extent and exceptional cultural diversity.

Vastmin archaeological site, located in Mazandaran Province on the Caspian Sea littoral with crypt graves, is known as one of the most important Parthian cemeteries in Iran. In this crypt type of burials, the belongings of the dead were put in the chamber, and then the hole used for burying was blocked by mud and stone. Furthermore, the chambers were subsequently reused for other burials.

During the third season of excavation in Vastmin in total 30 graves were identified, among them three with horse burials accompanied. Thirteen graves with better preservation conditions were examined from anthropological aspects.

From the 31 individuals distinguished, 12 were females, 9 males, 8 children, 1 fetal baby and one ambiguous sex was identified. The average age of death was 24 years old, and some osteological pathological observations could be made.

This Vastmin site was selected as the first archaeogenetic study of a larger research project to shed light on the genomic diversity of the Iranian plateau in the era of the first Silk Roads.

In this paper, we present preliminary analyses on an interdisciplinary collaboration, where the population of the Parthian Kingdom is analyzed from archaeological, anthropological and archaeogenetic aspects.

## 10 INTEGRATION, COMMUNITIES AND EXCLUSION IN BYZANTINE TIMES THROUGH BURIALS FROM HIERAPOLIS OF PHRYGIA (TURKEY)

**Abstract author(s):** Laforest, Caroline (Royal Belgian Institute of National Sciences) - Selsvold, Irene (University of Gothenburg; University of Leicester)

**Abstract format:** Oral

During the last decade, several research programs have shed light on the funerary spaces from the Byzantine city of Hierapolis, located in the ancient province of Phrygia, southwest Turkey. The diversity of the investigated burials has been studied using interdisciplinary approaches, including bioarchaeology. This recent research has enabled us to compensate for the incomplete data from former excavations and address new issues. Topography, architectural types, reconstruction of perishable arrangements, grave management, and the biological identity of the deceased have been jointly analyzed to identify three kinds of burial spaces in use during the Middle-Byzantine period. Our hypothesis suggests that each of these spaces could have been reserved for a specific social category: an enclosed cemetery surrounding a small church is interpreted as the burial place of the general Christian population in Hierapolis, while very prestigious sites, such as the urban Cathedral and the St. Philip sanctuary, probably accommodated tombs of clergy and privileged inhabitants. In contrast to these individual – albeit reused in some cases – graves, some individuals were interred in reopened collective Roman chamber tombs situated not far from the aforementioned St. Philip sanctuary. Finally, people looked to be excluded from the community in Hierapolis in death in the cases of tombs situated outside the cemetery walls, as well as three inhumations discovered in a waste and dumping ground. Together, our findings outline a Byzantine funerary landscape much more diversified than usually described and demonstrate community, social stratification, and separation of social groups within a Medieval city.

## UNTANGLING WESTERN ASIAN BIOARCHAEOLOGY: DATA MANAGEMENT AND RESEARCH OF COMMINGLED SAMPLES

**Abstract author(s):** Perry, Megan (East Carolina University)

**Abstract format:** Oral

Human skeletal samples from ancient Western Asian mortuary contexts often present a major impediment to bioarchaeological study: their commingled, fragmented disposition. The difficulty in working with such assemblages is likely one reason why archaeological skeletal remains have been understudied in this geographic region. Occasionally the intermixing of skeletal elements results from tomb looting, but more frequently, the commingling results from purposive mortuary behavior. This paper briefly outlines theoretical approaches to the meaning of purposive commingling in Western Asian contexts. The second half focuses on potential approaches for integrating multiple bioanthropological techniques in commingled and fragmented assemblages to understand ancient populations, and new areas for exploration, using the skeletal remains from the Petra North Ridge tombs as examples. Here the integration of paleopathology, isotope studies, proteomics, and cementochronology can provide a wealth of individual-level information even in commingled assemblages. In addition, population-level data provide key information on diverse experiences within the community. The successful study of commingled samples necessitates the multifaceted and interdisciplinary approach demonstrated by Holger Schutkowski during his illustrious career in bioarchaeology.

## DRESSING EUROPE: MAPPING AND DISSEMINATING EUROPEAN TEXTILE HERITAGE THROUGH DIGITAL RESOURCES

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Costeira, Catarina (UNIARQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities of the University of Lisbon) - Iancu, Alina (National Institute of Heritage of Romania) - Gomes, Francisco (UNIARQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities of the University of Lisbon)

**Format:** Regular session

Textile Heritage is a major component of the European Cultural Heritage, consisting of both archaeological remains and historical and ethnographic textiles. It includes both material heritage - from fabrics, utilitarian textiles and garments to tools and even workshops specialised in textile production - and immaterial heritage, namely traditional textile crafts.

In the last decades, textile research developed into a major field of research within the heritage sector. This impulse, coupled with the development of Digital Humanities as a new horizon for research and dissemination, has generated a strong necessity to create digital databases of textile heritage that might contribute to achieve new insights into European History and to foster an inclusive European identity based on a shared heritage. Exploring the shared experience of textiles at the European level could indeed foster a sense of belonging and social cohesion.

In this session, promoted by COST Action EuroWeb - Europe through Textiles (CA19131), we aim to gather together students, scholars and other stakeholders from academia, museums, the conservation sector and cultural institutions, as well as creative industries which would like to share data and experiences on:

- the online storage of textile resources in heritage databases, online catalogues and galleries that feature textiles;
- strategies of textile mapping, including the process of data selection and organisation, as well as the storage, processing, interpretation, and presentation of records;
- good practices on textile recording and textile data sharing in an online, accessible format;
- establishing a dialogue between researchers, practitioners and a broader audience of textile enthusiasts to deepen the current knowledge and to popularise textiles across Europe.

We strongly invite participants to include in their presentations case studies such as national databases, sites, galleries, forums, libraries and pages dedicated to textiles and textile resources.

### ABSTRACTS

## 1 LEARNING ABOUT TEXTILES. THE IMPORTANCE OF THE EUROWEB DIGITAL ATLAS OF EUROPEAN TEXTILE HERITAGE

**Abstract author(s):** Iancu, Alina (National Institute of Heritage of Romania) - Costeira, Catarina (UNIARQ - Centro de Arqueologia da Universidade de Lisboa; Faculdade de Letras de Lisboa. Universidade de Lisboa)

**Abstract format:** Oral

The Digital Atlas of European Textile Heritage is one of the most important deliverables in the COST CA 19131 action entitled 'EuroWeb. Europe Through Textiles: Network for an integrated and interdisciplinary Humanities. This presentation aims to highlight the role of The Digital Atlas of European Textiles and Dress, discussing the need of textile resourc-

es digitization and dissemination in Europe in the context of the recent progress in the field of archaeological textiles in particular and historical textiles in general.

Through this contribution we will outline the general features of the Atlas (aim, structure, content and addressing groups) and we will present the inherent challenges and the opportunities that such a major project brings for the European Textile Heritage. The following aspects will be discussed: the free redistribution of information, access to data, collaboration between institutions and project members, opportunities for dissemination of the European textile heritage. We will equally highlight the weak points that are inevitable in such a major project: the copyright problems, the difficulties in the comparison and interrelation of data from different regions and countries in Europe, the challenge of finding collaborators and volunteers to develop the Digital Atlas and the ability to keep this digital tool up to date after the end of the project.

## 2 INFORMATION AND POSSIBILITIES LOST BETWEEN THE DBMS AND THE PRESENTATION LAYER: DO WE KNOW WHAT WE ASK THE DATABASE FOR?

**Abstract author(s):** Pallin, Karolina (TexArk – The society for textile archaeology and culture studies; Textile studies, Uppsala University)

**Abstract format:** Oral

This paper's primary focus is to address the problem of extracting and consolidating detailed information between a database backend and a filtered view in a presentation layer. It will also give insight into how we worked with a purpose-built relational database for the textile collection at the Vasa Museum in Sweden.

The focus for the database development at the Vasa Museum has been designing it for researchers who need full primary data. However, while a query gives a defined dataset, most researchers only have access to and knowledge about filtered views, such as the most common search functions for collections online.

```
SELECT
    find.find_id,
    type.*,
    array_to_string(array_agg(DISTINCT beam.beam), ', '::text) AS
    beams,
    technique1_primary.primary_technique_eng,
    technique2_type.technique_type_eng
FROM find
    JOIN type ON type.find_id = find.find_id
    JOIN jointable_find__beam ON find.find_id =
    jointable_find__beam.find_id
    JOIN beam ON jointable_find__beam.beam_id = beam.beam_id
    JOIN technique1_primary ON type.technique1_primary_id =
    technique1_primary.technique_primary_id
    LEFT JOIN technique2_type ON type.technique2_type_id =
    technique2_type.technique_type_id
GROUP BY
    type.type_id,
    find.find_id,
    technique2_type.technique_type_eng,
    technique1_primary.primary_technique_eng;
```

A simple query like this above will with slight changes, none of them erroneous per se, show very different results. A more significant query used to service a filtered view in a presentation layer, works under the same principles. Principles who are not known to the researcher using the filtered view's search functions to find research data.

We can not ask researchers to know how to write SQL queries. Also, we can not ask from instances sharing their collection database to give everyone access to a SQL query tool. With more and more digitized collections, this put the scientific value of future research at risk and therefore, it needs to be explained, highlighted and discussed. Do we as researchers actually know what we ask the database for?

## 3 MAPPING AND DISSEMINATING THE USE AND RE-USE OF TECHNICAL TEXTILES IN SEALING PRACTICES IN BRONZE AGE GREECE

**Abstract author(s):** Ulanowska, Agata (Faculty of Archaeology, University of Warsaw)

**Abstract format:** Oral

Impressions of technical textiles: threads, cords and woven fabrics, as well as leather thongs, mats and basketry, preserved on the undersides of clay sealings from Bronze Age Greece comprise an important, yet so far largely

untapped, source of textile knowledge. A large number of such impressions, documented in plasticine and silicone casts of the undersides of clay sealings by the Corpus der minoischen und mykenischen Siegel (CMS) team and stored in the CMS Archive now in Heidelberg, has been examined within the 'Textiles and Seals' research project and published in an open access 'Textiles and Seals' database (<https://textileseals.uw.edu.pl/database/>).

In this contribution, I would like to demonstrate new research possibilities related to the evidence recorded thus far, focusing on how this data can answer questions about individuals involved in sealing practices and their potential preferences for securing the sealed objects in a certain manner. Recognising technical textiles that might have been repeatedly used in the sealing practices at a specific site is another challenge to be discussed in this paper. Finally, I would also like to comment on possible dissemination strategies in relation to research and evidence that seems to be highly specialist and, at first glance, not attractive to a general audience.

#### **4 DRESSING DIGITALLY THE IBERIAN PENINSULA: CURRENT STAGE, CASE STUDIES AND NEW POSSIBILITIES**

**Abstract author(s): Morgado-Roncal, Leyre (University of Granada)**

**Abstract format: Oral**

The studies of archaeological textiles and textile production in the Iberian Peninsula (Spain) have experimented a positive revitalization in the last decades. We are currently in a time of methodological consolidation and dissemination. However, it is still difficult to access digitally the results of over a century of research. The publications tended to be punctual, isolated and the databases inexistent or inaccessible. The digital perspective is at an early stage, hence the difficulty we have encountered to share internationally our investigations.

In this paper we will be examining our limited online textile resources, mainly museum catalogues and academic papers. We will be proposing new possibilities of data storage such as 3D models, online websites, and open databases, as well as reflecting on previous initiatives. In doing so, we hope to showcase the necessity and benefit of crafting a digital dimension. Finally, this discussion will enable us to integrate the Iberian Peninsula in this process of conforming a digital network of European Textile studies.

#### **5 THE CHALLENGES OF MAPPING ARCHAEOLOGICAL TEXTILE TOOLS: THE CASE OF THE PRE- AND PROTOHISTORIC TEXTILE TOOLS FROM SOUTHERN PORTUGAL**

**Abstract author(s): Costeira, Catarina (UNIARQ - Center for Archaeology in the University of Lisbon) - Gomes, Francisco (UNIARQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities of the University of Lisbon)**

**Abstract format: Oral**

In the past couple of decades, the increase in the number of archaeological works in Southern Portugal has led to the identification of a growing number of archaeological sites dating both to the Late Neolithic and Chalcolithic and to the Bronze and Iron Ages. Many of these sites have yielded various types of archaeological remains relating to textile production.

This presentation is meant as a reflection on the importance of mapping textile tools, particularly loom components/loom weights and spindle whorls, as a means to analyze their distribution and the geographic patterns of textile activities, while also highlighting their economic expression and their development over time.

Establishing a cartography for these materials does however pose significant issues, which will also be discussed. Simply mapping the presence of textile tools in each site may result in a misleading picture, establishing a false equivalence between single finds or small assemblages and large, representative, and highly significant groupings. This limits interpretations of the organization of textile production and of the subtleties of the economic relations underlying that organization.

We will therefore argue that this cartography needs to be built upon a previous assessment of the context, scale and, when possible, organization of textile activities in each site, based on well-established quantification protocols and a comparative analysis of their original context. Such an assessment can then be reflected in the adoption of specific conventions to express and graphically differentiate at least some standard, trans-cultural levels of textile production (e.g., household production, household industry, attached specialist production, workshop production...). In this regard, digital supports offer great potential for the production of a multi-scalar, interpretive cartography which goes beyond mere illustration and moves towards the realm of interpretation and storytelling.

## 6 THE VALORIZATION OF A ROMANIAN HERITAGE DATABASE CONTAINING TEXTILE RESOURCES THROUGH THE EUROWEB DIGITAL ATLAS

**Abstract author(s):** Iancu, Alina - Stan, Ania (National Institute of Heritage of Romania)

**Abstract format:** Oral

This contribution aims to present a case of study on the digitization of the Romanian textile resources through the valorization of the Romanian database Mobile Cultural Objects Listed in the National Cultural Heritage by the Romanian heritage specialists that are members in the EuroWeb COST Action, with the support of volunteers from the University of Bucharest.

The database Mobile Cultural Objects Listed in the National Cultural Heritage is developed by the National Institute of Heritage of Romania and contains around 80.000 heritage resources from all Romanian Museums and Collections. An important part of this database features objects related with textile crafts, including textile tools unearthed on many Romanian archaeological sites, archaeological and historical textiles, ethnographic garments that are part of the Romanian folk costume and textiles for domestic use (utilitarian textiles as carpets, coverlets and others). All this data is currently processed in order to be integrated into the Digital Atlas of European Textile Heritage, one of the most important deliverables of the EuroWeb.

We aim to present all the steps of data processing, including selection, cleaning, English translation and the import of data into the Digital Atlas of European Textile Heritage. This contribution will highlight the importance of the national online databases as repositories of textile cultural resources. Valorized through the EuroWeb Digital Atlas, these types of databases will offer important information about the Romanian textile heritage in a much more friendly and easy-to-access platform. Consequently, our paper will constitute an example of good practices in the field of digitization of textile cultural resources.

## 7 FINDING TEXTILE RESOURCES IN THE CHRONICLE OF ARCHAEOLOGICAL RESEARCH IN ROMANIA

**Abstract author(s):** Dinu, Georgiana (National Institute of Heritage of Romania) - Iorganda, Tatiana (Faculty of History, University of Bucharest)

**Abstract format:** Oral

The Chronicle of Archaeological Research in Romania is an annual publication edited by the National Institute of Heritage of Romania, which encompasses all the field studies carried throughout the year, in the form of individual technical reports. The publication is currently accompanied by an open database updated by specialists from the Institute.

The database has been one of the main resources for finding information regarding the textile-related discoveries in archaeological surveys used by the Romanian contributors in the EuroWeb COST Action while putting together the Digital Atlas of European Textile Heritage. Even if the reports are not fully comprehensive regarding the excavations, they may offer important details about the objects discovered and their archaeological contexts, prior to their official publication in academic papers. Among them are textile tools, such as spindle whorls, loom weights and sewing needles.

This presentation will cover the process of selecting and importing the data into the Digital Atlas of European Textile Heritage, while emphasizing the potential of the national databases available online and how they can represent a very useful resource for documenting the textile tools in archaeological research.

## 8 TEXTILE LANDSCAPES – CASE STUDY IRON AGE AND EARLY MEDIEVAL IN CENTRAL EUROPE

**Abstract author(s):** Groemer, Karina (Natural History Museum Vienna)

**Abstract format:** Oral

The motivation of modern archaeological textile research is to improve understanding of the role of textile production and textile products in the history of humankind. Embedding finds and their context information into socio-economical and cultural discourse contributes to a cultural anthropology of textile use. For pre- and protohistory in the region of Central Europe, it is a challenge that textiles are among those organic materials that are rarely preserved under the prevailing climatic conditions.

Data mining still continues to serve basic research needs in textile archaeology in terms of describing and analysing archaeological textiles, although superior research questions and theoretical aspects are more and more applied to the material. The author contributes to this with the aim of building as broad a database as possible on archaeological textile finds from the Neolithic to the Middle Ages, with the emphasis on a view of continental Europe.

In this contribution, strategies of data mining as carried out at the Natural History Museum Vienna are presented with some case studies concerning the Iron Age, as well as the Early Medieval Era.

## 9 **MAPPING THE INTERNATIONAL TRADE OF MEDIEVAL AND EARLY MODERN EUROPEAN TEXTILES**

**Abstract author(s):** Mordovin, Maxim (Eötvös Loránd University, Budapest)

**Abstract format:** Oral

The cloth seals have become quite well-known and familiar finds in the last couple of decades. Dozens of publications present a wide range of different types of such seals produced in hundreds of textile-production centres. After having excellent publications, and descriptive catalogues of some more extensive collections, it is time to take one step forward and observe this topic on a broader international level. The best solution to visualise the information provided by these finds is to put them on maps, connecting the origin and the findspots of particular types. The best available platform for this is the Digital Atlas of European Textile Heritage. This platform also helps in disseminating scientific results.

In this paper, I am to present the process of such mapping and its first preliminary outcomes. As a first step, I have started to get through all the data from the Carpathian Basin (mostly from present-day Hungary and Slovakia, including parts of Austria, Romania, Serbia and Ukraine). The mapped data enables the presentation of two types of evaluation. The first one displays a distribution pattern of several different cloth fabrics in a separate region; the second shows the spread of a particular cloth type across the investigated territory. As case studies, I have also examined two specific types of cloth seals, namely those from Gdańsk and Görlitz. Additionally, I have prepared a detailed analyse of cloth consumption of a medieval Western-Hungarian town of Pápa.

## 10 **"WWW.ARCHEO-TKANINY.PL" DIGITAL CATALOG OF TEXTILE GRAVE EQUIPMENT, SUMMARY OF THE PROJECT (POLAND)**

**Abstract author(s):** Majorek, Magdalena (University of Lodz; Institute of Archaeology)

**Abstract format:** Oral

During the presentation, I will discuss the goals and effects / results of the project, which I implemented under the name: "Digital catalog of post medieval funeral textiles from archaeological research in Biata Rawska" (the scholarship of the Minister of Culture and National Heritage, Poland, 2020).

The aim of the project was to digitize, research and disseminate information about the collection of textiles discovered during archaeological research in the church of st. Adalbert in Biata Rawska (central Poland) and popularization of knowledge about methods of protection, conservation and reconstruction of archaeological textile artifacts, production techniques and fashion of the 18th and 19th centuries.

I have set myself the following detailed aims:

- scientific research of textile archaeological artifacts from Biata Rawska;
- education on two levels: 1) of the scholarship holder: expanding knowledge, developing the ability to use documentation techniques and research activities at the textile object; 2) recipients: expanding knowledge, developing behaviors aimed at encouraging special protection to be given to exceptional relics of the past, such as old garments;
- informing the society about the state of preservation of textile objects from archaeological research and the importance of former garments as a determinant of national identity.

As part of the project, I conducted a literature search on the history of fashion, methods of protection and conservation of textiles; I visited selected museums (including virtual collections); I prepared a scientific study taking into account modern documentation techniques, technological analyzes, tailoring patterns; I performed an analysis of form, function, content and comparative analyzes; in addition, I created a website <www.archeo-tkaniny.pl> with a digital database (catalog) and 10 educational posters.

## A. **CHALLENGES OF SCOPE AND COLLABORATION: BUILDING A COMPREHENSIVE TEXTILE TERMINOLOGY LIST FOR THE DIGITAL ATLAS**

**Abstract author(s):** Korten, Meghan (University of Iceland)

**Abstract format:** Poster

This poster will present the collaborative efforts of the Textile Terminology Working Group from COST Action Euroweb in creating a terminology list for the Digital Atlas to use for the online database of a European textile heritage map. We were able to work collaboratively, in a series of online workshops, as a group of researchers representing 17 countries and a variety of research disciplines, each adding our own input from our own textile knowledge and expertise. The main challenge of this task was determining the scope of the terminology list: how to include the broad range of research interests, technology, and time periods of the various textile to be submitted to the database with the need for a concise list of terms so as to not overwhelm the developers or the researcher inputting data, while still meeting the needs of the anticipated data. The result was six lists of terms, three representing textile materials, techniques, and functions and three representing textile tool types, shapes, and materials. We believe that this list of terms meets the Digital Atlas' needs for disseminating European textile heritage, with the scope balancing inclusivity and exclusivity

for the expected range of textile artifacts to be submitted. The poster will display aspects of the 6 terminology lists and discuss the challenges that this project faced and was able to overcome. It will also discuss several interesting trends noted during the collaboration, including some differences in representation of the anticipated textile types across the spectrum of textile production techniques, by time period, and by specialization of the group members.

## 233 ISLANDS, MONASTERIES AND WATER MANAGEMENT

**Theme: 5. Climate Change and Socioenvironmental Perspectives**

**Organisers: Hueglin, Sophie (University of Tuebingen) - Germanidou, Sophia (Newcastle University)**

**Format: Regular session**

In recent decades, excavations and other research have greatly enriched our knowledge about island monasteries – may they be situated in the sea, in lakes or rivers. For some regions overviews and syntheses have been presented (e.g., Meier 2009; Gutscher 2000) and we are starting to see monastic islands as a pan-European phenomenon at the beginning of the medieval period (Signori 2019, Bully/Jurković/Sapin 2013).

Continuing but also complementing this Europe- and Christianity-centered approach, the session intends to widen the geographic, chronological and religious frame. At the same time, the topic will be narrowed by adopting a 'fluid focus' or 'liquid lens': presenters are asked to look for everything related to water and the technologies to manage it as a material and spiritual resource.

In the past, islands have attracted monastic communities across cultures. Water creates their isolation and interconnectedness at the same time. The session would like to explore these contradicting properties as well as varying perspectives and different methodologies for investigating island economics, monastic sites and hydraulic technology. The topic could be tackled from angles such as:

- water management on islands and the role of monastic communities,
- the application of water technologies in island monasteries,
- monasteries on marine islands as opposed to islands in lakes and rivers,
- island monasteries as part of 'water heritage' (e.g., Willems/Schaik 2015).

## ABSTRACTS

### 1 ISLAND MONASTERIES IN A GLOBAL PERSPECTIVE

**Abstract author(s): Hueglin, Sophie (University of Tuebingen)**

**Abstract format: Oral**

When we think of island monasteries, we think of Mont Saint Michel in the North of France, the Skelligs in Ireland, and Lindisfarne in the North of England. We should not forget the sweet water sites on lakes and in rivers like the Reichenau in the South of Germany or St Peter's Island in Switzerland. Also, the Mediterranean has several famous monastic sites on islands e.g., the Île Saint-Honorat (Lérins) or Mount Athos. They are part of much larger medieval sea- and water-scapes that we would like to make visible again.

Looking at Europe, Ireland is the region with not only many islands but also a multitude of monastic sites on them; Kehnel (in Signori 2019) lists over a hundred. Other regions with a high density of island monasteries are the Balears, the Dalmatian Islands, and the Cyclades. Their roles, relations and rivalries should be compared on a landscape level, possibly contrasting them with inland monastic landscapes (Sánchez-Pardo/Marron/Crîngaci Țiplic 2020).

Beyond Europe and Christianity, there are landscapes full of insular monastic sites. In South Asia, the island of Sri Lanka is full of early Buddhist monastic sites. Across the sea, Bali forms another focus of holy sites and monastic lifestyle in the Indonesian archipelago. The mighty rivers of India – especially the Brahmaputra in the Northeast and the Kaveri in the South – have a long tradition of island satras – the Hindu equivalent of a monastery. Japan would be another chapter of a book on monastic islands, for which this session will be but a starting point.

## 2 RENDERED BY WATER: THE HYDRAULICS OF CRAFT, DEVOTION, AND DWELLING ON CONNEMARA'S ISLAND MONASTERIES

**Abstract author(s):** Lash, Ryan (University College Dublin) - Kuijt, Ian - Chesson, Meredith (University of Notre Dame)

**Abstract format:** Oral

Archaeologists have grown increasingly attentive to the role of other-than-human forces in shaping patterns of human experience. Environmental phenomena do not only influence subsistence and economic practices, they can also afford evocative, sensory experiences vital to devotional practices within a variety of religious contexts. Building upon more than a decade of fieldwork along the coast of Connemara in western Ireland, this paper explores the practical and theological dimensions of monastic engagements with marine environments animated by the force of water.

Since 2008, the Cultural Landscapes of the Irish Coast (CLIC) project has conducted excavation, pedestrian and drone-aided survey, and pXRF lithic source analysis on Inishark and surrounding islands in Connemara. Early medieval people expertly engaged and explicitly referenced hydraulic forces in their building strategies, subsistence technologies, craft-productions, and devotional practices. Evidence for water mills indicates understanding of the properties and management of water as well as corporate investment in large-scale grain processing. A variety of stone objects associated with devotional practice (including carved crosses, thousands of quartz beach pebbles, and other eccentric 'natural' stones) demonstrate the intentional procurement and transport of materials conspicuously rendered by hydraulic forces. Drawing from early medieval writings, we suggest that monks perceived the properties and agency of water as manifestations of divinely governed Creation. As such, engagements with the power of water – in the form of rain, wave-action, tide-cycles, water-mills, or water-worn stone – offered evocations of the divine that monks pursued according to their theological, ideological, and institutional interests.

## 3 CONENTU TIOKKAKARLENSIS - A FRANCISCAN CONVENT ON KÖKAR ISLAND (ÅLAND, FINLAND) IN THE MIDDLE AGES AND TODAY

**Abstract author(s):** Seppanen, Liisa (Turku University; Helsinki University)

**Abstract format:** Oral

In medieval Scandinavia, circa 200 monasteries and convents were established, some of them on islands. The easternmost island convent was founded by Franciscans between Stockholm and Turku on a small and remote island called Hamnö which was (and is) part of the Kökar Islands in Åland archipelago belonging to Finland (Eastland of Sweden from the Middle Ages until 1809). Although situated on Hämnö, the convent was named and is still known as the Franciscan convent of Kökar. It was the only convent in Åland and one of the six convents of Finland all located by the sea.

In the Middle Ages, the archipelago of Åland and Finland provided an important waterway with sheltered harbours and loading bays and waters rich in fish. Hamnö became an important harbour providing a chapel for seafarers and it is very likely that Franciscans and other mendicant orders were active in this region from the 14th century at the latest. The written sources about the Franciscan convent, Conuentu Tiokkakarlenensis, are few, but the site has been excavated since the 1860s and it has been a target of several studies until the 1990s.

In this paper, I am discussing the role of the convent on Hamnö island and in the Åland archipelago in the Middle Ages from the point of view of its strategic location and its livelihood based on shipping and fishing. Furthermore, I am addressing the questions about the medieval significance of the site and commemoration of the convent after the Reformation and the cultural values entwined with the site and how they are recognized as part of the medieval maritime heritage of the Finnish archipelago today.

## 4 RIVER ISLANDS, MONASTERIES AND INNOVATIONS - THE CASE OF POHANSKO

**Abstract author(s):** Dresler, Petr (Masaryk University)

**Abstract format:** Oral

The early medieval center in Pohansko is a complex locality studied for more than sixty years. The three-part complex with a total area of 60 ha is located in the middle of the valley of the river Dyje. The centre was fortified by a massive almost 2 km long rampart. The Dyje river was used for transport and fishing; at the same time it served as a part of the fortification system and it was probably regulated. The most important structure inside the fortified centre is the so-called noble court, which was excavated between 1959 and 1965 and published by B. Dostál. Analogies to this structure were sought in Carolingian Pfalz. Nevertheless, archaeological movable finds from the area inside the palisades do not indicate the intense presence of any elite. Other inventory inside the complex is represented by ceramics, animal bones and common items of daily use, or home-made and common crafts. However, there is an

alternative interpretive model. According to this model, we are dealing with a monastery, or a monastery yard. Other similar localities with the presence of church buildings and theoretically also monastic districts are connected to the Morava River, to the main communication axis. These localities are very often located on the so-called river islands or very close to the river. The presence of monastic structures and their know-how would thus explain the technological innovations that are beginning to appear at Pohansko and in the wider area of the so-called Great Moravia during the 9th century. These are, for example, bridges, wells, riverbeds, fortifications, etc. The idea of monastic communities in the context of Great Moravia is not yet widely accepted, but it can explain the rapid development of the area.

## 5 MONASTERIES IN TRANSYLVANIA WITH THEIR NEARBY RIVERS AND THE SURROUNDING LAKES

**Abstract author(s):** Cringaci Tiplic, Maria Emilia - Cioltei-Hopartean, Corina (Institute of Social Sciences and Humanities Sibiu, Romanian Academy) - Tiplic, Ioan-Marian ("Lucian Blaga" University of Sibiu)

**Abstract format:** Oral

In the Middle Ages, monastic establishments, be they rural-based abbeys or convents located within the urban milieu were seen by communities nearby or surrounding them as isles of faith, of religiosity and hope. However, their own functioning had much to do also with pragmatic, day to day activities, beyond the religious spectrum, namely creating ways to sustain themselves, therefore turning also into economic isles, dependent on resources and privileges or donations. One of the most important resources within the economy of religious orders, namely their estates, was water, water supply and thus water management.

The Transylvanian Plateau is a hilly region with a network of valleys and its peripheral areas are characterized by a series of depressions cut across by a dense hydrographic network; all these are almost surrounded by branches of the Carpathian Mountains. It is for this reason, that religious orders did not develop isle-based establishments per se, but rather ones placed near rivers, in swampy areas or in some cases surrounded by lakes. This presentation aims to discuss the case of the Cistercian abbey in rural southern Transylvania, where the monks placed their monastery in a swampy area and made use of the river Olt in order to develop a water management system, whereas the urban pattern established in the German town of Sibiu, also in southern Transylvania, depicts the case of both Dominican and Franciscan convents located at first outside the fortified town walls, close to the river, where the friars could have drained the surrounding swamps in order to make use of water supply by turning them into ponds and lakes. Their usage becomes even more interesting when compared to other locations within the same area, namely other towns, such as Braşov, Orăştie, Vinţu de Jos, Bistriţa etc.

## A. WALKING OVER WATER, ON AN ARID ISLET IN SOUTHERN GREECE

**Abstract author(s):** Germanidou, Sophia (Newcastle University)

**Abstract format:** Poster

Tiny in size and almost entirely fortified, the islet of Meropi, in Messinia, southern Greece, is of great archaeological interest. An important monument on the islet is Virgin Mary's Dormition monastery, formerly dedicated to Saint Nicholas. The monk cells survive in ruins and the main standing structure is a small church, which was restored in the 18th century. Building material from a possibly ancient sanctuary and sculpted fragments from a probably Byzantine chapel were found immured within its masonry.

Right in front of the western entrance to the church, abutting to the wall façade, there is a barrel-vaulted cistern. Cisterns built below, above, or next to churches are uncommon but do exist. The case of a water storage construction directly in the front of the main entrance of a church is not only unique but also a rather peculiar arrangement: the incomers would have to step over the roof of the cistern to enter the holy space.

The association of water and religious buildings, usually a cistern and a monastery church, is typically interpreted based on the 'cleansing' (practically and metaphysically) properties of water: as a 'purifying' agent of the faithful's spiritual impurities and 'ablution' of their sins.

---

## 237 PROTECTING THE PAST IS THE KEY TO THE FUTURE: RIGHTS OF ARCHAEOLOGICAL HERITAGE STAKEHOLDERS AND SOCIAL JUSTICE

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Kairiss, Andris (Riga Technical University) - Mödlinger, Marianne (University of Genoa) - Olevska, Irina (Maastricht University)

**Format:** Regular session

Intentional damage and destruction of archaeological sites, looting and illicit trade of antiquities is a crucial point of concern of different interested parties. The aftermath of these criminal activities affect local communities, visitors, scientists, businesses, public institutions, governments, amongst others, in addition to broader society (hereinafter – the stakeholders).

As well as scientific and other non-material losses suffered by these and other groups of cultural heritage stakeholders, there are interests of purely economic nature that are directly affected by archaeological damage. Thus, damaged sites may cause attendance slippage, loss of jobs, market loss for site-related goods (e.g., souvenirs) and services. As a consequence, a decreasing quality of life and touristic attractiveness of an area occurs alongside the need for substantial resources for restoration.

Due to a lack of experience, established practice and social awareness, different groups of stakeholders are afforded little to no attention in criminal proceedings and do not get structurally accounted for in subsequent restoration or development projects. Thus, for example, the principle that everyone has the right to the protection of the moral and material interests linked to the works that result from one's cultural activity (Fribourg Declaration of Cultural Rights, Art.5(b)) is becoming purely declarative.

We aim to discuss theoretical and practical issues concerning the application of this principle in the context of the protection and development of archaeological heritage sites, as well as to share ideas on different opportunities that respect the interests of all stakeholders to the highest extent possible.

Papers for this session may include but are not limited to:

- Impact of archaeological research on the economic and touristic development of an area;
- Heritage-based socio-economic development;
- Rights and obligations of heritage stakeholders;
- Offences against archaeological heritage sites and damage assessment;
- Role of NGOs and other organizations in the protection and development of archaeological sites.

## ABSTRACTS

### 1 OFFENCE AGAINST ARCHAEOLOGICAL HERITAGE – IS EACH OF US A VICTIM?

**Abstract author(s):** Kairiss, Andris (Riga Technical University) - Olevska, Irina (Maastricht University)

**Abstract format:** Oral

Heritage offences affect socio-economic interests of various stakeholders - their owners, local communities, researchers, visitors, businesses, media, heritage institutions, etc., as well as society as a whole.

Damaging of archaeological sites and illegal acquisition of antiquities therefrom is more frequent offence in Latvia. The Latvian State is usually recognized as the only victim in these crimes, but the question arises as to whether the interests of other stakeholders are not significant enough to be identified and accounted?

While different countries approach these issues differently, international community recognizes that offences against cultural heritage can impact victims (also legal persons) directly and indirectly. Moreover, the impact of such offence may transcend the socio-geographical space it occupies, leading to a global impact that is identifiable in criminal proceedings (ICC, Policy on Cultural Heritage). As everyone has the right to enjoy culture and to participate in cultural life, it can be assumed that offences against archaeological heritage are detrimental to everyone, as everyone is deprived of the potential to enjoy or explore relevant cultural objects. Thus, assessing the damage to the interests and appropriate form of compensation of the stakeholders ensures both social justice and promotes crime prevention (e.g., by emphasizing the social impact of illegal activities, making perpetrator compensate relevant losses, etc.).

The presentation, analyzing Latvian situation and making international comparisons, uses the integration of socio-economic and legal approaches to the impact of heritage offences, providing theoretical and practical insights into:

- identifying the stakeholders whose interests are mostly affected (also for criminal proceedings),
- determining the type and amount of damage caused,
- identifying opportunities to protect stakeholders' interests,
- identifying possible regulatory improvements,
- promoting awareness among stakeholders of the harm caused to and advocacy of their interests.

The presentation is based on a study conducted by the authors in 2021-2022.

### 2 STEALING HISTORY: ILLICIT TRADE OF ARCHEOLOGICAL ARTEFACTS IN LATVIA

**Abstract author(s):** Kalnins, Marcis (National Heritage Board of Latvia; Faculty of History and Philosophy of University of Latvia)

**Abstract format:** Oral

In last 4 years more than 7,200 illegally traded or stored archaeological artefacts have been seized in Latvia, with estimated value of more than 115,000 EUR. Although the value of artefacts has been determined, the actual damage to the cultural heritage is immeasurable as illicit trade of archeological artefacts entails destruction of archaeological context and a loss of archaeological provenance.

According to data from Commission for the Evaluation of Archaeological Objects (Artefacts) of National Heritage Board of Latvia majority of archeological artifacts that has been seized from 2018 till 2021 are Medieval and Early Modern period (13th-17th c.) coins. The second largest group is small sized Late Iron Age (9th-12th c.) and Medieval (13th-16th c.) bronze jewelry. The analysis of data reveals that only less than 2% of all seized artefacts are foreigner origin, therefore Latvia at the moment should be considered mainly as the country-of-origin not as transit, as previously assumed. Such a large share of local archaeological artefacts in the illegal market is closely related to the growing treasure hunter community in last two decades. Although Latvian law stipulates that artefact (dated until 17th century included) found in archaeological site shall belong to the State and finder must notify the National Heritage Board within five days, annually only a small number of reports about found archaeological artefacts is received. At the same time, the information in various websites and social media groups, dedicated to the treasure hunting, reveals that the number of archaeological artefacts found by treasure hunters is significantly higher. This imbalance is likely to be explained by the actions of different stakeholders involved, as well as unawareness of archaeological artefacts as non-renewable cultural resource and historical perception of the concept of private and State property.

### 3 **PROTECTING A BROKEN WINDOW: VANDALISM AND SECURITY AT RURAL ROCK ART SITES**

**Abstract author(s):** Berzina, Diana (Maastricht University)

**Abstract format:** Oral

The majority of the ancient rock art sites of the U.S. Southwest are located in rural locations that are difficult to monitor or police. These sites seem to exert a pull on humans, an attraction that not only provokes curiosity and wonder but also what can be classed as destructive responses or vandalism. Many practical guidelines to protect rock art or similar rural targets, stem from urban-based criminological models for understanding vandalism. However, many of crime control methods are not feasible in remote rock art sites, and in some situations, they are even detrimental. By focusing the discussion on rural rock art sites, this presentation hopes to show the complexity of security and policing of these sites and how counterintuitive patterns of crime in these areas might seem. The ability of rock art to draw people to rural locations and to seemingly inspire them to commit crimes is both fascinating and understudied. Yet a more thorough understanding of the relationships between rock art and the people who interact with it could have major implications for policing and protecting sites that exist beyond the limits of existing urban-focused models of crime.

### 4 **KNOWLEDGE GRAPH POTENTIAL IN MONITORING THE TRANSNATIONAL TRADE IN ARCHAEOLOGICAL OBJECTS.**

**Abstract author(s):** Giovanelli, Riccardo (Ca' Foscari University of Venice; Center for Cultural Heritage Technology - CCHT, Istituto Italiano di Tecnologia - IIT, Venezia) - Traviglia, Arianna (Center for Cultural Heritage Technology - CCHT, Istituto Italiano di Tecnologia - IIT, Venezia)

**Abstract format:** Oral

Graph theory has been introduced in the 18th century by Euler and can be described as the study of mathematical structures modelling the relationships between entities. Since then, the concept has largely evolved and it represents the foundation of modern network science. With a high number of applications in different fields of science, it has been largely adopted in Social Sciences only from 1970 but it is still underrepresented in the field of Humanities. Archaeology, notwithstanding the centrality of the relationship between entities in the study and the comprehension of the archaeological record, has started only very recently to adopt hard methodologies based on a network perspective (Brughmans, Collar, and Coward 2016) and this branch of study is still young but presents great potentiality, as well as challenges to be solved.

The illicit trafficking of archaeological objects, due to the "trade" own discrete structure (where an entity A sells an entity B to an entity C), can be properly described and modelled as a social network, as originally suggested by Tsirogiannis and Tsirogiannis (2016) that represented persons as entities.

This paper will develop further on these concepts and will go beyond them by modelling data collected from a recent transnational investigation that disclosed the trafficking history of 180 archaeological objects from 11 different countries as a knowledge graph (a network of real-world entities, including objects, events, situations and concepts). By experimenting with different existing and tailored algorithms on the knowledge graph database, the paper will discuss the potential of the network approach, as well as its underlying challenges and the possible bias in understanding, representing, monitoring and finally preventing the illicit trafficking of cultural properties.

## 5 FROM THE SPACE DOWN TO EARTH: METHODOLOGIES TO DETECT AND PREVENT ARCHAEOLOGICAL LOOTING

**Abstract author(s):** De Bernardin, Michela - Traviglia, Arianna (Center for Cultural Heritage Technology - CCHT, Istituto Italiano di Tecnologia - IIT, Venezia) - Giovanelli, Riccardo (Ca' Foscari University of Venice; Center for Cultural Heritage Technology - CCHT, Istituto Italiano di Tecnologia - IIT, Venezia)

**Abstract format:** Oral

The adoption of Earth Observation in monitoring looting activities has developed at a rapid pace, evolving from the simple observation of aerial imagery to the deployment of robust methodologies exploiting both satellite imageries (multispectral, SAR, and optical VHR data) and processing technologies.

This paper will present an overview of the evolution of space applications for detecting illicit activities on archaeological sites. It will then focus on the most advanced techniques under development at the Center of Cultural Heritage Technologies, in collaboration with SatCen (European Union Satellite Center) and the ESA Copernicus programme.

Despite a long-lasting history of looting, Italian archaeological sites have rarely been objects of up-to-date research in terms of the detection of criminal excavations. Among the case studies here considered, the paper will present preliminary results of satellite analysis designed to assess the impact of looting activities on the archaeological areas of two Italian sites of notable significance that have been selected according to:

- the archaeological richness of their subsoil;
- the presence of scientific archaeological excavations (past and ongoing);
- their different topography and vegetation values;
- their substantial difference from the commonly researched archaeological sites in the MENA region;
- the different looting behaviour observed in the past documentation;
- the different looting-pits patterns;
- the accessibility of satellite imagery.

By building on this first set of data, the paper intends to lay the foundations of an effective methodology for detecting looting activities, which can be further implemented and customised based on different topographic features of the affected areas.

Altogether, this paper aims to highlight the relevance and impact of such a methodology in monitoring and contrasting illicit activities in broad archaeological areas, especially in remote or inaccessible locations or in conflict zones.

## 6 MORAL PANIC AND MEDIA RESPONSIBILITY IN THE DISCOURSE OF ILLICIT ANTIQUITIES AND ARCHAEOLOGICAL LOOTING

**Abstract author(s):** Loges, Luise (University of Glasgow)

**Abstract format:** Oral

In discussions of the destruction of archaeological context and cultural heritage, one stakeholder that is sometimes overlooked is the media. Yet especially in cases of destruction caused by the looting and trafficking of archaeological objects during armed conflicts, this problem attracts significant media attention. The shock value of heritage destruction is often used as a means to connect international audiences to conflicts in remote parts of the world. In some situations, media reporting on the loss of what is perceived as "world heritage" can even inspire public outrage.

Using news framing analysis, my talk will show how the portrayal of the global antiquities trade has changed in German-language newspapers between 2011 and 2016, following shocking reports of conflict-related looting in Syria, especially by the terrorist group "Islamic State".

These reports have roused public concern and led to reactions by authorities, including Germany's 2016 Cultural Heritage Protection Law. On the other hand, the antiquities market has reacted defensively to this portrayal, taking advantage of some obvious flaws in reporting.

I will demonstrate that this escalation of public discourse is consistent with a moral panic as defined by sociologist Stanley Cohen in 1972. I will also discuss the antiquities market's backlash on this change in representation, and what it can tell us about the self-conception of these stakeholders.

I conclude with a discussion about the role and responsibility of news media in the protection of cultural heritage from antiquities trafficking and other threats worldwide.

## IN THE SHADOW OF FRANCISCAN MONASTERY. RESCUE EXCAVATION OF CHURCHYARD AT RADZIEJÓW IN KUIAVIA (POLAND)

**Abstract author(s):** Mosiejczyk, Jakub (Archeo-Adventure) - Angeli, Effimia (Department of History & Ethnology, Democritus University of Thrace) - Majorek, Magdalena (Institute of Archaeology, University of Lodz)

**Abstract format:** Oral

The Franciscan monastery at Radziejów (Kuiavia, Poland), the Church of the Discovery of the Holy Cross and the churchyard were subjected to archaeological prospection for the first time in 2021. The impulse of the archaeological research was the conservation works aiming to secure the northern wall of the church along with the drainage. The earthworks revealed the relics of the former cemetery, where archaeological rescue excavation was carried out. As a result of the research, 19 burials from the Middle Ages and the modern era were explored and subjected to anthropological research. An analysis of ceramics was also conducted, providing new data about the everyday life of monks using the monastery territory. The documentation of foundation parts of the church illustrates the architectural changes from the time of its erection as a votive offering after the Battle of Płowce (1331) to modern times. The research is a successful example of cooperation between church authorities and private entities providing conservation services and archaeological research.

## A. THE ARCHAEOLOGICAL RESEARCH ON THE CONSERVATION PROJECT OF A GOTHIC CHURCH AT BLANKI IN WARMIA (POLAND)

**Abstract author(s):** Mosiejczyk, Jakub (Archeo-Adventure) - Angeli, Effimia (Department of History & Ethnology, Democritus University of Thrace)

**Abstract format:** Poster

St Michael the Archangel Church at Blanki (Warmia, Poland) has been undergoing conservation work since 2000 to restore its Gothic form. The church is unknown in the bibliography despite its unique medieval paintings. Archaeological research inside the church was carried out for the first time in 2021 as a part of the flooring renovation project. The results shed new light on the building history of the sacral architecture in the region. A test trench was established in the southern wall to determine the cause of the cracks. In addition, the preserved brick floors were recorded during the supervision of the floor replacement. The stratigraphy illustrating the history of successive modernization of the facility has also been defined. The presentation of the analysis results will occur for the first time. The research contributes significantly to the determination of the original form of the church and the tower location - known from historical descriptions - as the construction techniques and mortars used. Furthermore, this study comprises a characteristic example of the archaeological contribution in conservation projects and the need for cooperation with church administrators and private entities for the protection of medieval religious architecture.

---

## 239 A LOOK BENEATH THE SURFACE: MICRO-ARCHAEOLOGICAL AND GEOARCHAEOLOGICAL APPROACHES TO THE STUDY OF OCCUPATION SURFACES

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** George, Nebu (Bangor University) - Santiago Marrero, Carlos (Universitat Pompeu Fabra) - Schumacher, Mara (Newcastle University) - Tomé, Laura (University of La Laguna)

**Format:** Regular session

Occupation areas, surfaces, and floors are archaeological features able to provide behavioural and cultural information on past activities, human practices, and technological choices. Similar information has been conventionally gathered from artefacts in such locations until recently. Regardless of time periods, their identification and characterisation are at the base for subsequent study and interpretation of the related archaeological context and spaces.

The variety of surfaces and floors types, and the complexity of traces embedded in their sediment constituents, require analytical approaches that can change the scale of observation beyond the visible record. Invisible traces of (and on) surfaces can significantly contribute to questions regarding past human activities, use of space, construction techniques and raw materials, as well as maintenance and cleaning practices that may be linked to broader socio-economic and cultural developments. Therefore, micro-archaeological and geoarchaeological approaches are necessary to understand the formation, use, degradation, and post-depositional alteration of surfaces and associated deposits. The understanding of the spatial distribution of artefacts in revealing similar information in such contexts can offer a much important complementarity when it comes to the interpretations of such floors and surfaces. Moreover, as surfaces and floors are the products of intentional choices and human behaviour, the results of these analyses can contribute to the debate on materiality and material culture in archaeological contexts.

We invite papers on the study of occupation surfaces using geoarchaeological and/or micro-archaeological methods, including but not limited to soil micromorphology, geochemistry, micro-botanical analysis and spatial distribution analyses. The aim is to bring together scholars working on occupation surfaces ranging from the Palaeolithic to Medieval period stimulating discussion on the study of surfaces combining interdisciplinary methodologies and how

inferences about their archaeological significance can be made. In this way, leading to a discourse of re-integration of multidisciplinary approaches to the study of occupation surfaces.

## ABSTRACTS

### 1 WHAT LIES UNDER THE SURFACE AND CAN WE EXCAVATE IT PROPERLY?

**Abstract author(s):** Mallol, Carolina (Universidad de La Laguna)

**Abstract format:** Oral

In archaeological contexts, human occupation surfaces are traditionally located through the excavation of objects, which leaves behind an often illusionary "floor" on which we grossly assume that human activity took place. A growing body of high-resolution geoarchaeological and archaeostratigraphic data obtained from the sedimentary deposits representing hypothetical floors has shown a much more complex reality with numerous scenarios, including short-term and long-term palimpsests and micro-palimpsests, and syn- and post-depositional transformations of different nature (chemical or physical) resulting from a range of anthropogenic, biogenic and geogenic processes. These data are contributing invaluable, detailed information, not only to help assess the degree of integrity of archaeological contexts but also to directly interpret different aspects of past human behavior. Meanwhile, in the field, excavation methods do not usually accommodate the complexity that we now know of. First, excavation of the "occupation floors" typically occurs prior to obtention of the associated geoarchaeological data. Second, it is not clear how to make viable connections between our high-resolution, microstratigraphic information and the excavation strategy. Here, I draw on examples from my own experience facing this problem to reflect upon possible solutions.

### 2 WHAT TIED THE ROOM TOGETHER: A MULTIDISCIPLINARY PERSPECTIVE ON THE FLOORS OF NEOLITHIC GÖBEKLI TEPE

**Abstract author(s):** Ögüt, Birgül (Deutsches Archäologisches Institut, Orient Abteilung) - Kinzel, Moritz (Deutsches Archäologisches Institut, Abteilung Istanbul) - Sobott, Robert (Friedrich-Alexander-Universität Erlangen-Nürnberg, Geozentrum Nordbayern, Erlangen) - Schönicke, Julia (Institut für Vorderasiatische Archäologie, Freie Universität Berlin) - Huber, Barbara (Max Planck Institute for the Science of Human History, Department of Archaeology, Jena) - Clare, Lee (Deutsches Archäologisches Institut, Abteilung Istanbul)

**Abstract format:** Oral

Pre-pottery Neolithic Göbekli Tepe in south-eastern Turkey is prominently known for its monumental round-oval buildings with monolithic T-pillars which provided the ground for speculations about ancient life in this site. The former interpretations of these buildings were based on the artefacts but not on the surrounding floors.

In this paper, however, we re-evaluated the function of spaces within the buildings where these objects were used or found by comprehensively studying floor surfaces, plasters, deposits and sediments. We applied a multidisciplinary framework of methods, including geochemical sediment and lipid analyses in combination with phytolith analyses to shed light on hidden traces of use and spatial arrangements. Mineralogical analyses of the Neolithic plaster floors provided information on how floors have been constructed. Based on the scientific analyses from different floor contexts, the paper also includes architectural and archaeological considerations to approach so far rarely discussed domestic structures and spaces.

The results of this multidisciplinary work, linked via the floors, show that only through the combination of microarchaeological investigations in relation to artefacts, the archaeological context and the architecture it is possible to gain a comprehensive and small-scale insight into the lives of the inhabitants. These demonstrate that Göbekli Tepe was not a rigid place, created, inhabited and abandoned according to particular prescriptions (some of which are tied to contemporary Western notions of a sacred place), but a dynamically changing, living place that contained multiple facets of habitats.

### 3 LIFE THROUGH THE GEOCHEMICAL LENS: A STUDY OF THE USE OF SPACE IN A MIDDLE-IRON AGE HOUSE IN NORTHWEST WALES

**Abstract author(s):** George, Nebu (Bangor University)

**Abstract format:** Oral

Excavations at the Late Bronze Age- Middle Iron Age bivallate enclosed site at Meillionydd, Rhiw, Northwest Wales revealed a stone roundhouse that was built into the outer bank and faced the adjacent entrance passage of the site. The floor of this roundhouse was analysed for fourteen chemical elements using a Total X-ray Fluorescence Spectrometer to identify the use of various areas within the house and thus, get ideas of the organisation of space within. The analysis revealed a central-peripheral and a front-back division of space within the house, suggesting certain areas were designated for specific functions. This study also identified partitions, potential limits of various areas, and gave a better idea of specific daily functions that happened. In this way, established the utility of geochemical anal-

yses of roundhouse floors at a site that lacked any significant number of artefacts. Furthermore, this study also helped in checking the compatibility of this roundhouse with the models for the use of space within roundhouses suggested previously in British prehistoric studies.

#### 4 **PORTABLE X-RAY FLUORESCENCE (PXRF) ANALYSIS ON THE EARLY MEDIEVAL MOUNTAIN HUT AT BUSA DELLE VETTE, BELLUNO, ITALIAN ALPS**

**Abstract author(s):** Armigliato, Alessandro - Carrer, Francesco (Newcastle University) - Cavulli, Fabio (University of Naples Federico II)

**Abstract format:** Oral

Recent studies have proved portable X-Ray fluorescence (pXRF) analysis to be a powerful tool to detect invisible anthropogenic traces in archaeological soils. Still not widely applied on sediments, this technique, combined with elemental heat visualisation, has the potential to increase our understanding of past human activities. This paper presents the first results of the intra-site pXRF analysis of a high-altitude archaeological context. The principal objective of this research is to investigate the potential elemental spatial variation across the excavated area and assess whether this variation supported hypotheses about the existence and spatial patterning of specific activity areas. Archaeological soil samples were collected from all the stratigraphic units during the 2018 archaeological excavation of the Early Medieval mountain hut at Busa delle Vette, Belluno, Italian Alps (1850 m asl). Selected samples were analysed following the established ex-situ analytical protocol recently developed (Williams et al. 2020). Data were then processed and, based on their occurrence and concentrations, visualized using elemental heat maps. Machine learning methods (like Principal Component Analysis) and spatial statistics were combined to explore the spatial organisation of the outcomes. The main elemental concentrations were assessed and interpreted according to the associated archaeological contexts. The findings successfully contributed to a better understanding of the activities carried out at the site, showing how the integration of geochemical analysis with spatial and statistical analysis is an appropriate analytical approach to explore and assist archaeological interpretations of space.

#### 5 **COMPARING SOIL GEOCHEMISTRY AND ANTHROPOGENIC PATTERNS OF BUILDINGS OF DIFFERENT FUNCTIONS AND SOCIAL ROLES ON THE ÅLAND ISLANDS, FINLAND**

**Abstract author(s):** Ilves, Kristin - Holmqvist, Elisabeth (University of Helsinki)

**Abstract format:** Oral

In our presentation, we report on results of a pilot study in which archaeological soils were sampled during small-scale field school excavations of two separate Northern European Late Iron Age (550–1050 CE) buildings on the Åland Islands, Finland. Systematic and targeted feature sampling strategies were applied to collect 190 samples, analysed via energy dispersive X-ray fluorescence spectrometry (ED-XRF). We aimed to i) contribute to and supplement the archaeological identification of floor/activity levels based on vertical and horizontal geochemical anomalies; ii) compare the anthropogenic activity signals between the buildings, and discuss the implications for the overall interpretation; and iii) test the feasibility of a rapid and cost-efficient ex-situ analytical strategy for geochemical characterization of archaeological soils. The results, which correlate with and expand upon the archaeological findings, reveal multiple floor and event layers and pinpoint activity-areas. The anthropogenic signals detected from the two houses were markedly different; one was associated with intense domestic use, while the other was probably used more sporadically, perhaps during ceremonial activities.

#### 6 **MODELLING MERCURY BEHAVIOUR IN POST-ROMAN INHUMATIONS AND OCCUPATIONAL SURFACES.**

**Abstract author(s):** Álvarez Fernández, Noemi - Martínez Cortizas, Antonio (CRETUS-EcoPast GI-1553, Facultade de Bioloxía, Universidade de Santiago de Compostela) - López Costas, Olalla (EcoPast GI-1553-CRETUS, Arqueoloxía, Facultade de Xeografía e Historia, Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University; Laboratorio de Antropología Física, Facultad de Medicina, Universidad de Granada)

**Abstract format:** Oral

It is well known that occupation soils are usually enriched in chemical elements (e.g., phosphorous), depending on the activities developed on them. Among occupational surfaces, necropolises and other sites with funerary function have been scarcely approached. However, funerary deposits can be enriched with specific elements with an important impact due to their potential toxicity, as mercury and lead. Human activities, such as mining and metallurgy, released metals to the environment which were incorporated into human bodies by different routes (inhalation, intake, etc.). After inhumation, when bodies decompose, the metals are released to the soil. Although the necropolis area may change in function over time, element accumulation may persist. To test this hypothesis, we sampled two post-Roman (AD 5th-6th centuries; n= 46) burials from A Lanzada site (NW Spain), together with a pedo-sedimentary sequence (n= 34) from the occupational area. All samples were analysed by XRF (23 elements) and using a mercury analyser. We aimed to understand if burial soils could be mercury enriched, if this enrichment was higher than in the

occupational soil, and how the accumulation happened inside and outside the burials. Samples located inside the burials were 10-fold enriched compared to the occupational soil. In both areas, mercury was found to concentrate in the fine fractions (silt+clay). PLS-Regression modelling allowed to identify three drivers controlling mercury distribution: i) inside/outside burials; ii) differences between the buried individuals; and iii) micro-scale variability – somewhat related to proximity to the individuals' thoracic area. According to our results, soil/sediments inside burials can be significantly enriched in mercury compared to nearby occupational soils at the same necropolis. This fact should be taken into account when former funerary areas underwent new later uses, especially if it was/is agrarian.

## 7 PXRf AND GEOSTATISTICS APPLIED TO OCCUPATION SURFACES TO EXPAND THE ARCHAEOLOGICAL RECORD AT SOUTHERN AFRICAN 'STONE WALLED SITES' (14TH-19TH CE)

**Abstract author(s):** Biagetti, Stefano (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra; School of Geography, Archaeology and Environmental Studies - GAES, University of the Witwatersrand) - Alcaina-Mateos, Jonas - Ruiz-Giralt, Abel (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra) - Lancelotti, Carla (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra; ICREA) - Groenewald, Patricia (Department of Archaeology, University of Cape Town) - Ibañez-Insa, Jordi (Geosciences Barcelona - GEO3BCN, CSIC) - Gur-Arieh, Shira (Ludwig-Maximilians-Universität München) - Morton, Fred (Department of History, University of Botswana) - Merlo, Stefania (McDonald Institute for Archaeological Research, University of Cambridge)

**Abstract format:** Oral

'Stone Walled Sites' (SWS) are one of the most recognizable feature in southern African Late Iron Age landscapes. Showing considerable variability in size and form, these settlements are named after the dry-stone wall structures that characterize them. SWS were occupied by various Bantu-speaking agro-pastoral communities between the 14th and 19th century CE. Nowadays, numerous SWS are attested in the whole of southern Africa between the Orange and the Zambezi rivers. In this paper, we present the results of the use of portable X-ray fluorescence analysis (pXRF) to perform multi-element, chemical analysis to anthropogenic sediments from occupation surfaces, coupled with multivariate, exploratory statistics and geostatistical modelling at Seoke, a southern African SWS of historical age (18th century CE). Our research demonstrates the potential of pXRF combined with geostatistics to understand the use of space beyond the visible archaeological evidence, shedding light on the possible functions of domestic and livestock areas. Although much prospecting remains, the results herein presented can be used to design surveys and excavations in other archaeological surfaces or sites.

## 8 ARCHAEOLOGICAL CONTEXT AND REMOTE SENSING IN THE SOUTH OF IBERIAN PENINSULA: CORRELATIONS AND FIRST RESULTS

**Abstract author(s):** Villalón-Torres, David (Instituto Andaluz del Patrimonio Histórico) - Montorio-Llovería, Raquel (Universidad de Zaragoza) - Cuenca-García, Carmen (NTNU University Museum) - García-Viñas, Esteban - Gómez-Morón, Auxiliadora (Instituto Andaluz del Patrimonio Histórico) - Martín-Valero, M<sup>a</sup> Jesús - Villar-Navarro, Mercedes (Universidad de Sevilla) - González-Campos, Yolanda - Bernáldez-Sánchez, Eloísa (Instituto Andaluz del Patrimonio Histórico)

**Abstract format:** Oral

In this paper we present preliminary results about the correlation between anthropogenic chemical elements and remote sensing from two archaeological sites of Iberian south: Tejada la Vieja (Escacena del Campo) and Turóbriga/arucci (Aroche).

During our research we took a series of field samples of both the archaeological and surrounding non-archaeological soil to analyze its composition by various methods of edaphological chemical analysis. On the other hand, we carry out measurements with a field spectroradiometer to compare the spectral signatures and look for correlations with hyperspectral satellite images of the area on the same date, from PRISMA satellite platform. The objective is to identify the presence of these elements of anthropogenic origin in archaeological contexts and create a catalog of spectral signatures based on the soil characteristics of the area in which the deposits are located.

The measurements performed using hyperspectral imaging were contrasted with indexes obtained at several different stages of natural vegetation cover development and applied in a supervised classification experiment. A machine learning algorithm was developed to classify pixels based on P presence variants. In this sense we present whether it is feasible to analyze the occupation surfaces and the use of space in archaeological contexts through the correlations between the biochemical constituents of the vegetation cover and the presence of anthropogenic elements on the surface.

Our aim is to explore the possibilities of remote sensing technics with hyperspectral images to identify chemical elements on the surface that can be related to an anthropogenic origin in archaeological contexts. One of the elements that we are especially interested in is phosphorus, but we are also exploring the possibilities of other elements whose presence may also be linked to human activity, such as potassium, rubidium, thorium, cesium or strontium.

## BUILDING IN THE DETAIL: MICRO-STRATIGRAPHIC APPROACHES TO UNDERSTANDING NEOLITHIC STRUCTURES AT THE NESS OF BRODGAR, ORKNEY

**Abstract author(s):** McKenzie, Jo (Archaeological Sciences, University of Bradford) - Card, Nick (Archaeology Institute, University of the Highlands and Islands; The Ness of Brodgar Trust)

**Abstract format:** Oral

Since 2004, excavations at the Ness of Brodgar, within the 'Heart of Neolithic Orkney' World Heritage Site, have revealed a large complex of monumental Neolithic structures spanning over a millennium of activity. These show evidence for complex biographies potentially reflecting both ritual and domestic activity. Excellent preservation of in-situ deposit sequences comprising floor surfaces and occupation deposits are complemented by rich artefact assemblages, unique artwork, and well-preserved environmental materials. An extensive programme of micromorphological sampling has complemented the excavation and environmental sampling strategy within individual structures, with the aim of addressing questions of building function and significance, settlement organisation, the use of interior space, and patterns of resource utilisation.

This paper discusses the results of an interim, targeted micromorphological analysis undertaken for the project's first publication phase. Thin section sequences from key areas and features within four of the core structures (Structures 1, 8, 12 and 14) illustrate the extensive and wide-ranging dataset obtainable through micromorphology at this richly preserved site: detail on fuel types and patterning in conjunction with hearth placements within the buildings, the textural makeup of internal 'floor' surfaces and their comparability between structures, the composition and anthropogenic content of (often very fine) deposits within areas of special interest or unusual construction.

Invaluable in its own right as a uniquely powerful method of high-resolution data collection, the presence of a strongly multi-disciplinary team at Ness has also enabled micromorphological data to contribute to integrated studies into wider questions of how the Ness complex was built, used and what it represented. This presentation concludes with an introduction to interdisciplinary avenues of investigation such as preservation and distribution of botanical materials and environmental resources at different scales, complementary foci for micromorphological and other geochemical techniques, and researching the significance of geological typologies to the people of the Ness.

## THE MICROMORPHOLOGY AND GEOCHEMISTRY OF EARTHEN HOUSE FLOORS AT OLYNTHOS, GREECE

**Abstract author(s):** Schumacher, Mara (Newcastle University)

**Abstract format:** Oral

This research focuses on the geoarchaeological investigation of floors from a domestic context at the classical site of Olynthos, Greece. Over 100 residential buildings and associated find assemblages were uncovered which is why Olynthos has become one of the most important sites for the investigation of household organization in classical Greece. The domestic buildings revealed different floor types ranging from simple beaten earth floors to elaborate mosaic floors that convey varying functional or representative purposes. While the elaborately made floors are usually easy to recognize, the identification of earthen floors has found to be problematic. This is primarily due to the burial under a shallow fill which has led to partial disturbance of floors by bioturbation. Another reason is the textural and compositional similarity to overlying fills of decomposed mudbricks walls.

Only by differentiating floors from other earthen deposits, reliable statements about their construction technique and the use and organization of space can be made. A geoarchaeological approach was used to identify house floors at Olynthos. The combination of soil micromorphology and multi-elemental geochemistry allowed a high-resolution characterization of floors and made it possible to distinguish them from other earthen anthropogenic deposits. The results show that earthen floors at Olynthos are primarily associated with general living and working areas while lime plaster floors were commonly encountered in bathing contexts.

The case study is the first to investigate floors from a domestic context in classical Greece using a geoarchaeological approach. The research demonstrates that geoarchaeological techniques can contribute to the identification of earthen floors that would have not been recognized through excavation alone. By locating different floor types within the house, insights into technological and behavioural practices in the domestic sphere can be gained that may carry wider economic and socio-cultural inferences.

## SITE FORMATION PROCESSES OF THE MIDDLE PALAEOLITHIC CAVE SITE OF ARARAT-1, ARMENIAN HIGHLANDS: A GEOARCHAEOLOGICAL APPROACH

**Abstract author(s):** Sherriff, Jenni (Department of Geography, King's College London) - Rogall, Dominik (The Institute of Archaeology, The Hebrew University of Jerusalem) - Lauer, Tobias (Max Planck Institute for Evolutionary Anthropology – Department of Human Evolution, Leipzig; Terrestrial Sedimentology Research Group, Eberhard Karls University of Tübingen) - Fewlass, Helen (The Francis Crick Institute, London) - Vettefe, Delphine (Histoire Naturelle de l'Homme Préhistorique - HNHP, UMR 7194, Muséum national d'Histoire naturelle - MNHN, Homme et Environnement, Equipe Nomade, CNRS, Institut de Paléontologie Humaine, Sorbonne Universités; Dipartimento degli Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche, Università degli Studi di Ferrara; Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones Económicas y Ecológicas durante la Prehistoria, Dpto. Ciencias Históricas, Universidad de Cantabria) - Glauberman, Phil (Institute of Archaeology and Ethnography, National Academy of Sciences of the Republic of Armenia; Department of Early Prehistory and Quaternary Ecology, University of Tübingen) - Knul, Monika (Department of Archaeology, Anthropology and Geography, University of Winchester) - Karambaglidis, Teo (The Institute of Archaeology, The Hebrew University of Jerusalem; Department of Geological and Mining Engineering, University of Castilla-La Mancha) - Gasparyan, Boris (Institute of Archaeology and Ethnography, National Academy of Sciences of the Republic of Armenia) - Malinsky-Buller, Ariel (The Institute of Archaeology, The Hebrew University of Jerusalem)

**Abstract format:** Oral

The Middle Palaeolithic (MP) archaeological assemblage recently recovered from Ararat-1 cave, north-eastern Armenian Highlands is central to improving our understanding of Middle to Upper Palaeolithic cultural shifts and environmental change in SW Asia during Marine Oxygen Isotope Stage 3. This is due to the fact an occupation horizon containing a rich stone tool assemblage was found in close association with a diverse faunal assemblage and excellent preservation of palaeobotanical remains. However, as with many cave sequences, Ararat-1 has been subject to syn- and post-depositional modification by both chemical and physical agents.

Here, we present the first results of combined sedimentological, micromorphological and chronological (IRSL and <sup>14</sup>C) study of the Ararat-1 sequence. Through this work, we have identified the cave deposits to be principally clastic in origin, derived from both exogenic (aeolian) and endogenic (entrance talus and cave wall/roof collapse) sources. We demonstrate that the primary phase of sedimentation in the cave took place between 52–32 ka with the main MP occupation horizon currently constrained to 42–35 ka. During, and following, this interval were several phases of syn- and post-depositional modification of the strata through physical (resuspension of aeolian material and bioturbation), chemical (carbonate precipitation and phosphate mineralisation) and anthropogenic processes. Through discussion of the micromorphological and sedimentological evidence for post-depositional modification of the Ararat-1 strata, we highlight what these processes can tell us about environmental conditions at the Ararat-1 locale during and after primary sedimentation, and evaluate the impacts of these processes on the stratigraphic integrity of the MP occupation horizon. Our work at Ararat-1 demonstrates some of the challenges and opportunities in the reconstruction of Palaeolithic occupation surfaces and site formation processes in cave environments.

## OCCUPATION SURFACES AND USE OF SPACE AT NEOLITHIC SVINJARIČKA ČUKA: A PILOT STUDY USING SOIL MICROMORPHOLOGY

**Abstract author(s):** Webster, Lyndelle - Horejs, Barbara (Austrian Archaeological Institute, Austrian Academy of Sciences) - Cereda, Susanna (University of Innsbruck)

**Abstract format:** Oral

Soil micromorphology was recently introduced at the site of Svinjarička Čuka in southern Serbia to facilitate understanding of its early to middle Neolithic occupation horizons at a micro-scale. The excavation forms part of the FWF-funded NEOTECH ("Neolithic technological trajectories in the Balkans") project carried out by the Austrian and Serbian Archaeological Institutes and seeks to understand the Neolithisation process during the 6th millennium BC along the Axios-Vardar-Morava river system – one of the main communication routes between the Aegean and the Danube.

Using soil micromorphology, we hope to shed light on the construction, function and use of the early built environments that characterise the Starčevo horizon and the beginnings of the Neolithic with sedentary life ways on the central Balkans. This paper will present the results of our initial pilot study focusing on surfaces that directly underlie accumulations of pottery, finds, and burnt daub identified as the remains of a 'Starčevo hut'.

### THE MICRO-STRATIGRAPHY OF CHALCOLITHIC TELLS FROM SOUTHEASTERN ROMANIA. CONSTRUCTION TECHNIQUES, RAW MATERIALS AND OCCUPATION SURFACES

**Abstract author(s):** Haita, Constantin (National Museum of Romania History)

**Abstract format:** Oral

The Chalcolithic tell type settlements from south-eastern Romania, specific to Kodjadermen - Gumelnița - Karanovo VI cultural complex, are characterized by a well-defined surface (marked often by delimitation structures), circular or elongated shape (up to 200 m diameter), succession of many layers of construction, destruction and rebuilding (up to 12 meters of anthropic deposits at Hârșova tell) and well-structured area of occupation (built spaces, passage areas, waste zones). These monumental settlements are located in the river valleys – on erosion remnants, alluvial bars or small islands, at the border of the valleys – on edges or prominences of Pleistocene terraces, Lower Holocene terraces, and on the banks of lakes.

The micromorphological analysis, consisting in thin section interpretation, at the microscopic scale, of sediments and soils in undisturbed state, performed on the same principles as the micro-stratigraphic study, allowed the interpretation of the identified sedimentary facies, in terms of mode of formation and anthropic activities.

Our examined situations reflect a variety of specific cases, correlating either with the geomorphological background of the site, the type of archaeological structure or the kind of occupation surface.

The micro-stratigraphy of tell sites from the Lower Danube, located in the Romanian Plain and Dobrogea, bring significant information about the human habitation in Prehistory.

### DOMESTIC LIFE AT THE MICRO-SCALE: A GEOARCHAEOLOGICAL MICROCONTEXTUAL APPROACH TO CERRO DE SAN VICENTE IRON AGE VILLAGE (SALAMANCA, SPAIN)

**Abstract author(s):** Tomé, Laura (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica “Antonio González”, Universidad de La Laguna; Departamento de Geografía e Historia, UDI Prehistoria, Arqueología e Historia Antigua, Facultad de Geografía e Historia, Universidad de La Laguna) - Iriarte, Eneko (Departamento de Historia, Geografía y Comunicación, Área de Paleontología, Facultad de Humanidades y Comunicación, Universidad de Burgos) - Jambrina-Enríquez, Margarita (Departamento de Biología Animal, Edafología y Geología, Facultad de Ciencias, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica “Antonio González”, Universidad de La Laguna) - Égüez, Natalia (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica “Antonio González”, Universidad de La Laguna; Departamento de Geografía e Historia, UDI Prehistoria, Arqueología e Historia Antigua, Facultad de Geografía e Historia, Universidad de La Laguna) - Herrera-Herrera, Antonio V. (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica “Antonio González”, Universidad de La Laguna) - Blanco-González, Antonio (Departamento de Prehistoria, Historia Antigua y Arqueología, Área de Prehistoria, Facultad de Geografía e Historia, Universidad de Salamanca) - Mallol, Carolina (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica “Antonio González”, Universidad de La Laguna; Departamento de Geografía e Historia, UDI Prehistoria, Arqueología e Historia Antigua, Facultad de Geografía e Historia, Universidad de La Laguna; Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour - ICArEHB, Universidade do Algarve, Campus de Gambelas)

**Abstract format:** Oral

Cerro de San Vicente is an Early Iron Age village (ca. 600 BCE) located in the Northern Plateau of Iberia (Salamanca, Spain). Previous excavations at the site have unearthed the remains of a complex village layout, which include an array of domestic earthen structures: dwellings and other ancillary architectural features of unknown functionality. The aim of this study is to characterize the floors of two of these domestic structures through the combined use of archaeological soil micromorphology, sedimentary lipid biomarker analysis and compound-specific stable isotope analysis of fatty acids as high-resolution geoarchaeological tools for the study of past occupation surfaces. Our preliminary microcontextual results have allowed us to distinguish between floor preparation and earthen floor deposits and to gain sight into each of them. The lipid biomarkers preserved within the floor deposits indicate recurrent input of plant oil of unknown origin. We have also gathered relevant information linked to fuel and residue management in the village. Further research will enhance our knowledge and understanding of domestic space construction and use at the site. This study contributes to the scarce high-resolution, microcontextual dataset of Iron Age contexts in Iberia, and shows the potential of the approach towards its future consolidation.

## SPACE ORGANISATION AND ZONE OF ACTIVITIES ON THE EARLY MEDIEVAL HOMESTEAD AT POHANSKO (CZECHIA)

**Abstract author(s):** Prištáková, Michaela (Department of Archaeology and Museology, Faculty of Arts, Masaryk University) - Adameková, Katarína - Peřík, Jan (Department of Geological Sciences, Faculty of Sciences, Masaryk University) - Prokeš, Lubomír (Department of Physics, Chemistry and Vocational Education, Faculty of Education, Masaryk University)

**Abstract format:** Oral

The Early Medieval stronghold Pohansko is archaeologically excavated for more than 60. years, with excavations still ongoing. The central area of the stronghold consists of several homesteads, roads, burial grounds, church and more. So far, a total of seven rectangular or slightly longitudinal homesteads have been excavated and another 12 were recognised by geophysical prospection. The inner structure of the homesteads consists of several archaeological features located mostly along the edge of the homestead, with open space in the middle of the homestead. The homesteads themselves and their internal organisation have not yet been explored in detail.

By geoarchaeological prospection techniques we attempted to identify archaeological structures and thus define the internal spatial organisation of the selected unexcavated homestead and to identify the zones of activities and interpret it in the terms of function. By combining magnetometry, magnetic susceptibility, spatial distribution of the microartefacts and multivariate statistical analysis, we outlined various manifestations of anthropogenic activity. We defined open space in with no detected activity in the middle of the homestead, the potential presence of non-sunken features, waste management at the homestead and non-ferrous metal production and possibly metalworking at or/and close to the homestead.

16

## INVESTIGATING OCCUPATIONAL SURFACES AND ARCHAEOLOGICAL RECORD FORMATION USING GROUND-PENETRATING RADAR AT A MEDIEVAL ANGKORIAN SITE, KOH KER, IN NORTHERN CAMBODIA

**Abstract author(s):** Afforre, Tiago (Flinders University) - Klassen, Sarah (Leiden University)

**Abstract format:** Oral

Cambodia is home to the vast archaeological record of the Khmer Empire, whose capital stood for over 600 years at Angkor. Despite Angkor's dominance, Koh Ker became the center of the empire for a brief period, beginning in 928 AD, during the reign of Jayavarman IV. Besides being the fleeting Capital of the Empire, not much is known about the city, especially its long-term occupation history. This paper reports the ongoing investigations of the Koh Ker Archaeological Project, including the results from several ground-penetrating radar surveys around the main temple complex. In this paper, we highlight some of the challenges posed by a complex palimpsest, in which massive displacements of dirt, moved to manage the water flow of the region, may have covered a whole occupational surface. The ground penetrating radar results led us to revisit some of the features in the site that can be seen at the surface, as registered by a previous lidar survey, triggering new hypotheses for some of the monuments found in the area.

## DECIPHERING NEANDERTHAL BEHAVIOURS: AN ARCHAEOSTRATIGRAPHIC AND SPATIAL INTERDISCIPLINARY APPROACH TO A HEARTH-RELATED ASSEMBLAGE FROM ABRIC DEL PASTOR (EASTERN IBERIA)

**Abstract author(s):** Sossa-Ríos, Santiago (Àrea de Prehistòria; Departament de Prehistòria, Arqueologia i Història Antiga; Facultat de Geografia i Història, Universitat de València) - Mayor, Alejandro (Àrea de Prehistòria; Departament de Prehistòria, Arqueologia, Història Antiga, Filologia Llatina i Filologia Grega; Facultat de Filosofia i Lletres, Universitat d'Alacant) - Bencomo, Mariel - Pérez, Leopoldo (Àrea de Prehistòria; Departament de Prehistòria, Arqueologia i Història Antiga; Facultat de Geografia i Història, Universitat de València) - Galván, Bertila (Àrea de Prehistòria; Departamento de Geografía e Historia; Facultad de Humanidades, Universidad de La Laguna) - Mallol, Carolina - Hernández, Cristo (Àrea de Prehistòria; Departamento de Geografía e Historia; Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers Laboratory; Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Vaquero, Manuel (Àrea de Prehistòria; Departament d'Història i Història de l'Art; Facultat de Lletres, Universitat Rovira i Virgili; Institut Català de Paleoecologia Humana i Evolució Social - IPHES)

**Abstract format:** Oral

Obtaining detailed pictures of Neanderthal occupation dynamics and spatial behaviors is highly dependent on the analytical timescale. In recent years, there has been a shift in Palaeolithic Archaeology from a traditional use of the stratigraphic unit analytical framework to the interdisciplinary application of different techniques to tackle the palimpsest effect and narrow down the timescale (e.g. integrated archaeostratigraphy, spatial analysis, soil micromorphology, lithic and bone refitting). However, cases in which the resulting time resolution enables us to approach Neanderthal behavior at an ethnographic timescale are still scarce. Here, we present archaeostratigraphic data that allowed us to identify a hearth-related assemblage within Abric del Pastor lithostratigraphic unit IVf (Alcoi, Alacant, eastern Iberia). This data was coupled with spatial, petroarchaeological, technological, use-wear and ar-

chaeozoological data to characterize the Neanderthal occupation surface and associated activities. Our results display a low-density accumulation of remains from flintknapping, tool-use and animal processing around a hearth. This work conveys the high potential of interdisciplinary approaches to zoom in time, thus contributing high-resolution analytical frameworks and shedding light on past hunter-gatherer behaviors.

## 241 ARCHAEOLOGY AS STUDY OF THE FUTURE

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Meier, Thomas (Kaete Hamburger Center for Apocalyptic and Post-Apocalyptic Studies, Heidelberg University; Institute for Pre- and Protohistory, Heidelberg University) - Holtorf, Cornelius (Heritage Futures | Archaeology, School of Cultural Sciences, Linnaeus University Kalmar) - Högberg, Anders (School of Cultural Sciences | Archaeology, Faculty of Arts and Humanities, Linnaeus University Kalmar)

**Format:** Session with keynote presentation and discussion

Whereas archaeology's subject matter is the past, postmodern and critical approaches have claimed that all archaeology reflects on the present. However, little attention has been paid to archaeology's potential to explore the future.

Futurology has unlaced the opaque package of "the future" to some degree. Most expectations of the future are based on the assumption that the current system simply continues to run and can be optimized. This assumption satisfies our longing for certainty and forms the basis for technological visions such as geoengineering, but also for cultural heritage. To a certain extent, such developments can be analysed with probabilistic approaches that extend patterns of the past into the future. However, indications that systems could become unstable, chaotic and thus unpredictable in the medium and long term cannot be ignored. For that reason, resilience is required to cope with ruptures and non-linear developments. In the long term, the future may look so completely different from today that we cannot even imagine it. This future is not accessible scientifically and therefore considered the domain of art. But is it?

Archaeologists, who survey the entire human past, see stranger things than almost any other discipline. We are experts in difference as much as in similarity, and it is in our hands to narrate "history": to imagine past lifeworlds from the perspective of today, whether surprisingly different or disappointingly similar. Is archaeology therefore not best placed to think around the unthinkable? To imagine unimagined futures? And to analyse and evaluate the risks, side effects and potentials of such unimaginable futures as our potential futures?

We invite contributions on how archaeology can or already contributes to analytical knowledge or reflexive design of any of these three futures: the optimized, the unpredictable, or the unimagined future.

## ABSTRACTS

### 1 ARCHAEOLOGY IS ABOUT THE FUTURE!

**Abstract author(s):** Meier, Thomas (University of Heidelberg, Kaete Hamburger Center for Apocalyptic and Post-Apocalyptic Studies)

**Abstract format:** Oral

In recent debates the (western) linearity of time is questioned and time starts to collapse in the present: History is made of narratives in and of the present, and the future is fabricated in the present through desires and practices. Epistemologically the pro-gnosis of the future and the post-gnosis of the past converge. Utopian or dystopian futures are conceptualised along imaginations of arcadian or hellish pasts. The apocalyptic tone of post-modernity claims that a post-apocalyptic future will be radically different – while art, popular culture and scientific scenarios draft visions of remarkable continuity and similarity to the present.

When pasts and futures meet in the present and emerge along lines of power, hopes and fears, archaeology must not cling to the illusion of speaking solely about times more or less gone by, but must envisage the contributions it has to make to futurities worth living. Such contributions may differ according to the futures under discussion: The near future is characterised by a high degree of continuity, and we may assume that the opportunities and threats of our uses of the past can be prolonged and evaluated in their future results. The mid future we try to get hold on mainly by probabilistic approaches, which are often based on rather short time series and whose fuzziness and systematic bias is often overlooked. Finally the far future is considered "radically different" and therefore beyond any possible imagination. But is it? The humanities' subject is the human imagination, and archaeology – among other disciplines – is concerned with realisations of such imaginings. Is there a discipline that has seen stranger things than archaeology? Are there things more radically different than the past? Isn't the far future the realm of archaeology where it can best apply its capacities?

## 2 ARCHAEOLOGY IS ALL ABOUT THE FUTURE

**Abstract author(s): Criado-Boado, Felipe (INCIPIT-CSIC)**

**Abstract format: Oral**

Perhaps this is a bit naïve. But there are some of us that share the intimate conviction that Archaeology is magic and we archaeologists are magicians. Archaeology has got a superpower, we are the only ones able to explain how the future (in the long term) comes into existence. We know, for instance, what will happen if a social-oriented solution is not found for climate change (technology alone is not the solution, it is a false solution). Others can guess. But only we can speak about the future from an empirically informed and theoretically bounded perspective. I will emphasize in this contribution that Archaeology should be aware of our capacities to reconstruct and predict the future pasts or, indeed, the past futures. This special expertise could and should be mobilized by archaeologists to play a stronger role in present day social and political arenas, something that Archaeology lacks in spite of the strong capabilities we hold, between all the other Human and Social Sciences, to speak directly to society about our current (and future!) problems. Moreover, this ability to put mind in the future, also gives us a special sort of retroactive prospective sight that, however, we usually do not use. It seems like a word game, but archaeological intelligence gives us the capacity to inform and take tomorrow decisions looking at what will happen the day after tomorrow.

## 3 ARCHAEOLOGIES OF UNIMAGINED FUTURES

**Abstract author(s): Wollentz, Gustav (The Nordic Centre of Heritage Learning and Creativity)**

**Abstract format: Oral**

This paper will explore two ways that archaeology can expand the horizon of possible, plausible, probable, and desirable futures, including futures previously unimagined. The paper will also elaborate on why archaeology would benefit by increasing Futures Literacy, that is, increasing its capabilities to understand how futures affect the present and how to act consciously today to shape a future different than the present. Most of the paper will present insights from ongoing projects where the results are still being gathered and analyzed, and it will therefore be explorative in character. The paper will investigate two different - but interrelated - ways of engaging with the future: 1). Strategic foresight as an exercise to be better prepared at facing unexpected futures for archaeology, and 2). Tools and methods to expand the horizon of futures already present today, influencing the potential for archaeology to make change. Regarding Strategic foresight, I will build upon my own experiences from carrying out Strategic foresight for ICCROM and discuss both promising possibilities and possible pitfalls in applying foresight in archaeology. Regarding expanding the horizon of futures present today, I will draw upon my fieldwork in Former Yugoslavia as well as in Sweden. Here, I will discuss how archaeologists can become better adapt at co-creating futures together with communities, and the possible implications of such work.

## 4 ARCHAEOLOGY AND CULTURE HERITAGE AS FUTURE-MAKING PRACTICES IN THE CONTEXT OF CLIMATE CHANGE (1)

**Abstract author(s): Högberg, Anders (Linnaeus University; Palaeo-Research Institute, University of Johannesburg) - Holtorf, Cornelius (Linnaeus University)**

**Abstract format: Oral**

Archaeology produces cultural heritage which evokes deep-seated collective identities, emotions and values affecting the very fabric of modern societies. How such values play out varies and may in practice result in both desirable and undesirable outcomes. For example, in the context of climate change, archaeology's work with cultural heritage may have two different consequences:

- perceived changes and threats to cultural heritage can trigger people to support actions to mitigate climate change, or
- the impact of climate change can affect perceptions and uses of cultural heritage which may encourage prejudice and discrimination and fuel conflicts between groups over power and the right to citizenship or territory – threatening human rights as well as socio-cultural cohesion and resilience.

The most important question is to what extent the historical legacy which we construct and leave behind as cultural heritage will come to benefit future generations. This is the realm of 'heritage futures', which we introduce in this paper. Heritage futures is concerned with the roles of heritage in managing the relations between present and future societies.

## 5 ARCHAEOLOGY AND CULTURE HERITAGE AS FUTURE-MAKING PRACTICES IN THE CONTEXT OF CLIMATE CHANGE (2)

**Abstract author(s):** Holtorf, Cornelius - Högberg, Anders (Linnaeus University)

**Abstract format:** Oral

This paper applies the concept of heritage futures practically. In the context of climate change, asking how cultural heritage will come to benefit future generations means we need to become aware of our anticipatory assumptions about the future while also developing alternative scenarios of the future. We will present some ideas of how cultural heritage may contribute to a resilient society, social sustainability, and social cohesion.

Normally, the cultural heritage sector assumes that the cultural heritage we presently value will be valued in the future too, and therefore it must be preserved from threats such as rising sea levels. Alternative ways of imagining futures and future values of cultural heritage will suggest different heritage policies and priorities. What happens in relation to cultural heritage and the stories archaeologists tell people about their pasts (a) when we anticipate a world that thrives not on concepts rooted in Romantic Nationalism but on global solidarity between people, worldwide collaboration, and trust both within and between societies? (b) when their social and cultural resilience is built no longer on curating timeless continuities but on learning to adapt and transform to new conditions? In this paper, we will push the envelope a little and give a glimpse of various options for archaeology and cultural heritage management concerning the wellbeing of future societies that deserve to be explored in more detail today.

## 6 ARCHAEOLOGY AND ARTIFICIAL INTELLIGENCE. RELATIONS AND DEPENDENCES

**Abstract author(s):** Dzbynski, Aleksander (University of Warsaw; Zurich University)

**Abstract format:** Oral

One of the unimagined and unpredictable developments in the modern world is the issue of the thinking tools or thinking machines i.e. the issue of Artificial Intelligence. Some would even say that this is the central problem of our civilization. It needs to be stressed that thinking tools, machines and cyborgs are deeply interwoven with archaeology. Firstly, when looking at prehistory we find numerous examples of them in the European Bronze Age mythology exposed by Homer. Secondly, when looking at archaeological theory we find in the core of the middle range theory of Lewis Binford an approach according to which the irrational human factor could be replaced by an universal algorithm in the future. It was the processual approach too that elevated archaeologists quite specifically up to a certain stage from which they could look both at the past and at the future in one universal perspective. It seems therefore that archaeology is well equipped to discuss the future although per definitionem it's about the past. There is one thing, however, that sets limits for archaeology to predict the future. It is the issue of Artificial Intelligence itself. If Artificial Intelligence indistinguishable from human thought is possible it could not only replace archaeologists but it will overturn the course of human history. In the presentation I would like to address questions about possibilities of replacement the archaeologists by Artificial Intelligence and what does it mean for the archaeology at all?

## 7 ARCHAEOLOGISTS AS TIME TRAVELERS – CREATING UNIMAGINED FUTURES IN THE AGE OF THE ANTHROPOCENE

**Abstract author(s):** Schönicke, Julia (Institut für Vorderasiatische Archäologie, Freie Universität Berlin)

**Abstract format:** Oral

"I am a time traveler – I point and laugh at archaeologists!" said Doctor Who when meeting a group of space archaeologists on an extraterrestrial planet. For us it is not that easy (yet). Every archaeologist has surely asked themselves at some point how future researchers will excavate and perceive modern remains.

Since the Neolithization, humans have relentlessly reshaped earth to suit their needs, a process that culminated in the industrialization in the 19th century and the test detonation of the first nuclear weapon in 1945. Human impact on the planet became so severe that the (not undisputed) term "Anthropocene" has been introduced.

Future archaeologists will have to deal with relics of unknown dimensions. Repositories to store transuranic radioactive waste must be equipped with warning systems for future generations. The example of the Waste Isolation Pilot Plant (WIPP) in New Mexico demonstrates how a working group of anthropologists, archaeologists, linguists, futurologists, science fiction writers and material scientists is developing a warning system, both architecturally and symbolically, that must last for at least 10.000 years. Just recently, archaeology has left the terrestrial sphere with the International Space Station Archaeological Project (ISSAP), that studies the crew of the ISS as a "microsociety in a miniworld" which aims to have a positive impact on future space missions. Decisions about which ruins to preserve or to demolish shape the image that future people will have of today's societies. Increasing tourism will multiply the amount of (micro-) plastic waste and excavation infrastructure has irreversible effects on ancient stratigraphy adding an anthropocenic horizon to the biography of a site.

The talk aims to unveil the potential of archaeological methods for the exploration of futures but also critically reflects our present impact on sites and how they are being transformed by our actions.

## 8 FUTURE SEASCAPES: SOME REFLECTIONS ON MARITIME HERITAGE

**Abstract author(s):** Albero Santacreu, Daniel - Domínguez García, Ariana (University of the Balearic Islands)

**Abstract format:** Oral

Maritime heritage is often related to a romantic and idealized past loaded with a strong sense of nostalgia. As it can be seen in many maritime museums, there is usually a significant disconnection between the reinvented past that is represented in these heritage spaces and the problems that characterize 21st century society.

In this presentation, we seek to promote some reflection in order to overcome this biased and disconnected viewpoint regarding our relationship with maritime spaces. To this aim, we will focus on certain phenomena widely recorded in many regions of the Western Mediterranean and we will explore the benefits of their potential patrimonialization. In addition, we will reflect on how autoarchaeoethnography and the concept of "New Maritimity" can be two key tools from which to conduct the analysis of some significant phenomena present in our current and (presumably) future seascapes: mass tourism, development of privatopias, coastal gentrification, loss of identity and destruction of the maritime-coastal landscape.

Imagining the maritime heritage of the future can allow us to reveal some problems that have great social significance -such as those related to the phenomena mentioned before- and to reflect on them. These phenomena are inherent to our present, but also go beyond it and mark the path that will lead us to our future. In our opinion, reflecting on these "maritime present futures" is crucial, as it can help us to generate alternative unexplored ways. Furthermore, addressing the maritime heritage of the future can help us to solve most of the problems of maritime museums in the present, such as the disconnection between the museographic discourses and people's actual problems and experiences.

## 9 ARCHAEOLOGY AS AN IMPETUS FOR ARCHITECTURAL DESIGN

**Abstract author(s):** Lengyel, Dominik - Toulouse, Catherine (BTU Brandenburg University of Technology Cottbus-Senftenberg)

**Abstract format:** Oral

Archaeology is the basis for the future, but not only in archaeology, but in a very special way for a discipline that usually operates exclusively in the future: architecture, and in particular architectural design. We explicitly do not mean building history or historical building research, but expressly architectural design directed towards the future. For even if one regards design as a purely creative process, it is nonetheless based on experience. Design creates expectations, but it also needs assumptions about the needs of the future that go beyond optimising the here and now. In this respect, even this design of the future cannot offer certainty, just as archaeology cannot offer certainty about the past. It is precisely at this point that the two disciplines come together. And just as architectural design is able to translate uncertain knowledge in archaeology into visual design scientifically adequately, i.e. with as little speculation as possible, designers see strange things in it, specifically potential for future design. The tension between difference and similarity can be directly transposed to architectural compositions. Thus archaeology is the basis for a reflexive design in architecture, made visible by our method of Visualisation of Uncertainty.

The presentation aims to demonstrate and illustrate this method by several projects developed by the authors in cooperation with archaeological research institutions:

- Cologne Cathedral and its Predecessors (by order of and exhibited in Cologne Cathedral),
- Bern Minster – its first century (by order of and published by Bern Minster Foundation)
- The Metropolis of Pergamon (within the German Research Fund Excellence Cluster TOPOI),
- The Palatine Palaces in Rome (by order of the German Archaeological Institute, both latter exhibited in the Pergamon Museum Berlin),
- The Ideal Church of Julius Echter (by order of the Martin von Wagner Museum in the Würzburg Residence).

## 10 DOES THIS FIND TRANSFORM THE FUTURE? TAKING CARE FOR WHAT WE ENCOUNTER AT THE EDGE OF THE TROWEL

**Abstract author(s):** Waldhart, Elisabeth (Department of Archaeologies, University of Innsbruck)

**Abstract format:** Oral

The encounter of the previously unknown can be seen as an everyday practice at excavation sites, and a key-experience in archaeology. When working on site this encounter often sparks interest, resulting in engagement with the past. This sparks speculative thinking about potential pasts and futures. What can we learn from these affections about thinking of and dealing with unpredictable futures?

The "afterlife" of the discovery of a 17th century burial in a rural area is taken as a case study to examine encounters between archaeological finds, archaeologists, past humans, and a local community. The unusual place and selection of grave goods raised questions on their interpretation. But the unexpected discovery and its materiality also led to further decisions: How to care well for fragile findings, human remains and the biography of this person?

And who is caring about these lively things? With ongoing investigations, the site becomes a place of concern. It demands practices of care – documentation, conservation, narrating – that are important to remain responsible for the becoming of the burial. Various interests of the local community led to the narrative and presentation about this person getting out of control.

Taking seriously the encounters with unpredictable actors in the field (being troubled by them and troubling them) and the affections involved in caring about them and their futures, might be a way to explore how archaeology can contribute to discourses of unstable futures. As a material action, care might offer a specific approach to possible futures and their challenges. By slow and often repetitive tasks, archaeological work is providing different visions of futures where the maintenance of human-thing relationships is central. Taking the notion of care as an ethically and politically charged act, it can be explored as a future-making practice in archaeology.

## COMING BACK TO LIFE: REUSE OF MEDIEVAL BUILDINGS

**Theme:** 2. [Re]integration

**Organisers:** Berryman, Duncan (Centre for Community Archaeology, Queen's University Belfast) - Bouwmeester, Jeroen (Cultural Heritage Agency, Netherlands) - Patrick-Dawson, Laura (School of Natural and Built Environment, Queen's University Belfast) - Huggon, Martin (Bishop Grosseteste University) - Kerr, Sarah (School of Culture and Society, Aarhus University)

**Format:** Regular session

Legal protection and conservation have allowed many medieval buildings to survive to the present day, but many more have survived by accident through their continued use within urban and rural settings. Even in the Middle Ages we know of buildings being repurposed, moved, or recycled. The lifespan of a building was greatly increased when it was repurposed. Rural halls may have decayed and been converted to barns or animal houses, while sturdy timbers were recycled into new constructions or extensions to existing buildings. Today, large stone barns are often converted into holiday accommodation. Clearly the reuse and reintegration of old buildings is important in today's world, with new build making a massive contribution to climate change. Thus the study of medieval recycling and the modern reuse of buildings has a lot to contribute to our efforts to reduce greenhouse gas emissions and pollution.

This session seeks to explore the reuse of medieval buildings across Europe through two main strands - reuse in the medieval period and reuse in the modern period. Some of the topics we would like to cover include:

- medieval adaptation of buildings
- medieval recycling of building materials
- modern conversions of medieval buildings
- modern applications of medieval building techniques
- issues around the conservation of medieval buildings.

## ABSTRACTS

### 1 PROFANE INTERLUDES – EARLY AND LATE MODERN REUSE OF MEDIEVAL CHURCHES IN WESTERN SWEDEN

**Abstract author(s):** Gullbrandsson, Robin (Västergötland's Museum, Skara; Department of Conservation, University of Gothenburg)

**Abstract format:** Oral

The extent of medieval stone buildings in Western Sweden is apart from the churches very limited, since wood was historically the preferred building material. In general all preserved medieval stone churches in Sweden are still in use for their original purpose and have a strong protection by law. But some of these were under a part of their post Reformation existence used for other purposes, ranging from schools and hospitals to grain storage and museums. True, the church buildings had as the common property of the parish historically been used simultaneously for profane purposes such as storage in towers and attics. The reorganisation of the parish structure, first after the Reformation in the 16th century, but mainly in the 19th century, resulted in many medieval churches in Western Sweden becoming either superfluous or regarded as too small, too unmodern and "papist", too uncomfortable, leading to their demolition in favour of new churches. But some medieval churches were spared, since they got a new use by nobility, parishioners or associations. The reuses, its reasons, effects, actors and motives were diverse, in many cases leaving the historical substance more untouched than in those medieval churches that stayed in use as sacral buildings. In the 20th century most of them got reinstated as places of worship after careful restorations, reflecting the growing interest in conservation and the establishment of the medieval parish churches as central elements in the building of a Swedish national heritage. This paper will reflect over these "interludes" with examples from Western Sweden.

## 2 AWAY FROM GOD, BACK TO LIFE: A NEW CHANCE FOR MEDIEVAL CHURCHES

**Abstract author(s):** Cechura, Marín (Museum of West Bohemia, Pilsen)

**Abstract format:** Oral

Churches belonged to the most important parts of social life and cultural landscape during the Middle Ages and the modern era. Some churches have been demolished, others have survived in the form of more or less preserved ruins. Many churches have been rebuilt and transformed for various profane purposes. The transformations took place in the Middle Ages, in the modern period and during the 20th century as well. Almost 700 churches have disappeared in Bohemia, which represents about 20% of the original number.

Surprisingly, only a few churches disappeared during the Middle Ages, e.g. during war events (Hussite Wars, Thirty Years' War). A great intensity of transformation of churches occurred at the end of the 18th century, in connection with the state and church reforms of Emperor Joseph II. Redundant churches were sold at auctions for building materials or for irreversible rebuilding. Another period of transformation of churches occurred after 1948, when the predominant reasons were mainly political and ideological.

The presentation describes the most important circumstances in which churches were destroyed and transformed, and uses examples from the Czech Republic to present typical examples of the new functions of medieval buildings - dwellings, factories, hunting lodges, warehouses, etc. The current state of conservation and protection of these buildings is also presented.

## 3 MEDIEVAL IRISH ROUND TOWERS: EXPLORING LIFESPAN, MAINTENANCE AND ADAPTATION THROUGH RADIOCARBON DATING OF LIME MORTARS

**Abstract author(s):** Barrett, Gerard - Allen, Kerry - Reimer, Paula (Queen's University Belfast)

**Abstract format:** Oral

Round towers are iconic monastic structures from the medieval period in Ireland. Freestanding, cylindrical, and often standing in excess of 20m in height, their purpose, period of construction, and duration of use are poorly understood. Recent efforts to radiocarbon date the lime mortar from several towers suggest they were built from the 9th to the 13th centuries AD, extending the range previously considered likely based on annalistic records alone. In parallel with this long period of fabrication, dating evidence also supports the idea that individual towers were used and maintained across several centuries. This is manifested in reworking, for example repointing or plastering, that shows up through variation in radiocarbon dates from mortar originating in different parts of a tower. It is also evidenced in modernizing efforts, for example the adoption of Romanesque style doorways or cornices into earlier structures, again demonstrated by radiocarbon dates that pre-date stylistically dated architectural features that may have been added later.

Dating work has also revealed the extensive adaptation and reuse of one of these structures as a windmill in the late medieval period to the extent that knowledge of its original use as a round tower had been lost and could only be confirmed through scientific analysis. The quality of construction and technological understanding of their builders is apparent in the survival of approximately seventy examples of these towers. It is hypothesized that on account of their robustness, many more are likely to have survived into later periods and, like the windmill, have been adapted for alternative use so extensively that their original purpose has been forgotten.

## 4 REUSE AS RESILIENCE: THE CASE OF THE FOUR MANOR HOUSES

**Abstract author(s):** Kerr, Sarah (Aarhus University)

**Abstract format:** Oral

This paper examines the evidence for the reuse of select materials in late medieval and early modern Denmark. It explores the case studies of Nørre Vosborg, a site comprising a number of late medieval manor houses, describing the architecture and archaeological remains from surveys and excavations. It is argued that Nørre Vosborg 1, which remains only as a series of parallel sand banks, was moved at the end of the medieval period. It appears that the bulk of the material was reused and re-established as Nørre Vosborg 3 some 900m inland from its original setting. Similarly, Nørre Vosborg 2, a late medieval manor house owned by a secondary faction of the same family, also was moved. It appears to have been re-built to the south of Nørre Vosborg 3 as is reflected in its name: Sønder Vosborg.

The evidence for moving the manor houses is discussed in the context of climatic anomalies which occurred at that time including a series of storm surges in the sixteenth century, and a particularly violent event in c.1593. It appears that Nørre Vosborg 1 took the full impact of the storm and was all but destroyed whereas 2 was impacted to a lesser degree. The survival of the newer iterations, plus excavations at the original manors, allows examination of what was reused and what was not.

It is suggested that those materials not selected for reuse were not abandoned due to a lack of will to reuse them. Rather it appears that the materials in the lowest floors of Nørre Vosborg 2 were left behind as they remained flooded

when the site was abandoned. This allows contemplation of the pace at which the materials were removed and reused; that is, before the flood waters had fully retreated.

## 5 THE MEDIEVAL AFTERLIFE OF A LONDON OPEN-HALL HOUSE

**Abstract author(s):** French, Katherine (University of Michigan-Dept. of History)

**Abstract format:** Oral

In 1339, John Shorditch, a knight and diplomat in the courts of Edward II and III, and his wife Ellen endowed a chantry in Westminster Abbey with land that they owned in London. The property was located on Wood Street, a few doors north of the parish church of St. Peter's Westcheap. On it was not only an open-hall house, but a wardrobe, a brewhouse, and some shops with solar, probably built against the more substantial walls of the other buildings. John had owned the house since at least 1321, the same year he was sworn onto Edward II's council. In 1345, four of John Shorditch's servants smothered him as he slept, and Westminster Abbey took control of the house and tenement. Using two-hundred years of financial information from Westminster Abbey, this paper looks at the medieval afterlife of the buildings on this property. I argue that the decisions the Abbey made in renovation and altering this property reflected their understanding of London's changing housing market and the business opportunities available in London.

## 6 TO REBUILD OR TO REPAIR: EXTENDING THE LIFE OF AGRICULTURAL BUILDINGS IN MEDIEVAL ENGLAND

**Abstract author(s):** Berryman, Duncan (Centre for Community Archaeology, Queen's University Belfast)

**Abstract format:** Oral

Medieval agricultural buildings have generally been viewed as insubstantial structures that were often replaced. Today, barns are the most common medieval agricultural building to survive and most of those are stone structures. Excavations are believed to show us the ephemeral nature of timber structures, with little more than postholes being visible. However, an analysis of manorial accounts and other estate documents from England indicate that buildings were not regularly replaced. Instead, they were repaired to ensure they continued to stand. Some buildings could have stood for over a century with regular maintenance; in fact, there are many medieval timber-framed houses still standing today. Furthermore, buildings were often recycled, either a standing building was converted to a new function or they were dismantled and used as timber for other structures. This paper will explore the repair and reuse of medieval agricultural buildings and consider why new buildings were constructed. This will show that medieval estate management was often more concerned with preserving the existing building stock and ensuring that it continued to function rather than investing raw materials in new constructions. Therefore, medieval attitudes to buildings can provide inspiration for the recycling and reuse of existing buildings to reduce our environmental impact.

## 7 ADAPT, CONVERT, REUSE, RECYCLE – CASE STUDY MEDIEVAL MARIBOR

**Abstract author(s):** Jancar, Mojca (Terarhis)

**Abstract format:** Oral

Medieval buildings can be found everywhere in Slovenia. Some have succumbed to time and are known to us only from records, while others are still noticeable in the landscape as ruins. Despite the fact that fire and military conflicts often did not spare medieval buildings, quite a few have survived. Although they have changed their appearance over time, as they have often been renovated and adapted to the fashion of the period or the taste of their owner, many of them have changed their purpose. In the recent past, museums, hotels, restaurants, psychiatric institutions settled in castles, monasteries were transformed into military barracks, churches into warehouses or art galleries.

The city of Maribor, the second-largest city in Slovenia, located in its northeastern part, was built under the eponymous castle in the 12th century. In this research, I will try to show, what has happened to the most important buildings in the city in the last 800 years, how they have changed their image and purpose, and I will pay special attention to Upper Maribor Castle, which was repaired several times and after abandonment purposely dismantled and used as a building material.

## 8 THE OLD COURT PALACE: FROM A MEDIEVAL STRONGHOLD TO A MODERN OPEN-AIR MUSEUM IN THE BUCHAREST CENTRE

**Abstract author(s):** Ignat, Theodor Aurelian - Cleşiu, Sorin - Opreş, Vasile (Bucharest Municipality Museum) - Simion, Corina (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering) - Pîrvulescu, Dan - Majuru, Adrian (Bucharest Municipality Museum)

**Abstract format:** Oral

The Medieval Old Court Palace in Bucharest sits right in the center of the Romanian capital. The site has an evolution of more than 700 years, demonstrated both by archaeological observations and new radiocarbon data. The rulers of

Wallachia have used this place first as a stronghold and a place that controlled the commercial routes of the area. As the Palace grew in importance, it was adopted as Capital of Wallachia in 1659. Its walls have been repeatedly damaged in sieges, earthquakes and fires. Such major events were followed by reconstructions. Older walls were constantly integrated into the newer buildings.

The place was abandoned and put up for sale in 1799. This is the moment when the former centre of power changes its functionality. During the 19th century the stone and brick walls have been integrated into new buildings. The cellars built at the middle of the 16th century have been plastered, partitioned and new concrete floors have been laid. In the newly erected buildings, various shops were opened for business. By the 1970's small scale archaeological excavations had pin-pointed the long-forgotten Old Court Palace. The decision was made to demolish the business buildings, excavate the ruins and transform the place into an open-air museum.

Today, the medieval palace is in a new stage of consolidation and restoration. The archaeological researches conducted here in the last two years re-evaluated the evolution in time and space of the Old Court. The archaeological discoveries, corroborated to radiocarbon data on lime mortars, stratigraphic observation and archive documentation bring new interpretations of the adaptation, conversions and integration of the oldest building in Bucharest, from the medieval times up to the near future.

## 248 NEW APPROACHES TO LITHIC RAW MATERIAL STUDIES: INFERRING PAST HUMAN MOBILITY [PAM]

**Theme: 6. A Decade after the 'Third Science Revolution in Archaeology'**

**Organisers:** Sanchez de la Torre, Marta (SERP-IAUB, Universitat de Barcelona) - Eramo, Giacomo - Fioretti, Giovanna (Earth and Geoenvironmental Sciences Department, University of Bari Aldo Moro) - Abrunhosa, Ana (ICArEHB, University of Algarve) - Pereira, Telmo (Universidade Autónoma de Lisboa)

**Format:** Regular session

Since the beginning of the human history, rocks have been used for benefiting human activities. They are also one of the best preserved materials in archaeological sites, being their study essential to increase our knowledge about past societies. The study of lithic procurement has historically focused on the analysis of lithic artefacts and potential sources using visual and petrographic methods. Nevertheless, in the last decades, new analytical strategies have been applied to the characterization of lithic raw materials, in order to explore their chemical, mineralogical and petrographic features. The use of statistical methods for data exploration and lithic sample comparison completes these investigation approaches. In this session we will focus on these new approaches that, added to the classic characterizations of lithic artefacts, give valuable data to deep into past human mobility and procurement strategies. Proposals from all chronologies and lithic rocks using one or diverse analytical methods are welcomed.

## ABSTRACTS

### 1 FLINT PROCUREMENT IN THE WESTERN COAST OF IBERIA: INFERRING NEANDERTHAL MOBILITY AT GRUTA NOVA DA COLUMBEIRA

**Abstract author(s):** Pereira, Telmo (Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar; Centro de Geociências da Universidade de Coimbra; UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Abrunhosa, Ana (CENIEH -Centro Nacional de Investigación sobre la Evolución Humana; ICArEHB - FCHS, University of Algarve) - Carvalho, Milena (Department of Anthropology, University of New Mexico; ICArEHB - FCHS, University of Algarve) - Haws, Jonathan (Department of Anthropology, University of Louisville; ICArEHB - FCHS, University of Algarve) - Benedetti, Michael (Department of Earth and Ocean Sciences, University of North Carolina Wilmington; ICArEHB - FCHS, University of Algarve)

**Abstract format:** Oral

Gruta Nova da Columbeira is one of the key Mousterian sites from the western coast of Portugal. This cave has a 7-meter-thick sequence of layers with abundant lithics and fauna in two main sectors. The sector closer to the mouth encompasses a Mousterian sequence between ca. 101 to 36 ka sealed by a thick stalagmitic cap. The sector at the back of the cave, despite the Upper Paleolithic absolute dates (ca. 29 to 15 ka), also shows typically Mousterian industry.

The lithic assemblages are composed of chert, quartzite and quartz, probably collected in gravels. Quartzite and quartz are widespread in the Cretaceous levels of the Lusitanian Basin region. Though the Cretaceous overlies (stratigraphically) the Columbeira Jurassic limestone, it is eroded in that area, outcropping not too far west. Thus, rounded gravels and larger cobbles would be easy to access. So far, chert was not identified locally in the Columbeira Jurassic limestones hence its sourcing is still unclear. This could be due to: a) The exploitation of gravels from areas located further away; b) Current coverage of the gravels by the thick Holocene dunes; or c) The obliteration of the gravels by the LGM-post-LGM and/or the Pleistocene-Holocene transition.

Here we present the lithic assemblage, particularly the chert characterization through macroscopic, PIXE and pXRF analysis. Results suggest as possible provenance regions the nearby coastal bluffs and stream deposits draining across the Jurassic bedrock toward the Óbidos valley. Little is still known about the chert sources from Portugal and how they fit into the archaeological sites. With Columbeira being a reference to the Portuguese Mousterian, this study allows us to deepen the study of human population dynamics and the relationship with regional resources and landscape in the Late Pleistocene.

## 2 QUARTZITE CHARACTERIZATION AND PROVENANCE ANALYSIS PROTOCOL: A CASE STUDY OF LITHIC RAW MATERIALS AVAILABLE IN THE CÔA VALLEY (NORTHEAST PORTUGAL)

**Abstract author(s):** Abrunhosa, Ana (CENIEH - Centro Nacional de Investigación sobre la Evolución Humana; ICARE-HB - Interdisciplinary Center for Archaeology and Evolution of Human Behaviour. FCHS - Universidade do Algarve. Campus de Gambelas) - Dimuccio, Luca (University of Coimbra, Centre of Studies in Geography and Spatial Planning - CEGOT, Department of Geography and Tourism; UNIARQ - Centro de Arqueologia Universidade de Lisboa, Faculdade de Letras, Alameda da Universidade) - Aubry, Thierry (Côa Parque, Fundação para a Salvaguarda e Valorização do Vale do Côa; UNIARQ - Centro de Arqueologia Universidade de Lisboa, Faculdade de Letras, Alameda da Universidade) - Ribeiro, Maria (Department of Geosciences, Environment and Spatial Planning, Faculty of Sciences, University of Porto; ICT - Institute of Earth Sciences –Porto pole)

**Abstract format:** Oral

Characterization and provenance determination of lithic raw material allows us to infer multiple aspects about mobility and land use by hunter-gatherers. It also allows us to understand their technological adaptation to lithic resource availability. Prehistoric knapped lithic assemblages in the Iberian Peninsula are mainly composed of three main categories of siliceous rocks: fine-grained sedimentary rock composed of microcrystalline or cryptocrystalline quartz (e.g., chert, flint, silcrete), quartzite and quartz veins. Studies and methodological approaches for the characterization of fine-grained siliceous rocks, using macroscopic/mesoscopic observations, petrography, and geochemical analysis, have been developed during the last 30 years. However, data regarding quartzite and quartz veins are scarce and detailed characterization and provenance studies remain underdeveloped. In the framework of research at El Sotillo (project CEN154P20) and CLIMATE@COA (project COA/CAC/0031/2019), we propose a protocol to identify and characterize the quartzites that are available in the lower Côa river valley (northeast Portugal), with potential for exploitation by human groups (Neanderthal and Homo sapiens) during the Late Pleistocene. In the study areas, Ordovician quartzites are present as resistant reliefs in the landscape and as pebbles and cobbles (secondary sedimentary position) in the Plio-Quaternary siliciclastic covers. Geological samples were described considering macroscopic, petrographic, and geochemical parameters. Petrographic-mineralogical characterization of the samples and geochemical analyses were performed with destructive and non-destructive methods - whereas in archaeology preference is usually given to non-destructive methods. The data collected will result in a robust database with comparable results. These "identity cards" of regional siliceous rocks with potential for exploitation during prehistoric times will be the basis for future comparisons with archaeological lithic assemblages of the Côa Valley and other sites in the surrounding.

## 3 THE USE OF SCHIST OUTCROPS FOR SYMBOLIC PURPOSES: THE EXAMPLE OF OCREZA

**Abstract author(s):** Danelatos, Dionysios - Garcês, Sara (Instituto Politécnico de Tomar; Centro de Geociências da Universidade de Coimbra; Instituto Terra e Memória) - Pereira, Telmo (Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar; Centro de Geociências da Universidade de Coimbra; UNIARQ, Centro de Arqueologia da Universidade de Lisboa)

**Abstract format:** Oral

In 2021, a new palaeolithic panel with rock art engravings on a schist outcrop was unearthed in Ocreza river. At the vertical surface of the panel appear the outlines of at least three zoomorphic figures. The use of metamorphic rocks as surfaces for artistic representations is a common phenomenon at open air sites situated near rivers in Portugal. Considering whether this fact is a cultural tendency or a random behaviour, evidence suggest that there is an adaptation on the geological context of Western Iberia. While the exploitation of schist for lithic tools is a rare phenomenon, rivers can be seen as areas adequate for hunting and highways for human mobility. Taking as a starting point the case of Ocreza and testing relevant sites of similar dating situated on schist surfaces, there will be an attempt to understand further the relationship of hunter-gatherers' mobility and schist procurement during Upper Palaeolithic times in Western Iberia.

#### 4 **A COMBINED PETROARCHAEOLOGICAL AND TECHNOLOGICAL APPROACH TO A NEANDERTHAL FLINT ASSEMBLAGE FROM STRATIGRAPHIC UNIT VIII OF EL SALT (EASTERN IBERIA)**

**Abstract author(s):** Mayor, Alejandro (Àrea de Prehistòria; Departament de Prehistòria, Arqueologia, Història Antiga, Filologia Llatina i Filologia Grega; Facultat de Filosofia i Lletres, Universitat d'Alacant) - Sossa-Ríos, Santiago (Àrea de Prehistòria; Departament de Prehistòria, Arqueologia i Història Antiga; Facultat de Geografia i Història, Universitat de València) - Galván, Bertila (Àrea de Prehistòria; Departamento de Geografía e Historia; Facultad de Humanidades, Universidad de La Laguna) - Mallol, Carolina (Àrea de Prehistòria; Departamento de Geografía e Historia; Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers Laboratory; Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Hernández, Cristo (Àrea de Prehistòria; Departamento de Geografía e Historia; Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers Laboratory; Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna)

**Abstract format:** Oral

Neanderthal technological variability is a complex reality involving many possible factors. One of these factors is the lithic raw material. The possible mutual influence between raw material selection and technological schemes can speak about, for instance, provisioning strategies, mobility dynamics, resource management, diachronic know-how, or technical adaptability. In this framework, the flint remains from stratigraphic unit VIII of El Salt (Alcoi, Alacant, eastern Iberia) could represent a landmark in Neanderthal productive behaviours in the surrounding territory. It is because this stratigraphic unit might signify a critical juncture regarding both environmental and populating trends, since we can observe relevant climatic changes and a harsh decrease of human material impact in the site. Using unit VIII assemblage as a case study, we aim to collate these two proxies (i.e. technological and petroarchaeological data) in order to contribute to the relation between raw material provisioning and technological application. Preliminary results point to the existence of different technical strategies depending on the distance to the potential provisioning areas and the original nodule traits. Blank exploitation, tool manufacture and cortex proportions, amongst other variables, change from one flint type to another. Correlating technological and petroarchaeological proxies has allowed us to approach the territorial management performed by the Neanderthal groups who occupied El Salt throughout the formation of stratigraphic unit VIII, a time of critical climatic and demographic change in this region.

#### 5 **NEW DATA ON CHERT CATCHMENT ANALYSIS IN INLAND IBERIA DURING THE LATE PLEISTOCENE: RESULTS ON GEO-ARCHAEOLOGICAL SURVEYS AND PETROGRAPHIC CHARACTERISATIONS**

**Abstract author(s):** Sanchez de la Torre, Marta - Mangado Llach, Xavier (SERP-IAUB. Universitat de Barcelona) - Castillo Jiménez, Samuel - Alcolea González, José Javier - Alcaraz Castaño, Manuel (Àrea de Prehistòria. Universidad de Alcalá)

**Abstract format:** Oral

In this communication we will present the first results obtained after new fieldworks and characterisation studies on chert procurement analysis in the interior regions of the Iberian Peninsula. Research has been developed in the framework of the ERC project MULTIPALEOIBERIA: Population dynamics and cultural adaptations of the last Neanderthals and first Modern Humans in inland Iberia: a multi-proxy investigation. This research project aims to know the relations between cultural developments and environmental change among hunter-gatherers during the last glaciation. It focuses on inland Iberia, a key area due to its geographic position and ecological variability, and traditionally depicted as a marginal and few populated macro-region due to its harsh ecological conditions compared to the coastal areas of the Iberian Peninsula during the stadial phases of the last glacial.

The Peña Capón and Peña Cabra rock shelters host two of the most relevant archaeological sites that are currently under study in the framework of this project. They are placed in the southeastern foothills of the Central System range (Guadalajara province, Spain) and have shown a sequence of human occupations from the Middle and Upper Palaeolithic. In order to further our knowledge on mobility and lithic procurement strategies of past groups inhabiting these regions of inland Iberia, we have developed lithic raw materials studies. They have included two fieldwork campaigns aimed at determining chert outcrops and collecting geological samples for comparison with the archaeological lithic assemblages. Then, both archaeological artefacts and geological samples have been analysed under the same methodological conditions to determine their textural, micropalaeontological, mineralogical and chemical composition. As a result, we are now able to infer potential mobility patterns and catchment strategies of Neanderthal and modern human hunter-gatherers inhabiting inland Iberia during the Middle and Upper Palaeolithic.

## PATTERNS ON LITHIC PROCUREMENT STRATEGIES IN THE PRE-PYRENEAN MAGDALENIAN SEQUENCE OF COVA DEL PARCO (ALÒS DE BALAGUER, SPAIN)

**Abstract author(s):** Jiménez Ruiz, Luis (Primeros Pobladores y Patrimonio Arqueológico-IPH. Universidad de Zaragoza) - Sánchez de la Torre, Marta (SERP-IAUB. Universitat de Barcelona) - Langlais, Mathieu (UMR 5199 PACEA CNRS Université de Bordeaux; SERP-IAUB. Universitat de Barcelona) - Fullola, Josep - Mangado, Xavier (SERP-IAUB. Universitat de Barcelona)

**Abstract format:** Oral

Archaeological works developed in the last decades have demonstrated that the Pre-Pyrenees, a mountain range placed in north-east Iberia, were regularly frequented by several human groups during the Late Pleistocene. Cova del Parco archaeological site is an example of this large and regular human frequentation. The site was discovered and first excavated during the seventies, and since the eighties a team from the University of Barcelona has been developing archaeological works. We have documented that the site was frequented from, at least, the Middle Magdalenian, to historical times. In this communication we will present results obtained after the archaeopetrological and techno-typological studies from the Middle and the Upper Magdalenian sequence.

The textural, micropalaeontological and geochemical analysis of the lithic artefacts has allowed us to identify several chert types from local, regional and long-distance sources. Some of these cherts had their origin in the northern slopes of the Pyrenean chain, suggesting that this mountain chain was regularly crossed by Magdalenian groups. In this sense, we have developed GIS analyses to determine the paths and connections that could have linked the archaeological site with the different chert outcrops, as well as the more suitable routes to cross the Pyrenean mountains.

The techno-typological approach has shown an intentional discrimination on the use of the different chert types in regards of different productive and industrial aims. The local and regional cherts were mostly used for knapping processes and were destined to the fabrication of tools and weapons, while the long-distance cherts have just been documented in the form of finished retouched tools or bladelet cores.

As a result of this study, we have obtained a new vision on the mobility and complex economical interactions from two moments of the Magdalenian through groups that settled Cova del Parco at the end of the Late Pleistocene.

## CIRCULATION OF STONE ARTIFACTS IN THE SOUTH OF THE IBERIAN PENINSULA DURING THE CHALCOLITHIC PERIOD (IV-III MILLENNIA BC)

**Abstract author(s):** Lagarde, Bruno (Institute of Archaeology - University College London)

**Abstract format:** Oral

In order to analyse the circulation of stone artifacts in the south of the Iberian Peninsula during the IV-III millennia BC, a geochemical characterisation of the raw material will be made, with the aim of identifying which sources were used and how they circulated if they did.

In order to characterise the raw material of an archaeological artefact, it is not always enough by simple observation, and in most cases they present high cultural value and are usually on display in museums, making difficult to obtain the permits to carry out destructive analysis techniques. So, the main method of analysis will be by use of a portable X-rays fluorescence machine (pXRF). The objective is to chemically characterize the artifacts for later comparison through a database.

The objective is to look for patterns of chemical composition, with the intention of establishing recognisable groups that allow for the distinction and characterisation of pieces in order to make comparisons. Thus, in the case of artifacts made of foreign raw material, they should be clearly distinguished from the local context and, eventually, be able to be compared with artifacts found elsewhere. A goal to achieve is identifying the possible source of raw material and compare the field data of the site's surroundings with the archaeological artifact.

The artifacts to be analysed are those of worked stone with socio-cultural relevance for Late Neolithic societies, such as polished axes, bracelets and necklace beads, among others. In the present work I will analyse mostly objects from the site of Los Castillejos (Granada), together with some pieces from Los Millares (Almería) and El Malagón (Granada). The raw materials expected are generally metamorphic rocks from the Baetic System, specifically those potentially accessible in the catchment area of the site, expecting some of them coming from elsewhere due to circulation.

## 8 THE UNIQUE LAUREL-LEAF POINTS OF VOLGU DOCUMENT LONG-DISTANCE TRANSPORT OF RAW MATERIALS IN THE SOLUTREAN

**Abstract author(s):** Koch, Tabea (Department of Early Prehistory and Quaternary Ecology, Eberhard Karls University of Tübingen; Université Côte d'Azur, CNRS, CEPAM; University of York, Department of Archaeology) - Schmidt, Patrick (Department of Early Prehistory and Quaternary Ecology, Eberhard Karls University of Tübingen; Applied Mineralogy, Department of Geosciences, Eberhard Karls University of Tübingen)

**Abstract format:** Oral

The Upper Palaeolithic Solutrean culture that coincided with the Last Glacial Maximum has become famous for documenting an increasing investment of time and effort in the production of tools. However, Solutrean lithic assemblages predominantly document local procurement of flint and only in rare cases, stones were transported over distances above 100 km. The perhaps most remarkable Solutrean artefacts are the large bifacial laurel-leaf points of Volgu. Some studies on the points suggested long distance transport, proposing multiple raw material locations in the >170 km distant Paris Basin. These findings were based on evaluations of macro- and microscopically visible features at the surface of the flint. In this study, we aim to verify previously made propositions on the Volgu points' origin with an archaeometric technique. For this, we apply reflectance infrared spectroscopy, a method that relies on identifying differences in the crystallographic properties of flint. We compare eight of the Volgu laurel-leaf points with five regions of Upper Cretaceous flint deposits in France and Belgium. Our findings provide a reproducible line of evidence for the long-distance procurement of flint to produce exceptional artefacts in the Solutrean. Our study is the first application of this method to flint sourcing in a European context. It has therefore also implications for future provenance studies on other archaeological sites in France.

## 9 INTEGRATING TRACEOLOGY IN THE RECONSTRUCTION OF LITHIC RAW MATERIALS MANAGEMENT STRATEGIES: CASE STUDIES FROM THE NORTH-EASTERN ITALIAN PALAEO-MESOLITHIC

**Abstract author(s):** Visentin, Davide (Institución Milá y Fontanals, IMF-CSIC, Barcelona; Dipartimento di Studi Umanistici, Università degli Studi di Ferrara) - Bertola, Stefano - Cecchetti, Marzio (Dipartimento di Studi Umanistici, Università degli Studi di Ferrara) - Clemente Conte, Ignacio (Institución Milá y Fontanals, IMF-CSIC, Barcelona) - Fontana, Federica (Dipartimento di Studi Umanistici, Università degli Studi di Ferrara)

**Abstract format:** Oral

The potential of lithic raw materials to inform about mobility is generally linked to the possibility of identifying the outcropping areas of specific lithotypes through petrographic and geochemical analyses. To complement such data technological analyses of flaked assemblages have been used to infer the modality in which raw materials were transported (e.g., raw blocks, cores, flakes) and whether they were entirely or only partially exploited at the site. Such information is mainly obtained by comparing the presence/absence and frequency of specific categories of artefacts (e.g., cortical flakes, wastes). Nonetheless, this approach is limited because studied materials are generally a sample of the original assemblage and could be biased by spatial and selective phenomena. On the other hand, traceological analysis can provide direct evidence of artefacts transportation by identifying specific wear patterns and can thus be considered an interesting complementary technique to reconstruct raw materials management strategies.

This paper provides the example of two sites located in the Dolomites (North-Eastern Italy): Casera Staulanza and Mondeval de Sora. The first one is located at 1681 m a.s.l. and presents Final Palaeolithic (Late Epigravettian) and Early Mesolithic (Sauveterrian) occupations. The latter is a Late Mesolithic (Castelnovian) burial context identified at 2130 m a.s.l. under an erratic boulder.

## 10 LOCAL AND ALLOCHTHONOUS CHERT SUPPLIES IN EARLY AND MIDDLE NEOLITHIC TRASANELLO VILLAGE (BASILICATA, SOUTHERN ITALY)

**Abstract author(s):** Muntoni, Italo (Soprintendenza ABAP BAT-FG, Ministry of Culture) - Eramo, Giacomo (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro") - Allegretta, Ignazio (Dipartimento di Scienze del Suolo, della Pianta e degli Alimenti, Università degli Studi di Bari "Aldo Moro") - Dell'Università, Emanuela (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro") - Conforti, Jacopo (Università di Pisa) - Terzano, Roberto (Dipartimento di Scienze del Suolo, della Pianta e degli Alimenti, Università degli Studi di Bari "Aldo Moro")

**Abstract format:** Oral

The settlement of Trasanello (Matera, Basilicata) is one of the ditched villages typical of the Early and Middle Neolithic of the Southern Italy. These villages have one or more defensive ditches enclosing inhabited areas subdivided by wide empty spaces. The archaeological investigations, carried out from 2007 to 2017 by the Pisa University, allowed the definition of its frequentation. The Early Neolithic phase corresponding to the lower fill of the trench, dated to the first half of VI millennium cal BC, and ascribed to a final phase of the local development of the Impressed Pottery

Culture. The Middle Neolithic phase is dated to the second half of VI millennium cal BC and correspond to the lost of function of the trench.

A selection of 57 chert artefacts of Early and Middle Neolithic underwent nondestructive petrographic and chemical (pXRF) analyses to understand the provenance of raw materials. The availability of primary (Calcare di Altamura) and secondary (fluvial/marine terraces) chert in the area of Matera motivated the sampling and analysis of local geological chert as reference.

The analysis of the knapped chert industry shows the presence of two distinct components. The main component is produced using local secondary chert sources (radiolarite, silicified calcarenites and nodular chert) originated from the outer geological units of the Southern Apennine. Knapping was done by direct and bipolar percussion to obtain non-standardized products. The second component, much rarer, is constituted by ramp to basin cherts from Gargano promontory, introduced in the site as blades and bladelets obtained by pressure flaking or indirect percussion and, minimally, also as prepared and partially exploited cores. Direct and bipolar percussion were employed to recycle and over-exploit a part of the products and by-products.

The results of the integrated archaeometric and typo-technological analyses of the knapped chert industry will be then presented.

## **MICROPETROGRAPHY AND GEOCHEMISTRY OF PREHISTORIC RAW MATERIALS IN BULGARIA: CHALLENGE AND QUERY**

**Abstract author(s):** Gurova, Maria (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences) - Stefanova, Elitsa - Andreeva, Polina (Geological Institute, Bulgarian Academy of Sciences) - Kecheva, Nadezhda (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences)

**Abstract format:** Oral

The abundant empirical data from prehistoric chipped-stone (flint) assemblages in Bulgaria invites a re-assessment of their significance for our understanding of cultural and economic transitions in prehistory and requires a particular interest in lithics and their complete chaîne opératoire, starting with the procurement strategy and network distribution of the raw materials and ending with the exhaustive resharpening, reuse and/or discard of the artefacts. In reality, such a comprehensive study is still in the sphere of futuristic expectation.

For over a decade there have been notable advances in raw material studies, documented in a series of publications. A combination of macro and micropetrography combined with geochemical analysis of raw material samples and flint artefacts has been applied to Bulgarian flint provenance studies, beginning in 2010 when the approach was tested and subsequently expanded and developed more systematically.

Four extensive field prospections for raw material outcrops have resulted in the identification of numerous flint sources used by prehistoric people in Bulgaria. Separately, a large number of Early Neolithic artefacts have been subjected to the same analytic procedures. The combination of analytical data from geological and archaeological samples has advanced our understanding of past human mobility, raw material networks and distribution patterns. Latterly, GPS modelling has been used to reconstruct the paths between raw material sources and consumption sites.

The paper summarises the results of this complex analytical approach to investigating the problem of Balkan Neolithization.

## **THE LITHOTHEQUE ROLE IN THE LITHIC RAW MATERIALS STUDIES. THE CASE OF THE ITALIAN SILIBA**

**Abstract author(s):** Fioretti, Giovanna (Earth and Geoenvironmental Sciences Department, University of Bari) - Muntoni, Italo Maria (Soprintendenza Archeologia, Belle Arti e Paesaggio per le Province di Barletta - Andria - Trani e Foggia, Ministero della Cultura) - Monno, Alessandro - Eramo, Giacomo (Earth and Geoenvironmental Sciences Department, University of Bari)

**Abstract format:** Poster

Chert artifacts represent one of the most durable product manufactured by the humans and their recovery and characterisation allow to assess new data on the technological and cultural features of prehistory civilizations. The geographic identification of procurement area of lithic raw materials is essential in the reconstruction of the social and economic behaviours of the communities.

In this view, a significant role is played by the lithotheques since they include lithic samples coming from variable spread geographic area and constitute a valuable comparison tool for provenance studies of archaeological finds.

An Italian example of lithic collection is Siliba, the lithotheque of the Earth and Geoenvironmental Sciences Department of the University of Bari Aldo Moro. It consists of about 1500 samples of geological cherts collected from outcrops, sites and mines mainly in the Apulia (Southern Italy) region and across southern Italy (Basilicata, Sicily), Croatia, Serbia, Switzerland and Iraqi Kurdistan, belonging to formations from the Cretaceous to the Quaternary Period.

The strength of the collection is its database, reporting the petrographic, colourimetric, geochemical and micropaleontological features, obtained by a dedicated non-invasive investigation protocol (NM-PCI). Such results represent a fingerprint for each samples and make the SiLiBA lithotheque an essential reference point in the identification of provenance of lithic raw materials transformed by the prehistory local humans for the producing of chert objects.

The SiLiBA database is constantly evolving and new lithic samples are collected and investigated and original data are produced and recorded in the database. This last consists of report sheets containing, together with the results of the NM-PCI investigation, other several information such as photographs, geographic coordinates, geological outcrop description. A website dedicated to the presentation of the lithotheque will soon be online, even if the complete database is already available for consultation by the scientists and archaeologists on request.

## **B. FROM LITHIC ASSEMBLAGES TO RAW MATERIAL SOURCES A NEW PROJECT OF CHARACTERIZATION OF CHERT SOURCES IN SABINA (CENTRAL ITALY)**

**Abstract author(s):** Conati Barbaro, Cecilia - Carletti, Elena (Department of Classics - Sapienza University) - Forti, Luca (Department of Earth Sciences "Ardito Desio" - University of Milan) - Ranieri, Cristiano (Archaeological Museum of Salisano) - Moscone, Daniele (Anamed Fellowship - Koç University Istanbul) - Eramo, Giacomo (Department of Earth and Geo-environmental Sciences, University of Bari Aldo Moro)

**Abstract format:** Poster

Mobility patterns can be inferred through lithic raw material characterization analyses.

Here we present a new research project aimed at the identification and georeferencing of chert outcrops in the Sabina region (northern Latium, Italy). We also aim at characterizing the lithic raw materials exploited in several archaeological sites of the area through a multi-parametric protocol (NM-PCI) that includes macroscopic and microscopic observations and chemical analysis.

In central Italy, projects that rely on a detailed geo-archaeological procedure to detect regional availability of chert and prehistoric exploitation patterns are still rare. This is the first attempt to systematically analyze the lithic sources of the area in relation to a long-term occupation, spanning from the Middle Paleolithic to the Bronze Age, attested by stratigraphic cave excavations in progress. The wide chronological range will allow a diachronic comparison of the procurement strategies. Identification of selected lithotypes and their provenance could highlight key anthropological issues such as mobility patterns, landscape familiarity, long or short distance networks, and inter-group relationships. A further goal is the creation of a reference collection (lithotheca).

This project is part of a broader research aimed at investigating the use of caves and the exploitation of the environment in the Sabina region during Pre-Protohistory, through an integrated approach which combines archaeological with paleoenvironmental data.

## **C. LITHOLOGICAL SELECTION IN POLYGENIC GRAVELS OF NOTARCHIRICO (EARLY ACHEULEAN, SOUTHERN ITALY)**

**Abstract author(s):** Eramo, Giacomo (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro") - Allegretta, Ignazio (Dipartimento di Scienze del Suolo, della Pianta e degli Alimenti, Università degli Studi di Bari "Aldo Moro") - Fioretti, Giovanna (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro") - Terzano, Roberto (Dipartimento di Scienze del Suolo, della Pianta e degli Alimenti, Università degli Studi di Bari "Aldo Moro") - Moncel, Marie-Hélène (UMR 7194 HNHP - MNHN-CNRS-UPVD, Département Homme et Environnement, Muséum National d'Histoire Naturelle, Paris)

**Abstract format:** Poster

The several human occupations attested at Notarchirico (Venosa, southern Italy) date back to 610-695 ka, among the oldest ones in Western Europe at the MIS 17/MIS 16 transition.

Open-air occupations were at the top or in proximity of polygenic pebbles/cobbles formed in fluvio-lacustrine environment, which made available various knappable material. Prevalent larger limestone lithotypes, together with smaller silicified calcarenites (flysch chert), nodular chert (carbonate platform) and radiolarite (basin) originated from the outer geological units of the Southern Apennine.

The technological study of the lithic assemblages identified pebbles with percussion marks or broken, pebble tools, Large Cutting Tools (bifaces, cleavers, unifacial tools, pick), cores, flakes, flake-tools and retouched nodules.

A selection of archaeological and geological lithic samples was studied to verify the archaeological hypothesis of the exploitation of local polygenic pebble/cobble lags to produce artefacts, as well as the hypothesis of lithological selection. Petrographic analysis of samples as such, coupled with thin section microscopy for geological samples, as well as colorimetric (spectrophotometer) and geochemical (pXRF) analyses were carried out.

The results show that the lithotypes of the pebble/cobble lags are compatible with those of the artefacts. Moreover, pre and post depositional black patina due to wetland conditions further prove local exploitation. Preferential use of limestone cobbles, with some exception, for Large Cutting Tools and silicified calcarenites to produce very

small flakes indicate adaptation to local raw materials. The relative abundance of flysch chert among artefacts, compared to the other chert varieties, is interpreted as a consequence of its abundance among chert lithotypes. The size/shape of the pebbles/cobbles was the main limiting factor in the choice of raw materials for lithic artefacts.

#### D. THE CONTRIBUTION OF ARCHAEOMETRY TO RECONSTRUCT HUMAN MOBILITY DURING THE PALAEO-LITHIC OF PORTOSELVAGGIO (NARDÒ-LE)

**Abstract author(s):** Eramo, Giacomo (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro") - Massafra, Dario (Museo della Preistoria di Nardò) - Stasolla, Vincenzo (ETHRA srl. I beni culturali al servizio del turismo e dell'ambiente; Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro") - Monno, Alessandro - Tempesta, Gioacchino - Allegretta, Ignazio - Fioretti, Giovanna (Dipartimento di Scienze della Terra e Geoambientali, Università degli Studi di Bari "Aldo Moro") - Kitagawa, Keiko (Museo della Preistoria di Nardò; Institute of Prehistory, Early History and Medieval Archaeology, University of Tübingen) - Strafella, Silvia (Museo della Preistoria di Nardò) - Ranaldo, Filomena (Museo della Preistoria di Nardò; Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, Università di Siena)

**Abstract format:** Poster

Grotta Torre dell'Alto (GTA) is one of the most important caves among the numerous Pleistocene sites located in the Mesozoic limestone along the Neretina coast (Nardò-LE), excavated between 1961 and 1967.

"Museo della Preistoria di Nardò" started a project to reconstruct the evolutive dynamics of this coast and the organisation of prehistorical groups, reviewing stratigraphic series, faunal fossils and lithic tools of GTA.

A selection of 186 chert artefacts was analysed with a non-destructive multiparametric protocol (NM-PCI), based on petrographical, micropaleontological and chemical variables. The obtained data were compared to those of geological chert from Porto Selvaggio (Nardò), Bradanic through, Tavoliere plain, Murge and Gargano promontory, obtained with the same protocol.

The lithological variety observed in the three archaeological levels of GTA investigated points to different source areas. The high frequency of silicified calcarenites and calcilitites and the scarce presence of radiolarites and nodular chert among artefacts correlates with the lithologies present in the Bradano and Tavoliere plains, both fed by sediments from the outer units of the Southern Apennine belt. Two tools were made with nodular chert compatible with the lithotypes in the terraced deposits of the Gulf of Manfredonia (FG).

In summary, all the lithologies identified in the lithic industries certainly come from secondary deposits that are no less than 120 km away. Moreover, raw material data indicates a low-selective use of resources to produce tools, but suggests that Neanderthals' territory was a considerable area and points to the scale of their mobility. NM-PCI protocol proved to be an accurate and useful tool to obtain a consistent dataset on archaeological and geological chert easily expandable on a large sample population to make the reconstruction of the alternated mobility models during this phase more detailed and reliable.

#### E. MULTI PROVENANCE FROM OBSIDIAN SOURCES IN MEDITERRANEAN AREA: HIGHLIGHTS FROM WD-XRF AND SEM-EDS CHARACTERIZATION OF NEOLITHIC ARTEFACTS FROM SOUTHERN ITALY

**Abstract author(s):** Muntoni, Italo (Soprintendenza ABAP BAT-FG, Ministry of Culture) - Micheletti, Francesca - Pallara, Mauro (Dipartimento di Scienze della Terra e Geoambientali - Università degli Studi di Bari 'Aldo Moro') - Acquafredda, Pasquale (Dipartimento di Scienze della Terra e Geoambientali - Università degli Studi di Bari 'Aldo Moro'; Centro Interdipartimentale "Laboratorio di Ricerca per la Diagnostica dei Beni Culturali")

**Abstract format:** Poster

This paper summarizes the data on the provenance of obsidian from three Early - Late Neolithic sites in Southern Italy (Apulia and Basilicata) obtained at the Earth and Geoenvironmental Sciences Department of Bari University and compares two different non-destructive techniques, SEM-EDS and WD-XRF using peak intensity ratios of some trace elements, useful for geological source determination.

Provenance data (n=23) from two Early and Middle Neolithic sites (Trasanello and Grotta San Biagio) has confirmed the exclusive predominance of Lipari obsidian. Also in the Late Neolithic necropolis of Galliano (Taranto) the Lipari source have been identified for almost all of 52 samples of obsidian artefacts.

Only two samples from Galliano necropolis show a different origin area: one from Palmarola, the southernmost signalling in Puglia for this source, and one from Pantelleria (sub-source of Salto la Vecchia and Balata dei Turchi) as first signalling on the continental Italy. Both source area, Palmarola and Pantelleria, have also been safely ascertained through quantitative compositional analyses of the microphenocrysts (pyroxenes and feldspars) present in the glass of 27 and 42 obsidian samples.

In particular, the discovery of obsidian from Pantelleria in the Late Neolithic necropolis of Galliano, which can be dated back to the first centuries of the second half of the fifth millennium BC, significantly expanded its distribution area towards the east and the north, in a chronologically well-defined context.

## F. **WD-XRF/SEM-EDS AND LITHIC TECHNOLOGICAL ANALYSES TO ADDRESS THE STUDY OF OBSIDIAN PREHISTORIC NETWORKS IN THE NORTHERN IRAQ**

**Abstract author(s):** Moscone, Daniele (Research Center for Anatolian Civilizations, Koç University) - Pallara, Mauro (Department of Earth and Geo-environmental Sciences, Bari University) - Oselini, Valentina (Department of Civil, Environmental and Materials Engineering, Bologna University) - Vacca, Agnese - Peyronel, Luca (Department of Literary Studies, Philology and Linguistics, Milan University) - Acquafredda, Pasquale (Department of Earth and Geo-environmental Sciences, Bari University)

**Abstract format:** Poster

Excavations at Helawa (Erbil Plain, Kurdistan Region of Iraq) headed by the University of Milan provided evidence of a multi-period settlement of ca. 10 ha occupied between the 6th millennium BC and VII century AD with several breaks in the cultural sequence. In this paper we consider the obsidian evidence as a proxy for highlighting prehistoric supply networks and distribution patterns following a diachronic perspective, by combining lithic technological and raw material provenance analyses.

The obsidian assemblages from Helawa are characterised by hundreds of chipped artefacts, mainly consisting of blades and bladelets produced using several pressure technique modes. Although flakes are present throughout the sequence as well, very few clues support in situ cores' reduction. However, a manufacturing open space unearthed in the Late Chalcolithic 1 layers provided us evidence of a dumping area characterised by waste and technical elements connected with bladelets and micro-bladelets production, suggesting the presence of skilled knappers at the site.

Based on such results, a total of 30 samples were selected from architectural phases ranging from the late Ubaid until the Late Chalcolithic 3 periods (5th to mid-4th millennium BC) and were analysed at the Department of Earth and Geo-environmental Sciences of the Bari University using Non-destructive Wavelength Dispersive X-Ray Fluorescence (WD-XRF) using "peak intensity ratios" of some trace elements. SEM-EDS analysis for the discrimination of major and minor elements also provided us chemical data more easily comparable with other analytical methods to address the geographical provenance of the samples.

This study is significant for the Erbil Plain, and the whole eastern Tigris sector as well. First, Helawa represents the best known prehistoric sequence for crucial periods of growing social complexity, and, secondly, our supply networks' study revealed that connections strengthened over the long period with the Lake Van sources area of eastern Anatolia.

## G. **RECONSTRUCTING HUMAN MOBILITY AND SOCIAL INTERACTIONS. NEW OBSIDIAN CHARACTERISATION DATA USING SEM-EDS AND WD-XRF ANALYSES FROM NORTHERN KURDISTAN REGION (IRAQ).**

**Abstract author(s):** Conati Barbaro, Cecilia (Department of Classics - Sapienza University) - Sconzo, Paola (IANES Department - Eberhard Karls Universität Tübingen) - Moscone, Daniele (Anamed Fellowship - Koç University) - Pallara, Mauro (Dept of Earth and Geoenvironmental Sciences - University of Bari Aldo Moro of Bari Aldo Moro) - Iamoni, Marco - Simi, Francesca (Department of History and Preservation of the Cultural Heritage - University of Udine) - Coppini, Costanza (Freie Universität Berlin) - Morandi Bonacossi, Daniele (Department of History and Preservation of the Cultural Heritage - University of Udine) - Acquafredda, Pasquale (Dept of Earth and Geoenvironmental Sciences - University of Bari Aldo Moro)

**Abstract format:** Poster

Obsidian artefacts are among the most powerful evidence of human mobility during pre-protolith. This paper presents a new body of data based on a broad regional and chronological scale.

64 obsidians from PrePottery Neolithic to Middle Bronze Age sites of the Northern region of Kurdistan (Iraq) have been characterized through non-destructive SEM-EDS and WD-XRF techniques. The archaeological sites are located in the areas of the Land of Nineveh Archaeological Project (LoNAP) and of the Eastern Habur Archaeological Survey project (EHAS).

They show a homogeneous trend across the region over time. Several Anatolian sources are attested, some exploited for a long time, others only in certain periods, indicating specific choices of human communities, probably linked to different dynamics in social interactions.

Our results will be compared with other datasets stemming from other new research projects of the Kurdistan region and beyond, allowing for large-scale reconstruction of transmission routes and a better understanding of local communities' role in forming and iteration of the exchange networks.

**Theme:** 3. The Carpathian Basin: Integration, Mobility and Diversity

**Organisers:** Szenthe, Gergely (Hungarian National Museum) - Gáll, Erwin ("Vasile Pârvan" Institute of Archaeology, Bucharest) - Bugarski, Ivan (Institute of Archaeology, Belgrade)

**Format:** Regular session

Local and microregional-based social and economic structures can be found at the roots of every macroregional and global power system. In historical periods, the circumstances of human life were primarily determined by these basic structures and networks, which were created by interconnected microregional centres.

We intend to investigate microregional and regional networks emerging in the Carpathian Basin and the neighbouring territories at the time of the early medieval transformation. In these geographical frames, after the collapse of the Roman *limes* and the short intermezzo of the Hun Empire, relatively weak formations built their own regional systems, communicating and competing with each other and the surrounding powers. One and a half centuries later, the Avar invasion unified the better part of the macroregion under one system. While certain elements of the late Roman system of "central places" seem to prevail, and there are other signs of microregional-based structures, from the late seventh century a radically new system of central zones emerged.

What kinds of social and economic opportunities helped to grow local communities and/or microregional power centres? Who or what were the catalisators of such processes? What kinds of processes drive their social and economic organisation? What were the factors preventing, helping, or even demanding cooperation between them? What kind of role did microregional centres or central areas play in structuring the surrounding area? And how could regional power reflect the problem of the presence of macroregional or global structures of considerably higher complexity?

We expect both case studies and theoretical presentations from the post-Roman period to the Middle Ages to investigate the questions of regionality, power centres, and central areas. We await contributions addressing the questions of the organization of communication, subsistence, production, redistribution of specialised craft products and strategic resources like salt, iron, and non-ferrous metals.

## ABSTRACTS

### 1 INTERACTIONS. THE AVARS IN THE VICINITY OF VIENNA

**Abstract author(s):** Daim, Falko (Institute of Prehistoric and Historical Archaeology, University of Vienna; Institute of Medieval Research, Austrian Academy of Sciences) - Tobias, Bendeguz - Pohl, Walter (Institute of Medieval Research, Austrian Academy of Sciences) - Wang, Ke (Max Planck Institute for Evolutionary Anthropology Leipzig) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology Leipzig; Department of Archaeology and Museology, Masaryk University, Brno) - Berner, Margit - Pany-Kucera, Doris (Department of Anthropology, Natural History Museum Vienna) - Ingrová, Pavlína (Department of Archaeology and Museology, Masaryk University, Brno) - Eggers, Sabine (Department of Anthropology, Natural History Museum Vienna) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology Leipzig)

**Abstract format:** Oral

The Avar cemeteries in the Vienna Basin, especially those of Mödling - An der goldenen Stiege and Leobersdorf, have helped to refine the chronology of Avar find types and burial customs. They also provided the impetus to rethink the successive settlement of the Avar territory. However, the analysis of archaeological and anthropological data also enabled insights into social life, forms of communication between groups of people, aspects of identity and demarcation from others, and relations with neighbouring entities to be explored. In recent years, however, with archaeogenetics booming everywhere, new data sets have been added which can be compared with archaeological-historical results. Mostly, the focus is on the "origin" of groups of people in the Avar empire, but it is now also possible to identify families, even entire family trees for individual burial communities (cemeteries) and possible relationships with people from neighbouring or even distant settlements.

The presentation will shed light on the possibilities and limits of modern archaeology, taking archaeogenetic data into account, and draw a new picture of life on the Avar country side.

### 2 OBERLEISERBERG - FROM SUPRA-REGIONAL TO LOCAL AND BACK AGAIN

**Abstract author(s):** Richards, Nina (Austrian Academy of Sciences)

**Abstract format:** Oral

The hill of Oberleiserberg in lower Austria, north of Vienna was an important supra-regional center in the late Roman resp. Migration period. With the beginning of the Early Middle ages, it loses its importance and one can only trace

local influences regarding material culture and archaeological remains. However with the political, social and cultural developments after the fall of the Avar Khaganate until the 10th century it regains its importance as a site where different spheres of influence - the newly established Hungarian kingdom as well as the Frankish Babenberg march and the Přemyslid Moravia - meet.

For that time an Arpadian age burial ground was excavated on the plateau of the limestone hill. The finds dating until the first half of the 11th century show best parallels in the east-alpine region/Ottonian Empire as well as in the Carpathian Basin. These finds, as well as the other nearby cemeteries with "mixed" inventory, suggest close contact between both realms in this border region.

Furthermore, stray finds from the plateau label the site as a central place with regional if not supraregional importance. 51 coins were found as well as a spherical weight. The coins, mint under several Hungarian kings, suggest close contact with that entity while comparable weights are most common in the Baltic region as well as Moravia. With those finds, the site of Oberleiserberg is comparable to contemporary sites like Kostice (Czech Republic) as well as the so-called productive sites in northwestern Europe.

At the end of the 11th century, the site loses its importance again.

### 3 "SCLAVI QUI DICUNTUR QUARANTANI" - SOCIAL SYSTEMS BETWEEN AVARS AND FRANKS

**Abstract author(s): Eichert, Stefan (Natural History Museum Vienna)**

**Abstract format: Oral**

In the Eastern Alpine region, after the end of the late Roman provincial administration, the first Slavic political structure was established, which is mentioned by name in written sources - Carantania. In the 8th century Slavic princes are described, which are Christianized and pass on the rule within a dynasty for several generations. In sum, then, a picture is conveyed that suggests a hierarchical and socially structured society on a macro-regional level.

The presented paper takes a look at written tradition, regional archaeological sources as well as theoretical concepts and discusses how, from a largely sociological point of view, the described circumstances can be interpreted.

The main archaeological sources known from this period are grave finds and, from the time of Christianization, church buildings. Overall, in terms of fashion, a strong Avar and even Byzantine influence is evident, while in military matters Frankish aspects predominate.

How can regional groups be interpreted on the basis of burial grounds and church buildings, and what is the relationship between the observed conditions and those conveyed in written sources for the eastern Alpine region?

### 4 SPACE USE IN SYRMIA DURING THE MIGRATION AND AVAR PERIODS

**Abstract author(s): Bugarski, Ivan (Institute of Archaeology, Belgrade)**

**Abstract format: Oral**

Although there is no general agreement on what geographic area constitutes Central Europe, Syrmia should certainly be considered its part. Lying between the Danube and Sava rivers, this history-soaked land used to be the northern fringe of the Roman Empire and, later on, the southernmost possession of the Avars. This region had been named after one of its few cities, the Late Roman capital of Sirmium, the birth-place of several emperors and home to many martyrs. By the beginning of the fifth century, the city started to lose its importance, and at the time of Attila Sirmium lost its administrative status. After the fall of the Hunnic Empire, Syrmia was controlled by the Ostrogoths, who would gradually leave for Italy. In 510 the Romans had to accept that the whole of Syrmia was Ostrogothic, except for its southeastern corner with the city of Bassianae, but already around 512 Emperor Anastasius settled the Heruls there. The Gepids, with short interruptions, held Sirmium for almost a century, from 474 to 567, when the Avars established their rule in the Carpathian Basin. In the course of more than a century, including the time of Justinian, who was unable to restore the rule to what it was before the barbarian settlement, the way of life and space use in Syrmia underwent significant changes, and it seems that the crisis was further deepened with the arrival of the Avars. Quite paradoxically with respect to all their efforts to capture Sirmium, which they finally did in 582, the Avars seem not to have settled Syrmia on a large scale. We know fewer than ten sites that produced Early Avar finds, while in the Late Avar period this number was doubled. Some of these finds testify to supra-regional trade.

### 5 BEYOND THE STRUCTURES: THE PROBLEM OF LACK OF BURIAL SITES IN EASTERN TRANSYLVANIA, NORTHERN-MUNTENIA AND -OLTENIA (7/8–10TH CENTURIES)

**Abstract author(s): Erwin, Gáll (Institute of Archaeology) - Hőgyes, Mihály Huba (Székely National Museum)**

**Abstract format: Oral**

In the scientific debates published to date, there is a huge number of contributions addressing the archaeological spectrum of burial sites in the Transylvanian Basin, Oltenia, and Muntenia from a general and comprehensive perspective, however, without taking into account regional or microregional conditions.

This omission is mainly caused by an antagonistic presumption of uniformity, perpetuated in the theoretical approaches in archaeology from the 18-19th centuries.

This contribution proposes to debate the lack of burial sites in certain regions of the Transylvanian Basin, Oltenia and Muntenia and it explains this hiatus to a lesser extent by the current state of research and much more probably by the differences in burial customs, respectively by the differently demographical indexes between these regions. Thus, the lack of funerary sites in the aforementioned regions, can be attributed primarily to the fact that in the 8-10/11th centuries these areas were a kind of "stateless", unintegrated into the "network" of powers in the early medieval times ("Avar", "Bulgarian", or "Hungarian"). Thus, without a doubt, in these regions, the identification of the funerary behavior of the populations from the 7th-10th centuries remains one of the future challenges for the archaeologists of the early medieval period.

## 6 CENTRES ON THE PERIPHERY: A MICRO-REGIONAL APPROACH CONCERNING THE CEMETERIES IN TRANSYLVANIA BETWEEN THE 6TH AND 8TH CENTURY

**Abstract author(s): Dobos, Alpár (National Museum of Transylvanian History - Cluj-Napoca)**

**Abstract format: Oral**

The Avar conquest in 568 caused radical changes in the cultural, social and economic dynamics of the Carpathian Basin, which had a major imprint on the material culture as well. Throughout its approximately two and a half century history, the Avar Khaganate itself went through a series of significant changes in matter of lifestyle and external connections that led to the emergence of a new type of redistribution system in the second part of the Avar Age. During the Avar period, Transylvania can be considered a peripheral region whose integration into the social and economic system of the Khaganate deserves special attention. Regrettably, it is one of the most understudied areas of the Carpathian Basin, which seriously hinders a thorough analysis and calls for caution in drawing conclusions.

One of the greatest challenges of the early Avar Khaganate was the integration of the various 'non-Avar' communities with different cultural backgrounds, which led to a cultural diversity with a heterogeneous material culture. In this mosaic-like picture Transylvania has generally been treated as a distinct, but rather uniform region, usually associated with the survival of the late Gepids. However, a closer examination can reveal several micro-regional differences which point towards certain external connections and different degrees of implication in the communication networks of the period. This situation changed radically in the late Avar period, when a regional centre with a military character emerged along the middle course of the Mureş/Maros River. The presentation will attempt to outline the shifts in the settlement pattern in Transylvania between the 6th and 8th century, reflecting on the micro-regional centres and their integration into the general picture of the Avar Khaganate.

## 7 NETWORK OF THE EARLY AND MIDDLE AVAR AGE CHRONOLOGY

**Abstract author(s): Samu, Levente - Blay, Adrienn (Institute of Archaeological Sciences, Eötvös Loránd University)**

**Abstract format: Oral**

As the archaeological chronologies are based mostly upon co-occurrences of different object types, thousands of belt garnitures, jewelleries and other clothing accessories - which are the most frequent and important finds of the early and middle Avar period (6-7th c.) - were built into a database to investigate their relationship to each other, and in order to test the existing Avar age chronologies. Though the visualization of the correlations between thousands of archaeological objects in a network in itself is a big challenge, it allows us to oversee the connections and raise special questions (regarding special cultural phenomena such as distribution of male graves earrings, changing elements of the representation culture etc.) for the different groupings in the archaeological record. Furthermore it helps us to visualize old problems and draws attention to the limits of the chronological interpretations of the material. What can we see in the changing picture of an enormous archaeological material and how can we distinguish between the cultural traits and chronological phenomena? The recent study reveals insight to these questions.

## 8 MAKE ME ONE OF THESE

**Abstract author(s): Šmalcelj Novaković, Pia (Institute of Archaeology) - Rapan Papeša, Anita (Municipal museum Vinkovci)**

**Abstract format: Oral**

If we leave elite Late Avar period warrior burials aside what story can be told from female perspective? Repertory of finds from Late Avar period female graves is rather modest, therefore every little exception makes a difference. Female graves are often considered to be reflection of their male equivalents and luxurious objects are symbols of stabile economy. One of such finds are crescent shaped lunular earrings which have not been in focus since the last one dealing with those being Z. Čilinská in the last century.

Crescent shaped lunular earrings with star shaped pendant occur on several Avar period sites in Croatia, both in graves as well as surface finds. We can distinguish two types: top notch specimens made in silver or bronze and

casted bronze imitations. High quality products must have been made in a very well organized workshop; imitations could have been local products. Possible existence of a highly specialized workshop raises the question of the role of the microregion in 8th century Khaganate. This work has been developed under project Life on the Roman road: communications, trade and identities on Roman roads in Croatia from 1st – 8th CE (Croatian Scientific Foundation; UIP-05-2017-9768).

## 9 IN THE CONTACT ZONE: REGIONALITY IN THE AVAR AGE MIDDLE TISZA REGION

**Abstract author(s):** Horváth, Ádám (Institute of Archaeological Sciences, Eötvös Loránd University)

**Abstract format:** Oral

The Middle Tisza region is a geographical mesoregion in the Great Hungarian Plain. The river Tisza intersects its land creating a border zone connecting the middle and eastern part of the Carpathian basin. Based on earlier archaeological research and the preliminary results of the exploratory data analysis, two local groups can be separated. One of them is the Tiszafüred group and the other one is the Tiszántúl group. The former has ties with certain Transdanubian groups while the latter is connected to other communities in the eastern part of the Carpathian basin. They may have connections to different social groups (ethnicities?). The author of this paper seeks to examine three question groups regarding the local, microregional and macroregional structures of the mesoregion: (1) What kinds of historical, social (attitudes toward gender or age, and their connections to group identities), economic (subsistence strategies, rate of social inequalities, earlier and contemporary infrastructure) and environmental (changes in the river systems or climate, natural borders) events and processes affected or driven these local groups and their organisations? How do these events and processes affect each other or reflect a macrostructure? Are there any of them helping or preventing the growth, change and cooperation of each communities and local groups? Is there any factor demanding ingroup and outgroup cooperation? If yes, are there any signs of these? (2) Can any of the cemeteries be connected to central places in the mesoregion? If yes, do these places structure the region? (3) Is there any sign in the local and microregional level of the analysis of macroregional structures? If yes, can the differences between the local groups and communities be explained by different roles they played in the macroregional structure or by different opportunities each groups and communities had?

## 10 ANIMAL SKINS AS SIGNS OF SOCIAL STATUS? INTERPRETATION OF AN EARLY MEDIEVAL BURIAL CUSTOM IN EASTERN HUNGARY

**Abstract author(s):** Gulyás, Bence (ELTE)

**Abstract format:** Oral

The skulls and the lower legs of the horses, which are presumably left in the skin, are common features in the early medieval graves of the stock-breeder societies in the western part of the Eurasian steppe belt. Based on the most common interpretation, the appearance of the horse skin burials refers to an economic crisis. According to these views, society cannot afford such a waste of meat, so the animals were eaten during the feast except for their heads and legs. However, this explanation is insufficient and outdated. In the area of the present study, a large number of graves contain more than one animal skin, which contradicts the theory of impoverishment. The accumulation of animal skins in the graves is common in the western fringe of the Tiszántúl region, along the Tisza and Maros Rivers. The Byzantine import finds are just like the gold items concentrated in these microregions as well. Is there a link between the number of animal sacrifices and the number of status-related finds? In my presentation, I will try to answer these questions.

## 11 EVIDENCE OF GLASS BEAD PRODUCTION IN THE “LATE AVAR” PERIOD CARPATHIAN BASIN

**Abstract author(s):** Fülöp, Réka (Hungarian National Museum / Magyar Nemzeti Múzeum) - Bajnóczi, Bernadett (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, Eötvös Loránd Research Network - ELKH)

**Abstract format:** Oral

In the 8th and 9th centuries, the glass trade was significantly transformed. Our analysis focuses on how the changes in the major redistribution centres affected the Carpathian Basin. In total, more than 4500 beads from 17 cemeteries were examined. From these series, after detailed morphological studies, 50 beads were selected for microchemical and microtextural analysis. In the 8th century, soda glass, which followed Roman and post-Roman traditions, was gradually replaced by glass made with alkalis from the ashes of halophyte plants. This phenomenon is generally associated with the emergence of new production centres in the Islamic world. Long-distance redistribution is well documented by the occurrence of metal-foil beads and millefiori beads. At the same time, glass material obtained from the primary production centres via trade was locally processed into beads of different shapes and colours. Based on the technological features, we can assume that in the 8th and 9th centuries a regional tradition of making glass beads was developed in the Central Danube Basin, with several local differences. We have also found evidence for lead glass, which is significant since it is presumably closely related to the appearance of local workshops.

The local network shaped an interconnected system of workshops of relative cultural independence, maintaining close relations with each other. The characteristic regional bead types of the late Avar period, like melon-shaped beads, can mostly be traced back to Roman traditions. Additionally, new bead-making techniques emerged: copper metal sheets were used to make beads, "hair effect" appearance on the bead bodies, and some other techniques were developed to imitate high-quality beads, made with highly specialised technological knowledge. Thus, our archaeological analysis aimed to find answers to the issues of production, and cultural processes that took place in the late Avar period.

## 12 CHANGES IN THE COMPOSITION OF COPPER ALLOYS IN THE CARPATHIAN BASIN DURING THE LATE AVAR PERIOD

**Abstract author(s):** Mozgai, Viktória (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, Eötvös Loránd Research Network - ELKH) - Szenthe, Gergely (Hungarian National Museum) - Villa, Igor (Centro Universitario Datazioni e Archeometria, Università di Milano Bicocca; Institute of Geology, Bern University) - Bajnóczi, Bernadett (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, Eötvös Loránd Research Network - ELKH)

**Abstract format:** Oral

We have still only a few data about the production, distribution and use of non-ferrous metals during the Early Middle Ages (8th century AD). However, the origins of the largescale medieval European use of non-ferrous metals seem to go back to the 8th and 9th century AD. Therefore, in our project we investigate this period in detail. During late Avar period there was a drastic change in the use of metals in the Carpathian Basin, which is primarily reflected by the drastic growth of copper alloys in circulation. Although some traces indicate that the production of certain strategic goods (especially iron) had begun in this region, in case of copper we have not known the sources yet. The study of the copper alloys distributed en masse in the entire Carpathian Basin contributes not only to our knowledge about the technological traditions, but through the combined use of lead isotope and chemical analyses we expect results on the sources of the copper, too. According to the first results, the mostly cast objects were manufactured from lead-tin bronzes. However, the alloy compositions underwent some changes between the first and second half of the late Avar period. The difference is detectable in the more heterogeneous alloy compositions of the later part of the period, and in the presence of higher zinc content as well. The composition of the rivets has also changed. While the first half of the late Avar period is represented by rather homogeneous unalloyed copper, in the course of time the size of the rivets became smaller and their composition more heterogeneous with higher amount of lead, tin and zinc. The lead isotope composition of the unalloyed copper rivets was compared to the lead isotope database of copper ores, and most probably a northern source can be assumed.

## 13 BOUND BY BELTS. SOCIAL NETWORKS IN THE LATE AVAR PERIOD CARPATHIAN BASIN (LATE SEVENTH–EARLY NINTH CENTURY AD)

**Abstract author(s):** Szenthe, Gergely - Soós, Bence (Hungarian National Museum)

**Abstract format:** Oral

The Avars are traditionally interpreted as a nomadic people who arrived in the Carpathian Basin in the 6th century AD. In fact, in the first half of the Avar era; war booty and gifts played a decisive role in operating Avar society. After the mid-7th century, rapid changes led to the emergence of a radically new cultural, economic, and most probably, social model. The context of this "Late Avar" culture was the early medieval transformation of the European environment. This time, settlement became relatively dense in the Carpathian Basin and early village structures occupied new zones. The emergence of new regional centres or settlement hubs, and the restructuring and development of agricultural and craft production are well-proven. More recently, there is also a growing body of research on the social background of this system, as well as its embeddedness in the redistribution and power network. This latter issues are explored in our research in relation to a specific type of object, the ornamental belt. The circumstances in which ornate belts were deposited suggest their role in social representation. From the Late Avar period, we know of thousands of belt ornaments, mainly cast in copper alloy, from 20 to 40 percent of the Avar male burials. Our network analysis is based on the ornament combinations of 962 belt sets. By applying network models and statistical methods we hypothesized the main traits of the social mechanisms that shaped the visual representation of the Late Avar communities and patterns of interaction within the Late Avar society.

**Theme: 2. [Re]integration****Organisers: Denis, Solène (Masaryk University; UMR 8068 TEMPS) - Defranould, Elsa (Université Côte d'Azur; UMR 7264 CEPAM) - Kačar, Sonja (University College Dublin, School of Archaeology; UMR 5608 TRACES) - Szilágyi, Kata (Kiel University, Institute of Pre- and Protohistoric Archaeology)****Format: Regular session**

Borderline is understood here as an umbrella term for spatial, temporal overlapping and social processes which clearly shows the indefinite situations, so-called transformations. Our session will explore this notion thanks to lithic analysis. Neolithic cultural entities were mainly defined based on the typo-stylistic analysis of the pottery, neglecting other materials. Lithics have been poorly included in this issue. But they are a first-choice proxy to overcome the spatial perception of these entities. Indeed, of very good conservation, they are ubiquitous on prehistoric settlements and thanks to recent development, it is often possible to finely identify the raw material outcrops. Furthermore, because any action on the material is irreversible, they are offering first-rate documentation to decipher technical know-how. As such it is possible to draw and compare new spatial groupings: systems of the value of lithic tools among groups, raw material circulation networks, communities of practice...How to sketch their outlines? Are there overlaps between different spatial proxies? How to qualify frontiers/margins effects? Our session aims to [re]integrate lithic industries in the construction of Mesolithic and Neolithic narratives, especially from a methodological point of view.

In this perspective, we want to gather experts from Europe with different research traditions to identify and explain borderline effects.

We welcome contributions to the following questions:

1. Methodological point of view: how to highlight the phenomena of boundaries/margins (geographical, spatial, chronological, cultural) from the lithic data?
2. [Re]integrating socio-historical interpretations from this approach: how deciphering European Neolithic according to its lithic's borderline brings new insights in the understanding of these societies? Which social processes are at play in margins areas - (im)permeability, interaction, opposition, mixture, innovation?

By comparing these spatial patterns on a large European territory, we want to challenge the diversity of behaviours of these first agro-pastoral communities facing different environmental and geographical areas.

**ABSTRACTS****1 MULTI-LAYER ANALYSIS AND THE IDENTIFICATION OF DIFFERENT BORDER[LINES]: IF ONE CROSSES THE LINE?****Abstract author(s): Denis, Solène (Masaryk University) - Defranould, Elsa (Université Côte d'Azur, UMR 7264 CEPAM) - Kačar, Sonja (University College Dublin, School of Archaeology) - Szilágyi, Kata (Kiel University, Institute of Pre- and Protohistoric Archaeology)****Abstract format: Oral**

Lithic analyses reveal multiple interdependent spatial organisations, questioning their social meaning. We suggest here to discuss the articulation between three scales: long-distance circulation networks; regional communities and settlements organization. To introduce this session, we will gather different examples from Central Europe, North-Western Europe, and the Mediterranean area to compare the different spatial patterns underlying the dimensions of connectivity or isolation between territories. According to the three scales defined, we will question the different perceptions of borderline effects. The confrontation between our different examples will be dedicated to bringing new insight into the social meaning of these margins/boundaries. Besides this, our goal is also to discuss these social-material-technological borders, and how can we compare them with relation to different geological units. We have to pay special attention to the fluid character of borderlines, which derives from the flexibility of the border idea, e.g. the potential borders relating to raw material distribution could be different than those relating to technological traits.

**2 BETWEEN THE BALKANS AND THE MEDITERRANEAN: INTERACTIONS, INTEGRATIONS AND BORDERS DURING THE LATE MESOLITHIC AND EARLY NEOLITHIC OF SOUTH-EASTERN EUROPE****Abstract author(s): Kacar, Sonja (University College Dublin; TRACES, UMR 5608)****Abstract format: Oral**

Prior to the arrival of Neolithic settlers, south-eastern Europe was inhabited by local groups of hunter-fisher-gatherers, who, between cca. 6500 and 5500cal BC, occupied the area between the Balkans and the Adriatic. These Late Mesolithic groups are broadly identified with the so-called « Blade and Trapeze technocomplex » of western Eurasia. Known as Castelnuovian culture in the context of the central-western Mediterranean, their lithic assemblages

are characterized by a change in the conception of technological systems and the emergence of new knapping techniques.

The social mechanisms behind these transformations still require proper characterization and to date several explanations have been suggested, but there is no consensus. However, the disruption of the entire technological system can be primarily explained by an influx of foreign traditions.

This presentation aims to confront lithic data obtained from Montenegro, Croatia and Slovenia in order to examine the development of the Late Mesolithic of south-eastern Europe. Can it be viewed as a uniform phenomenon (emerging from the same "centre of origin") or is it possible to observe local/regional particularities, i.e. Late Mesolithic of south-eastern Europe as a result of the integration of different traditions. How can this be approached from the perspective of lithic assemblages? Are there notable differences in the traditions of lithic production (e.g. use of different methods and techniques, manufacture of different tool types) and if so, do they coincide with geographical borders, i.e. is there a difference between continental and littoral regions? Finally, how did these Late Mesolithic traditions shape the future "cultural boundaries" that would designate the Early Neolithic of south-eastern Europe?

### 3 THE STONE INDUSTRY FROM THE LOWER VOLGA REGION SITES DURING THE NEOLITHIZATION.

**Abstract author(s):** Vybornov, Alexander (-) - Kulkova, Marianna (-) - Giljazov, Filat (-)

**Abstract format:** Oral

The Lower Volga region is located in the steppe and semi-desert zones. The transition to domestication connects with the Cis-Caspian (Prikaspiyskaya) culture. The stone industry of this culture has strong differentiation from previous Neolithic Orlovskaya culture. For the manufacture of stone tools, the new raw source of stone has been used. Flint was exchanged for quartzite. There are known quartzite sources in the Lower Volga region. This quartzite type has differences in comparison with sources used in the earlier cultural tradition. This is evidence of raw material source changing. The new enhanced pressure technology to obtain long and wide plates was developed. The assortment of stone tools has been changed also. The microliths disappeared and arrowheads were used. They were treated by means of the bifacial retouch. Their shape is a peculiarity of the Cis-Caspian culture. All these transformations were connected with the appearance in this region of new population. The conjunction of the special raw material sources used, the technique of chipping, and different types of stone tools allows us to mark the territorial borders of the Cis-Caspian culture distribution and establish their chronology from ca. 5500 to 5000 calBC. On the base of these features, the traces of this culture were found in other regions and also other chronological periods. For example, about 5000 calBC in the stone tool assemblage of the Khvalinian culture in the Lower Volga region there was noted a combination of flint and quartzite raw sources which has been applied for tool making. The technique of an enhanced pressure was used for tool making. This supports the influence of the Cis-Caspian culture on the formation of the stone industry of the Khvalinian culture.

### 4 MODES OF CHIPPED STONE TOOLS PRODUCTION OF THE EARLY FARMING SOCIETIES IN THE SOUTH OF THE EASTERN EUROPE

**Abstract author(s):** Kiosak, Dmytro (Ca' Foscari University of Venice)

**Abstract format:** Oral

The chipped stone assemblages of early farmers (EF) in the south of the Eastern Europe take several shapes. 1) They can have a developed laminar component, with production wastes underrepresented, with a high percentage of retouched items (mostly blades with lateral retouch and end-scrapers on blades), an exploitation of a high-quality long-distance imported raw material. These assemblages usually are numerically small. 2) Some complexes demonstrate a "simplified" technical set (wide use of hard-hammer), many wastes of production, relatively low percentage of formal tools, most retouched tools on flakes (mostly retouched flakes and end-scrapers on flakes), an exploitation of medium quality local chert. These assemblages are relatively larger in numbers. The latter complexes are often explained via the interaction with a local hunter-gatherers' population.

An alternative explanation can be sought via the notion of social organization of flintworking by EF. The EF were able to develop a complex system of flintworking based on intra- and inter- communal specialization and constant exchange of blanks and tools. The complexes of the first type result from an inclusion of a settlement into its exchange network. The complexes of the second type represent domestic production of households, satisfying its needs on its own, being excluded from its exchange network. So, EF flintknapping existed in two modes: "domestic" and "exchange". "Exchange" mode is a common way of chipped stone tools production in early farming societies. "Domestic" mode is common in "borderline situation" under conditions of on-going Neolithization of new terrain. Every early farming lithic assemblage can be treated as composed of products of these two modes to varying degree.

## 5 UNDERSTANDING EARLY NEOLITHIC LOCAL COMMUNITIES THROUGH THEIR TECHNOLOGICAL TRADITIONS: THE DISTRIBUTION OF THE CASA MONTERO FLINT IN CENTRAL IBERIA

**Abstract author(s):** Castañeda, Nuria (Universidad Autónoma de Madrid) - Herrero-Alonso, Diego (Museo Arqueológico de Cacabelos; Universidad Autónoma de Madrid) - Cabrera-Taravillo, Cristina (Universidad Autónoma de Madrid) - Tarrío, Antonio (Universidad del País Vasco/Euskal Herriko Unibertsitatea) - Consuegra, Susana - Díaz-del-Río, Pedro (Consejo Superior de Investigaciones Científicas - CSIC)

**Abstract format:** Oral

The Early Neolithic communities of central Iberia were considerably small and mobile and developed aggregation mechanisms in order to build and maintain extra-local relationships. One such activity was flint mining. Communal events created shared knowledge, experiences and technological traditions that reinforced a sense of community and belonging. Perhaps the main evidence of these local traditions is the deliberated addition of crushed bone as temper in most pottery containers.

The second line of evidence comes from the extraordinary archaeological record recovered at the Casa Montero flint mine, one that displays the organizational complexity of early farming communities, most noticeable in the array of learning activities that assured the continuity of knowledge and traditions. However, the site and the vast amount of invested collective labor contrasts with the striking scarcity of its contemporary domestic record.

Small flint blades were the main production at Casa Montero. These blades were subsequently distributed through both mobility and social networks. We present the first technological and petrological analyses of a set of contemporary lithic productions from ten sites. Results suggest that lithic production is another key way of approaching, recognizing and tracing technological tradition of these Early Neolithic groups.

## 6 OUTSIDE THE BOX – LITHIC ANALYSIS AS AN INDICATION OF EARLIEST LBK CROSSING CULTURAL BORDERLINES

**Abstract author(s):** Bauer, Lisa (University of Erlangen-Nürnberg)

**Abstract format:** Oral

For the earliest LBK in Central Europe, Southern Bavaria marks a marginal area of the Early Neolithic distribution. To the south, the northern Pre-Alps represent an "empty space", where no simultaneous interaction or landuse can be shown archaeologically. Therefore, the Southern Bavarian area is suitable as a basis for discussing several aspects regarding borderline phenomena – from diverse landuse and raw material procurement to cross-cultural contact and interaction. Regarding Neolithic research in this region, the focus has been largely on pottery analysis as basis for chrono-cultural questions, leaving lithic analysis as a proxy for spatial processes at a lower resolution. To confront this gap in the empirical basis, a lithic assemblage from an earliest LBK site in Southern Bavaria in the Isar valley was studied with a special focus on typo-technological aspects and raw material analysis. As a result, the raw material use shows bridges to the southern Alpine region and Switzerland, which supports the assumption of a more permeable quality of the clear-cut archaeological borders. This opens up discussion about the agents and processes of long-distance raw material transport, relations of cultural entities as well as mobility of the earliest LBK itself across its archaeological borders.

## 7 NIGHTMARE AT THE BORDER: LIMINAL CONTACTS AND POROUS MARGINS DURING THE 6TH AND 5TH MILLENNIA IN SOUTHERN FRANCE

**Abstract author(s):** Defranould, Elsa (CEPAM - UMR7264) - Galin, Wilfrid (Paléotime; UMR5608-TRACES) - Gibaja Bao, Juan Francisco (Escuela Española de Historia y Arqueología en Roma - EEHAR-CSIC, Consejo Superior de Investigaciones Científicas)

**Abstract format:** Oral

Defining precisely the notion of borders has always been a delicate exercise for the prehistorian, since we generally only focus on the material aspects of borders. Generally, the cultural or chronological definition of an entity involves the perception of the limits of these different technical, economic or symbolic features, which we then sometimes consider as a frontier. The approach to supply systems and the circulation of raw materials on the one hand, and the recognition of technical traditions, their diffusion, adoption or rejection on the other, constitute heuristic keys in an attempt to circumscribe chronocultural entities. Finally, understanding what happens on the periphery of these entities raises the question of whether it is possible to characterize the presence of real border phenomena (temporal, spatial, cultural), or on the contrary to consider these margins as spaces of cultural syncretism or zones of multiple influences.

Using examples from Southern France in the second half of the 6th to the beginning of the 4th millennium, we will see how lithic industries allow us to understand various manifestations of these liminal phenomena and their social and economic implications. In particular, we are interested in the development of large-scale specialist product distribution networks; focusing on areas perceived as peripheral. In this paper, we will try to distinguish in the lithic pro-

ductions what are internal anchorings and what testify to external influences, as well as dealing with the integrations or modifications of the different technical systems. Technical borders, symbol borders, zones of syncretism, shared or confronted networks... We will see how the lithic industries testify that the Neolithic margins are not hermetic borders but rather porous zones of passage marking discontinuities while affirming and recomposing cultural identities.

## 8 OBSIDIAN AND BLOND BALCANIC FLINT - SILEX SANS FRONTIÈRES?

**Abstract author(s):** Sommer, Ulrike (Institute of Archaeology, UCL)

**Abstract format:** Oral

Ulrike Sommer, Ivana Jovanović

The distribution of lithic raw materials is normally interpreted in terms of trade "as an action of distance". In contrast, pottery styles and lithic tools are traditionally used to define archaeological cultures, or areas of closer interaction.

We are going to look at two types of lithic raw material, blond Balcanic flint from Bulgaria and Carpathian obsidian which are widely distributed in South-East Europe, in order to understand how cultural boundaries influence the distribution of these two materials, both in the early Neolithic (Starčevo-Körös-Criş) and the later Vinca-LBK-Bükk-ALP horizon. We will ignore Wolhynian flint, as it is not found in all of the study area, which can be roughly defined as the Middle Danube and its tributaries. We will discuss if there are different processes of distribution for each obsidian and Balcanic flint. To understand the networks of exchange in general, this should be combined with studies of more local lithic raw materials, lithic technology and lithic tool types, intra-settlement distributions of lithic artefacts, as well as the study of other raw materials like pottery, ground stone, spondylus and copper. This can only be done in an impressionistic manner at the moment, for systematic studies databases are needed.

## 9 EXCHANGE NETWORK BORDERS AND TECHNICAL TRANSFERS ACROSS NEOLITHIC MIDDLE BELGIUM AROUND 4000 BCE

**Abstract author(s):** Collin, Jean-Philippe (Paris 1 University; Namur University)

**Abstract format:** Oral

Between 4300 and 3650 BCE, the area between the Rhine and the Scheldt was occupied by populations belonging to the cultural entities of the so-called Belgian Michelsberg and the Group of Spiere.

In this area of Europe, lithic resources are concentrated on a band of Cretaceous outcrops corresponding to Middle Belgium. At the turn of the 5th and 4th millennia, in the midst of a demographic increase, three mining complexes developed across Middle Belgium, in the Mons Basin, in Hesbaya and in Limburg.

Although geographically distinct, these complexes share a series of common features, notably the centralization and control of the large blades production on the major mining sites of Spiennes (Mons Basin), Orp (Hesbaya) and Rijckholt (Limburg). Moreover this production highlights exclusive technical transfers between them. What socio-economic or cultural processes are at work, as those relationships between the very beating heart of each mining complex appear to be in contradiction with the current vision of autonomous sites feeding contiguous exchange networks? Where are the borders when data derived from lithic technology and exchange networks appear to give conflicting signals?

## 10 SOME DIAGNOSTIC PHENOMENA AMONG STONE TOOLS IN THE HUNGARIAN NEOLITHIC

**Abstract author(s):** Farago, Norbert (Eotvos Lorand University, Institute of Archaeological Sciences)

**Abstract format:** Oral

Research into the Neolithic period in Hungary (between 6000 and 4600/4500 BC) began at the beginning of the last century, and the frames of the cultures we use today were coined relatively early. Not surprisingly, the relevant units, for example, Körös culture, the Bükk culture, or even the Tisza culture, were distinguished based on their ceramic styles and forms. In the last hundred years, Hungarian prehistoric research has done much to delineate the spatial and temporal boundaries of these cultures, and by the 1980s a chronological system had crystallized that is still valid today, while the ceramic-centered approach remains dominant to this day. Although systematic research on Neolithic knapped stone tools does not have a long history, the lessons of the last thirty years are sufficient to try to compare the experience with other elements of material culture and to draw further conclusions by integrating them at a higher level.

It is generally agreed that the expedient nature of Neolithic stone tools does not allow for the kind of sophisticated typologies that we know from the Palaeolithic or Mesolithic. However, we are not necessarily lacking general phenomena that could be used to distinguish one region, period, or one archaeological culture from another. These phenomena may be differences in the choice of raw materials, differences in typology sets, or technological changes. For example, the abundance of end-scrapers and distant, trans-Carpathian raw materials can be connected to the Late Neolithic on the Great Hungarian Plain. However, almost all these phenomena have one common characteristic that can be considered generally true, namely that they are not necessarily exclusive, but rather can be

considered as a rule of thumb. In this presentation, these observations in the Carpathian Basin will be explored and interpreted in the context of our classically known cultural units.

## 11 LITHICS AS PETRIFIED GATEWAYS BETWEEN SOCIAL-MATERIAL-TECHNOLOGICAL BORDERS

**Abstract author(s):** Szilagyi, Kata (Kiel University)

**Abstract format:** Oral

The Carpathian Basin is often called as borders between East and West, which is also the title of the permanent archaeological exhibition of the Hungarian National Museum. In addition to this, we can find several art history and contemporary art, cultural anthropological and also archaeological exhibitions with the same title. This is not a strange coincidence, it emphasizes the similar phenomena of diverse human-made materials and modified landscapes between two different worlds – the Eurasian Steppes and temperate Europe. If we look closer the archaeological research history, we can see that the reaction to the diversity of the archaeological material was to create several contemporary cultures and subgroups. This approach was methodologically largely based on the pottery decorations and the major vessel styles, which were used to indicate regional differences and variations, which were in turn identified with social units and supposed spatial borders between them.

In this paper, I instead focus on the lithic material in Neolithic and Copper Age in Carpathian Basin and its surroundings. I will use the lithic assemblages as an interwoven layer of spatial interaction which show different spatial dynamics as opposed to the pottery-based units. This gives us a broader understanding of the complexities of interregional exchange and social interaction and their change over time.

## 12 CHIPPED LITHICS VS POTTERY. DECIPHERING THE MATERIAL AND SOCIAL PAST IN THE NEOLITHIC OF THE POLISH TERRITORIES

**Abstract author(s):** Nowak, Marek (Institute of Archaeology, Jagiellonian University, Kraków) - Wilczyński, Jarosław (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences, Kraków) - Brzeska-Zastawna, Agnieszka - Zakrzewska, Justyna (Institute of Archaeology, Jagiellonian University, Kraków)

**Abstract format:** Oral

Reconstructions of the spatial and to some extent chronological differentiation of the European Neolithic, at least in the 'continental' tradition, are based on pottery. Consequently, other elements of Neolithic material culture are subordinated to ceramic divisions. This also applies to chipped lithics, which results in the biased picture of the past. In reality, chipped lithics were a very important element of Neolithic culture, perhaps even more permanently and fundamentally recording technological, typological, functional, social and mental boundaries, when compared to pottery (susceptible to short-term stylistic fashions). Comparative analyses from today's Poland clearly indicate that spatial and temporal borders of visible, territorially and chronologically distinct lithic entities do not coincide with the borders of traditional Neolithic entities, distinguished on the basis of pottery. Only by way of example let us signal two phenomena. As a matter of facts, one entity constitutes chipped lithics of the Linear Pottery culture as well as of many, highly differentiated, post-LBK units (Stroke Band Pottery culture and early/middle Lengyel-Polgár complex). On the other hand, within the Funnel Beaker culture, relatively homogeneous from pottery perspective, several entities within the chipped lithics are easily discernible. The presentation will first present the circulation networks which can be deciphered based on chipped lithic phenomena. The relationships between them and to other circulation networks will be analysed as well. Secondly, social processes which may have been hidden behind these networks and their transformations will be considered. In conclusion, we will argue that the obtained inferences change previous narratives on the diversification and development of Neolithic communities in Polish territories. The presentation will use data from Neolithic sites in Poland, including the multicultural site at Miechów (western Lesser Poland), which will be used as a case study, due to very recent investigations (within the project no. NCN 2016/23/B/HS3/00387).

## 13 LITHIC INDUSTRIE(S) AND STYLISTIC ENTITIES DURING THE EARLY NEOLITHIC (RUBANÉ) IN THE RHINE-MEUSE-SEINE BASINS

**Abstract author(s):** Allard, Pierre - Delvigne, Vincent (CNRS-UMR 8068 TEMPS)

**Abstract format:** Oral

The study of the decorated ceramics of the Rubané or Linearbandkeramik (LBK) has long structured the construction of the chronological sequence of the Early Neolithic of northwestern Europe. Recent contributions make it possible to individualize regional stylistic groups. After a common stylistic stage - the Flomborn entity - the examination of the different regional corpus shows that from the dislocation of this entity, the decorative elements of each region present different evolutions, individualising entities that sometimes seem very homogeneous from a stylistic point of view of the decorations (e.g. the Rhine-Meuse set during the Middle LBK).

This contribution aims to compare the results coming from the ceramic corpus with those of the lithic industry, that shows beyond common basis, regional differences that are also quite significant, whether from the point of view of the procurement of raw materials, their knapping processes and of the tool typology. For example, the geographi-

cal network of raw materials circulation shows preferential axes between certain regions or, on the contrary, border effects that should be confronted with the entities previously defined by decorated ceramics. The theoretical significance of these first observations and the contribution that the techno-economic analysis of lithic industries can make to the understanding of the relations between communities in the Early Neolithic of the Rhine-Meuse-Seine basins will be examined in the framework of this presentation.

## 14 CLASSIFYING BEHAVIOUR FROM ECOLOGICAL PATTERNS. A STUDY OF DIVERSITY IN EARLY NEOLITHIC SICKLES AND BOTANICAL REMAINS IN THE IBERIAN PENINSULA

**Abstract author(s):** Barrera-Cruz, María - García-Puchol, Oreto (Department of Prehistory, Archaeology and Ancient History. University of Valencia) - Cortell-Nicolau, Alfredo (Department of Archaeology. University of Cambridge) - García-Rivero, Daniel (Department of Prehistory and Archaeology. University of Seville)

**Abstract format:** Oral

The identification of different kinds of crop management over space and time is a crucial aspect for the understanding of the Neolithic spread. In this regard, at least two aspects must be considered. First, the current state-of-the-art, revealing oscillations in the crop spectrum and differences in the harvesting technology which have been linked to various episodes of population movements. Second, the underdetermination problem, where archaeological analysis of cultural transmission and spread is frequently forced to rely on large-scale spatio-temporal records.

Considering these aspects, this presentation focuses on the Iberian Peninsula to explore such changes at a higher resolution and at a regional scale. How diverse are these Early Neolithic groups according to the way they interact with the environment? Is the variability in the crop package significative? Which are the factors responsible for this diversity? Could the harvesting lithic set undergo modifications due to fluctuation in the crop spectrum, or were the changes only determined by cultural factors? To what extent can we recognize dispersal and/or culture transmission of Neolithic farmers from the classification of farming behaviour?

In order to answer these questions, we propose a multi-proxy approach where we explore specific differences in the crop package between Early Neolithic groups. This will include the analysis of domestic taxa dominance or diversity, as well as analytical approaches to adventitious species management, all within a multiple time-window chronological frame. Ultimately, we will address whether changes in farming practices relate to lithic technology or we must look for differences in the material culture under the perspective of stylistic and cultural transmission dynamics.

---

## 254 UNDERSTANDING THE DYNAMICS OF MAKING AND TRADING GOODS ACROSS MEDIUM AND LONG DISTANCES IN THE 2ND MILLENNIUM BC

**Theme:** 4. Polis, Empire, League and Beyond – Living in Interconnected Societies

**Organisers:** Roberts, Benjamin (Department of Archaeology, Durham University) - Ialongo, Nicola (Georg-August-Universität Göttingen, Germany) - Williams, Alan - Badreshany, Kamal (Department of Archaeology, Durham University)

**Format:** Regular session

It has long been known that the widespread adoption of tin-bronze across Europe, north Africa and Asia during the 2nd millennium BC had to be underpinned by an extensive connectivity linking directly or indirectly metal producers and consumers. However, the debates concerning the economics and logistics of this Bronze Age trade have tended to concentrate upon single sites or single materials (e.g. metal, ceramics, glass, amber etc.) or widely distributed artefact types. This seems to be missed opportunity especially in the light of limited engagement with potentially overlapping debates concerning the transmission of technologies and foodstuffs, the movement of people as well as the nature of economic systems during the 2nd millennium BC. This session seeks consider how to define and evaluate the dynamics of the Bronze Age trade. The aim is explore, using examples of various traded goods: the organisation of production; the direction and logistics of transport; the potential quantities involved; what was traded; who was involved; the knowledge and expertise required; and the broader economic and social implications.

## ABSTRACTS

### 1 "INTERLINKING EXCHANGE" : FIRST LESSONS FROM THE STUDY OF TEMPORALLY AND SPATIALLY FAR-REACHING RAW MATERIAL-EXCHANGE NETWORKS

**Abstract author(s):** Kerig, Tim - Hilpert, Johanna (ROOTS cluster of excellence CAU Kiel)

**Abstract format:** Oral

The systematic synthesis of individual studies on trade networks of single raw materials (e.g. flint, ground-stone, amber, ivory, glass, metals) has long been missing in prehistoric archaeology. With an increasing interest in economic archaeology and at the same time with new tools of informatic network studies, new possibilities for data collection, organisation and analysis are now emerging.

The contribution will present first results of the joint analysis of different data sets on sourced raw materials from a large area (Europe, North Africa, West and Central Asia) and in long time series (Mesolithic to Late Bronze Age). Interesting fundamental differences are already becoming apparent: a quantitative classification of different exchange networks makes it possible to show different network activities over time.

Using examples from our case studies we will show several network-effects which are important for the research into the second millennium BCE. We will define scales of exchange networks (e.g. household, landscape, kingdom, inter-continental) as well as spheres of interaction (e.g. family, market, administration, diplomacy).

In our current project "Interlinking Exchange", such networks are brought together by the collaboration of the respective researchers. The interdisciplinary project is located within the Cluster of Excellence ROOTS as a collaboration between prehistoric archaeology and data-sciences. It connects archaeologists from all over Europe and works as a moderated but basically open platform for the cooperation of interested parties.

## 2 SCRAP FOR CASH: ASSIGNING MONEY A ROLE IN THE ECONOMY OF LATE PREHISTORIC EUROPE

**Abstract author(s): Ialongo, Nicola (University of Goettingen)**

**Abstract format: Oral**

Prehistoric archaeology never acknowledged money a role. For decades, prehistoric economies were believed to be so small and 'primitive' that they could not be explained by modern economic principles. In recent years, the narrative has changed radically. Increasing evidence suggests that – starting c. 2500-2000 BCE – the whole of Western Eurasia became entangled in a continental trade network driven by the need to secure the supply of copper and tin. However, while research on Bronze Age currencies is slowly starting to provide compelling evidence, money still has not found its place in the grand narratives of prehistoric Western Eurasia.

Data show that, in the Late Bronze Age of Italy and Central Europe, bronze objects were intentionally fragmented to obtain pre-determined mass values, and that these values complied with the weight systems that were in use in those regions where these fragments circulated. The most plausible explanation for this phenomenon is that fragmentation was meant to create small portions of metal that matched the value of the quid pro quo that was required to complete a transaction. That is, what today one would call a price.

Being able to identify metal currencies, however, does not explain why money emerged and how it was used. In this paper, I will explore the significance of monetary patterns of exchange in modelling the movement of metals in late prehistoric Europe. While current research focuses on top-down models of organized, long-distance trade, I will explore the potential role of metallic currencies in sustaining a vast distributed network of small-scale, short-range exchange.

## 3 DYNAMICS OF METAL PRODUCTION IN THE 2ND MILLENNIUM BC EURASIAN STEPPE

**Abstract author(s): Calgaro, Ilaria - Radivojević, Miljana - Altaweel, Mark (University College London - UCL)**

**Abstract format: Oral**

Nomadic pastoralists of the Eurasian Steppe were the major producers and suppliers of copper and bronze in Eurasia during the 2nd millennium BC. Nevertheless, what role did metallurgy play in shaping socio-economic relationships between and beyond the Bronze Age steppe communities is still contentious. Given the volume of copper alloys produced and traded at the time, the characterisation of metalmaking technology in the steppes emerges as a key aspect to inform on the dynamics of communication and supply networks that underline the Bronze Age economy in the Eurasian Steppe.

In a previous work, we built a database of metallurgical evidence collected from 14 small- and large-scale metal-making sites across 2nd millennium BC in the steppes and Eurasia in order to observe patterns of production that may connect them. It highlighted the diverse pathways metalsmiths at the time took to master the two stages of metallurgical production – matting and matte smelting – mainly through different furnaces design and recipes.

This contribution expands on our former results by developing an SQLite database in QGIS including compositional and provenance legacy data from 144 2nd millennium BC workshops, metal extraction sites, settlements and burials of the Eurasian steppes, in progressive update. Statistical analyses of such legacy data will enable a wide spectrum investigation of the metallurgical knowledge and traditions. Plus, our SQL database considers both the spatial and temporal dimensions by matching coordinates and radiocarbon and relative dates with legacy data to explore the logistics behind the quality of raw materials exploited, the stages of the process involved, and the type of smelted metal across different Eurasian Steppe regions during different chronological intervals.

In this way, we aim to further explore socio-economic networks across 2nd millennium BC communities of the Eurasian Steppe Bronze Age through the lens of metalmaking technology.

## 4 THE DYNAMICS AND IMPACT OF MEDIUM AND LONG DISTANCE TRADE OF METALS IN THE 2ND MILL BC EURASIAN STEPPE

**Abstract author(s):** Radivojevic, Miljana (UCL Institute of Archaeology)

**Abstract format:** Oral

Over the last 30 years it has been convincingly argued that the control of resources, innovation and intensification of production and use of copper and bronze artefacts in the Eurasian Steppe was at the heart of social, economic and technological transformations that took place from the Atlantic to the Pacific between c. 3500 and 1000 BC. The vast expanse of the Eurasian Steppe was populated with a varied range of pastoralist societies, whose sociopolitical, economic and technological advancement in the BA has long been inconsistent with the Childean and later models of the evolution of societies, involving chiefdoms, states or empires. Yet, this diverse conglomerate of steppe communities living outside the shifting boundaries of the 'urban', 'settled' or 'civilised' worlds carried out the earliest pan-Eurasian trade network, unrivalled in complexity, power and scale, effectively feeding the 'civilised' realm.

The recent archaeometallurgical research in the Bronze Age steppes presents the scale of connectedness of metal production technology across small and large scale metal making sites. Networks analysis show the regionalisation of supply networks for ores and metals, while environmental data point at significant impact of metallurgy on the landscape at the time. A synthesis of the current state of knowledge on the synergies of metals, trade and environment reveals the most important factors that facilitated the growth of the metals trading industry in the 2nd mill BC steppes: communication, logistics and access to resources.

## 5 ON THE ROAD WITH MILLET: DISPERSAL OF BROOMCORN MILLET AND THE ECOLOGY OF ITS EARLY CULTIVATION IN EUROPE

**Abstract author(s):** Filipovic, Dragana (Christian Albrecht University Kiel) - Silva, Fabio Parracho - Vander Linden, Marc (Bournemouth University)

**Abstract format:** Oral

In Europe, cultivation and consumption of broomcorn millet began in the mid-2nd millennium BC, in the Middle or Late Bronze Age. This was the time of marked growth of population, ongoing shift in burial ritual from inhumation to cremation, modifications in architecture and settlement layout, increase in the production and trade of metal. Moving along the trade routes, millet spread fast across the continent, into both prime and marginal farming zones. At the time, a range of cereal, pulse and oil/fibre crops was already cultivated and consumed, i.e. there was no obvious shortage of cultivars. But the apparently increasing population and the unstable (Subboreal) climate, involving cold and dry phases and, in the second half of the 2nd millennium BC, increasing aridity, perhaps stimulated the rapid dispersal of this highly-adaptable, drought-resistant, fast-growing cereal. Along with millet spread the knowledge of its properties and management. Adoption of the new crop likely prompted changes in the existing agricultural systems and technologies. These may have related to, for instance, cultivation intensity, organisation of work, seasonality of agricultural tasks, extent/location of land under cultivation, types of tools and techniques, cuisine and recipes, plant-related rituals and symbolism.

This paper summarises the existing multi-proxy evidence on the spread of millet from Asia to Europe and the possible regional and local routes and mechanisms via which this movement took place. It reviews the changes in agricultural production potentially related to the adoption of millet and explores the character of ecological niches in which early millet was cultivated.

## 6 BRINED STORIES IN THE BRONZE AGE EAST OF THE CARPATHIANS (ROMANIA)

**Abstract author(s):** Bolohan, Neculai („Alexandru Ioan Cuza” University of Iași)

**Abstract format:** Oral

Lately, there is a keen interest in unveiling the role of salt sources (brine, crystalized salt) in the life of ancient communities. The concentration of scientific concerns is enhanced by the visible association between archaeological sources and the location of brine sources, which have been exploited since the Eneolithic period. This is a favorable situation! But what about the Bronze Age communities located in the Eastern Carpathian area, knowing that their lives are closely linked to the breeding and exploitation of animals? The first consistent answer was given by the results of research in eastern Transylvania, where we can already talk about the industrial exploitation of brine in the Bronze Age. Apparently, there is no evidence of the use of brine or salt by these communities for the proposed work area. Gradual answers could be found in a more careful reading of the landscape, the distribution of these sources, the evaluation of the technological potential, the identification of the transport routes, etc. In order to go through the proposed stages, a work area was chosen, represented by depressions in which there are old springs of salt and in which the old communities exercised an apparent control over them. Cartographic, ethnographic and archaeological sources were used in this initiative to facilitate inferences about economic and social implications.

## 7 HOW SHOULD WE UNDERSTAND THE BRONZE AGE TIN TRADE IN EUROPE AND BEYOND?

**Abstract author(s):** Williams, Robert (Durham University) - Montesanto, Mariacarmela (University degli Studi di Firenze) - Ponting, Matthew (University of Liverpool) - Badreshany, Kamal - Roberts, Benjamin (Durham University)

**Abstract format:** Oral

Identifying the sources, routes and dynamics of the trade in tin (ore and metal) during the 2nd millennium BC has been debated since the 19th century, invariably with only fragmentary evidence. However, the last decade has seen major archaeological discoveries and scientific advances which, when integrated, shift our understandings of the Bronze Age tin trade in Europe and beyond. This paper will evaluate the evidence and contexts for the origins of tin-bronze alloying, contrasting these with the transmission and contexts of tin-bronze as a widely adopted metal. It will highlight the high quantities of tin involved in the 2nd millennium BC production and trade from major and minor tin ore sources when compared only to copper metal output from 2nd millennium BC copper mines.

It will provide an integrated review of the archaeological, geological and geochemical evidence in southwest Britain to propose a de-centralised model for the exploitation and production of tin by small farming communities. It will review the current state of knowledge regarding the provenancing of tin metal to tin ore sources. Finally, it will propose models for the routes of movement and logistics of the tin trade over hundreds of kilometres and contrast these with the (pre-)existing movements of other goods and technologies.

## 8 CERAMIC TRANSPORT JARS AND THE EMERGENCE OF SOCIAL COMPLEXITY IN THE EARLY BRONZE AGE LEVANT

**Abstract author(s):** Badreshany, Kamal (Durham University)

**Abstract format:** Oral

Purpose built storage and transport vessels emerge in great numbers across the Levant during the third millennium BC. This period saw the emergence of complex societies, alongside population expansion and urbanisation. This paper presents new evidence indicating that these jars underpinned a system of centralised agriculture and were designed for trade and reinforcing tributary relationships in the earliest Levantine states. They were likely used for storing and transporting high-quality commodities, such as olive oil and wine, and facilitated the circulation of these commodities within the Eastern Mediterranean, but especially with Egypt where Levantine jars are found in large numbers. This paper focuses on a region of northern Lebanon, exploring specifically the role of these jars in maritime trade with Egypt during the 'Pyramid Age' and what benefits this relationship delivered to local elites. We then examine jars of the second millennium BC showing how the economic templates established during the Early Bronze Age were utilised for millennia in the region.

## 9 WHAT WE THINK WE KNOW ABOUT TRADE BETWEEN THE AEGEAN AND OTHER PLACES DURING THE SECOND MILLENNIUM BC: A SUMMARY

**Abstract author(s):** Aulsebrook, Stephanie (University of Warsaw)

**Abstract format:** Oral

This paper aims to summarise the current thinking on the role of the Aegean in the extensive trade networks that existed between Africa, Asia and Europe in the second millennium BC. Often characterised as an intermediary between East and West, the geographical position of the Aegean situates it at the heart of both maritime and overland routes. All the evidence, from the analysis of both artefacts and iconography, points towards the palaces, the centres of political power within the Aegean, as playing a major role in these international networks, yet intriguingly any mention of trade is absent from the fragmentary deciphered texts from the palatial administrative archives (Linear B). Despite this, the importance of the metal trade in particular is unequivocal, through the inclusion of the Aegean in the copper oxhide ingot network, with 'exotic' materials such as amber, elephant ivory, glass and lapis lazuli demonstrating the range of connections. There is also evidence of what the Aegean offered to its trading partners, including high-quality metalwork, textiles and perfumed oil, as well as clear indications for the movement of people (e.g., fresco painters) and ideas (e.g., the "gold embroidery" technique), with tantalising glimpses of how aspects of this trade may have functioned from finds such as the Ulu Burun shipwreck. The organisation of trade appears to have changed over time, following major shifts in political power, and it has been suggested that these international contacts, especially the ability to access new trading partners and act as a 'gatekeeper', may in itself have played an important role in these internal political developments within the Aegean. Nevertheless, significant gaps in our knowledge still exist, which this paper will also endeavour to highlight.

## 10 EMISSARIES, PRINCESSES AND TRINKETS: AMENHOTEP III SCARABS IN THE LATE BRONZE AGE AEGEAN AND WEST ANATOLIA

**Abstract author(s):** Frankovic, Filip (Institute for Prehistory, Protohistory and Near Eastern Archaeology, Heidelberg) - Matić, Uroš (Austrian Archaeological Institute)

**Abstract format:** Oral

This paper will analyse the distribution of scarabs and other objects from the reign of the Egyptian pharaoh Amenhotep III in various archaeological contexts in the Aegean and West Anatolia. Such an analysis allows a reconstruction of the direction and logistics behind diplomatic travel. The Eastern Mediterranean itinerary of Amenhotep III is attested on his colossal statues at Kom el-Hetan, Upper Egypt. This itinerary consists of toponyms in the Egyptian language which can be identified with the Aegean toponyms in Linear B texts and possibly West Anatolian toponyms in the Hittite language. Furthermore, the Amarna letters EA 31 and 32 testify of the diplomatic relations between the West Anatolian king Tarhundaradu of Arzawa and Amenhotep III. In this paper we will present the results of the analysis of the chronological, spatial and quantitative distribution of Egyptian scarabs and other epigraphic material from the Amarna period (Amenhotep III to Akhenaten) in the Aegean and West Anatolia. We will argue that most of this material, despite its occasional appearance in later contexts, originates from an intense diplomatic exchange between Amenhotep III and his peers. Finally, the questions we want to address are: 1) whether scarabs and other epigraphic material testify of trade or gift-exchange; 2) whether these two models necessarily exclude each other; 3) what the broader economic and social implications of such highest-level diplomacy are; 4) whether the distribution of these objects corresponds to the Kom el-Hetan itinerary as previously suggested by other scholars.

## 11 UNDERSTANDING WESTERN EUROPE "AMBER ROUTE" IN THE 4TH TO 2ND MILLENNIA BCE

**Abstract author(s):** Romero García, Galo - Garrido-Cordero, José Ángel (Department of Prehistory and Archaeology - University of Seville) - Odrizola, Carlos P. (Department of Prehistory and Archaeology - University of Seville; UNIARQ - University of Lisbon)

**Abstract format:** Oral

Much has been discussed about amber dynamics, its geographical origin and distribution patterns. It is assumed that amber follows a down the line distribution pattern from its sources (Baltic Sea and Sicily) to its destination, rather than a directional trade pattern. However, the paths that ended with these Baltic and Sicilian ambers in the Iberian Peninsula during the 4th-2nd millennia BCE are highly biased by geomorphology, because it limits humans' mobility capacity.

The research on human mobility during the last two decades have refined computational and quantitative methods to model human movement dynamics in Prehistory (Palmisano, 2017). Towards what, spatial analysis has played a preeminent role.

In this paper we model human mobility and connectivity in the Iberian Peninsula, specifically in the Tagus basin, during 4th-2nd millennia BCE based on statistical analysis of amber artifacts distribution.

Least Cost Path (LCP) is presented as one of the most efficient applications of GIS. White (2015) defines it as a quantitative geospatial tool, which can help archaeologists to better understand how people could have moved through a territory. The multitude of results to be obtained does not depend solely and exclusively on the algorithm used, but also on the cost model chosen, which in most cases is associated with what are known as cost components (Herzog, 2014). In addition to the GIS analysis, the results must be interpreted considering the absence of prehistoric orographic data in an area whose geomorphology has undergone great variations over the past millennia.

## 12 THE RISE OF SOUTH BOHEMIA: THE IMPACT OF EARLY BRONZE AGE TRADE NETWORKS

**Abstract author(s):** Hlášek, Daniel (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Chvojka, Ondřej (Institute of Archaeology, University of South Bohemia in České Budějovice) - Ernée, Michal (Institute of Archaeology of the Czech Academy of Sciences, Prague)

**Abstract format:** Oral

South Bohemia belongs to specific regions of European prehistoric development. Due to the absence of the best agricultural soils, they were very sporadically inhabited in the agricultural prehistory until the end of the Late Neolithic. This changed fundamentally in the first half of the second millennium BC, probably due to intensive copper mining in the eastern Alps. Copper was transported further north through southern Bohemia to the dynamically developing areas of the Early Bronze Age. This process caused one of the greatest peaks of prehistoric settlement in the region of southern Bohemia.

The region is a suitable model area for studying various aspects of trade. The north-south orientation of the main trade artery following the course of the Vltava River is evident. There is significant evidence of archaeologically visible tradable commodities such as copper in the form of numerous hoards of ingots of the raw material. Finds of Baltic amber are significantly represented. The region's comparative advantage may also have been its rich natural deposits of

gold or graphite. During the first half of the second millennium BC, a hierarchy of settlements was established. It is a dense network of hillforts following the expected trade routes, but also an exceptional settlement in Hostý - a trade and production centre of supra-regional importance. South Bohemia thus appears to be a suitable area for testing economic models of Bronze Age trade.

### 13 **TEXTILES AND TRADE DURING THE 2ND MILLENNIUM BCE: A CASE STUDY OF BRITAIN IN ITS WIDER EUROPEAN CONTEXT**

**Abstract author(s):** Harris, Susanna (University of Glasgow)

**Abstract format:** Oral

Here, trade will be taken in its broad sense to include all modes of the exchange of goods between the two or more parties. The second millennium BCE is an important juncture in understanding the significance of textiles as trade goods beyond the immediate farmstead unit. Where there are written and representational sources, textiles feature as significant trade goods alongside metals, crops and livestock. Yet, due to their perishable nature, textiles as trade goods are difficult to identify outside these sources. As the field has evolved, textile researchers have developed methods to approach textile trade from the archaeological evidence, including the analysis of textile tools, scientific investigation, production centres and access to fibre resources. Using models of trade taken from these sources, this paper will explore textile trade through a case study of Britain in the second millennium BCE in its wider geographical context. It will consider what made textiles desirable as trade goods, aspects of textiles that can be traded, and the archaeological evidence for textiles in the context of the other trade goods that characterise this period. The aim of this paper is to take a difficult category of archaeological evidence, textiles in second millennium BCE Britain, and re-evaluate it in the light of short to medium distance trade.

### 14 **LEAD ISOTOPES AND CHEMICAL COMPOSITION OF SILVER REVEAL DEVELOPMENTS IN THE MEDITERRANEAN METAL TRADE DURING THE BRONZE AND IRON AGES**

**Abstract author(s):** Eshel, Tzilla (University of Haifa)

**Abstract format:** Oral

Silver, before the invention of coins, was the dominant means of value and exchange in the southern Levant. Approximately 40 silver hoards, unearthed in various contexts, assert that silver served as currency in the Levant throughout the Bronze and Iron Ages. The hoards were studied for their chronology, context and content, and the silver was subjected to chemical and isotopic analysis. The results of this study reveal a persistent, wide diversity in silver sources. In several sub-periods within the Bronze and Iron Ages, clear changes in ore sources can be pointed out. Each such change has broad implications on the study of long-distance maritime trade in the Bronze and Iron Ages because silver-bearing lead ores do not occur in the Levant. Using an interdisciplinary approach, we combined geochemical methods and careful archaeological investigation in order to associate between changes in silver ore sources and transformations in regional trade systems, which are often imperceptible in ceramics.

### 15 **FIRST EVIDENCE OF ATMOSPHERIC TIN POLLUTION IN PREHISTORY: A PROXY TO UNDERSTAND THE PRODUCTION AND CIRCULATION OF METALS?**

**Abstract author(s):** Silva-Sánchez, Noemí (Instituto de Ciencias del Patrimonio, Incipit-CSIC) - Martínez Cortizas, Antonio (Ecopast Research Group, Universidade de Santiago de Compostela) - Armada, Xose-Lois (Instituto de Ciencias del Patrimonio, Incipit-CSIC)

**Abstract format:** Oral

The scarcity of tin sources and their concentration in very specific areas explains the high degree of connectivity in Bronze Age Europe. This has led some authors to define this period as a type of pre-modern globalisation.

The Northwest of the Iberia Peninsula is one of the most important tin areas in Western Europe. However, the archaeological study of the exploitation and circulation of these resources faces several problems. In this paper, we present a high-resolution chronology of past tin atmospheric pollution determined by Inductively Coupled Plasma Mass Spectrometry (ICP-MS) and obtained from a peatland in NW Iberia. The peat record showed a significant tin enrichment since Prehistory, something that was considered highly unprovable until now, as it was thought that tin extraction methods, based on placer mining, would not have produced a detectable environmental impact. Significant tin enrichments were found in peat layers dating between 3422 BC and 950 AD, with three relatively higher levels within this temporal frame; although the maximum tin enrichment occurred in recent times.

Our data reasonably matches the archaeological knowledge about tin use in prehistory and history, and we will present some arguments in support of the circulation of these metal resources in the Atlantic area during the 2nd millennium BC. Furthermore, our data also suggest that the palaeopollution approach, if extensively used and applied to other stanniferous mining areas, will be of great importance to get insights into the chronology and intensity of past tin mining and metallurgy.

## WHAT MAKES A WORKSHOP? CERAMIC PRODUCTION IN LATE BRONZE AND IRON AGE IBERIA

**Abstract author(s):** de Groot, Beatrijs (The University of Edinburgh)

**Abstract format:** Oral

In the Iberian Peninsula, the shift to the systematic production of ceramics as surplus for interregional and long-distance trade is generally ascribed to the establishment of Phoenician mercantile colonies on its southern coastline. Phoenicians utilised the double-chambered updraught kiln and low-mounted potter's wheel, producing tangible evidence of the emergence of workshop modes of production. Due to limited evidence, however, little is known about the organisation of ceramic production prior to the adoption of these innovations, driving the assumption that hand-made ceramics are produced domestically for local and personal consumption.

Drawing on archaeometric studies from across the Iberian Peninsula, this presentation aims to shed light on the organisation of ceramic production prior to the introduction of the potter's wheel in different regions in the Iberian Peninsula. It highlights differences between the production processes of hand-made and wheel-made ceramics, as well as discussing new evidence from northern Iberia of the interregional circulation of hand-made ceramics during the Iron Age. This informs discussions on the difference between the economic systems in which Bronze Age and Iron Age modes of ceramic production were embedded and on what a workshop makes in Late Bronze Age and Iron Age Iberia.

## GLOCAL COMMUNITIES IN LATE BRONZE AGE SOUTHWEST EUROPE

**Abstract author(s):** Diaz-Guardamino Uribe, Marta (Durham University)

**Abstract format:** Oral

This paper examines the role of local Iberian communities, traditions and places in the mediation of regional and global connections with the Atlantic and the Mediterranean during the Late Bronze Age. Approaches to connectivity often have problems in reconciling top-down macro-scale models with local and regional dynamics, failing to acknowledge the active role of the so-called 'peripheries'. This paper adopts a bottom-up, multidisciplinary approach within a 'glocalization' framework to focus on local engagements with material culture and landscape, and their connections with the regional and the global. The paper discusses various interrelated phenomena and their contribution to understanding the temporal depth and landscape dimension of connectivity networks within and beyond Iberia at multiple scales: rock art, metals, amber, etc., potential riverine and terrestrial routes and coastal landing places. Ultimately, the paper seeks to highlight the importance of considering various lines of evidence at multiple scales to provide a better understanding of regional and global connectivity in Late Bronze Age Europe, in this case through Iberia as a case study.

## BOOT-SHAPED VESSELS AND POTTERY DECORATED WITH BRONZE BUTTONS: CONTACTS BETWEEN THE DANUBE REGION AND VENETO IN THE LATE BRONZE

**Abstract author(s):** Jankovits, Katalin (Pázmány P. Catholic University)

**Abstract format:** Poster

Vessels modelled in the shape of boots or other footwear or human legs can be found in various regions of Europe from the Neolithic onward. These have been interpreted as cult vessels whose function can be compared to rhytons that were used for presenting libations. In the Danube region, vessels of this type began to be used more frequently from the Tumulus period, although their true flourish was the Urnfield period. Their use is attested up to the La Tène period.

Early boot-shaped vessels have principally been brought to light on settlements. In contrast, the exemplars from the Late Bronze Age were mostly recovered from burials.

A strong concentration of boot-shaped vessels could be noted in the Budapest-Békásmegyer cemetery of the Urnfield culture (Ha A2–B1). Several types could be distinguished based on their form and ornamentation.

A distinctive ornamental mode noted in the Békásmegyer cemetery was the use of small bronze buttons to decorate pottery, which in addition to various other vessel types, was also employed in the case of some boot-shaped vessels (Graves 47 and 51).

A handled cup decorated with bronze buttons has been reported from Grave 222 of the Vörs-Battyáni disznólegelő cemetery in southern Transdanubia. The grave dates from the Ha A1 period. In Italy, the earliest pottery adorned with bronze buttons comes from the Casalbo cemetery and the Frattesina settlement.

The use of boot-shaped vessels and the practice of decorating pottery with bronze buttons began in the Carpathian Basin, whence it spread to Veneto, where the use of similar pottery flourished in the 8th–6th centuries. These vessels are yet another attestation of the many strands linking the material and spiritual culture of the Danube region and north-eastern Italy and of the interactions between these two regions.

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Maijanen, Heli (University of Oulu) - Campanacho, Vanessa (American Museum of Natural History; Centre for Functional Ecology, University of Coimbra); Laboratory of Biological Anthropology and Human Osteology, CRIA, New University of Lisbon) - Savolainen, Jenna (University of Oulu) - Seppänen, Liisa (University of Turku)

**Format:** Discussion session

Repatriation, reburial, and analysis of archaeological human bones is an ongoing topic of debate. The 'right way' to handle human remains may take different forms in various contexts. Current ideas about morals, essentialism, human rights, religion, sanctity, ethnicity, and national identity are examples of factors that can influence the decisions on how human remains are treated and whether they are curated or reburied. For example, in the United States the Black Lives Matter movement has impacted the discussion about ethical issues of researching and curating unclaimed African American skeletons in historical collections. Other examples of human remains' treatment are grounded in practical reasons such as lack of resources. For example, in Finland the current practice of reburying skeletons excavated from historical sites is partly driven by the lack of storage space.

This session aims to share case studies and general processes behind the decisions of whether human skeletons are curated and available for research or whether they are repatriated and/or reburied. Furthermore, issues concerning practical and ethical questions related to the treatment of human skeletons will be addressed in this session. Discussions on skeletal collections from various contexts including those without connections to present cultural or religious groups, remains from historic periods, remains from indigenous and other minority groups but also majority groups are welcomed. We encourage the presenters to discuss how these decisions affect both living individuals as well as scientific research.

## ABSTRACTS

### 1 GREY AREA: ABORIGINAL AND TORRES STRAIT ISLANDER LIFE CASTS AND CASTS OF HUMAN REMAINS IN EUROPEAN COLLECTIONS

**Abstract author(s):** Howes, Hilary (The Australian National University)

**Abstract format:** Oral

Since the 1960s, calls for repatriation from First Nations peoples in Australia, Canada, New Zealand and the USA have spread to become a global movement. Collecting institutions in virtually every continent continue to return human remains to their Traditional Owners where there is sufficient provenance information available. Calls for the return of secret/sacred objects, ceremonial objects, antiquities, and other cultural heritage material have also received greater attention in recent years. In contrast, casts (plaster or plastic copies of skulls and skeletal elements, as well as models and moulds taken from the bodies and faces of living or recently deceased individuals) have received relatively little specific attention to date. Nevertheless, the Australian Government is currently supporting the establishment of a National Resting Place to care for the remains of Aboriginal and Torres Strait Islander ancestors that are unable to be returned to their communities of origin, including not only skeletal or mummified remains, hair, biological samples and grave goods, but also casts. This paper discusses ethical concerns around such casts and reasons Indigenous communities may seek their return, focusing particularly on Aboriginal and Torres Strait Islander life casts and casts of human remains in European collections.

### 2 JUST LIKE BIOBANKS? A NEW APPROACH TO HUMAN OSTEOLOGICAL COLLECTIONS.

**Abstract author(s):** Alves-Cardoso, Francisca (LABOH/CRIA – Centro em Rede de Investigação em Antropologia, Faculdade de Ciências Sociais e Humanas, Universidade Nova de Lisboa; Cranfield University, Defence Academy of the United Kingdom) - Riso, Brígida (Instituto de Saúde Ambiental, Faculdade de Medicina, Universidade de Lisboa; Instituto Universitário de Lisboa - ISCTE-IUL, Centro de Investigação e Estudos em Sociologia, Lisboa)

**Abstract format:** Oral

This presentation forwards a new understanding of Human Osteological Collections (HOC), their role in advancing science, and their importance as agents of research agendas. Rather than framing HOC exclusively within cultural heritage and archaeological contexts, it expands their profile into the arena of biological and medical sciences, bringing a different perspective that may have implications on current practices and decision making on storing human remains (regardless of their provenance), and consequently in societal policy-making. To achieve this, we will draw a comparison with the notion of biobanks – repositories of human biological samples associated both with personal and medical data. It explores how HOC would fit into this concept, specifically identified HOC, since these contain human remains and associated biographical data (e.g. sex, age, cause of death, and other information). Additionally, the ongoing academic discussion on the definition and provenance of samples/remains incorporated

into HOC is not far from biobanks. As so, expanding the profile of HOC sets in motion the need to consider additional ethical, social, legal and practical issues when considering the storing and accessibility of HOC and associated data, as it happens with biobanks. Furthermore, we will address this latter point combining the “cultural heritage” framework. This new approach to HOC raises questions that have not been considered to date, and that may impact curation and preservation practices and policies, by establishing HOC as relevant, reliable and valuable resources for research.

### 3 **ENTANGLED VIEWS: THE HISTORY, RESEARCH, AND EDUCATIONAL APPLICATIONS OF ANATOMICAL COLLECTIONS IN THE US IN THE WAKE OF ETHICAL CONCERNS**

**Abstract author(s):** Campanacho, Vanessa (Department of Anthropology, New York University) - Alves Cardoso, Francisca (LABOH—Laboratory of Biological Anthropology and Human Osteology, CRIA—Centro em Rede de Investigação em Antropologia, Faculdade de Ciências Sociais e Humanas, Universidade NOVA de Lisboa) - de la Cova, Carlina (Department of Anthropology, University of South Carolina)

**Abstract format:** Oral

The initial creation of documented human skeletal collections in the United States is intimately tied to the development of anatomy and physical anthropology. This paper offers a view on the history and research undertaken on these collections, discussing the current ethical concerns that may shape/transform the profile and use of anatomical collections. In the 19th and early 20th centuries, physical anthropology studied skeletal variation, with an emphasis on racial classification. To observe the wide range of human anatomical diversity, dissection of human bodies was needed. However, in the late 18th and early 19th century due to the increasing numbers of medical schools and dire need for teaching/practicing material, despite its illegality, grave-robbing was relied upon for access to human remains. Facing illegality and populace uprisings, in 1831, the first Anatomy Act was passed in Massachusetts. This legislation legalized access to the bodies of unclaimed individuals for anatomization, deterring grave-robbing. Other states followed suit in passing anatomy acts. These laws would ultimately allow anatomists and physical anthropologists to legally amass documented human skeletal collections from dissected bodies. Despite this legal frame of permissiveness, in recent years ethical concerns associated with the composition of anatomical collections are growing. These include the absence of consent, aligned with replication, in death, of structural violence individuals in these collections experienced during their lifetimes. One consequence has been the request for repatriation and reburial of many remains. Another is the calls for scientists to seek descendants' consent before researching skeletons from ancestors or members of their community. Guidelines will be discussed on how to ethically engage with anatomical collections.

### 4 **EVOLUTION OF HUMAN REMAINS PRESERVATION IN PADUA (ITALY): FROM THE 18TH CENTURY COLLECTIONS TO THE MODERN MORGAGNI MUSEUM**

**Abstract author(s):** Magno, Giovanni (University Museums Centre CAM, University of Padua) - Zanatta, Alberto (Department of Cardiac, Thoracic, Vascular Sciences and Public Health - University of Padua)

**Abstract format:** Oral

The first scientific museum in Padua (Italy) was born during the 18th century thanks to Antonio Vallisneri, collecting rare and peculiar biological specimens. This museum was established for students' education, departing from the previous attitude of the Cabinets of curiosities. Giovanni Battista Morgagni also tried to create a medical museum in 1756, although never completed. It was only in the 1860s that Lodovico Brunetti managed to establish the first Museum of Pathology, collecting various antecedent collections.

The absence of laws on body acquisition and the lack of medical records made difficult to know if the specimens were voluntarily donated or if they were collected posthumously. Also, different attitudes to death and the dead may have favored a spontaneous donation of bodies.

In 1933 and thereafter, new laws have significantly limited the possibility of specimen preservation in Italian anatomical museums. In 2011 the University of Padua started to promote a body and anatomical parts donation program within the Institute of Human Anatomy, for the purposes of teaching and scientific research. A new legislation was introduced in 2020, allowing consensual body donation for study, medical training and scientific research, and updated regulation for body restitution.

Today the growing criticism of traditional medicine has shown the need for a medical museum to keep equally in step with the times. Thus, the old Museum was recently renovated and renamed Morgagni Museum of Pathological Anatomy, to improve educational and scientific usability of the specimens, also for non-specialistic visitors. The exhibition focuses on the scientific nature of the preparations in accordance with methods that ensure respect for the human body, to increase the knowledge on sensitive topics and issues, such as human pathologies and the ancient living conditions, often intended only for specialists. Indeed, nowadays, these specimens have also important value for understanding Western cultural heritage.

## 5 **CONSIDERING REPATRIATION? EXPERIENCES FROM THE ANATOMICAL COLLECTIONS OF KAROLINSKA INSTITUTET STOCKHOLM, 2015 TO PRESENT**

**Abstract author(s):** Ljungström, Olof - Gustavsson, Ann (Karolinska institutet, Medical History and Heritage)

**Abstract format:** Oral

What do we do when we repatriate human remains? As custodians of the remaining anatomical collections at the Karolinska Institutet Medical University (KI) in Stockholm (in practical terms the Stockholm medical faculty), we have carried out a number of repatriations of human remains to various indigenous populations in the period 2015-2019, followed by a hiatus due to the pandemic, but still ongoing.

We would like to take the opportunity to present and discuss some of our internal considerations in relation to these processes (all of which typically have come with peculiar inflections making them all distinct in some way). In a successful repatriation process, ending with the hand-over and departure of the remains, the focus is primarily on the happy occasion for the recipients and their experiences. What is not automatically presented, often underreported, are the procedural underpinnings and reflective considerations that have gone into what remains after all exceptional decisions on the part of the KI. Some of this is due directly to the legal underpinnings of how the Swedish system of government administration parses agency, responsibility and institutional independence (not least relevant for universities), and the levels of freedom of initiative this accords us. At other times it is a matter of judgement calls regarding the exceptional status accorded in particular indigenous native population around the globe.

Our experience is already one of a considerable mismatch between how we as university administrators and professional academic researchers with museum collection responsibilities frame our own understanding of the issues, and how often media and large and parts of the public view this. Not least relevant in Sweden is a seemingly rapid dissemination of ideas of genetics as the basis for collective identities (nationality or even "race"), for both minorities and national majorities.

## 6 **THEORY AND PRACTICE OF CURATING ARCHAEOLOGICAL HUMAN REMAINS IN POLAND**

**Abstract author(s):** Jastrzebska, Emilia (University of Warsaw)

**Abstract format:** Oral

The topic of keeping human remains in museum collections and displaying them to the public has been debated for several decades, however, the debate mostly focused on the post-colonial assemblages, for the most part leaving the „unclaimed" majority aside. Post-colonial collections in Poland are relatively small and rarely discussed as controversial. Therefore the ethical dilemma related to curating human remains discussed broadly in the West, also never received the attention it deserves, even though human tissue is present in Polish museums in a variety of contexts. Until recently, very little have been published regarding the issue. It is worth mentioning that legal regulations remain tremendously unhelpful in this matter. To address the question I have made an effort to interview a considerable number of Polish museums to find out about their staff's opinions and attitudes as well as practices regarding archaeological human remains kept in their collections, which varied greatly among institutions. The questions raised in the process were: should museums acquire human remains at all? Should they enter the inventory record and in what manner? How should they be stored and displayed (if at all)? And is reburial the right thing to do? The project was conducted in cooperation with the National Institute for Museums and Public Collections and resulted in officially opening the debate in a Polish museum environment, which will hopefully lead to developing straightforward, accessible, and universal guidelines for museums in the near future.

## 7 **CURATION OF HUMAN SKELETAL REMAINS IN FINLAND – TOWARDS MORE HOLISTIC DECISION-MAKING**

**Abstract author(s):** Savolainen, Jenna - Maijanen, Heli (University of Oulu) - Seppänen, Liisa (University of Turku)

**Abstract format:** Oral

The preservation and curation of skeletal remains have been a part of Finnish archaeology since the 19th century. No specific laws nor instructions have been established regarding the curation of osteological remains for scientific purposes and deposition decisions are made by following common practices and the general atmosphere of the scientific interests at the time. The Finnish Museum Agency has provided a guide for their own curation and handling practices. This guide, however, does not involve other stakeholders and it does not outline a detailed decision-making process regarding collection and curation of human skeletal remains.

The absence of uniform guidelines has led to the decision-making being more individual-based and subjective, thus conflicting the idea of preserving collections for future research as well. Furthermore, pre-historical and historical skeletal remains have been valued inequally in the decision-making process. Where all prehistoric skeletal remains are annexed into the National collection, historical (14th to 19th century) remains are not. Historical remains are often reburied after a basic skeletal analysis. These reburial decisions are often motivated by the religious status of the deceased – they were buried in a Christian cemetery and thus should be reburied. Another, more practical reason is the

lack of storage space. In addition, the field of bioarchaeology has been quite small in Finland and the future research needs have not been fully recognized. At the very moment, skeletal collections are curated and/or stored in the National collection, local congregations and museums, universities, and other parties assigned the right of possession. In this presentation, we discuss the current curation practices in Finland and their long-term effects on research and emphasize the importance of securing skeletal collections with both ethical and scientific considerations.

## 8 HISTORY AT OUR HANDS - ADBOU, A DANISH RESEARCH COLLECTION

**Abstract author(s):** Weise, Svenja (University of Southern Denmark)

**Abstract format:** Oral

In Denmark, research on, and display of, local historical human remains are mostly met by the public without reservations. The curation of skeletons is largely unproblematic, and it is a common practice for the museums to deliver new finds from excavations to one of the two still growing skeletal collections in Copenhagen (KU) or Odense (SDU). Since 1992, ADBOU at SDU has specialized in curating and studying human remains from all time periods. Currently the collection comprises nearly 17,000 skeletons, all excavated in Denmark, and the size of the different samples varies from single individuals to large cemeteries.

Museums pay for the storage of skeletons and permit their use for research and teaching, including handling the bones by students and researchers. The ADBOU collection is open for guest researchers after assessment of their projects. Occasionally destructive methods are employed, but only after careful evaluation and with permission by the owning museum. Conferences, workshops, and seminars are held on a regular basis, often also involving hands-on parts. Apart from university teaching there are offers for non-scientific audiences; from evening classes for adult learners to the "Bone Box" for schools and museums, a training aimed at disseminating knowledge about history and human biology through practical work with skeletons. "Open house" days at skeletal excavations are well attended.

Over the last 20 years, reburial of local skeletons only happened twice in Denmark; in both cases the deceased were originally buried in recent times. Museums display human remains in permanent and temporary exhibitions regularly, and the homogeneous composition of the ADBOU collection ensures that no interests of minority groups are harmed. Generally, Danish citizens are very interested to learn from skeletons about the lives of their ancestors and perceive them as source of information rather than distressing.

---

## 257 BIG PROJECT, BIG DATA: CREATING A WEB OF KNOWLEDGE

**Theme:** 6. A Decade after the 'Third Science Revolution in Archaeology'

**Organisers:** Plunkett, Emily (High Speed Two - HS2) - Schweitzer, Holger (Jacobs)

**Format:** Regular session

As Daniel Keys Moran highlighted "You can have data without information, but no information without data".

As an industry we need to ask ourselves:

- How do we ensure that we apply a process to avoid collecting data with no end goal, but at the same time avoid bias in the development of the goal?
- How do we "close the loop" and ensure our project data allows decision making and storytelling?
- How can we account for the needs of different project stages which use the same data for diverse purposes?

Large scale projects, such as infrastructure or long term research, generate some of the largest data sets which form the core of their legacy for research and future projects. Due to the scale of the data being generated and managed, projects have developed innovative approaches to transform data into information and ensure integration of data into the project lifecycle.

Large projects also present opportunities to gather data and generate information to assist in the effective management of heritage assets. Data can assist in decision making and responses to threats from development or other factors, such as changes in planning regime, natural forces, or cultural shift. In addition, when data becomes information it can support communication of stories or expressions of community heritage.

We will discuss thoughts or perspectives on tools, concepts, solutions, or approaches to manage data across all stages of the project lifecycle from assessment to excavation, and beyond.

This session is a space for sharing knowledge and we also invite papers that consider:

- How data and information we generate is viewed by the end users?
- What does innovative integration of "information creation" into data generation look like?
- What does innovation in data mean for the future of the profession or research potential?

## 1 BIG DATA AND LOTS OF DATA ARE NOT THE SAME THINGS: SMALL DATA SOURCES IN THE SOCIAL SCIENCE OF ARCHAEOLOGISTS

**Abstract author(s):** Aitchison, Kenneth (Landward Research Ltd)

**Abstract format:** Oral

Big Data is a misunderstood but technically definable concept; it's large volume, unstructured, heterogenous information, being generated at a high velocity - which normally means it is being constantly updated in real time. And, in many situations, this is very difficult to work with; an analogy might be to compare the curated content of Netflix, which is a (very) large but structured data set, with the unending chaos of YouTube content, which is Big Data.

Since 1998, consistent, comparable longitudinal (time-series) datasets have been collected on professional archaeology in the United Kingdom on a roughly five-year cycle, and these data have been analysed and published in a series of Profiling the Profession reports. On two occasions, in 2008 and 2014, these exercises were expanded out to become pan-European projects – Discovering the Archaeologists of Europe. A lot of data points have been assembled, and the important thing has been that these have been structured, comparable and interrogable Small Data.

The data gathered for these projects were not archaeological data, they were social science data – and data gathered from current survey populations is different, as the longer it has been since the data were harvested the less 'fresh' they become, and loss of freshness leads to loss of (perceived) value, when compared with historical data (including archaeological data) that hold value over time.

This paper will review the challenges of gathering comparable data from similar but different targets to produce labour market intelligence reports that are then reliable and useful, and that allow employers, educators, heritage agencies and individual archaeologists to plan for their individual, corporate or sectoral futures.

## 2 ONE ARCHIVE, MANY WINDOWS

**Abstract author(s):** Green, Katie - Zoldoske, Teagan - O'Brien, Jenny (Archaeology Data Service)

**Abstract format:** Oral

Large data sets are both a blessing and a curse. They contain a tremendous wealth of information, but navigating, finding, and understanding everything they hold can be a challenge. The UK is currently undertaking the largest single archaeological intervention in its history in advance of building a new high speed rail line connecting the North and South of England. The archaeological data archive from the High Speed 2 (HS2) project is expected to be over 15 terabytes in size, increasing the holdings of Archaeology Data Service (ADS) by about 60%. It will be difficult to effectively disseminate such a large and complicated dataset in an ordered and re-usable manner, but it provides an opportunity to explore different methods to disseminate a large data set to different audiences. These methods will include interactive maps and data viewers, data searches, thematic data dissemination, data papers and integrated publications with the digital journal Internet Archaeology.

This paper will set out the ADS and Internet Archaeology's ambitions for the dissemination of the HS2 dataset, the challenges that will be faced, and how the different windows into the data will be used to foster greater public benefit. By giving access to data, enabling readers to come to their own conclusions, we are giving individuals the opportunity to assimilate and manipulate (in personal ways) the content they are being exposed to. Additionally, by allowing the data to be accessed via different means, e.g., spatially, temporally, or by subject term, we are increasing the number of people who are able to view and re-use the data. This will be a sign of a successful public benefit legacy.

## 3 REALLY SAYING SOMETHING? MAKING HISTORIC CHARACTERISATION MORE ACCESSIBLE

**Abstract author(s):** Conway, Melissa (LUC)

**Abstract format:** Oral

This paper will cover recent work to make characterisation data more accessible through the use of common, clearly explained, terminologies using a series of case studies. Case studies will include HS2 Phase 2b and urban historic characterisation.

Historic characterisation takes an archaeological approach to understanding the landscape around us. It has been applied at various scales in the UK since the early 1990s, either funded wholly by the government's historic environment advisor or through partnership between national and local government. In England, characterisation work has ranged from large-scale studies of seascapes and landscapes to in-depth reviews of archaeological data for historic cities. Although these are valuable resources, uptake and use of studies has not always been as widespread as desired, in part due to issues with terminology between studies but also due to poor understanding of how outputs can be used.

Historic landscape characterisation (HLC) data has been used to understand and report the effects of HS2 Phase 2b for the scheme's Environmental Impact Assessment (EIA). This required concordance of 11 HLC datasets and rationalisation to common typology. These all used different terminologies and were created over a 15-year span so required significant retooling to create something useable at project-scale. Subsequent work focussed on training and mentoring those using the HLC dataset so that robust and transparent EIA assessments could be undertaken.

Characterisation of the urban historic environment has been a key focus of Historic England for the past thirty years. Over this time the focus has expanded and studies now span character, archaeological potential and deposit modelling. Recent review has highlighted the crucial importance of common terminologies in maximising the impact of studies. This has resulted in design of a London-specific typology for articulating and analysing character, allowing understanding of character and change at both local and London-wide level.

#### **4 COLLECTING INFORMATION AND DEVELOPING NARRATIVES: THE USE OF DATA ON HS2 PHASE 1, UK**

**Abstract author(s): Halsted, John (HS2 Ltd; Atkins)**

**Abstract format: Oral**

Large Infrastructure projects create vast amounts of data during the course of programmes of archaeological investigation from complex three-dimensional survey data to the description of an archaeological deposit. It is key for future research and the completion of the archaeological programme that the data are useful for the questions we wish to ask. Those questions are clearly influenced by existing prevailing narratives and in the case of HS2 Phase 1 have been set out in a research and delivery strategy.

For HS2 Phase 1 a series of data specifications were set out from the outset. This paper will consider to what extent the specification of data delivery has been influenced by the questions we ask and the extent to which incoming data deliverables may influence the narratives that are developed. The paper will also consider which data are key for different stages of the project lifecycle, how those data are received and how they are disseminated. Looking to the future the paper will consider the balance between fixed data specification and the need for flexibility and change.

#### **5 METADATA FOR DISCOVERY - PLANNING FOR AN INFORMATION NETWORK**

**Abstract author(s): Zoldoske, Teagan - Green, Katie - O'Brien, Jenny (Archaeology Data Service)**

**Abstract format: Oral**

The UK is currently undertaking the largest single archaeological intervention in its history in advance of building a new high speed rail line connecting the North and South of England. While the High Speed 2 (HS2) project has created a wealth of new information, before any of that information can be disseminated to the general public it must first be properly collected, documented, and linked. To this end, data collection is integral to facilitate effective data dissemination and FAIR - Findable, Accessible, Interoperable and Reusable - data to achieve the greatest public value for an archive. The most exciting search results and maps come from what is often seen as scary technical jargon.

This paper will discuss some of the limitations the Archaeology Data Service (ADS) experiences as a digital repository and what is currently being done to maximise the reach of the ADS collections. Starting at the beginning of the data life cycle, this paper will show how large infrastructure projects like HS2 allow the ADS to work with depositors to raise issues about data collection, generation, and description during project development and how collaborative efforts can improve the creation and import of data and metadata into the archive. This paper will then present how the ADS has made steps towards keeping our data FAIR but simple, by streamlining what metadata is essential to foster better discovery and reuse within an archive, and from there, how metadata can be passed to external data catalogues such as ARIADNEplus and The National Archives in the UK. The paper will then conclude with a reflection on how innovations facilitated by the HS2 project can be implemented in smaller archives and benefit the ADS's cataloguing policy and practice as a whole.

#### **6 ARCHAEOLOGISTS, HUNTER-GATHERERS OF DIGITAL DATA**

**Abstract author(s): Urankar, Rafko (PJP d.o.o.) - Krajšek, Jure (The Celje Regional Museum) - Lipovec, Boris (Abacus BL d.o.o.)**

**Abstract format: Oral**

The rapid advancement of digital technologies has paved the way for a revolution in archaeological documentation. Since digital cameras, tablets, portable printers, drones, and other electronic gadgets have become readily available and easily replaceable, this sensitive electronic equipment has become a much more common sight at excavation sites.

In the not so distant past, information about small finds, stratigraphic units etc. had to be documented on paper and later manually transferred into digital formats. The data were stored and processed using various programmes, many of which were less than ideal for the task. Indeed, the process of digitalising the data was itself suboptimal and

a source of many hours of extra work, which carried significant financial consequences. To alleviate these issues, we began developing a specialised programme that would enable entering and combining data from different work phases and ultimately produce reports directly usable in final site publications. Enter Zoot, a database interface for inputting and retrieving data such as lists, photos, 3D site models, small finds details etc. It can process data, perform calculations, and prepare exports intended for further processing with more specialised programmes.

Zoot provides a framework for keeping track of and linking all graphical documentation (photos, drawings, models ...), small finds data, and samples with the primary excavation documentation. In addition, it supports the direct retrieval of data for GIS and statistical processing. Most importantly, the programme is a paperless solution designed to shorten the time of writing reports as it automatically generates catalogues (e.g. of small finds, graves etc.). This enables researchers such as us faster data evaluation, and ultimately leads to more affordable and timely publications of our work.

## 7 OLD TECH'S NEW WAVE – WHY ARCHAEOLOGISTS SHOULD GET FAMILIAR WITH RTI ONE MORE TIME. A NEA PAPHOS EXAMPLE

**Abstract author(s):** Lech, Pawel (Polish Centre of Mediterranean Archaeology, University of Warsaw) - Kłębowski, Marcin - Beldyga, Michał - Ostrowski, Wojciech - Wilk, Łukasz (Warsaw University of Technology)

**Abstract format:** Oral

Technological changes are accelerating today at unprecedented speed. This phenomenon does not bypass archaeology. From omnipresent 3D models, through GIS to LIDAR – all these tools improve documentation techniques and allow archaeologists to answer more questions. Still not all technologies are fully usable from the beginning. It is normal that some of them evolve and new areas for their use occur.

One of these technologies is Reflection Transformation Imaging (RTI), which is a computational photographic method that records surface, shape, colour and light simultaneously. 20 years had passed since the introduction of RTI, and digital imaging moved forward. The Cultural Heritage Imaging organisation popularised the use of RTI in the area of archaeological finds digitalization. As an organisation created to promote digital capture of the cultural heritage they had also published a number of RTI software. Today's RTI models are easy to prepare, transfer and online use.

After 20 years of RTI operation we would like to present it in a new light. For the needs of the Polish Archaeological Mission in Cyprus, led by prof. Ewdoksia Papuci-Władyka we had prepared a number of RTI models of archaeological finds. We have carried out our works using newly constructed dome, that capture data for 2.5D RTI models in an automatic process. It also provided us with fast data transfer and fixed work conditions. The experiments in the area of data capture led us to create an original workflow for mass documentation of archaeological finds like amphora stamps or coins. Models after automatic processing are stored in a web-database built on Arches – an open source platform which was integrated with MARILE RTI viewer. A final database record containing field data and interactive RTI imagery could be annotated and studied by any member of the team from any place in the World.

## 8 VISUALISING HERITAGE: USING 3D IMMERSIVE TECHNOLOGIES TO INNOVATE, DOCUMENT AND COMMUNICATE RICH NARRATIVES FOR HS2

**Abstract author(s):** Wilson, Andrew - Sparrow, Thomas (University of Bradford)

**Abstract format:** Oral

The University of Bradford have established wide-ranging skillsets and capabilities as Visualising Heritage that have been built around expertise in 3D imaging of human remains, artefacts, archaeological sites, landscapes and heritage structures. This presentation will reflect upon how these have been put to use during enabling works for HS2 and also the potential of this work for analysis, public engagement and legacy. Firstly, we will discuss the capture of the world's first railway roundhouse designed by Robert Stephenson at Birmingham Curzon Street, together with immersive content that helps to tell the story of its discovery and exposure. We discuss 3D modelling that help to link both to the original architectural drawings and to the broader narratives for understanding changes to the design of the building during its working life and its place within the historic environment. Secondly, as HS2 embarks upon the post-excavation phase, we will also discuss the potential that recent investment in our capabilities at Bradford offers, building upon our pioneering 3D work at the object scale with 'Digitised Diseases', to bring within reach the tantalising possibility for high throughput digital capture. This offers the potential to streamline high fidelity 3D capture for key human bioarchaeology exemplars as digital assets that would otherwise be lost to future study as they are destined for reburial.

## SUEDLINK – THE CHALLENGES OF MANAGING CULTURAL HERITAGE A NATIONAL INFRASTRUCTURE PROJECT IN A FEDERAL ENVIRONMENT

**Abstract author(s):** Schweitzer, Holger (Jacobs)

**Abstract format:** Oral

Stretching over more than 700 kilometers Suedlink is currently, Germany's largest infrastructure project and one of largest underground cable projects worldwide. It is part of Germany's goal to implement the transition towards renewable energies. The aim is to enable the exchange of wind electricity produced in the North of Germany with solar energy generated in the southern parts of the country.

The enormous scale and unprecedented way of implementing such a cable project underground results in several challenges, including mitigating its impact on a multitude of cultural heritage sites. Another major challenge lies in the projects planning and implementation context. Whilst being a national project funded by the German Government, and subject to a new accelerated planning route, the cable route passes through six separate federal states (Bundesländer), each with its own political and administrative structure.

Without a unifying national heritage legislation, both the requirements in terms of procedure and methods of each Bundesland must be met, whilst also serving the standardization needs of a major project. With heritage legislation implemented on a federal level, the archaeological profession in Germany is consequently largely organized towards this respective regional scope. Consequently archaeological consultancy for nationwide projects, such as Suedlink, with associated heritage management demands has hitherto not played a significant role and is therefore largely in its infancy.

This paper presents the challenges and opportunities of implementing international standards of best practice in protecting and mitigating impacts on cultural heritage in the complex project environment of Suedlink.

## THE ROLE OF BIM AND GIS IN HS2 ARCHAEOLOGICAL DATA MANAGEMENT

**Abstract author(s):** Plunkett, Emily - Aryankhesal, Fred Farshid (HS2)

**Abstract format:** Oral

High Speed Two (HS2) railway as the backbone of Britain's transport network, is more than a railway project. Beside building bridges, tunnels, tracks, and stations, HS2 project includes the largest single archaeology programme ever undertaken in the UK.

The remarkable aspect of this programme is the fact that it has been fully integrated with the overall construction programme, as an evolution of existing and recent approaches to the design and delivery of historic environment works associated with major infrastructure projects. To put this approach into practice, Historic Environment Research and Delivery Strategy (HERDS) has been introduced. HERDS sets out the project mechanisms for:

- designing works,
- undertaking evaluation,
- delivering investigations,
- undertaking post excavation assessment, and
- archive deposition.

For creating and managing information on construction projects across the project lifecycle, including design, construction, and operational stages, Building Information Management (BIM) and Geographic Information Systems (GIS) have been deployed as the two key elements of HERDS structure, to fulfill this important demand of archaeological data delivery and management. According to BIM approach, HS2 archaeological assets are considered as part of the construction assets, alongside the other disciplines assets such as highways, bridges, tunnels, fencing, etc. Meanwhile, GIS and geospatial data play the role of a glue to demonstrate the interrelationship and hierarchy between archaeological assets, recording their location and geometry, designating a unique asset ID (UAID) to each archaeological asset, and joining them to their attributes table.

According to HERDS, HS2 archaeological primary assets, and according to their hierarchical order are as follows: Location Specific Written Scheme of Investigation (LS-WSI), Project Plans (PPs), Written Scheme of Investigation Interventions (WSI-Interventions), Archeological Features, and Archaeological Objects.

Such an efficient, transparent, and readable asset data structure provides a lasting and valuable legacy for the lifecycle of the project.

## 11 ORPHANED HERITAGE: COLLATING DATA IN A BLIND QUANTITATIVE MANNER

**Abstract author(s):** Evans, Daniel (Arcadis)

**Abstract format:** Oral

In the UK, large infrastructure projects require a detailed assessment of the historic environment as part of the consenting process. Data is generated in large quantities to inform an understanding of impact from proposed developments, allowing decision makers to judge the merits of proposals.

However, the issue faced in collating these big data sets is that the methodology focuses on quantitative metrics and not the qualitative content of the data being collected. Study areas are usually established by a simple buffering of the proposed development boundary, with a disregard to the nature of the historic and present environment around the development site. This leads to assets being severed from their associated groupings by an imaginary blue line, x meters, from an imaginary red line.

It also leads to data being considered, which hold no relationship with the development area and therefore holds next to no value in the assessment. As a result, this paper will discuss real examples to illustrate issues in data generation in planning based assessments and theorise challenges and opportunities to innovate in how we collate data for a proportionate presentation.

## 12 A HIDDEN STORY: HERITAGE IN THE DESIGN ENVIRONMENT

**Abstract author(s):** Farr, Sarah-Jane (HS2)

**Abstract format:** Oral

This paper presents the results of a review of how High Speed Two Ltd. (HS2) addresses heritage in our design processes - from the perspective of highlighting and delivering opportunities to physically integrate the results of our investigations and also share them through a range of other engagement media.

How has HS2 identified and maximised opportunities in scheme design and design stages? How do we as HS2 historic environment experts identify and promote colleagues to take the 'leap of faith' often required to secure commitment to the 'information' potential in advance of the 'data' delivery?

This paper:

- considers our processes and stages of when, and how, to integrate our historic environment research, survey and intrusive investigations in the HS2 scheme design,
- shares case studies of identifying and maximising opportunities in scheme design and interpretation through variety of story-telling media,
- identifies any lessons learnt and opportunities to improve integration of heritage in HS2 scheme design.

## 13 ARCHAEOLOGY DATASETS AND MAJOR INFRASTRUCTURE PLANNING AND CONSTRUCTION

**Abstract author(s):** Carver, Jay (4AD Consultants Ltd)

**Abstract format:** Oral

From the late 1990s to now, major infrastructure projects in the UK have sought to develop systems to source, manage, create and share for reuse, large amounts of new archaeological data. We shall look at some of the key milestones along this journey with UK project examples, and review how big data integration is being addressed in a current large rail project High Speed 2 Phase 1 London to Birmingham. We shall discuss current issues, and how the future may look for data that is standardised, interoperative, and genuinely capable of effective reuse with least effort. Is it even achievable and or desirable? Or are the barriers to real integration too large? Finally we shall highlight some the different audiences for reuse of the data, from teams undertaking post excavation synthesis (what do they need?), future researchers (what will they need?), and local communities. What tiered approaches are required to maximise the use and reuse of data and how should it be shared?

---

## 260 WHOSE POT IS IT ANYWAY? STYLE, INFLUENCE, INTEGRATION AND MEANING IN EUROPEAN CERAMICS

**Theme:** 1. Archaeologists and Archaeology Here and Now

**Organisers:** Hall, Derek (Independent Researcher) - Casimiro, Tania (NOVA University Lisbon) - Wennberg, Tom (Goteborgs Stadsmuseum) - Witte, Frauke (Museum of Southern Jutland)

**Format:** Regular session

Nothing originates from nothing, and this seems to have been the case of medieval, early modern, and even contemporary European ceramics. All around Europe many traditions originated with the Romans with some of those technical aspects spreading. Tin glazed ware may be considered as a paradigmatic example. While it was developed in the East it entered Europe through the Iberian Peninsula due to the Muslim presence. By the 14th century it was already being made in Italy from where it was sent to countries such as France, England, and the Netherlands,

reaching the North in the middle of the 18th century, already as an industrial production. This type of ceramic production then receives an external influence motivated by global contacts in the 16th century when all European countries began to adopt an Eastern style in their productions.

The way cultural traditions are shared in Europe at different times and speeds and how they are reflected in pottery production and use is what we intend to discuss in this session. We aim to defy traditional approaches that tend to talk about ceramic production as an isolated phenomena and instead locate it in the wider European panorama discussing if these can be considered as assimilation, diffusion, refusal, or appropriation processes. These similarities reflect how Europe may share identity aspects and can be seen not only in techniques, forms, decorations, or symbols, but also in ways of using such objects in different environments and how they reflect social, cultural, and even political behaviours.

We welcome proposals for papers from the fields of archaeology, iconography, ethnography, geography, history, linguistics, and other related fields.

## ABSTRACTS

### 1 "KERNOI" OF ENEOLITHIC-EARLY IRON AGE IN THE NORTHERN BLACK SEA REGION

**Abstract author(s):** Makhortykh, Sergey - Kotova, Nadia (Institute of Archaeology Ukrainian Academy of Sciences, Kiev)

**Abstract format:** Oral

Our presentation is devoted to consideration of very exciting ceramic class conventionally classified by kernoï, which are located in the northern Black Sea region. They mainly belonged to the two chronological epochs – the Eneolithic and Early Iron Age. There are several typological groups among this ceramic material (multi-mouthed vessels, vessels with integral small cups or tubes on their shoulders, etc), which were found in settlements or necropolei contexts like Starye Bedrazhi, Krutukha Zholob, Neporotiv, Yaseniv, Komarov, Velikaya Aleksandrovka, etc. This ware usually functioned as cult feasting or offering pottery, but sometimes they were also used as proper grave goods. Appearance of "kernoï" in the northern Black Sea region was connected with various kinds of cultural impetus (migrations or network of long-distance culture contacts) came from the Danube-Carpathian and Mediterranean regions. At the same time, distribution of multi-spouted vessels also known in Italy, is possibly associated with the Near Eastern influence. Kernos-type vessels functioned as a symbol of group identity and represents similar religious beliefs, although many of them had own style and were local production.

### 2 WHOSE URN IS IT ANYWAY?

**Abstract author(s):** Kovacic, Ana (Independent researcher) - Stemberger Flegar, Kaja (PJP d.o.o.)

**Abstract format:** Oral

The Latobici were a Celtic tribe who resided in the area of the modern day Dolenjska region in Slovenia (Roman Pannonia Superior). Their presence is attested both epigraphically as well as in the works of ancient authors. The uniqueness of Praetoricum Latobicorum (Trebnje) and Municipium Flavium Latobicorum Neviodunum (Drnovo) and their surroundings in the Roman period is most strikingly manifested in local forms of pottery, which are especially prominently featured in the mortuary sphere. Some of these forms are clearly relics of Prehistoric traditions, as the area was flourishing in the Iron Age.

However, the distinct form of vessels known as house urns are not such a relic despite being exclusive to the region and limited to the funerary setting. Initially, the urns were ascribed to the Latobici tribe by Peter Petru, who named them 'Latobici house urns' (hišaste žare Latobikov) due to their distribution, but Dragan Božič argued against the connection of the prehistoric tribe with this specific pottery form since not a single urn was actually found in graves that could be dated to the prehistoric period or to the transition between Prehistory and the Roman period.

This paper aims to revise the typo-chronology and distribution of different types of these house urns. Moreover, it discusses possible explanations of the origins of this unique form in the context of the major shifts observable in material culture after the Roman occupation.

### 3 EARLY MODERN MERCURY PRODUCTION AT IDRİJA, SLOVENIA: RESULTS FROM THE EXCAVATION AT THE MERCURY ORE ROASTING SITES

**Abstract author(s):** Kawashima, Takamune (Hiroshima University Museum) - Rupnik, Janez (Avgusta, d.o.o.) - Hudson, Mark (Max Planck Institute for the Science of Human History) - Uchiyama, Junzo (Sainsbury Institute) - Pelloli, Claudio (Independent Researcher)

**Abstract format:** Oral

Idrija is known as one of the most important mercury mines in the world and was registered as a UNESCO World Heritage Site in 2012. However, the early mercury smelting in Idrija is only known in the literature, and the early stages of

smelting activities and trade are still unknown. As no archaeological excavation has been conducted before 2019, previous studies have been conducted based on pottery collected on the ground surface. Therefore, the changes in the pottery and the date of the sites have not been clarified. The authors conducted small-scale excavations in 2019 and collected mercury ore roasting pottery stratigraphically at several sites. As well as accumulations of pottery sherds, we could find the fragments of clay seals for the pottery at the Trate and the Padarjeva grapa sites, which have been firstly recognized archaeologically. At Padarjeva grapa, under a thick layer of the black soil, we could find a possible hearth platform. A geomagnetic survey at the Prenštat site revealed the concentration of the pottery sherds at some places, one of which was an accumulation of the sherds. By a survey at the Pod rovtom site, we found the sherds with inscriptions, which might imply the potter or the kiln. These results will contribute to clarify the early stage of mercury production in Idrija, transportation of the mercury, and supply system of the pottery.

#### **4 ACCULTURATION, ASSIMILATION, CONNECTIVITY IN THE EARLY MEDIEVAL CARPATHIAN BASIN: CASE STUDIES FROM THE POTS POINT OF VIEW**

**Abstract author(s): Hajnal, Zsuzsanna (Hungarian National Museum / Magyar Nemzeti Múzeum)**

**Abstract format: Oral**

5-8th cc has meant the period of Great Migration in the Carpathian basin various peoples formed states with their special pottery traditions and need. Two almost totally (70-80%) excavated settlements of around 5 hectares at Kolked-Feketekapu and Tiszagyenda-Lakhatom were examined and more than 30.000 ceramic shards unearthed from each site.

The Kölked site could be dated to the 6-8th centuries and consisting of several families of high social status, metal finds of the burials speaking of close and strong connections with Late Antique and Merovingian material culture; giving evidence of people of different origin living under Avar rule. The earlier flourishing phase has closer parallels with Italy, the Balkans and the western Germanic kingdoms than the Avar Khaganate' sites in fashion, in the used pottery, and even in architecture as well. The process of social (political) changes and with new cultural influences could be visible during the 7th c. The decline of Mediterranean trade, the radical reduction of spending power of the households, the elimination of cross-border connections, and the assimilation into the mass population of the late Avar Empire could be detected on the ceramic material as well.

The Tiszagyenda site would be represented as a control case study: what happened after the Huns burnt down the former Sarmatian settlement, how a new population did formed their village and how they lived through the Avar conquest in the eastern part of the Carpathian basin. Changes in settlement structure and reorganizing the economic units of the site would reflect in transformation of the used vessels also.

Intra site analyses of distinctive and characteristic ceramic technological groups together with comparisons of their presence, frequency in other areas of the Carpathian basin are planned. The lecture would focus on the questions of producing centres, trade, acculturation, assimilation that visible on the pottery.

#### **5 THE INFLUENCE OF THE VISTULA TRADING ROUTE ON THE DISTRIBUTION OF CERAMIC VESSELS IN POST-MEDIEVAL POLAND**

**Abstract author(s): Starski, Michal (University of Warsaw, Faculty of Archaeology)**

**Abstract format: Oral**

The paper is devoted to the main trading route in Poland from the 15th ct. to the end of the 18th ct. Beyond mass products such as grain, wood and raw materials also, pottery was distributed from production centres to the main towns, both from the south to the north and also from the north to the south. The signification of such trade was primarily focused on local or regional demand, but some products were sold across the Baltic Sea.

The paper will outline the main trends of products distributed on the internal market in Poland (whitewares, glazed whitewares, local slipware, pomeranian faience). For example, data from Gdańsk, Puck, Bydgoszcz, Płock, Warsaw and others will be presented. The time range for discussion is specified from the second half of the 15th ct. to the 18th ct. Also, a future perspective for identifying such products around the Baltic Sea will be outlined.

#### **6 A WHITER SHADE OF CLAY. MEDIEVAL AND POST-MEDIEVAL WHITEWARE POTS NORTH OF THE CARPATHIANS – AN OVERVIEW**

**Abstract author(s): Trzeciecki, Maciej (Instytut Archeologii i Etnologii Polskiej Akademii)**

**Abstract format: Oral**

White kitchenware vessels appeared and disappeared with varying intensity in different places of East-Central Europe between the 10th and 18th centuries. Researchers generally perceive them as a material indicator of technological progress, allegedly necessary to work with this type of raw material, and study them with regard to a given region or at most a country, usually within the borders after 1945.

This paper proposes a broader view, taking into consideration both the *longue durée* approach and a broader geographical perspective that includes vast territories north of the Carpathians, between the Oder and Dnieper rivers. In such a perspective, studies on the production and distribution of whiteware in East-Central Europe point to the variability of cultural, economic, and political entanglements of societies living in this part of Europe. Each time the emergence, widespread, and finally decline of whiteware manufacture and use seem to be strongly related to fundamental socio-cultural changes, frequently promoted or even forced by the political power. The sources of inspiration seem to be different each time, both in terms of the directions of technology transfer and the ways of adaptation/interpretation of stylistic features. The paper focuses on three issues that can be regarded as fundamental: whiteware manufacture in the princedoms of Kievan Rus' (11th-13th century), the inflow of white pots into Polish towns chartered on so-called German Law (14th-15th century), and, finally, mass-scale production and distribution of the white ceramics in the territories of the Polish-Lithuanian Commonwealth (17th-18th century). Given the current state of the research, the observations are only preliminary, but they clearly set out the great, although still not recognized, the cognitive potential of this ware group.

## 7 THE (IN)VISIBLE COOKING POT: SOME THOUGHTS ON KITCHENWARES IN MEDIEVAL TARTU (ESTONIA)

**Abstract author(s):** Haak, Arvi (Tartu City Museum; University of Tartu, Department of Archaeology and History)

**Abstract format:** Oral

Among the archaeological collections from the medieval town of Tartu, the ceramic assemblages have shown differentiation even among kitchenwares. During the town formation period (13th century in Estonia), the influence of Northwest Russian ceramic tradition on the local wheel-thrown pottery production has been recognized, and such flat-bottomed vessels are numerous. At the same time, a small number of western imports have entered the cooking sphere, mostly Paffrath-style globular pots. Thus, differentiation exists even in that sector.

From the 14th century onward, the use of local earthenware vessels clearly diminishes, although these are present in latrine complexes of 15th-century dating, even from plots with clear evidence of conspicuous consumption. Compared to neighbouring areas, this can be considered rather late development. As ceramic tripod pots, another common form, remain almost non-existent in Tartu until mid-16th century, the question remains, what has remained of late medieval cooking vessels? Could the metal tripods, which leave very limited traces in the urban archaeological record, have filled not only the upmarket niche, but become standard equipment in most urban households? If so, how to interpret the parallel usage of local earthenware pots?

These developments, namely several influences, parallel developments and temporal changes in Tartu are used as a basis for interpretations on diffusion, tradition, assimilation, and refusal in the ceramic sphere, which will be seen as related to the development of appliances for heating and cooking, and methods of food preparation.

## 8 UNCONSCIOUS SIGNALLING: MIGRATION AND APPROPRIATION IN THE DIVERSE POTTERY-MAKING TRADITIONS OF THE WESTERN BALKANS.

**Abstract author(s):** Carlton, Richard (University of Newcastle) - Djordjevic, Biljana (National Museum of Serbia in Belgrade)

**Abstract format:** Oral

The current pottery-making traditions of the Western Balkans centred of Bosnia-Herzegovina arguably exhibit, in their surviving remnants, greater diversity than those of any other part of Europe. Although not presented as a direct analogy, the presence of such diverse traditions, represented by starkly different production technologies as well as their products, is reminiscent of the picture presented by the distribution of Roman and medieval pottery derived from archaeological contexts here and elsewhere. Thus, in eastern Serbia and Bulgaria semi-industrial potters producing glazed wares using foot-wheels and updraught kilns exist alongside potters using hand-building and open-firing techniques, while to the west are potters using hand-wheels and open- or single-chamber firing methods to produce predominantly calcite-tempered cooking wares. This paper will discuss the notion of 'tradition' in the context of these potters, investigating its parameters with respect to ethnographic and archaeological perspectives. Aspects of the continuing hand-wheel tradition suggest the continuity of technological tradition since it was imported in the early medieval period, while the ramifications of a century-long migration of Piroćanci potters from the eastern tradition (itself heavily influenced or derived from late Ottoman and Byzantine traditions) into 19th and 20th century Bosnia and Northern Croatia will also be discussed. The latter will focus on the example of a single potter, Zoran Jontić, who migrated 600 km westwards into Croatia from eastern Serbia in the 1980s, returning to Serbia in the early 1990s. His willingness to adapt to local demand in both Western Croatia, where he began to produce local as well as imported forms in the mid-1980s, and currently in Serbia, where he produces local forms as well as imitations of West Serbian hand-wheel potters, is considered along with the wider, continuing impact of the Piroćanci tradition.

## 9 TRANSFER OF FASHION – THE SLOW NORTH?

**Abstract author(s):** Witte, Frauke (Museum of Southern Jutland)

**Abstract format:** Oral

The expression of the post medieval earthenware in the southern part of Scandinavia and Northern Germany is very similar to other European areas. Common forms and decorations shows common fashion awareness.

Through transport of ceramic by water and land as food containers or gifts, the local potters became to know pots, bowls and plates people had brought with them. In addition, moving potters have carried on the style of their homeland.

At the same time, the local understanding of motives was crucial for the interaction between potter and buyer/customer. The result was a fashion that has its roots in the faience and earthenware of southern Europe and the Netherlands. It can be compared in many ways with different regions of Europe, but it has also its own character. What is interesting about this adaptation of forms and decoration is both the selection of motives and the shift in time that has occurred. This can be partly explained by political and religious circumstances.

## 10 THE DISTRIBUTION OF ANABAPTIST FAIENCE IN THE HABSBURG MONARCHY

**Abstract author(s):** Blažková, Gabriela (Institute of Archaeology of the Academy of Sciences of the Czech Republic)

**Abstract format:** Oral

Anabaptist faience is a special phenomenon of world cultural heritage. It is an important concept in the field of art history and (private) collecting. Anabaptist faience was produced in Anabaptist workshops in South Moravia. Its origin dates back to the second half of the 16th century. Production in Moravia ended around 1620 when most of the workshops closed due to the Thirty Years' War. In 1622, the Anabaptists were expelled from Moravia for religious reasons; however, faience production continued smoothly in present-day western Slovakia and Transylvania.

Archaeological excavations have documented twelve workshops that produced richly painted ceramic tableware of representative function. Anabaptist religious principles forbade depicting living creatures (humans and animals) as well as making humorous vessels in terms of shapes. The largest workshop was found in Vacenovice where a large-capacity ceramic kiln was discovered. The initial production of faience was sold to aristocratic and patrician households. Thanks to orders faience products became part of aristocratic families' property throughout the territory of the Habsburg Monarchy.

Archaeological research of the Anabaptist workshops plays a key role in solving the question of where the Anabaptists learned by the technology of faience. It turns out that the direct source of inspiration was southern Germany where faience technology was already known in the 16th century and where a large group of members of the Moravian community of Anabaptists came from. It follows that the influence of Italian faience was secondary and mediated in the case of Moravian production.

## 11 FAIENCE PRODUCTION IN SCANDINAVIA - A BRANCH OF THE EUROPEAN TIN-GLAZED EARTHENWARE TREE

**Abstract author(s):** Wennberg, Tom (Museum of Gothenburg)

**Abstract format:** Oral

Faience production in Scandinavia begins in Copenhagen 1722. From there it spreads over Scandinavia during the course of the 18th century. Faiences are being produced up until the very early 19th century when it's ousted by industrial earthenware from Britain. The Swedish production changes from faiences to refined earthenware during this period.

This paper will discuss workshop materials and how the faience potter's knowledge spread over Europe in general and in Scandinavia and the Baltic area in specific. Excavated material from Marieberg in Stockholm, Pålsjö outside Helsingborg and Sölvesborg in the southeast of Sweden will be presented. These manufactures were producing faience in the latter half of the 18th century. The excavations yielded different kind of kiln furniture like parts of saggars, saggar pins, setters and more. The workshops are related in many ways. The production techniques will be discussed in relation to the group of Baltic tin-glazed earthenwares and in connection to a general European tradition of faience production in the early modern times.

## 12 HOW A WORKING-CLASS COMMUNITY IN 19TH CENTURY COPENHAGEN ACCESSED A GLOBAL CERAMIC STYLE – INTERPRETATIONS OF A LARGE POTTERY ASSEMBLAGE

**Abstract author(s):** Keenan, Samuel (Museum of Copenhagen)

**Abstract format:** Oral

In 2018 archaeologists from the Museum of Copenhagen excavated a series of 13 brick lined latrines from a backyard of a row of houses in the Nyboder area of central Copenhagen. Historical sources, as well as the archaeology,

show that these latrines were put out of use and filled with household waste in the 1850s. From these latrines approximately one tonne of ceramics were collected, including large amounts of Chinese and European porcelain and English whitewares.

Although coming from a working-class area of Copenhagen, this assemblage is very similar, in terms of its distribution of ceramic types, to those that have been found from South America to South Africa, and across Europe in this period. From this we see a working-class community that has adopted an identifiably global aesthetic. However, much of this material was likely acquired through second-hand markets and thus demonstrates the varying modes of acquisition different groups exploited to take part in this global style. It also shows how poorer sections of society were able to access the same trends and fashions as wealthier citizens due to developments in the commercial and manufacturing spheres of the globalising 19th Century economy.

Despite being representative of a global style, this assemblage has several distinctly Danish characteristics, including significant amounts of Danish produced porcelain, as well as redwares from several production centres across Denmark. As such, a large assemblage such as this can inform us about local social and political structures, despite its seemingly generic nature.

### 13 **“TRACING BACK YOUR POT”: PUNIC-ROMAN FOODWAYS AND CERAMICS AND THEIR PERMANENCE IN SOUTHERN IBERIA UNTIL NOWADAYS**

**Abstract author(s):** Sánchez Moral, Carmen María (Universidad Autónoma de Madrid)

**Abstract format:** Oral

Ceramics are the most direct -yet silent- witness to daily culinary practices. Food consumption, besides being fundamental to human existence, transcends a mere physiological necessity and reaches a deeper dimension, since it is the result of the choices and cultural interpretation made by a human group within its specific socio-economic and cultural framework. Thus, foodways and the (pottery) technology linked to them represent an invaluable marker for cultural dynamics and their evolution during centuries, as well as the integration, reinterpretation, resignification, imitation and assumption of foreign traditions. These are practices that define the way a society understands and conceives itself, but also its self-representation and identity.

This being said, the main aim of this paper is to study some cooking and culinary habits -food preparation, conservation, consumption and storage methods- that survive until the present day in Southern Iberia and can be traced back to Punic-Roman times, the Middle Ages and Early Modern Period. Even if starting from a specific geographical framework, archaeological and ethnographical parallels with other areas of Northern Africa and the Mediterranean Basin will be considered, since they shared a common past (current Italy, Portugal, Greece, Tunisia, etc.). The principal method to do so will be the ceramological study of the Hellenistic, Punic and Roman cooking pots and tableware pottery -which have been the object of my PhD Thesis as part of the “Carteia Project”- and the long-term persistence of some of their technical and typological features and culinary uses in subsequent historical periods until nowadays. We will proceed with a polyhedral and holistic approach, that is, taking into account other fields of knowledge such as Experimental Archaeology, Ethnology, Etymology, Nomenclature, Metonymy or Commensality.

A necessary interdisciplinarity required by these complex yet fascinating artefacts: ceramics. True “History pots”.

### 14 **GUESS WHO'S COMING TO DINNER? CERAMIC FORM AND STYLE IN MEDIEVAL SCOTLAND, A REFLECTION OF DIETARY CHANGE AND EXTERNAL INFLUENCE**

**Abstract author(s):** Hall, Derek (Independent Consultant)

**Abstract format:** Oral

This paper will consider the effect of the introduction of new eating and drinking habits into Medieval Scotland by looking at the development and manufacture of different types of pottery vessels. The creation of the first towns in Scotland (burghs) by King David the First in the 12th century and his introduction of the major monastic orders introduced new settlers into Scotland from both England and the Continent. Pottery specialists have often considered the possibility that the arrival of these new people can be identified in both the origin of pottery that is found and the noticeable change in locally produced vessel forms and decorations. The introduction of the consumption and preparation of new foodstuffs into everyday life can also be seen to be reflected in the use of new types of ceramic forms. This presentation will examine the available evidence from excavated ceramic assemblages to see if this theory holds true.

## 15 FROM THE MEDITERRANEAN TO THE BALTIC: THE SPREAD OF USE AND PRODUCTION OF LEAD GLAZED EARTHENWARE

**Abstract author(s):** Langkilde, Jesper (Roskilde Museum)

**Abstract format:** Oral

The technique for lead glazing earthenware had spread from its origin in the Near East to the Western Roman Empire during the first century BC to the first century AD. In the following centuries, lead glazed earthenware was produced in small amounts in Europe north of the Alps at Roman production centers in Gaul and Britain. Like many other Roman innovations, lead glaze disappeared north of the Alps following the 4th century, but continued in the Mediterranean and the Byzantine Empire. Transalpine lead glazed earthenware production then reappeared in Frankia in the 8th-9th centuries and in Britain in the 9th-10th centuries, but it was not until the time around 1200 that lead glazing took the jump to local production in Southern Scandinavia and the western Baltic. Why did it take so long for this technique to go from Western Europe to Scandinavia and the Baltic? This paper will try to give short overview of the travel of the lead glazing technique from the Mediterranean to the Baltic and discuss the dynamics and cultural context for this process. Emphasis will be on the transfer from Western Europe to Southern Scandinavia/Western Baltic.

## 16 THE INS AND OUTS OF EUROPEAN EARLY MODERN TIN GLAZE WARE: TECHNIQUES, AESTHETICS, AND IDENTITY

**Abstract author(s):** Casimiro, Tania (CFE HTC - Nova University of Lisbon)

**Abstract format:** Oral

The first experiences of early modern tin glaze ware production in Europe occurred still in the Middle Ages in the Iberian Peninsula and from there it widespread to other countries. Although the medieval production is a fascinating subject and the genesis of what will happen in later centuries, this paper will discuss European productions from the late 15th to the late 18th century and how different countries assimilated similar traditions. Although a thorough analysis of the distribution of European tin glaze ware within Europe is not made yet it seemed that the countries which were producing such wares were also consuming wares made in other countries. In this sense Portuguese, Spanish, Italian, British, Dutch, and French vessels were circulating around the European continent. This means that potters had access to what was being made and could do similar things. This European productive and consumer panorama did not only used the same techniques, but it shared similar subjects in their decorations. Drawing from the theme of this session it would be important to discuss, based in archaeological evidence, how these relations made that a similar aesthetic behaviour occurred within Europe, especially in the cities associated to maritime trade where these objects can be recognized as the materialization of European cultural contacts allowing the possibility to discuss even a shared identity.

## A. SMALL CERAMIC VESSELS IN THE CHEESE-MAKING PROCESS - FROM THE NEOLITHIC TO THE MODERN ERA

**Abstract author(s):** Zdeb, Katarzyna - Żurek, Magdalena (Institute of Archaeology Cardinal Stefan Wyszyński University in Warsaw)

**Abstract format:** Poster

Vessels with sieves were found on the archaeological sites. Such vessels dated from the Neolithic period till the Early Iron Age are different in shape - vessels are similar in form to strainers, as well as cups, bowls, and funnels, with sieves on the whole surface, but we know also bowls with sieves in bottoms. In early mediaeval layers, cups with sieves in bottoms occur. Research over the last few years shows us that even in late mediaeval and early modern archaeological material we can distinguish vessels with sieves. Their function is still under discussion but some of them could be used in the cheese-making process. To prove these chemical analyzes are required. They are necessary to determine if vessels have been in contact with foods and if so, they can determine a kind of food.

Four cups are presented that were found during the excavations in the Teutonic Knights castle at Przewmark. These cups have few sieves in bottoms and they are dated to the end of the late mediaeval period. This has decided to carry out analyzes of the fatty acid content of these vessels.

A case of Przewmark cups shows us that the tradition of using vessels with sieves for cheese production was still alive – from bowls with sieves from the Neolithic period till ceramic moulds are applied nowadays in traditional housekeeping. Perhaps because of this tradition cups with sieves were produced to use them in a new technology of cheese production – for rennet dispensing in the rennet-cheese making process, implanted in northern Poland at that time. At this point, it is important to stress the need to use different methods to verify the results that can be the starting point to develop our knowledge about the castle inhabitants diet.

**Theme:** 2. [Re]integration

**Organisers:** Luciañez Triviño, Miriam (University of the Basque Country - UPV/EHU) - Provenzano, Noëlle (CNRS, Université Paul Valéry-Montpellier III) - Choyke, Alice (Central European University)

**Format:** Discussion session

"Craft specialization" is an archaeological category used to define and identify degrees of socio-economic complexity. It is also one of archaeology's most loosely employed terms due to the widespread assumption that specialization is self-evident, that the concept is understood in the same way and does not require clarification between different cultural contexts. Criteria for "specialised" craft activity are usually not made explicit, making comparative studies difficult. Binomial, often mutually exclusive, concepts are found in the archaeological literature that may or may not refer to the same thing or actually to different things: e.g. Craft specialization versus Non-specialized craft production; Independent craft specialization versus associated craft specialization (for objects produced in different media) and Full-time craft specialization versus Part-time specialized craft activity.

Some suggested criteria include: 1) Place and size of production units; 2) Procurement strategies for raw material; 3) Choice of raw material; 4) Special time of year for production; 5) Level of technical segmentation; 6) Level of know-how (expertise); 7) Homogeneity of transformation modes; 8) Volume and variety of productions; 9) Specialization of the tools used; 10) Scale of product distribution; 11) Workshop associations with products in other media.

Presenters will be asked to reflect on the various criteria, both objective and subjective, they use to define and identify craft specialization in their worked osseous assemblages. We aim at a diachronic and transdisciplinary session in order to assess different definitional practices, regardless of chronological period. Contributions from Archaeology, Ethnography, Cultural Anthropology, etc. are welcome. We invite researchers in worked osseous assemblages from any period to share how they identify the archaeological signature of craft specialization using examples from their own work. Papers should include direct commentary on definitions, parameters and even doubts about issues of craft specialization.

## ABSTRACTS

### 1 **MOTIVATIONS FOR TECHNOLOGICAL INVESTMENT, OR BEING EVASIVE ABOUT CRAFT SPECIALISATION**

**Abstract author(s):** Christidou, Rozalia (UMR 5133, CNRS/Univ. Lyon 2)

**Abstract format:** Oral

In the Aegean Neolithic and Bronze Ages, the worked hard tissues of animals, with the exception of the imported ivories and the Spondylus and Murex shells represent rarely compelling cases for testing the social and economic implications of the adoption of specialised complex technologies. The osseous materials which were locally available feature various tools and techniques used to process them and the involvement of bone tools in diverse tasks typically related to the domestic economy. They also often show variability in the quality of the products made and the care used in the production, suggesting small-scale, household-level activities. However, certain areas of the Final Neolithic bone-working demonstrate introduction and careful manufacture of new tool types and tool decoration patterns and strategic modifications of the products obtained from select bones such as the deer antlers. In the Bronze Age, the production of personal items becomes part of the bone-working activities and largely based on the use of metal tools. Although the scale of production does not seem to change in these periods, the technical aspects of the production indicate different production agendas and a motivation for self-definition and advertisement of producers.

The Aegean Final Neolithic and the subsequent Bronze Age are characterised by the restructuring of local economic and social systems and receptiveness to novel ideas. Then, should we be more careful about the ways this evolution influenced personal and group motivations for technological investment and reshaped tasks related to bone-working? Thus, the beginning of specialised craft production from bone could start to be explored in a methodical manner.

### 2 **SPECIALISATION IN THE BRONZE AGE? REFLECTIONS ON THE OSSEOUS PRODUCTIONS OF THE NORTH ITALIAN TERRAMARES**

**Abstract author(s):** Provenzano, Noelle (CNRS)

**Abstract format:** Oral

For a very long time, many studies have been interested in the question of the specialization of production in pre- and protohistoric contexts, focusing, in particular, on the theoretical elaboration of criteria that could define the different levels of specialization and the status of craftsmen. The numerous works on flint, ceramics, metal or some prestigious

materials have demonstrated the informative potential of this approach for the understanding of the organization of these societies of the past. Production on hard animal materials has attracted much less study, with the exception perhaps, of certain very specific productions or those elaborated on prestigious materials like ivory or certain shells. Bone productions are nevertheless an integral part of the whole economic system but, in addition to not always being numerically abundant, they are marked by a strong and perennial technical tradition that can sometimes give them a monotonous aspect of a daily domestic production. Beyond the theory, we tried to establish the most reliable and objective criteria possible that can help us understand to what extent we can evaluate the organization of these bone productions, their destination and the role of the actors of these productions. In order to carry out this reflection, we have focused on the bone productions from the Terramare of the Northern Italian Middle Bronze Age, productions known for their impressive quantity and quality and which are one of the particular aspects of this culture.

### **3 CHALCOLITHIC IVORY CRAFTSMANSHIP IN THE IBERIAN PENINSULA. SPECIALISED CRAFTS(WO) MEN AND SPECIAL(ISED) CONSUMERS?**

**Abstract author(s):** Luciañez Triviño, Miriam (University of the Basque Country UPV-EHU; University of Seville)

**Abstract format:** Oral

Today, everyone accepts that ivory work is a specialised activity. It seems to be true that the production of ivory objects and their consumption have characteristics to define it as specialised craft. Here a reflection on ivory working in the Iberian Peninsula during the Chalcolithic period is presented. Valencina de la Concepción (Seville, Spain) is used as a case study. As far as our studies have revealed, we have some data on: procurement strategies for raw material (through exchange or trade from other Mediterranean areas); choice (selected for the most showy objects); segmentation of chaîne opératoire (the procurement and preparation of the blocks, and probably also the procurement of the blanks, was carried out at the place of origin of the raw material); homogeneity of production modes (systematised exploitation, mainly through the production of longitudinal plates); variety of products (production of a huge variety of objects, aimed at specific groups or collectives) and use of specialized tools (metal tools). However, there are still gaps to be filled in the Iberian Peninsula, probably in Europe as a whole. Where are the place of production? how are and where are the workshops? how can we define them? which is the volume of production and scale of distribution? The data available to date for defining (or not) ivory craftsmanship as specialised is discussed here. In addition to presenting and reflecting on some criteria that have been observed archaeologically, I would also like to reflect on whether "the end user" is, or can be, a further criterion for defining specialised craftsmanship.

### **4 DECORATE, FIT AND COMBINE. INLAYS AND FACING IN THE HARD ANIMAL MATERIAL INDUSTRY OF THE IRON AGE. SPECIALIZED CRAFT TECHNIQUES**

**Abstract author(s):** Blasco Martín, Marta (ICAC, Tarragona, Juan de la Cierva-Formación.) - Soria Combadiera, Lucía (Univ. de Castilla-La Mancha. Dpto. de Historia, Área de Prehistoria. ARQPAT - Arqueología y Patrimonio) - Mata Parreño, Consuelo (Universitat de València. Dpto. de Prehistòria, Arqueologia i Història Antiga. GIUV2015-222 GRAM)

**Abstract format:** Oral

The studies of hard animal materials industries of the Iron Age in the Iberian Peninsula have made possible to document a great craft variability in the objects, the raw materials and the techniques used. Among them, it is worth highlighting the decorative techniques of inlays and facing. Both suppose two technological decisions linked to a specialized degree of know-how, because they imply a planning, a precise mastery of the tools and the actions carried out and the work of various raw materials, either by the same craftsperson or by the communication between several of them. For the first time in the western Mediterranean area in these chronologies, artefacts with the indicated technologies have been found, they combine various exogenous materials, such as amber and ivory. In this work we will focus on what type of objects present these decorations, what materials are combined and how they would be accessed, in what places they appear and who could carry out these ornamental techniques related to a high degree of craft knowledge.

### **5 COMPARING PRACTICES OF WORKED ANIMAL OBJECT PRODUCTION AT ANCIENT METHONE**

**Abstract author(s):** DiBattista, Adam (Institute for the Study of the Ancient World, NYU)

**Abstract format:** Oral

Archaeological evidence for the production of worked animal materials in the Greek world is severely limited during the Early Iron Age and Archaic Periods (ca. 1100-500 BCE). However, the site of ancient Methone, an early Greek colony in northern Greece, represents some of the only direct evidence for the production of worked animal objects during this period. Moreover, the deposition of the Methone assemblage (ca. 800-600 BCE) coincides with a time when individuals were dedicating new forms of worked animal objects at sanctuary sites across the Greek world. The assemblage shows extensive evidence for worked elephant ivory, strongly suggesting that craftspeople at Methone were creating objects intended for dedication at such sanctuaries. However, the wide variety of animal materials (e.g., bone, antler, boar tusk) and final products indicates that different forms of craft production were occurring si-

multaneously; analysis of the site also suggests that the social arrangement of craft production changed throughout time. In order to better understand the different approaches to creating worked animal objects at ancient Methone, this talk examines the variations among the choice of animal materials, acquisition methods, final products, and production environments at the site.

## 6 EVIDENCES OF CRAFT SPECIALISATION DURING THE HUNGARIAN LATE NEOLITHIC: AN OVERVIEW

**Abstract author(s):** Tóth, Zsuzsanna (Hungarian National Museum, Department of Archaeology)

**Abstract format:** Oral

Worked hard osseous industry of the Hungarian Neolithic is characterised already from the Early Neolithic onward by standardised tool types in raw material selection, shape as well as manufacturing methods.

The Late Neolithic is a time period of complex social and cultural changes which is reflected also in the worked hard osseous industry. The average technological background and available raw materials and tools are more or less unified with minor variabilities between certain regions and sites of the period. Variabilities can be detected in raw material selection regarding species and skeletal elements of certain tool types, but typological composition of the different site's assemblages show some differences, too. In my opinion these variations cannot be explained only by regional or cultural differences, but certain tool types (such as bipartited awls and double points) prove the emergence of craft specialisation. In my presentation I try to present an overview of Hungarian Late Neolithic worked hard osseous industry as such and shed light of possible traces of craft specialisation through the examination of worked hard osseous assemblages of several Late Neolithic sites.

The research was granted by NKFIH 121128.

## 7 A ROMAN BONE-PROCESSING HOUSE IN AQUAE GRANNI (AACHEN, GERMANY)

**Abstract author(s):** Nolde, Nadine (Institute for Prehistory, University of Cologne) - Schaub, Andreas (Stadtarchäologie Aachen) - Deschler-Erb, Sabine (IPNA, University Basel) - Deschler-Erb, Eckhard (Archaeological Institute, University of Cologne)

**Abstract format:** Oral

During a sewer renovation between 2013 and 2017 in the vicus Aquae Granni, (the modern city of Aachen, Germany), a large quantity of late Roman animal bones from a street-side house close to the forum and thermae, possibly destroyed in the context of the riots in the years 275/276, were found by excavations. Particularly striking was the distribution of animal remains as well as their modifications and state of processing within this house, that could be associated with at least one bone-processing craft. Three single rooms indicating different bone-working activities within each chamber. In one room, half-finished products, blanks as well as a specific waste spectrum associated with the workshop of a bone carver were present. Another room, facing the street is interpreted as a sales area and contained mostly finished bone needles and pins. The faunal material from the third room, however, is more indifferent and, apart from bone carving, may have housed another bone-processing trade, such as a glue boiling shop or a soup kitchen. In this case a combination of different trades under one roof reflects the symbiosis between all the craftsmen working in the processing of animal remains, such as bone, meat, marrow and glue.

## 8 CRAFT SPECIALIZATION IN WORKED ANTLER AND BONE IN URBAN RIBE AS SEEN IN WORKSHOPS FROM DIFFERENT AREAS BETWEEN 700-1300 AD

**Abstract author(s):** Qvistgaard, Sarah (Sydvestjyske Museer) - Sindbæk, Søren (AU)

**Abstract format:** Oral

Ribe, Denmark, faces the North Sea with travel routes towards the European continent and Scandinavia. Excavations in recent years have produced a large and well-documented corpus of workshop waste and finished objects. They reveal extensive production using red deer antler, which shifts over time towards bone from cow and horse. This is a development paralleled in many other Viking-age and Medieval towns.

The occurrence and relative amount of finds of endemic red deer, horse, cow, and goat, and Nordic exotica such as reindeer and whale, give an impressive insight into craftsmanship and raw-material procurement over 600 years.

Specific contexts such as house floors or activity areas hold evidence of exceptional artefacts from different, specialized workshops, not just from combmakers, but also glass bead makers and copper-alloy metalworkers. The craft specialization took place in a combined dwelling-cum-workshops, where specialized craft activities were integrated in the living spaces of the household.

Consistent patterns of material selection for Scandinavian-type comb as opposed to Frisian/North-Sea types show the importance of style and regionality. The quality of the combs show a wide range of variation. Some combs display excellent, highly skilled craftsmanship with precise symmetry and ornamentation. Others are plainly functional, and a few are distinctly poorly made, and were not ever brought into use. The presentation will discuss the implica-

tions: What does the patterns reveal about the level of artisan craft specialization and the artisans, whose work was at times highly skilled, or at others just about home-made "5- minute crafts?"

## 9 GATHERED, EXCHANGED AND VALUED? IDENTIFYING SEMI-SPECIALIZED ANTLER WORKING IN MIDDLE BRONZE AGE HUNGARY

**Abstract author(s):** Choyke, Alice (Central European University)

**Abstract format:** Oral

The Middle and late Middle Bronze Age marks a time of increasing social and technical complexity in the Carpathian Basin. Bronze metal working must have been controlled by specialists, forming part of an organized and far-flung system of trade and distribution that provided predictable access to ores. Production of goods also required specialist knowledge without the need, necessarily, for actual workshops supplying demands of a market economy.

Much less is known about specialization in other crafts, for example, the worked hard osseous materials still found abundantly in site materials from this period. Bone objects still followed manufacturing trends from earlier periods which operated on the household level. Tools and ornaments were manufactured as the need arose on an individual basis using abrasion and cutting-scraping-drilling with chipped stone tools. A technical shift becomes apparent with antler working. Fitting one criterion for semi-specialized manufacture, settlements lying outside ecotone regions of present-day Hungary may have had to barter in antler raw material. In addition, all antler manufacturing was carried out using metal tools, including the first stage of manufacturing, segmentation of red deer antler rack.

It is in this period that topological and technical innovations occur in antler manufacture. These include fine decorative incising, employing motifs found on metal objects, fine imitations of metal objects, use of a pinning technique and inlay. These new techniques and objects are widely distributed would have required specialized metal tools and people with the manual dexterity to use them at a high level. Using materials drawn from the site of Százhalombatta-Földvár as well as other coeval Bronze Age sites in Hungary, I will outline my argument for the existence of semi-specialized workers who produced a small range of refined, highly decorated commodities, perhaps for a more elite audience.

## 10 CRAFTS ON THE EASTERN SHORE OF THE BALTIC IN THE LATE BRONZE AGE: SPECIALISED SITES, SPECIALISED CRAFTSMEN?

**Abstract author(s):** Luik, Heidi (Tallinn University)

**Abstract format:** Oral

The new settlement type – fortified settlements first appeared within the settlement pattern of the eastern Baltic region in the first quarter of the first millennium BC. These settlements were not evenly distributed in the area. In Lithuania, they are known from the north-eastern part of the country, in Latvia mainly from the Daugava River basin. Only a few fortified settlements are known in Estonia. Traces of different crafts have been found in these sites, e.g., bronze casting, pottery making and bone and antler working. Were the crafts spread in the same way in all fortified settlements, or were they rather concentrated in only a part of such sites? Is it possible to identify the specialisation of any areas or buildings for different crafts within these settlements? Are there differences in specialisation between different crafts, for example when comparing bone and antler working with bronze processing, which requires more knowledge and skills? How did the availability of raw materials affect the specialisation of different crafts? The raw materials needed for bronze casting, copper and tin are not found locally in the eastern Baltic region. Bone and antler are locally sourced materials. Domestic animal husbandry played an important role in these settlements, but hunting was of secondary importance, and there are only few bones of wild animals in these sites. Certain differences can be found between the use of domestic animal bones and the antlers of wild animals.

## 11 CRAFT SPECIALISATION AND HOME-BASED PRODUCTION IN BONE AND ANTLER PROCESSING FROM THE EARLY MEDIEVAL CATHEDRAL ISLAND IN WROCŁAW, POLAND

**Abstract author(s):** Baron, Justyna - Diakowski, Marcin - Jaworski, Krzysztof - Pankiewicz, Aleksandra (University of Wrocław)

**Abstract format:** Oral

The Cathedral Island (polish "Ostrów Tumski") is a prominent center of the state and church administration of the early Polish State. It was located at the crossroads of important trade routes connecting Prague with Greater Poland and Pomerania, as well as Western Europe with Kievan Rus. The oldest structures of Cathedral Island (including massive wooden ramparts) date back to the middle 10th century.

The collection of over 1,000 objects made of bone, antler, horn, ivory and teeth were excavated from the 1940s to the present day. They come from almost 20 settlement layers that can be dated from the mid-10th to the mid-13th century. They were both finished products, half-products and numerous waste materials proving local production,

however, that the early medieval workshops have not been discovered. Today the collection is the richest and most diverse of early medieval Poland.

Based on formal and technological features, two basic groups have been distinguished. They differ in both the assortment of types and the tools used to manufacture them. The first group includes items carefully made with the use of a wide range of tools, such as saws, compasses, files, drills and knives. These were decorated elements of boxes, combs, chess pieces, inkwells, styluses, parts of a horse harness. The second group, in formal terms, includes everyday items such as needles, pointed objects (awls, perforators), arrowheads, buttons, skates, etc. They were made with the use of multi-functional tools such as knives and probably axes. An interesting aspect is also the relation between the forms and the selected raw material, which is well illustrated by the production of skates almost exclusively from horse metapodial bones. We argue, these two groups reflect the existence of various degrees of specialisation. In this case both home-based and craft activities represent the most contrasting strategies.

## 12 CRAFT SPECIALIZATION IN MEDIEVAL BUDA

**Abstract author(s):** Font, Ágnes (Central European University)

**Abstract format:** Oral

Craft specialization is a complex issue in medieval archaeology. In recent decades, there have been numerous publications on the subject and on the theoretical frameworks that can be used to characterize and discuss zones of workshop activity or even to localize specific workshops in the mirror of worked bones or antlers. In Hungarian archaeology, there have been numerous attempts to interpret worked animal raw materials in the context of medieval crafts. On the basis of the established criteria and the combined analysis of different types of historical and archaeological sources, several attempts have been made to analyze materials related to workshop activities and craft specialization in the Carpathian Basin. Generally, it is difficult to have a complete picture of the medieval craftspeople, workshops, local trade, and everyday life through the study of archaeological material or the written sources alone. By reviewing the available sources, archaeological materials, and documentation, I aim to discover the existing concepts in archaeology about craft specialization in connection with the hard osseous finds from the excavations in the territory of the medieval Buda Castle District. With regards to this, the following questions can be addressed. How can we, and should we attempt to localize different types of workshops based on written, topographical, and archaeological sources? How are they connected, inter-related to each other? How do the different types of sources overlap, complement, or contradict each other? How can we map the spatial information gained from the written sources? In my paper, I attempt to discover these connections and relationships between the various types of medieval handicrafts in the mirror of worked hard osseous materials.

---

## 264 BIOARCHAEOLOGICAL APPROACH TO HUMAN HEALTH THROUGHOUT THE MEDIEVAL PERIOD IN EUROPE

**Theme:** 5. Climate Change and Socioenvironmental Perspectives

**Organisers:** Roshem, Irmine (University of Aberdeen) - Veiga-Rilo, Clara (Universidade de Santiago de Compostela)

**Format:** Regular session

The pandemic has highlighted a need to better understand the relationship between people and health in order to better assess our resilience as a species. The discipline of bioarchaeology is ever-evolving and holds a large amount of data from various sources about health in the past (pathological evidence, isotopes, DNA, calculus composition, and many others). This historical data provides insight into our understanding of health today and in the future. In this session, the focus is placed on the Medieval period in Europe, which extend from the AD5th until the AD16th centuries. For instance, the session may include studies on the impact of the environment and climate changes on disease patterns; stress indicators; diet reconstructions; epidemics; frequency of interpersonal violence; and migration patterns. This session also covers how these factors affected settlement types, genders, social classes, and occupations differently. Contributions related to the bioarchaeology of care and treatments are also welcome.

## ABSTRACTS

### 1 INJURY CHARACTERISTIC FROM POLÁKY-DOLANY SITE: PATTERNS, PREVALENCE AND VIOLENT-RELATED TRAUMA IN A SMALL EARLY MEDIEVAL BOHEMIAN VILLAGE.

**Abstract author(s):** Witan, Joanna (University of West Bohemia in Pilsen; Institute for Preservation of Archaeological Heritage of Northwest Bohemia)

**Abstract format:** Oral

Poláky-Dolany (Chomutov District, Ústí nad Labem Region) site represents one of the few early medieval villages in Bohemia, which was archaeologically studied including its cemetery. According to archaeological evidence the settlement existed already in the 11th century. Afterward the nucleated village of Dolany, which was established during

the later Middle Ages, was demolished in the late 1960s due to construction of a dam reservoir. Archaeological data indicate that inhabitants of the early medieval settlement were farmers, benefited also from the nearby river and ran a local smithy. It would seem Dolany was an average, small agriculture settlement.

Trauma is one of the more common palaeopathological changes observed on bone material from archaeological excavations. Their incidence depends on many factors that occur in various periods and cultural contexts. This study, based on skeletal trauma, tries to supplement the information about daily life and the dangers that the individuals buried in Dolany had to face. 118 individuals and 1 ossuary (MNI = 23) were examined to determine the type of fracture. Signs of trauma were found in 20 individuals; the majority of them were accident related. However 6 individuals had fractures probably associated with violence-related trauma of which 2 were sharp-force trauma. Therefore, it can be concluded that the lives of residents were generally peaceful, but there was also a risk of work-related injuries. Moreover, the residents occasionally experienced the injuries as a result of possible violence, which are not unusual, but quite rare in the rural populations.

## 2 APPROACHING PATHOLOGICAL CASES IN MEDIAEVAL IBERIA THROUGH THE ARCHAEOLOGY OF CARE PERSPECTIVE: BEING SICK IN AL-ANDALUS

**Abstract author(s):** Olivé-Busom, Júlia (Universitat Autònoma de Barcelona; Group EcoPast - GI-1553, Universidade de Santiago de Compostela) - López-Costas, Olalla (Group EcoPast - GI-1553), Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University; Laboratorio de Antropología Física, Facultad de Medicina, Universidad de Granada) - Kirchner, Helena (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

Since 711 AC a new and Islamic political entity emerged in the Iberian Peninsula, Al-Andalus, and with it a new medical current that incorporated novelties to Galenic medicine. Islamic medicine achieved renown throughout Europe, influencing medical theory taught in *māristānāt* and Christian universities. However, we have little knowledge on daily medical practice, especially in rural areas.

We present a biocultural approach to paleopathological cases of three Iberian skeletons from rural sites of this context to understand the societal effort put towards their care. We also introduce testimonies of Mediaeval Islamic medical treatises (MIMTs) regarding their conditions and available treatments to comprehend the repercussions these had.

The first case focuses on a ~12 years of age-at-death skeleton. It presents a possible case of otitis media that developed into mastoiditis, possibly causing hearing loss and vertigo. MIMTs recommend drainage to treat abscesses and copper acetate to aid cicatrization. A second skeleton belonging to an adult male presents lesions compatible with severe ankylosing spondylitis, which would have caused chronic pain and disability affecting motor skills. Avicenna was aware of such spinal diseases, recommending the use of traction and diet therapy together with edible and local medicines to treat inflammation. Thirdly, a 20-30 years of age-at-death male skeleton suffered an ante-mortem trauma to the frontal bone. Considering the characteristics of the lesion, they were likely cared for by its community during convalescence and, possibly, the prefrontal and orbitofrontal cortex were affected. MIMTs recommend trepanation for cranial trauma and topical treatments, dietary administration and oral medications, and manipulations to treat traumatic brain injuries. These cases show not only that individuals from rural areas had access to specialised medical treatments but that their communities were able to care for them through long convalescences or chronic illnesses.

## 3 BIOARCHAEOLOGY OF CHILDREN AND HEALTH PROFILES FROM A MEDIEVAL CEMETERY SITE (GZ10) IN GIECZ, POLAND

**Abstract author(s):** Slusarska, Katarzyna (Uniwersytet Szczeciński) - Agnew, Amanda (The Ohio State University) - Miciak, Magda (Muzeum Pierwszych Piastów na Lednicy, Rezerwat Archeologiczny Gród Wczesnopiastowski w Gieczu)

**Abstract format:** Oral

The medieval cemetery in Giecz (site 10) is part of a complex linked to the early Piast state stronghold (Giecz, Greater Poland voivodeship, Poland). The burial ground is dated to XI up to XIII centuries based on C14 and stylistic analyses of material goods.

The site is excavated collaboratively by the Slavia Field School in Mortuary Archaeology (Slavia Foundation, First Piasts Museum in Lednica, and The Ohio State University). Over 150 graves have been discovered during the period from 2014 to 2021. Subadults aged up to 11 years old at the time of death represent almost 50% of all individuals from the excavated part of the cemetery (n=75).

The study examines burial treatment and health in the youngest group. Preliminary analyses show a weak correlation between age and grave depth and construction but no clear correlation with other ritual parameters (e.g., presence of grave goods). Therefore we can assume that differences in this aspect may be dictated by cultural rather than biological factors.

The subadults were grouped into smaller cohorts based on dental development and eruption, epiphyseal fusion, and metric assessments (e.g., pars basilaris and clavicle). The group of peri- and neonates group is underrepresented (n=7), likely as a result of various factors, both cultural and taphonomic.

Cranial lesions were observed the most frequently in groups of infants and children up to 6 years (n=18/65; 28%). Usually, they were characterized by excessive porosity and periosteal reaction on the occipital, sphenoid, and temporal bones.

Demographics of the children in this study were compared with other medieval skeletal series from Poland.

#### 4 LET'S TALK ABOUT THE WEATHER - POPULATION DEVELOPMENT AND MORTALITY PATTERNS OVER THE MEDIAEVAL PERIOD

**Abstract author(s):** Weise, Svenja (University of Southern Denmark)

**Abstract format:** Oral

Population size and differential mortality between the sexes are shaped by biological and cultural factors; both interact with the availability of resources, which varies dependent on the climate.

Survival and population size depend strongly on the availability of healthy nutrition, and therefore the amount of arable land and other readily available natural resources, e.g., fish. Population estimates for the Mediaeval Period vary widely, but a trend is clearly visible. After population growth in the High Middle Ages the decrease started already around AD 1300. The changing climate and the resulting shortages in resources prepared the ground for the epidemics that reduced population size after AD 1350, with the lowest point in the first half of the 15th century.

Mortality patterns for both sexes are contrasted for populations with different subsistence forms: farming, beginning urbanization, and urban centers of trade. There is a change in young adult mortality during the Medieval and Early Modern history: from an increased female mortality during the reproductive years through a period of nearly equal risk of dying for both sexes to a surplus mortality of young males. The observed transitions run parallel to changes in subsistence and gender roles, driven by the availability of land and hands to work it: from farming villages to a well-connected urban network with a high level of migration into towns and the areas surrounding them.

Human mortality has changed noticeably over time. Mortality data derived from skeletons in combination with historical data can help to reconstruct these changes and add to our understanding which processes shaped the structure of historical populations.

#### 5 CLIMATE CHANGE IMPACT ON RESPIRATORY HEALTH IN MEDIEVAL IRELAND

**Abstract author(s):** Roshem, Irmine - Dittmar, Jenna (University of Aberdeen) - Drain, Deidre - Carlsson, Stine (Queen's University Belfast) - Crozier, Rebecca (University of Aberdeen) - Oxenham, Marc (University of Aberdeen; Australian National University) - Murphy, Eileen (Queen's University Belfast)

**Abstract format:** Oral

Northern Europe experienced two major climate periods during medieval times: the Medieval Warm Period (9th to 14th centuries) and the Little Ice Age (14th to 18th centuries). During the former, the warmer temperatures allowed the expansion of agricultural land and a consequent increase in production. The transition to the Little Ice Age led to a sharp cooling of temperatures which significantly impacted people's lives. Despite past climate reconstructions often being used in current climate studies, they often neglect how human health was affected at a local scale. To better understand the relationship between climate and health, this research aims to determine the effects of past climate changes on respiratory health throughout the medieval period. To assess this, the human skeletal remains from three Irish sites, Ballyhanna (n=695), Ranelagh (n=167) and Stacumny (n=68), were macroscopically examined with the aid of an endoscope for evidence of maxillary sinusitis, otitis media and pathological rib lesions. The human remains within these collections were divided into three groups: those that date to before, during and after the medieval climate transitions. The results are presented in this session. This study is part of a larger project comparing medieval respiratory health in Ireland and Scotland. By considering the palaeoclimates in Ireland and Scotland, the potential causes of regional variation are discussed. Such research has the potential to provide insight into current climate challenges.

## THE IMPACT OF THE NATURAL ENVIRONMENT ON HEALTH IN PAST POPULATIONS FROM IRELAND AND SCOTLAND: PRELIMINARY RESULTS FROM IRISH SITES

**Abstract author(s):** Carlsson, Stine (Queen's University Belfast; University of Aberdeen) - Murphy, Eileen (Queen's University Belfast) - Crozier, Rebecca (University of Aberdeen) - Oxenham, Marc (University of Aberdeen; Australian National University) - Dittmar, Jenna (University of Aberdeen) - Drain, Deirdre - McKinley, Jennifer (Queen's University Belfast)

**Abstract format:** Oral

It has long been known that human health and the environment are inextricably linked, and that there are a number of external factors that influence our health and wellbeing. The climate, local availability of resources, diet, geochemical composition of local soil and water, as well as other factors, can all have a significant impact on the levels of physiological stress in a given population. The role in which the physical environment, specifically the underlying geology, plays in the observed levels of physiological stress in populations from Medieval Ireland and Scotland has not been investigated on a large scale. This study is aimed at utilising available environmental and geological data to determine if, and to which extent, the local environment in which humans lived had a significant effect on the levels of physiological stress within and between populations. By looking at non-specific indicators of physiological stress, specifically cribra orbitalia, porotic hyperostosis and linear enamel hypoplasia, we hope to gain better insight into past Irish and Scottish physiological stress profiles. In taking into account the wider cultural, biological and socio-economic context of the populations, as well as the role of different diets, we investigate the relationship between the physical environment and physiological stress. In this session, preliminary results garnered from the Irish sites Stacumny, Co. Kildare, Ranelagh, Co. Roscommon and Ballyhanna, Co. Donegal, will be presented.

## INVESTIGATING ENVIRONMENTALLY DRIVEN HEALTH ISSUES IN MEDIEVAL YPRES THROUGH OSTEOLOGICAL- AND STABLE ISOTOPE ANALYSES

**Abstract author(s):** Spros, Rachèl (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel) - Jackson, Veronica (Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel; Anatomical Research and Clinical Studies, Vrije Universiteit Brussel) - Lambert, Bart (Historical Research Into Urban Transformation Processes Research Unit, Vrije Universiteit Brussel) - Veselka, Barbara (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel) - Probyn, Steven - Snoeck, Thyl (Anatomical Research and Clinical Studies, Vrije Universiteit Brussel) - Claeys, Philippe (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel) - Snoeck, Christophe (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel)

**Abstract format:** Oral

Just like today, the late medieval period knew many challenges caused by climate change and diseases. The Little Ice Age, starting in the fourteenth century, and the famines and diseases that followed left their marks on past European populations, which are still visible today in the human skeletal remains. The influences of these potential stressors on human skeletons from the late medieval population from Ypres, Belgium, is assessed via stable isotope and osteological analyses. Ypres, rapidly growing into one of the biggest cities in Europe during the thirteenth century, was struck by social polarisation, conflicts, proletarianization, and famines. As a result, the booming city once known for its cloth industry, started to decline during the fourteenth century and provides a good opportunity to study the dynamics of densely populated urban centers during such tumultuous times. Preliminary results from the stable carbon and nitrogen isotopes ( $\delta^{13}\text{C}$  &  $\delta^{15}\text{N}$ ) analyses seem to indicate some levels of physiological stress with higher  $\delta^{13}\text{C}$  &  $\delta^{15}\text{N}$  values observed in some of the individual's ribs compared to the femurs, suggesting they may have suffered from malnutrition or even starvation. The stable isotope results occasionally match pathological changes. One individual in particular displayed enamel hypoplasia, cribra orbitalia, and vitamin D deficiency and had high  $\delta^{15}\text{N}$  values in the ribs (14.1‰), reinforcing the possibility that inhabitants of Ypres suffered from starvation. This presentation provides more insights into how bioarchaeology can help research the health status in Ypres during its rise and decline in the late medieval period.

## FROM FISH TO PALEOPATHOLOGY: DIETARY RECONSTRUCTION OF MEDIEVAL PONTEVEDRA (NW SPAIN) COMBINING PALEOPATHOLOGY AND STABLE ISOTOPES

**Abstract author(s):** Veiga-Rilo, Clara - Mangas-Carrasco, Elvira (CRETUS. Group EcoPast - GI-1553, Area of Archaeology, Dpto History, Facultade de Xeografía e Historia, Universidade de Santiago de Compostela) - López-Costas, Olalla (CRETUS. Group EcoPast - GI-1553, Area of Archaeology, Dpto History, Facultade de Xeografía e Historia, Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University; Laboratorio de Antropología, Departamento de Medicina Legal, Toxicología y Antropología Física, Facultad de Medicina, Universidad de Granada)

**Abstract format:** Oral

During the Middle Ages (12th to 16th centuries), Pontevedra (Galicia, NW Spain) became one of the most important ports on the Atlantic coast. The economy of the village was based on fishing and trading of derived products due to the concession of royal privilege in the monopoly on exporting, processing and conserving four marine species. Also, detailed historiographic studies have revealed an incredible dependence on marine products. The bioarchaeological study of the two necropolises located inside-walls provides an excellent opportunity to approach lifestyle in such a characteristic site. Santa María (marine activities guilds, n=60) and San Bartolomé o Vello (artisan's guilds, n=22) were studied. The populations buried were not socially diverse, i.e. middle-class people related to seafaring and craft activities. The main objective was to define health status and dietary patterns in these collections through three different approaches: (1) dietary reconstruction using stable isotope analyses in bone collagen ( $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ), (2) oral pathology studies (caries, dental wear) and (3) non-specific stress markers (cribra orbitalia, cribra femoralis, cribra humeralis, porotic hyperostosis and hypoplastic enamel defects). The isotopic studies suggest that they were some of the most marine resources dependent populations in Europe, also showing variation between both studied necropolises -higher  $\delta^{15}\text{N}$  levels in Santa María than in San Bartolomé- and with an important intake of C4 plants, i.e. millets. Elevated dental wear frequencies were observed possibly related to fish consumption. High frequencies of cribra orbitalia and cribra femoralis have been found in comparison with other Iberian sites, which has been associated with possible parasitic infections, related to smoked or salted fish, and millet consumption. Historiographic and biological information both coincide about a very specific lifestyle of the Pontevedra inhabitants during the Middle Ages, distinct from other Iberian Peninsula populations of the same chronology but different economies.

## FOOD, HEALTH AND ORIGIN OF A CHRISTIAN MOZARABIC RURAL COMMUNITY IN AL-ANDALUS: THE CASE OF TÓZAR (GRANADA, SPAIN)

**Abstract author(s):** Mattei, Luca - Sarr, Bilal (Department of Medieval History, University of Granada) - Alexander, Michelle (BioArCh, Department of Archaeology, University of York) - Jiménez Brobeil, Sylvia (Department of Legal Medicine, Toxicology and Physical Anthropology, University of Granada) - Sánchez Almazo, Isabel (LIE Laboratory, CIC, University of Granada) - Abdelaziz, Mohamed (Department of Genetics, University of Granada)

**Abstract format:** Oral

The use of bioarchaeology and different types of biomolecular analysis is increasingly employed to investigate the information included in the bones of individuals who have constituted the past societies and communities. In this work, we present a case of study to enrich the knowledge of a mozarabic community who has lived in the X and XI centuries in Iberian Peninsula, more specifically in Tózar, in the western mountains of Granada.

We present an interdisciplinary bioarchaeological research about individuals of the necropolis associated with the mozarabic village, in combination with data extrapolated from a previous anthropological study.

In this session we provide the data obtained from different analysis, especially carbon ( $\delta^{13}\text{C}$ ), nitrogen ( $\delta^{15}\text{N}$ ) and oxygen ( $\delta^{16}\text{O}$ ) stable isotope, which were performed on the bone collagen. Furthermore, DNA has also been investigated in a representative sample of individuals.

All of this data will shed light on diet patterns, strategies of food production associated to the food supplies network of this rural village, the overall health status of the population, and the mobility and provenance of this minority rural community that lived in the times of Al-Andalus.

## OF STRESS AND PLAGUE: AN ASSESSMENT OF STRESS INDICATORS IN THREE FRENCH BURIAL SITES RELATED TO THE FIRST PLAGUE PANDEMIC

**Abstract author(s):** Holleville, Marion (UMR 5199 PACEA – De la Préhistoire à l'Actuel : Culture, Environnement et Anthropologie, Université de Bordeaux, CNRS, MC, Pessac) - Durand, Raphaël (UMR 5199 PACEA – De la Préhistoire à l'Actuel : Culture, Environnement et Anthropologie, Université de Bordeaux, CNRS, MC, Pessac; Service archéologique de Bourges Plus, Bourges) - Castex, Dominique - Deguilloux, Marie-France (UMR 5199 PACEA – De la Préhistoire à l'Actuel : Culture, Environnement et Anthropologie, Université de Bordeaux, CNRS, MC, Pessac) - Kacki, Sacha (UMR 5199 PACEA – De la Préhistoire à l'Actuel : Culture, Environnement et Anthropologie, Université de Bordeaux, CNRS, MC, Pessac; Department of Archaeology, Durham University)

**Abstract format:** Oral

The bacterium *Yersinia pestis* caused tens of millions of deaths during three historical pandemics that profoundly shaped European societies. The first plague pandemic, also known as the 'Justinianic Plague', raged in Europe and the Mediterranean basin from the 6th to the 8th century AD. At that time, Europe was undergoing numerous climatic, political and societal changes that presumably have created a fertile ground for its emergence. Here, we contribute to discuss this hypothesis by assessing the health status of the populations that were struck by the pandemic. To this end, we conducted a multi-proxy study on skeletal remains recovered from three early medieval burial sites from Central France (Sens, Bourges and Poitiers). Besides testing the detection of the bacillus through palaeogenomics analyses, we assessed the presence of stress indicators to evaluate the environmental conditions the individuals were exposed to before they died from plague. Prevalence of stress indicators, which were similar in all three skeletal series, match those previously reported for Black Death burial sites, suggesting an epidemiological analogy between the first and the second pandemic. Overall, this multidisciplinary study allowed for a richer and more vivid representation of the population of Central Gaul between the 6th and 8th centuries and suggests massive level of stress in the populations that were confronted with the plague.

## BIOMECHANICS OF PHYSICALLY IMPAIRED INDIVIDUALS IN MEDIEVAL IRELAND

**Abstract author(s):** White, Jessica (Queen's University Belfast)

**Abstract format:** Oral

It is difficult to visualise how individuals in the past would have functioned with physical impairments and how treatment may have increased their mobility. Disability is not defined by a set of disease conditions; individuals will have different experiences of their condition depending on the nature of their environment, culture, social status, and skills. Thus, the day-to-day quality of life of an individual, and associated limitations in activity or restriction in participation, cannot be inferred from macroscopic analysis of bone alone. Bone can adapt according to the mechanical stresses placed on it. Bone form indicates function, therefore, analysis of bone morphology may have the potential to reveal information regarding the daily life of physically impaired medieval Irish individuals. By assessing the amount of cortical bone in long bones using radiographs, this study may reveal limb function after disability. Crucial to the understanding of bone morphology is the assumption that the levels and patterns of habitual biomechanical stress are reflected in the quantity and distribution of cortical bone in the diaphysis. It is based on this assumption, that allows comparison of limbs for signs of weight bearing, revealing the level of function after injury/illness. This along with macroscopic analyses will reveal if the individual used walking aids following incapacitation of their lower limbs. From this, the level of care they may have required can be established, revealing information about the type of community these individuals lived in. Three-dimensional musculoskeletal models of the physically impaired individuals will be developed to allow visualisation of their gait revealing how they may have functioned on a day-to-day basis. Assessing the impact of physical impairment in an archaeological setting will reveal information about the care and treatment in the past and will also show the development and outcome of diseases and injuries if left untreated medically.

## INJURED, MAIMED AND IMPAIRED: FEMALE EXPERIENCES OF PHYSICAL IMPAIRMENT AND DISABILITY IN MEDIEVAL SCOTLAND

**Abstract author(s):** Dittmar, Jenna - Crozier, Rebecca - Baker, Nick (University of Aberdeen) - Cameron, Ali (Cameron Archaeology) - Hall, Derek (University of Stirling) - Mann, Bruce (Aberdeenshire Council Archaeology Service) - Oxenham, Marc (University of Aberdeen; Australian National University)
